**Present methods for characterizing the watering of milk, particularly the simplified molecular-constant method.** E. CATTELAINE AND L. BLIECO. *J. pharm. chim.* [8], 8, 455-9, 510-8(1928); cf. following abstr.—A critical review is presented of the methods of Villiers and Bertault (detg. the refractive power of the whey, *Bull. soc. chim.* [3], 19, 305-10(1908)), of Winter (1895) (cryoscopy of the milk, cf. *C. A.* 5, 2670), of Gros (1903) (detg. solids not fat, *C. A.* 10, 1899) and of Mathieu and Ferré, (S. M. C. method, *C. A.* 8, 2908, 10, 1899). In practice, the methods of Gros and detn. of the true S. M. C. together permit the definite recognition of the addn. of H<sub>2</sub>O to milk. An extensive bibliography is added.

S. WALDBOTT

**Analyses of milks of the region of Sées (Orne), their apparent and true simplified molecular constant.** L. BLIECO. *J. pharm. chim.* [8], 8, 543-6(1928); see *C. A.* 23, 215.

S. WALDBOTT

**A rapid stain for direct microscopic examination of milk.** N. M. ERB. *J. Lab. & Clin. Med.* 14, 377(1929); *Stain Tech.* 4, 61.—As in the Breed method, 0.01 cc. of milk is spread over 1 sq. cm. on a cover slide, dried and stained for 1 min. with the following soln.: Et<sub>2</sub>O 50 cc., abs. MeOH 50 cc., certified methylene blue 0.59 g. The slide is rinsed in water and dried.

C. R. FELLERS

**The separation of the components of frozen milk by fractional melting.** VIKTOR V. WINTER. *Chem. News* 138, 321-4(1929).—The fat contents in the fractions of re-melted milk may be dependent on the conditions of the freezing and re-melting as well

as on other circumstances. The proportion of the quantity of proteins in relation to that of the sugar and salt is very stable. Instead of Vieth's av. % proportion of 39 : 52 : 9, W. found 40 : 52 : 8. The division of protein is not even as might be expected, probably because of the quality and quantity difference between casein, lactalbumin and lactoglobulin. The % of sugar is increasing toward the end of the melting. The division of the content of salts approaches the division of proteins more than that of sugar, and towards the end of the fractional re-melting the quantity of salts as well as of proteins diminishes. J. C. JURRIGS.

**The sanitary control of ice cream.** F. W. FABIAN. *Am. J. Pub. Health* 19, 590-600(1929).—It is much more satisfactory to require pasteurization of the whole mix since it gives more uniform results and is in accord with the best practice of the industry. With proper care it is possible to produce ice cream with a bacterial count of 100,000 or less per g. Periodic inspection plus regular bacteriological analysis will do much to keep a close check on the sanitary quality of the product. Expts. have shown that *B. typhosus*, *B. diphtheriae* and hemolytic streptococci may remain viable for considerable periods of time in ice cream. Numerous epidemics have been definitely traced to ice cream.

**Mechanical stabilization of emulsion in dairy manufacture.** F. J. DOAN. *Food Ind.* 1, 358-60(1929).—Homogenizers and other emulsion-forming equipment commonly used in ice cream plants and creameries are described. C. R. FELLERS.

**The presence of mixed glycerides in butter.** E. DE COMO AND E. SCOPINARO. *Ann. chim. applicata* 19, 55-65(1929).—The authors have shown the presence of 2 mixed glycerides in butter, stearopalmitin and palmitostearin, both solids. They have not been able, however, to confirm the presence of a liquid glyceride (butyro-palmito olein) as deduced by J. Bell and confirmed by Bleyt and Robertson. A. W. CONTIERI.

**Development of soapiness in margarine.** KARL BRAUN. *Chem.-tech. Rundschau* 44, 345(1929).—Discussion of previous work on development of rancidity in fats by molds and bacteria. Soapiness in margarine was investigated and found not due to the quality of the raw materials. Conclusion: The practice of washing machines, containers, etc., with soda solns. should be abandoned since it penetrated the wood from which it was difficultly removable by washing and where it combined with any traces of free fatty acid to form scraps. E. PICKERING.

**A study of churn sanitation.** NORMAN JAMES. *Sci. Agr.* 9, 649-55(1929).—Filling the churns above the rolls and the working of the churn during sterilization are recommended as important procedures in minimizing the germ content of a churn. Molds and yeasts known to be present in water did not grow when plated on lab. media after the water had been chemically treated for 10 mins. using 4 different solns. The germicidal inhibiting effect of the chemical in the bacteriol. medium may account for this result. Accordingly, conclusions relative to the efficiency of chem. solns. for sterilizing are not warranted. C. R. FELLERS.

**The conservation of egg yolk by lactic acid and glycerol.** F. BORDAS. *Ann. hyg. publ. ind. sociale* 1928, 705-12; cf. *C. A.* 22, 643.—A discussion of the question under what conditions the use of the above agents may be considered hygienically unobjectionable. G. TOENNIES.

**The behavior of sulfur compounds in cooking vegetables.** JEAN SIMPSON AND EVELYN G. HALLIDAY. *J. Home Econ.* 20, 121-6(1928).—Detns. of evolved S compds during cooking of cauliflower or cabbage together with organoleptic examn. of the cooked products show that S compds. of these vegetables tend increasingly to decompose on long cooling and that it is their decompn. products which are responsible for the bad taste and odor which are assocd. with these vegetables when overcooked. L. D. E.

**Chemical composition of the pumpkin (*Curbita maxima*).** G. RIVIÈRE AND G. PICHARD. *J. soc. natl. Hort. France* [4], 28, 274-5(1927).—The varieties Rouge vif d'Etampes and Turban du Natal contained, resp., water, 92.20, 93.42; dry matter, 8.80, 6.58; reducing sugar, 2.68, 0.00; sucrose, 0.32, 0.92; matters capable of forming sucrose, 3.60, 0.00; acidity, 0.00, —; ash, 0.90, 0.09. H. L. D.

**Chemical composition of West Indian seedling avocados.** JENNIE TILT AND MAY WINFIELD. *J. Home Econ.* 20, 43-6(1928).—One hundred twelve samples of Florida avocados representing different varieties and stages of maturity showed the following range and av. figures, resp.:  $H_2O$  81.65 to 83.92, av. 83.02; protein 1.12 to 1.16, av. 1.14; fat 6.43 to 8.09, av. 7.33; carbohydrate 6.72 to 6.92, av. 6.82; crude fiber 1.16 to 1.19, av. 1.17; and ash 1.02%. The ash calcd. on the basis of g. per 100 g. fresh avocado analyzed P 0.0477 to 0.0507, av. 0.0492; Fe 0.0054 to 0.0072, av. 0.0063; Ca 0.0368 to 0.0381, av. 0.0370; Mg 0.0323 to 0.0407, av. 0.0365. A comparison of results obtained in California shows that the Florida avocado is somewhat higher in  $H_2O$  and lower in fat

and protein. Ca, Mg and P agree closely with the California fruit while Fe is approx. half that of the California avocado.

**Modern processing methods in fruit canning.** F. HIRST. *Food Manuf.* 4, 157-9 (1929).—H. outlines the technic of canning from the British standpoint and emphasizes several features which render their problems somewhat different from those experienced in America.

**The effect of sulfur dioxide on the oxidase of fruits.** W. V. CRUICK AND W. Y. FONG. *Fruit Products J. and Am. Vinegar Ind.* 8, No. 10, 21(1929).—SO<sub>2</sub> exerts a strong inhibiting action on the darkening by oxidation of the natural color bases of fruits in addn. to its blanching action on the anthocyan pigments.

**The story of carbonated beverages. Composition and value.** LILLIAN B. STORMS. *Practical Home Econ.* 7, 40-4(1929).—A history of carbonated beverages is given. Carbonated beverages contain 7-17% sugar. Addn. of carbonated beverages to the diet of rats caused better growth and reproduction. The acids used in carbonated beverages are citric, tartaric, acetic, lactic and phosphoric. The CO<sub>2</sub> present increases the death rate of microorganisms. Twenty-nine references are given.

**The copper content of plant and animal foods.** C. W. LINDOW, C. A. ELVEHJEM AND W. H. PETERSON. *J. Biol. Chem.* 82, 465-71(1929).—The Cu content of about 160 samples of common food materials has been detd., ranging from 0.1 mg. per kg. of fresh celery to 44.1 mg. for fresh calf liver. The classes of foods in descending order of Cu content are as follows: nuts, dried legumes, cereals, dried fruits, poultry, fish, animal tissues, green legumes, roots, etc., leafy vegetables, fresh fruits and non-leafy vegetables. The Cu content of leafy vegetables does not place them in the preëminent position which they hold with reference to their Fe content. There is a wide variation in the Cu content of livers from various animals, calf liver being highest and hog liver lowest. Oysters contain a strikingly high amt. and surpass all sea foods in Cu. The degree of variation in the Cu content of foods falling in the same class was less than that of either Mn or Fe. There is a wide distribution of Cu in food materials, no food examd. being without it. Certain milled cereals, such as polished rice and patent wheat flour, are very low in Cu as compared to the whole grain from which they are made.

**The copper content of feedingstuffs.** C. A. ELVEHJEM AND E. B. HART. *J. Biol. Chem.* 82, 473-7(1929).—The Cu content of 47 common feeds is given, the av. content being 1/3 of the Mn and 1/16 of the Fe in 42 of these feeds. The feedstuffs arranged in ascending order of Cu content are as follows: straws and stovers, hays and grasses, and seeds and seed products. The variation in Cu content in general is very small. The Cu content of the crop can be increased within certain limits by fertilization of the soil with a Cu salt. Certain manufactured feeds were unusually high in Cu probably because of contamination.

**Test of hydrocyanic acid in cattle feed.** G. MOUSSU. *Réc. méd. vétérinaire* 13, No. 1, 5-8(1927); *Intern. Rev. Sci. & Practice of Agr.* [N.S.], 18, 610T.—A simple process is described by which it is possible to detect the presence in feeds and industrial residues of products such as cyanogenous glucosides which generate HCN. The suspected production is soaked in tepid water at 35-38° until it has a pulpy consistency. A test-tube is half filled with this pulp. A strip of picro-soda paper (blotting paper plunged first into a concd. aq. soln. of picric acid, then dried and immersed in a 10% soln. of Na<sub>2</sub>CO<sub>3</sub> and again dried) is placed in the upper half of the test-tube and kept in place by the cork only. After 12 to 20 hrs. at ordinary temp. or after 5 to 6 hrs. at stove temp., the glucoside is decomposed and the HCN is set free, producing iso-purpurate of Na, which colors the soda paper red, more or less intense according to the richness in glucoside which generates HCN of the product under suspicion.

**The composition of mineral licks.** W. R. JEWELL. *J. Dept. Agr. Victoria* 27, 231-4(1929).—A satisfactory mixt. of inorg. salts for use in the feeding of animals is compounded in the following proportions: NaCl, 187; ground phosphate rock, 62 or sterilized bone meal, 93; S, 14; FeSO<sub>4</sub>, 9; and MgSO<sub>4</sub>, 7 lbs., and 4 ounces each of KI and MnSO<sub>4</sub>. "Ground rock phosphate is now generally used, and is quite efficient as a source of Ca and P, provided it does not contain appreciable amts. of F, which is harmful to stock. Nauru and Ocean Island phosphates, which constitute the bulk of rock phosphate used in Victoria, contain only small quantities of F, and for that reason are satisfactory. Superphosphate should not be used as it may produce internal disorders."

**Poisonings caused by vetches.** ALBERT GUILLAUME. *Bull. sci. pharmacol.* 36, 293-301(1929); cf. C. A. 23, 3279.—The toxicology is discussed. *Lathyrus* does not contain alkaloids or HCN. The poisoning may be due to a poisonous protein, saponin, phytotoxin or to anaphylaxis.

A. E. MEYER

Labor-saving devices for the commercial protein testing laboratory (WHITCOMB) 1. The Cu content of sugar-beet leaves treated with Cu compounds, and changes in their oxalic acid content (FRIGERIO) 15. Esters [for use as foods] (Fr. pat. 654,535) 10.

**Food product from bananas.** CHARLES JAEGER. Fr. 653,620, April 30, 1928. See Brit. 290,195 (C. A. 23, 916).

**Preserving food.** CHRISTIAN BERTRAM. Fr. 653,809, May 3, 1928. Food such as fruit or vegetables can be kept fresh for months by covering them with a mixt. contg. 992 g. of either chalk, talc or dolomite on the one hand, or paraffin, neat's foot oil or suet on the other hand and colophony 4, Na benzoate 1, benzoic acid 0.5, salicylic acid 1, meadowsweet powder 1, basic carbonate of  $\text{NH}_4$  0.5 g. The prepn. is washed off before using.

**Preserving food.** STUDIEN-GES. FÜR WIRTSCHAFT UND INDUSTRIE M. B. H. Ger. 476,434, Jan. 25, 1925. Foodstuffs are preserved by a combination of the known methods in which colloidal solns. of metals and dild. acid vapors are used. Thus, apples may be treated in a container with an atomized spray of a colloidal soln. of Ag, and before the spray has settled the container is covered with a lid to which a rag satd. with HCl is attached.

**Determination of water content of solid substances such as cereals or flour.** FRANKFURTER FORSCHUNGSMITTEL FÜR GETREIDECHEMIE, G. M. B. H. Fr. 654,422, May 18, 1928; See Brit. 290,645 (C. A. 23, 794).

**Flour.** ERNEST A. FISHER and CHARLES R. JONES. Fr. 654,324, May 15, 1928. An app. is described for improving the cooking quality of flour, in which the flour in the form of a cloud is treated with moist heated air, so that the flour is heated between 54–82° without appreciable loss of water.

**Apparatus for drying and cooling flour or starch.** ALEX. G. HUHN. Fr. 652,858, April 3, 1928.

**Breadmaking.** EUZIM (SOC. ANON.). Fr. 654,056, May 10, 1928. Fermentation of bread dough is activated by adding to the yeast a mixt. contg. Mg phosphate 7,  $\text{NaHCO}_3$  3,  $(\text{Ca}_3\text{PO}_4)_2$ , in which there is 37% of phosphoric anhydride sol. in citrate, 90%

**Bakery furnace.** JEAN DUPIC. Fr. 652,870, April 12, 1928.

**Bakery furnaces using liquid fuel.** PAUL LINKE. Fr. 653,723, Feb. 25, 1928

**Preserving egg material.** EGG PATENTS, LTD. Fr. 654,512, May 21, 1928. See Brit. 296,462 (C. A. 23, 2510).

**Vitamin preparation.** AAGE W. OWE. U. S. 1,715,945, June 4. A vitamin-contg. fatty material such as a fish liver oil is treated with an alk. earth hydroxide such as  $\text{Ca}(\text{OH})_2$  to form a water-insol. metal soap; the soap is pulverized, and vitamins are extd. from it by the use of an edible fat such as cotton oil to form a vitamin-contg. food product.

**Apparatus for curing meat by smoking.** MAX RIND. U. S. 1,715,625, June 4. Structural features.

**Nut-meat food product.** JOSEPH L. ROSENFELD. U. S. 1,716,152, June 4. Nut meats such as those of peanuts are cut into small particles in which some of the oil cells are severed but in which most of the oil is retained in the cells, and mixed with a hard edible oil such as hydrogenated peanut oil to produce a plastic product.

**Coffee preparation.** THOMAS M. RECTOR (to Vitapack Corp.). U. S. 1,716,323, June 4. Coffee is ground in a fatty medium, part of the fatty medium is expressed and the expressed material is added to a fresh batch of coffee, which is also similarly ground and expressed. The product may be used for prep. beverages or as a flavoring.

**Concentrated onion juice.** CARL MARX (one-half to Rudolph Weiss). U. S. reissue 17,324, June 11. A reissue of original pat. No. 1,619,826, issued March 8, 1927 (C. A. 21, 1318).

**Fruit containers.** ARNOLD KUPFER. Swiss 130,911, Dec. 15, 1927. The containers are impregnated with paraffin wax, stearin, ceresin or mineral oil or a mixt. of these.

**Apparatus for preserving fruits.** JACQUES DUPRAT. Fr. 653,038, Sept. 26, 1927.

**Preserving citrus-fruit juices.** VAMAN R. KOKATNUR. U. S. 1,715,932, June 4. An aq. ext. of the skin of citrus fruit such as oranges, lemons, grape fruit or tangerines is mixed with juice of the fruit without addn. of any extraneous preservative; the treated juice is heated to 45–55° for at least 2.5 hrs.

## 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**Science in industry.** GUSTAV EGLOFF. *Petroleum Times* 21, 908, 910-11(1929).—A lecture on the place of research in modern mfg. processes. M. B. HART

**Two examples of the smaller industrial research organizations.** WASHINGTON PLATT. *Ind. Eng. Chem.* 21, 659-61(1929).—Research organizations of a baking company and of the American Dry Milk Inst. are described. E. H.

**Structure of an industrial research organization.** CHARLES M. A. STINE. *Ind. Eng. Chem.* 21, 657-9(1929).—The nature of the research organization of E. I. duPont de Nemours & Co. is outlined. E. H.

**Some aspects of chemical patent searches.** FREDERICK H. UNTIEDT. *Ind. Eng. Chem.* 21, 689-91(1929). E. C. M.

**How chemical engineering has improved aircraft.** GEORGE E. WALKER. *Chem. Met. Eng.* 36, 348-50(1929). E. J. C.

**An indirect method of measuring air flow.** A. F. DAY. *Commonwealth Eng.* 16, 387-8(1929). E. J. C.

**Heat transfer between gases with the secondary introduction or removal of heat.** R. NITZSCHMANN. *Metallbörse* 19, 1127-9(1929).—A series of equations and tables for simplifying calcs. in heat transfer. W. C. EBAUGH

**Means of ventilating and freeing chemical factories of dust.** H. REININGER. *Chem. Fabrik* 1929, 205-7, 230-2, 271-3.—Descriptions of proper construction of roofs, of the Körting, Wolpert and Kaüffer ventilators, fan exhausters, sprays, masks, etc. J. H. MOORE

**Results of testing materials with Röntgen rays.** H. BECKER-ROSE. *Chem. Fabrik* 1929, 229-30, 270-1.—A summary of results on catalyzers, ceramics, metals, mineral pigments, double salts, mixed crystals, silk, cellulose, rubber, etc., with 44 references. J. H. MOORE

**1,4-Dioxan.** E. W. REID AND H. E. HOFMANN. *Ind. Eng. Chem.* 21, 695-7(1929).—1,4-Dioxan is adapted for use as a solvent for cellulose esters (alcohol-wet), cellulose acetate, cellulose ethers, resins, oils and waxes, dyes and many other org. compds. Its use is indicated in the manuf. of lacquers and celluloid. It may also be used in many other diversified arts, where its solvent properties are desired. B. H.

**The gravitational flow of fertilizers and other comminuted solids.** W. EDWARDS DEMING AND ARNON L. MEHRING. *Ind. Eng. Chem.* 21, 661-5(1929).—Data are given for the rates of flow of various solids through funnels of different angles and with openings of various sizes. The materials used include crystd. urea and  $\text{NH}_4$  phosphate, crushed rock phosphate,  $\text{KNO}_3$  pellets, glass beads, lead shot, marbles and various varieties of seeds. The rates of flow of such materials depend upon av. particle size, on kinetic coeff. of friction, on apparent density, on diam. of opening and on the vertical angle of the hopper, or in case all the material does not flow out, on the angle between opposite slopes of material at repose. An expression for computing the rate of flow is derived. M. S. ANDERSON

**Status of silicosis.** E. R. SAYRES, E. R. HAYBURST AND A. J. LANZA. *Am. J. Pub. Health* 19, 635-40(1929).—A comm. rept. J. A. KENNEDY

**The effect of added impurities on the breakdown voltage of insulating oils.** A summary of experimental work. ANON. *J. Inst. Elec. Eng.* (London) 67, 750-6(1929).—Water as an impurity may reduce the breakdown voltage to less than 10% of that of the dry oil. C. G. F.

**Lead poisoning in the United States.** CAREY P. MCCORD, DOROTHY K. MINSTER, ROBERT KEHOE. *Am. J. Pub. Health* 19, 631-4(1929).—A comm. rept. J. A. K.

**Ultra-filtration and its industrial applications (GÉNIN) 2.** Rubber composition [for use as insulating material] (U. S. pat. 1,716,478) 30.

**Drying materials with waste gases.** OESTERREICHISCHE BAMAG-BÜTTNER-WERKE A.-G. Austrian 113,019, Dec. 15, 1928. The process relates to drying materials such as beet slices, which are usually dried with hot waste gases, and consists in superficially drying the materials with cleaned waste gases or with hot air before completing the drying in the usual way. The products are then less contaminated with ashes and soot. App. is described.

**Drying gases.** ALLGEMEINE GESELLSCHAFT FÜR CHEM. IND. M. B. H. Fr. 652,691, Apr. 14, 1928. An app. is described for bringing gas into intimate contact with a drying liquid such as  $H_2SO_4$ , abs. alc. or  $Ac_2O$ .

**Gas purification.** FRANZ LENZE and ANTON RETTENMAIER. Fr. 653,832, May 3, 1928. Substances such as  $Fe_2O_3$  used for gas purification are desulfurized when exhausted by heating to the temp. corresponding to the first phase of the liquefaction of S, preferably 110–150°, then centrifuged or compressed or both. Solvents for S such as  $C_6H_6$  or paraffin oil may be added before centrifuging and may act as heat carriers for the S.

**Scrubbing effluent gases.** FRANK A. CANON (to Seldon Co.). U. S. 1,716,028, June 4. Gases from vapor phase org. reactions such as in the production and purification of phthalic anhydride are passed over water-insol. carbonates such as  $CaCO_3$  in the presence of water.

**Separating gases.** SOC. ANON. IND. AMMONIACA. Fr. 654,805, May 24, 1928. An app. is described for sepg. a gas from a mixt. of gases by forming a satd. soln. of the gas.

**Separation of gas mixtures.** HERMANN BLAU. Fr. 654,161, Sept. 7, 1927. A mixt. of gases of different solubilities in a liquid is sepd. by subjecting the compressed mixt. to the action of the liquid so that the gas of higher soly. and part of the gas of lower soly. are absorbed, the constituent of lower soly. being subsequently entirely expelled by rectification. An app. is described.

**Separating carbon dioxide from gas mixtures.** GES. FÜR LINDE'S EISMASCHINEN A.-G. Ger. 476,289, Feb. 16, 1924. In sepg.  $CO_2$  from gas mixts. by cooling the mixt. to a temp. below the f. p. of  $CO_2$ , particularly in sepg. residual  $CO_2$  from mixts. from which the bulk of  $CO_2$  has been preliminarily removed by soln. in water under pressure, a hydrocarbon which is gaseous at ordinary temp., e. g.,  $C_2H_6$  or  $C_3H_8$ , is added to the mixt. (if not already present) so that, on cooling, a soln. of  $CO_2$  in the hydrocarbon is obtained. The process may be applied to the liquefaction of air.

**Removing dust from gases.** LÉON DEBRIER. Fr. 654,371, May 16, 1928. An app. of the type in which the gas current is directed against damp surfaces is described.

**Reaction between gases and solids.** I. G. FARBENIND. A.-G. (Hermann S. Schultz, inventor) Ger. 475,555, Apr. 11, 1928. Solid materials are produced in a form suitable for reaction with gases by powdering and allowing a liquid such as water to fall drop by drop on to a layer of the powder to form uniform spherical grains, which are sifted from the powder and dried.

**Extracting volatile substances from aqueous solutions.** HERMANN SUIDA. Austrian 112,980, Dec. 15, 1928. The soln. is distd. in a series of stills at successively decreasing pressures, and the vapor mixt. from each still in extd. in a sep. column with a high-boiling solvent. The residual vapors from each column are used to heat the succeeding still. The process may be applied in working up dil. AcOH. App. is described.

**Purifying liquids by osmosis.** LEONARDO CERINI. Austrian 112,961, Dec. 15, 1928. In the osmotic purification of NaOH solns. from viscose manuf., or of other solns., the dialytic membranes are made from a mercerized vegetable-fiber fabric. The mercerization may take place *in situ*.

**Purifying oils with liquid sulfur dioxide.** ALLGEMEINE GES. FÜR CHEM. INDUSTRIE m. b. H. Ger. 476,464, Dec. 24, 1925. The  $\text{SO}_2$  evapd. from the ext. and from the refined oil is compressed and used to heat the evaporators.

**Revivifying spent clarifying and decolorizing agents.** MARVIN L. CHAPPELL (to Contact Filtration Co.). U. S. 1,715,535, June 4. Decolorizing materials such as have been produced by the  $\text{H}_2\text{SO}_4$  treatment of montmorillonite clay, after use for clarifying or decolorizing mineral oils, are washed with a combined color and oil solvent contg. less than 3%  $\text{H}_2\text{SO}_4$  and which also may contain acetone, alc. and gasoline; they are further washed with a solvent such as an acetone, alc. and gasoline mixt. which is free from  $\text{H}_2\text{SO}_4$ . An app. is described.

**Baffle, impact and gravity systems for separating suspended matter from industrial effluents or other liquids and effecting their clarification.** ROBERT J. MARK. U. S. 1,717,111, June 11. An app. is described.

**Elimination of silica.** ARTHUR ROSENHEIM. Fr. 653,784, April 30, 1928.  $\text{SiO}_2$  is eliminated from liquids, particularly from water, by bringing the liquids in contact with gels of oxides of Fe, Al, Mg, Zr, Sn, etc., or mixts. thereof. The gels may be mixed with inert org. or inorg. substances or with gels contg. basic substances. Hardness may be removed before, during or after the removal of  $\text{SiO}_2$ . The gels are regenerated by reaction with aq. solns. of alkalis or alk. substances, or with substances such as molybdates, which form with  $\text{SiO}_2$  sol. complex silicates, or with steam or hot water, or with water contg.  $\text{CO}_2$  at ordinary or increased pressure.

**Chemical reactions.** RICHARD VETTERLEIN. Fr. 653,124, April 20, 1928. Chemical reactions such as those between salts and acids or between reducing agents and salts, metallurgical treatments or simple liberation of gas are carried out in a furnace having several floors after the system known in the Herreshoff furnaces for roasting pyrites.

**Dielectric substances.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 654,711, Feb. 18, 1928. Dielectrics such as nitrobenzene oils, nitrotoluenes and other org. liquids or solids, which are liquid when heated, are purified by treatment with fuller's earth or fuller's earth and charcoal and then with an oxide of Al, Ca or Ba. The 2 treatments may be combined in a single filtering. Cf. C. A. 23, 3174.

**Elimination of free halogens.** BRITISH DYESTUFFS CORP., LTD. Fr. 653,032, Apr. 19, 1928. Free Cl or Br is eliminated from gases by passing them through a layer of solid  $\text{C}_{10}\text{H}_8$ ,  $\text{C}_{14}\text{H}_{10}$  or solid olefins, and from liquids by agitating the liquids with these compds.

**Controlling boiling liquids.** ROBERT KRINGS. Ger. 476,211, April 10, 1926. The boiling-over of liquids, e. g., soap, aq. solns., oils and fats, is prevented by assocg. with the boiler a pump which withdraws liquid from the bottom of the boiler and feeds it to a plate or like subdivider arranged above the liquid surface. The height of the plate above the liquid surface should be sufficient to cool the returning liquid considerably.

**Finely divided solids.** BRITISH DYESTUFFS CORP., LTD. Fr. 654,747, April 11, 1928. See Brit. 293,896 (C. A. 23, 1702).

**System for supplying air currents for drying, carbonizing, oxidizing or similar processes.** ROBERT GLINKA. U. S. 1,715,830, June 4. An app. is described.

**Refrigerators.** DAVID F. KEITH. Fr. 654,774, May 10, 1928.

**Refrigerators.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 653,221, Feb. 4, 1928.

**Refrigerators.** SULZER FRÈRES, SOC. ANON. Fr. 654,791, May 22, 1928 and Fr. 654,796, May 23, 1928.

**Refrigerating machine.** PLATEN-MUNTERS REFRIGERATING SYSTEM AKTIEBOLAG. Ger. 475,565, April 14, 1927. Details of arrangement are given.

**Refrigerating machine.** PLATEN-MUNTERS REFRIGERATING SYSTEM AKTIEBOLAG. Ger. 476,256, Mar. 29, 1925. The absorption refrigerating machines work on a continuous cycle and have an inert gas circulating between the evaporator and the absorber.

Improved means are described for facilitating heat exchange in the evaporator and in the absorber. Cf. C. A. 23, 2229.

Refrigerating machine with top condenser. AKTIEN GESELLSCHAFT BROWN, BOVERI & CIE. Ger. 475,674, Jan. 17, 1925.

Refrigerating system of the absorption type. WILLEM A. SIAGER (to Kodowa Refrigerator Co., Ltd.). U. S. 1,717,173, June 11.

Refrigerating system of the compression type. ALEXANDER T. KASLEY (to Westinghouse Elec. & Mfg. Co.). U. S. 1,715,709, June 4. Structural features.

Absorber for refrigerating machine. ERNST SCHÄREN. Ger. 476,668, July 18, 1923.

Evaporator for refrigerating machines. A. FREUNDLICH, MASCHINENFABRIK. Ger. 475,888, April 5, 1928. Details are given.

Overflow evaporator for small refrigerator. GABRIEL ZIWICKY. Swiss 131,194, Sept. 23, 1927.

Insulating material. EMILE KOLLER. Swiss 131,383, May 7, 1928. The material is composed of paraffin wax, Chatterdon's compd., colophony and bees wax.

Insulatin material from soot. RUSSFABRIK KAHL. Ger. 476,946, Jan. 30, 1927. The soot is mixed with tar, pitch, coal-tar oil, resin, glue or size to a stiff paste and roasted in a muffle furnace.

Insulating device for electrical gas purifiers. METALLGES. A.-G. Ger. 476,854, May 27, 1928.

Heat insulator. WALDEMAR HESSLING. Swiss 131,196, Jan. 25, 1928. Non-conducting material imbued with gaseous CO<sub>2</sub> is enclosed hermetically between outer and inner walls.

Heat-insulation for safes, etc. CHARLES J. BATES, JR., and CARL P. BARTELS (to Mosler Safe Co.). U. S. 1,715,977, June 4. Vermiculite material is used with diatomaceous earth and a binder such as cement or plaster of Paris. Cf. C. A. 23, 224

## 14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Town water supply in India. J. W. MADELEY. *Munic. Eng. Sanit. Record* 82, 535(1928); cf. C. A. 23, 1193.—Most large Indian towns are still supplied by water from shallow wells and tanks. Slow sand filtration is most usual. Water must be husbanded.

C. H. BADGER

Recent municipal activities at Stockport (England). HERBERT HAMER. *Munic. Eng. Sanit. Record* 82, 404-5(1928).—Seven pptn. tanks, each 200 ft. by 40 ft. wide, av. depth 7.75 ft., capacity 375,000 gals., are arranged in parallel. 2-42 in. feed pipe lines lead from the pptn. tanks to 5 concrete aeration tanks each 143 by 266 ft., capacity 900,000 gals. at 4 ft. depth. These are divided into a 5.25 ft. continuous channel 7000 ft. long by thin reinforced concrete walls. Agitation is by means of 9 or 10 ft. paddle wheels, 26 per tank. Sludge is pressed into cake and sold or is lagooned. The coarse and fine screens and the accompanying rakes are briefly described.

C. H. BADGER

Some municipal works at Portsmouth (England). RICHARD J. JENKINS. *Munic. Eng. Sanit. Record* 82, 447(1928).—Brief descriptions are given. Salt water is used for street washings with success.

C. H. BADGER

Portsmouth (England) drainage scheme. RICHARD J. JENKINS. *Munic. Eng. Sanit. Record* 82, 446-7(1928).—Seven collecting tanks, total capacity 11,250,000 gals.,  $\frac{1}{4}$  mile from the Eastney pumping station, are filled in less than 3 hrs. max. pumping. A description of the storm tank, consisting of 2-1,000,000 gal. compartments worked in series, is given. The storm water is discharged over weirs to the sea. There are 135 miles of sewers, max. 5 ft. diam. These take the storm water in some districts. The treatment plant of the sep. Cosham drainage district is to be modernized and the district to be completely sewered.

C. H. BADGER

German waterworks in 1928. H. STRINGER. *Engineer* 147, 564-5(1929).—A short account of the water supply of Shanghai, Cologne, Berlin and Hamburg.

D. B. DILL

Water softening for municipalities. EDWARD BARTOW. *Am. City* 39, No. 4, 131-2(1928); *U. S. Pub. Health Eng. Abstracts E-789b*, 60.—A discussion of water softening with a description of methods used at Columbus, Ohio, Okla. City, Springfield, Ill. and other cities. The demand for soft water is increasing and proper provision should be made by municipalities.

C. R. FELLERS

The softening of magnesian water by the lime-soda process. S. R. THOMAS. *Dyer, Calico Printer* 61, 192-3, 268-9(1929).—The various factors affecting the pptn. of magnesia are considered, and a method is described for detg. the best quantity of lime and soda ash in softening.

Chemical constituents of water. W. S. MAHLIE. *Domestic Eng.* (Chicago) 124, No. 9, 31-2, 55(1928); *J. Am. Water Works Assoc.* 21, 444.—M. lists the usual mineral constituents, discusses hardness, alkalinity and acidity; and gives a rapid method for calcn. of softening chemicals.

Detection of traces of phenol in water. H. BACH. *Gas u. Wasserfach* 72, 375-7(1929).—This method for detg. very small amts. of phenolic substances in water involves reaction with Na phenolate, filtration and evapn. of as much as 25 l. of water after oxidation with  $H_2O_2$  (free from aromatic preservatives). The concd. residue is neutralized with chloroacetic acid and distd. Phenol is detd. colorimetrically in the distillate by means of the Folin-Denis reagent. By this method it was found that the taste of the Essen drinking water after chlorination was due to 1 part of phenol in 125,000,000 parts of water due to insufficient biol. purification (of sewage, etc.) during the winter. The method gives good results at a diln. of 1 in 10,000,000 and fair results for 1 part phenol in 100,000,000 parts of water.

The detection of nitrites in drinking water by toluylene red. A. ROCHAIX. *Bull. sci. pharmacol.* 36, 302(1929).—Claim of priority referring to the note of Vergnoux (C. A. 23, 3037).

New treasury department drinking water standards. H. N. OLD. *Pub. Service Mgmt.* 46, 118-20(1929).

Unusual methods of water purification. MARTIN E. FLENTJE. *J. New Engl. Water Works Assoc.* 43, 38(1929).—The problems cited included: control of color and turbidity (alum was satisfactory) and elimination of water fleas and crustacea ( $CuSO_4$ , while satisfactory required too high a dosage and Cl treatment was used instead). Taste resulted in complaints, especially in the winter, owing largely to the short interval between chlorination and use. Dechlorination was resorted to, soda ash being used with the thiosulfate. The method of applying these 2 chemicals was considered worthy of a detailed outline.

Purification of potable waters for industrial purposes. F. DIÉNERT. *Chimie & industrie Special No.*, 182-3(Feb., 1929).—A brief discussion of the purity requirements of water for use in the fermentation industries.

Decolorization by storage in clean-bottomed reservoirs. KARL R. KENNISON. *J. New Engl. Water Works Assoc.* 43, 60(1929).—Two examples are selected where observation was possible and where color was high. From the data obtained the percentage reduction in color seems to be about 20% over 30 days.

The removal of iron from hard ground waters. R. L. MCNAMEE. *J. Am. Water Works Assoc.* 22, 758-67(1929).—The Fe occurs usually as  $FeCO_3$ . When the content exceeds 0.5 p.p.m., it is objectionable, fostering the growth of *Crenothrix* and interfering in laundering, dyeing, cooking, etc. Treatment involves aeration by sprays, falls or contact trays, coagulation usually with lime or an inert clay, sedimentation and filtration by contact beds or sand filters. Details and estd. costs are given.

Water filtration at Auckland, New Zealand. The Huia filter station. D. B. MANSERGH. *Commonwealth Eng.* 16, 329-33(1929).—The Huia filter station is of the Sandy rapid gravity type. It has an ultimate capacity of 28,000,000 g.p.d. Each bed is capable of treating 1,000,000 gal. The sand is specially graded and rests on a filter floor, which is laid on the floor on the water-tight tanks. A longitudinal sunk drain channel is provided in the concrete floor and then rows of special earthenware drain tiles of 3" internal diam. are laid on the floor 6" apart. These butt against one another and are 12" long. In the tops are holes 1" in diam., 6" pitch, to receive the brass nozzles. Then the filter is cemented to the top of the bosses on the nozzle plates. On this rests coarse gravel, medium gravel, coarse sand and fine sand. Tests are given of the filtered  $H_2O$ .

How turbid waters of the Tennessee River are filtered. C. V. SWEARINGEN. *Water Works Eng.* 81, 1265(1928); *J. Am. Water Works Assoc.* 21, 444.—Alum is used almost exclusively. Equipment for settling and filtration is described.

Report on the chemical quality of the surface waters of North Carolina with reference to industrial use. C. E. RAY, JR., and F. E. RANDOLPH. North Carolina Dept. of Conservation and Development, *Econ. Paper* 61, 73 pp.; *J. Am. Water Works Assoc.* 21, 444.—I. the chem. point of view these surface waters would be considered exceptional good.

Chlorine substitute standard valves for chlorine containers under fifteen tons capa-

city. ROBERT T. BALDWIN. *J. Am. Water Works Assoc.* 21, 81, 22, 129.—Specifications are given for a satisfactory standard valve tainers.

Chlorination of pipe lines under construction. JOHN R. MC WATER WORKS ASSOC. 21, 781-3(1929).—The importance of constructed work is emphasized and a method used in both con described.

Chlorination of water supply in the state of Washington. H. WEST. *Construction News* 4, 265-6(1929).—The control of chlorin Chlorinated water is used by 57% of the cities or towns.

Experience in the chlorination of surface water at low temperat GALL. *Arch. Hyg.* 100, 25(1928); *U. S. Pub. Health Eng. Abstracts* F slow sand filtration is used, it is not always possible, because of ta water sufficiently to reduce the total bacterial count to below 10 per absence of *B. coli* in 1000 cc. Cautious chlorination will reduce the 100 per cc. without introducing an excessive amt. of Cl.

The chlorination of running water. JOKAI IGUCHI AND TSUN Health Assoc. (Japan) 4, No. 12, 1-10(1928); *U. S. Pub. Health Eng.* 58.—Running ditch water, highly polluted with org. wastes, had cat teric outbreaks. A bbl.-feed, automatic device for treating the wa powder reduced the nos. of bacteria approx. 80%. An emulsion of and dil. HCl was even more efficient than bleaching powder alone a odor in the water.

Boiler operation at high pressure demands exact water conditio Power 69, 873-5(1929).—Caustic alk. should be 10-25 p. p. m. of phosphate as final conditioning chemical gives independent control of scale formation at desirable low concns. of alkali. Phosphate has vantages of sulfate. Its high protective action is due to its part permeable film. Conc. of Cl in boiler water should be kept low beca properties.

Comparison of behavior of distilled water with that of chemically high-pressure boilers. R. KLEIN. *Wärme* 51, 740-6(1928); *J. Assoc.* 21, 582-3.—Modern evaporator practice and results and ther ment are discussed.

Fundamental principles of feedwater-treatment processes for BALCKE. *Wärme* 51, 747-52(1928); *J. Am. Water Works Assoc.* 21, 2519.—Treatments by evapn. and chemical means are discussed and

Progress in the production and treatment of feedwater. B. 765-8(1928); *J. Am. Water Works Assoc.* 21, 583.—In addition to a distd. and chemically treated water, there is a discussion of methods

The causes and prevention of corrosion in steam boilers. C. Eng. 32, 265-8(1928); *J. Am. Water Works Assoc.* 21, 442.—A genera ing oxygen, electrochem. theory and embrittlement.

Boiler-feed water should be free from oxygen. *Power Plant* (1929).—A description of the newly modified Winkler iodometric met

Prevention of boiler corrosion by the addition of alkalis. Chem. Fabrik 1929, 253-6.—A review, with references, of the literature of corrosion and embrittlement by the proper adjustment of the alkali on the use of  $\text{Na}_3\text{PO}_4$ .

A rational basis for scale prevention in Diesel water jackets Oil Engine Power 7, No. 3, 170-2(1929).—A complete, if somewhat of the causes of scale formation in Diesel engine jackets and methods. Installations of small or moderate size, where the crection of a sof warranted, are given especial consideration.

Salt and sludge removal from boiler water. H. MANZ. *Wärme* J. Am. Water Works Assoc. 21, 583.—The influence of sol. salts is com of changes in concn. in feed water is given; also means is suggested fo

Protection of catchment areas. JOHN F. SKINNER. *J. New E Assoc.* 43, 1-17(1929).—Phys. and public precautions are considered ch

A new kind of pipe for water mains. R. W. MITCHELL. *J.*

*Works Assoc.* 43, 19-31 (1929).—Stresses the advantages of concrete pipe, including the use of asphalt as a waterproofing agent. A method of manuf. is described. D. K. F.

**Mitigating electrolysis of water mains.** W. B. BUCHANAN. *Am. City* 39, 35-6 (1928); *U. S. Pub. Health Eng. Abstracts* E-789b, 58; cf. *C. A.* 22, 2422.—The potential of the pipe line should be kept below that of the railroad tracks at any point to avoid possibility of exchanging currents at any other than bonding points. Any tendency for direct current to flow from the Fe pipe to the soil creates a hazard due to possible electrolysis. C. R. FELLERS

**Identification and control of algae types in water supplies.** L. B. MANGUN. *Water Works Eng.* 82, 607-8 (1929); cf. *C. A.* 23, 1972.—The quant. estn. of plankton and the use of algacides are discussed. Cl is superior in storage reservoirs. E. I. S.

**The activated carbons and their use in removing objectionable tastes and odors from water.** JOHN R. BAYLIS. *J. Am. Water Works Assoc.* 21, 787-814 (1929).—To meet the increasing demand for a palatable drinking water, activated carbons are suggested for the removal of tastes and odors. Bone black and vegetable char are described. Darco from lignite is mentioned. After references to activation, adsorption, revivification and uses of these carbons, exptl. data are given regarding removal of phenols, dechlorination and reduction of oxidizable org. matter, with special reference to Darco, which emphasizes the value of such treatment. D. K. FRENCH

**Sewage and other works (Nuneaton, England).** R. C. MOON. *Munic. Eng. Sanit. Record* 82, 367 (1928).—The sewerage system and the operation of the refuse destructors are briefly described. Refuse is sepd. by screens. Tins are baled. Steam developed is used by the sewage and water works. C. H. BADGER

**Notes on the sewage outfall works (Nuneaton, England).** A. J. CLIFFORD. *Munic. Eng. Sanit. Record* 82, 367 (1928).—Percolating filters occupy 2.75 acres, worked at approx. 65.5 gals. per cu. yd. per day. The dry weather flow is 1,250,000 gals. daily. Sludge and humus are disposed of on land or in lagoons. C. H. BADGER

**Sewage sludge.** J. H. GARNER. *Munic. Eng. Sanit. Record* 82, 589-91 (1928).—A discussion of the methods of sludge disposal by (1) ploughing and trenching into land, considered the best and cheapest if well planned and if land is available, (2) dewatering upon sludge filters, a method used by  $\frac{2}{3}$  of the sewage works, excepting very small ones, (3) filter pressing as used at plants with site restrictions, and (4) sep. digestion of the sludge. C. H. BADGER

**Odor control by the use of chlorine.** WM. J. O'CONNELL, JR. *Proc. 13th Ann. Meeting. N. J. Sewage Works Assoc.* 1928, 4-6; *U. S. Pub. Health Eng. Abstracts* E-789c, 36-7.—Most of the odors in sewage works are due to decompn. of org. matter. At Plainfield, the odor was most marked during the early forenoon of each day. An application of 12 p. p. m. of Cl early in the morning cleared up the trouble. When chlorination is so controlled as to reduce the  $H_2S$  content to nearly 0 p. p. m., the nauseating odors of decompn. are destroyed. The Cl treatment was found most effective when introduced after the screens and ahead of the settling tanks. C. R. FELLERS

**Economy in refuse disposal.** S. W. MOBBS. *Munic. Eng. Sanit. Record* 82, 398-9 (1928).—A compilation and discussion of the different methods of refuse disposal used by 160 local authorities. Av. cost per 1000 population per yr. is £56 and av. cost per ton is 4s. 2d. Pulverization is the most expensive, while crude tipping is the cheapest but is condemned by sanitarians. Controlled tipping or the covering of refuse by soil appears to be the most satisfactory method. C. H. BADGER

**Old and new methods for the disposal and utilization of dairy effluents.** J. BETTELS. *Gesundh.-Ing.* 51, 539 (1928); *U. S. Pub. Health Eng. Abstracts* E-789a, 34.— C. R. FELLERS

**Purification of waste waters from beet-sugar factories with special reference to the Poppleton factory.** H. McLEAN WILSON AND J. H. GARNER. *Pamphlet of W. Riding of Yorkshire Rivers Board, Wakefield, Eng., 1928, 73 pp.*; *U. S. Pub. Health Eng. Abstracts* E-789c, 40-1.—Three kinds of waste waters are produced: (1) from washing and conveying of the beets; (2) from the diffusers and pulp presses; (3) waste lime from carbonation and sulfitation. Wastes of the first type, constituting as much as 75% of the total vol., contain largely soil particles and org. vegetable debris; their clarification consists in removal of suspended solids by sedimentation. The application and design of settling ponds, tanks and screens for this purpose are discussed. Wastes from diffusers and pulp presses are the most difficult to handle, because of their high content of org. matter. Practically all methods applied to the treatment of sewage have been and are being tried. The bulk of the evidence seems to favor a controlled fermentation process. The continuous diffusion process of sugar manuf. eliminates entirely this type of waste.

Spent lime has some com. value as a fertilizer, but is not generally used because of the large amt. of moisture it contains.

**Waste waters from flax retting.** A. I. ROSSOLIMO. *Trans. Central Comm. for Protection of Water Reservoirs from Being Polluted by Ind. Waste Water* (Moscow), No. 8, 7-27(1928).—The waste water from flax retting is treated by means of lime, which causes the water to lose 50-60% of the org. matter dissolved in it. The results are improved by addn. of  $Al_2(SO_4)_3$ ; 4.5 g. per l. of lime and 2.5 g. per l. of  $Al_2(SO_4)_3$  are the most satisfactory proportions. The ppt. is used as a fertilizer. This treatment is followed up by biol. purification and 1:1 diln. with pure water.

**The composition of waste water from flax retting and experiments on its purification by biological treatment.** A. V. EVLANOVA. *Trans. Central Comm. for Protection of Water Reservoirs from Being Polluted by Ind. Waste Water* (Moscow) No. 8, 29-55(1928).—The method of treatment of the raw flax is described in detail. The waste water from the process after the lime treatment is subjected to the action of anaerobic bacteria belonging to *Plectridium* type. However, the water subjected to this treatment is still below the Health Dept. standards.

**Electrolytic oil removal from waste manufacturing liquors.** H. WINKELMANN. *Chem.-tech. Rundschau* 44, 82-3(1929).—By this means oil, even when present in traces, is sepd. from waste liquors as a foamy agglomerate, which can be mechanically removed. Electrolytic sepn. is facilitated by the addn. of hard water or soda, or by treatment of the liquors while hot. Energy requirements vary according to the oil content from 0.15 to 0.20 k. w. hr. for each cu. m. Labor requirements are low.

**Atmospheric pollution in England and Scotland in 1927-8.** JOHN B.-C. KERSHAW. *Engineer* 147, 175-6(1929).—A considerable increase in pollution took place during the year ending Mar. 31, 1928. Fine particles are carried to high levels of the atm. Increase in atm. pollution thus becomes a matter of concern to districts remote from industrial centers.

**Employment of Paris green at the anti-malarial station of Porto-Torres, Sardinia.** CLUZEL. *Arch. Med. Pharm.* 117, 141-53(1927); *U. S. Pub. Health Eng. Abstracts* E-789, 19.—A 1% diln. of Paris green used every 8 days on the sluggish Turitano River effectively controlled malaria in a town of 6000 inhabitants. The malaria incidence was reduced from 60% to 0.1-0.2%. The larvacide was particularly efficient in *Anopheles* destruction.

**Malaria and the malaria danger in certain irrigated regions of southwestern United States.** M. A. BARBER, W. H. W. KOMP AND C. H. KING. *U. S. Pub. Health Repts.* 44, 1300-15(1929).

**Apparatus for dissolving and feeding  $Ca(OH)_2$  into Fe pipes to check corrosion by water, etc.** (U. S. pat. 1,716,205) 1. Baffle, impact and gravity system for separating suspended matter from industrial effluents or other liquids and effecting their clarification (U. S. pat. 1,717,111) 13. Filter for water, etc. (U. S. pat. 1,715,435) 1. Illumination of  $SiO_2$  [from water] (Fr. pat. 653,784) 13. A comparison of Seitz and Mandler filters (LARKUM) 1.

**TELEKY, L.: Results of Dust Investigations.** Berlin: Reichsarbeitsblätter (Reimer Hobbing). 91 pp.

**Softening water.** OSKAR RITSCHEL. Ger. 476,893, Jan. 26, 1926. A heating and filtering app. is described for removing hardness due to carbonates.

**Softening water.** WAYNE TANK & PUMP CO. Ger. 473,913, Oct. 28, 1922. App. for softening water by ground zeolite material is described.

**Apparatus for softening water by use of zeolitic materials.** LEE G. DANIELS. U. S. 1,715,642, June 4. Structural features.

**Base-exchange substances.** THE SELDEN CO. Fr. 654,702, Jan. 31, 1928. See Brit. 286,212 (C. A. 23, 247).

**Apparatus for the rapid aeration of water.** S. A. B. SOC. ANON. BREVETTI. Swiss 130,705, Nov. 25, 1927. Details are given.

**Vacuum-control means for boiler-feed deaerators.** MARTIN EIFERT. Ger. 476,320, May 11, 1926.

**Preventing boiler incrustation.** EUGEN HAASZ. Austrian 112,787, Nov. 15, 1928. The boiler wall is included in an a. c. circuit, no electrodes being employed.

**Scale preventing.** JAMES GORDON & CO. Fr. 654,361, May 16, 1926. See Brit. 299,073 (C. A. 23, 3043).

**Scale preventing.** JAMES GORDON & Co. Fr. 654,362. See Brit. 299,074 (C. A. 23, 3043).

**Treating sewage.** KARL IMHOFF. Ger. 476,068, July 23, 1925. See Brit. 255,833 (C. A. 21, 2949).

**Plant for treatment of sewage with chemical reagents by settling, etc.** JOHN T. TRAVERS (to Travers-Lewis Process Corp.). U. S. 1,715,438, June 4. Structural features.

**Apparatus for digesting sewage sludge.** JOHN R. DOWNES (one-half to S. F. Miller). U. S. 1,717,100, June 11. Structural features.

**Filter floor for sewage disposal tanks, etc.** CLARE H. CURRIE (to Plymouth Clay Products Co.). U. S. 1,715,537, June 4. Structural features.

**Purifying polluted and industrial waste liquids.** JOHN T. TRAVERS (to Travers Process Corp.). U. S. 1,715,877, June 4. Polluted liquids contg. colloidal org. matter, e. g., sewage, are treated with a mixt. formed of lime,  $\text{FeSO}_4$  and a sludge contg. over 15% each of  $\text{CaSO}_4$  and  $\text{CaCO}_3$  such as is obtained by treating waste pickling liquors of steel mills with  $\text{Ca}(\text{OH})_2$  and  $\text{CaCO}_3$ .

**Treating polluted liquids.** THE TRAVERS-LEWIS PROCESS CORP. Fr. 653,771, April 26, 1928. See U. S. 1,672,587 (C. A. 22, 2632).

**Moving screen apparatus for purifying "town waste water," etc.** EUGEN GEIGER. U. S. 1,716,376, June 11. Structural features.

**Septic tank.** WILLIAM F. MILLER (to Rellim Investment Co.). U. S. 1,715,466, June 4. Structural features.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

J. J. SKINNER

**Recent advances in science : Pedology.** G. W. ROBINSON. *Science Progress* 23, 601-8(1929); cf. C. A. 22, 2020.—A review of recent work on the chemistry and analysis of soils.

JOSEPH S. HEPBURN

**Soil reaction, its measurement and meaning.** S. E. BORISOV AND V. VRBENSKÝ. *Sborník Českoslov. Akad. Zemědělské* 2, 113-49(1927); *Chem. Zentr.* 1928, I, 1089.— $p_H$  detns. were made by the method of Michaelis. Soil is a highly buffered substance. The addn. of 5-20% of a base changed the  $p_H$  from 8.31 to 8.49 and the exchangeable acidity from  $p_H$  7.11 to 7.18. Measuring the soil ext. under const. exptl. conditions gave valuable data such as indication of  $p_H$  changes in the soil through various treatments. To obtain an ext., the preferred method consisted in putting the air-dry soil through a 2-mm. sieve, shaking for 1 hr. with  $\text{H}_2\text{O}$ , then filtering through S. and S. Filter No. 605 and immediately using for  $p_H$  detn. The Michaelis value for  $p_H$  differed from the colorimetric result by 1.8  $p_H$ . The cause of this discrepancy of results is attributed to colloidal matter and salts. Numerous  $p_H$  data on soils are given. C. R. FELLERS

**Influence of the absolute reaction of the soil on the formation and composition of the essential oil of *Artemisia dracunculus*.** M. AND MME. HENRY DEEL. *Bull. soc. chim.* 45, 175-7(1929).—The better yields in wt. and in essential oil of *Artemisia dracunculus* are obtained with a  $p_H$  in the vicinity of 6.2. The  $p_H$  does not influence the % of oil in the plants. The optimum  $p_H$  corresponds to a max. in the phenolic content of the essential oil.

ALBERT L. HENNE

**The laboratory examination of alkaline soils.** A. F. JOSEPH. *Proc. and Papers 1st Intern. Congress Soil Sci.* 4, 490-3(1927).—The object of this paper is to invite discussion as to the methods of examn. of alk. soils.

E. F. SNYDER

**Distribution of acid soils in Jackson Co., Hillsdale Co., Ingham Co., Tuscola Co., Kent Co., Mich.** J. O. VEATCH. *Mich. Agr. Expt. Sta., Circ. Bull.* 118, 119, 120, 121, 122(1929).—A map showing the range of acid soils in each county is given and the degree of acidity.

J. J. SKINNER

**Ammonification in Yahola soils.** HENRY F. MURPHY. *J. Am. Soc. Agron.* 20, 89-92(1928).—All of the comparisons reported show that ammonification, although of importance, is quite a variable biological activity.

E. F. SNYDER

**Studies on the soils in rice field: II. General microbiological investigation.** ARAO ITANO AND SATIYO ARAKAWA. *Ber. Ohara Inst. landw. Forsch.* (Japan) 4, 35-54(1929); cf. C. A. 21, 2951.—The temp. of irrigation  $\text{H}_2\text{O}$  and the temp. at the soil surface reached as high as 34°, which is 4 to 5 degrees higher than that of the air up to Aug. 20th; after that the atm. temp. gradually became higher than the others. The moisture content of the soil of the field, which was irrigated, was 41% and at other times 26-39%. The  $p_H$

value varied between 5.90 and 7.25. Soon after the application of fertilizers, the reaction became alk.  $p_H$  7.25 and toward the end of the season it became slightly acid  $p_H$  5.90. The irrigation  $H_2O$  remained alk.,  $p_H$  7.32-7.94. One g. of soil contained on an av.  $2151 \times 10^4$  bacteria. The same amt. of soil contained  $0.3-5 \times 10^4$  fungi. One cc. of irrigation  $H_2O$  contained about  $8 \times 10^4$  bacteria and  $0.02-2 \times 10^4$  fungi. The ammonification capacity of the soil was strongest at the end of Aug. while it was very feeble in the case of the irrigation  $H_2O$ . The nitrification capacity reached a max. at the beginning of Sept. It was small in the case of the irrigation  $H_2O$ . The denitrification capacity was quite strong through the months of July and Aug. while the field was covered with water. The fixation of N of the soil reached its max. in July. The fixation was very much less in the irrigation  $H_2O$ . The cellulose fermentation was at its max. at the beginning of July. The activity in the irrigation water was rather weak. The respiratory and decompn. powers of the soil were detd., the former increasing from the beginning of July while the latter decreased slightly, approaching each other in Nov.

**III. Microbiological analyses of soil profile in rice field and dry-farm.** *Ibid* 55 66 -- The soil from the rice field contained more humic substance than that of the dry-farm, and showed the wider C:N ratio. In both cases the  $p_H$  was slightly less than 7 in the first stratum and approached 7 as the depth increased. The no. of bacteria, actinomycetes and fungi was detd. aerobically by using 4 different media, the albumin agar giving the best results. The no. of bacteria in a g. of dry soil decreased as the depth increased. The no. of actinomycetes in a g. of dry soil in the rice field showed a tendency similar to that of bacteria in respect to the depth, and the % amounted to 20.7, 20.5 and 28.4 in the first, second and third stratum, resp. In the dry-farm there were 23.4, 25.1 and 11.2% in resp. strata in relation to the no. of bacteria. The majority of colonies, 95-100%, were grayish white and the other colors, such as red or scarlet, orange or yellow, were rather few. The no. of fungi was 20,080, 2310 and 1170 in the rice field and 20,260, 6280 and 2610 in the dry-farm in the resp. stratum. Thus, the no. of fungi is small in comparison with bacteria. Forty-seven strains of bacteria were isolated from the rice field and 44 from the dry-farm, and they were subjected to morphological and cultural tests. The isolated organisms were grouped and their percentages detd. The biochem. action of the isolated organisms was studied and also that of soils. It was found that the soils from the dry-farm manifested a much more vigorous action than those taken from the rice field.

E. F. SNYDER

**Microbiological investigation on the virgin and arable volcanic soils from Sakurajima, Japan.** ARAO ITANO AND SATIYO ARAKAWA. *Ber. Ohara Inst. landw. Forsch. (Japan)* 4, 27-33(1929).—In a brief period of 14 yrs. since the last eruption, the soil is inhabited by the microorganisms throughout. A majority of the organisms are autotrophic in nature. All soils examd. were slightly acid,  $p_H$  less than 7. Eighty four strains of organisms were isolated and most of them found to be cocci or short rods and a comparatively few long rods. More than half of these strains were non-spore formers. Most of them were found to be gram-positive. The ammonifiers, although few, were found in all the soils except in the arable soils. More or less nitrification occurred in all the soils examd. Denitrification was observed in the arable soils only. Fixation of N was observed only in one soil. The fermentation of cellulose was found in the arable soils only. The most striking fact is that so many organisms, which are able to grow on the N-free medium, were found in the virgin soils. The mysterious properties of these soils which produce such big radishes still remain a mystery.

E. F. SNYDER

**A note on the lowering of the carbonate horizon in the soils in the vicinity of Odessa due to irrigation.** V. G. TANFIL'EV. *Pochвоведение (Pédologie)* 23, Nos. 1-2, 96-8 (1928).—T. shows that irrigation practices lowered the carbonate horizon in the steppe soils near Odessa from its normal depth of 55-65 cm. to 89-95 cm. Forestation of the steppe also influences the lowering of the carbonate horizon.

J. S. JOFFE

**Reduction of soil nitrates during the growth of soy beans.** E. P. DEATRICK. *J. Am. Soc. Agron.* 20, 947-58(1928).—Nitrates in soils under maturing soy beans are very low. When the soy bean harvest is so late that the period between the harvest and the planting of the wheat is too short to allow for considerable nitrification, the supply of  $NO_3$  is apparently too low to produce an increase in the yield above normal. It is thought that the decrease in  $NO_3$  is largely due to absorption by the plant. Where it is desired to follow soy beans with winter wheat in a rotation, it appears advisable to plant soy beans of shorter growing periods so as to allow for longer intervals for nitrification in the soil before the planting of the wheat. Pot work results indicate that a long period for nitrification is more beneficial than top dressings of 200 lbs. of  $NaNO_3$  or 8 tons of manure per acre, regardless of whether the soy bean tops are removed or not.

E. F. S.

**The oxidation of sulfur in the soil.** WLADYSŁAW OLSZYŃSKI. *Roczniki Nauk Rolniczych i Lesnych* 18, 231-78(1927); *Chem. Zentr.* 1928, I, 1696.—Exptl. tests proved

that the addn. of  $\text{CaCO}_3$  delayed oxidation of S in soils. Inoculation of soil with *Thiobacillus thiooxidans* increased the speed of S oxidation.  $\text{MnSO}_4$  as well as colloidal Fe accelerated the chem. oxidation of S but retarded the biol. oxidation. C. R. FELLERS

History and technic of the superphosphate industry. VII. Mining of phosphate and the manufacture of superphosphate in Algeria. ANON. *Superphosphate* 2, 101-4 (1929); cf. C. A. 23, 2236. K. D. JACOB

Laboratory and plant experiments with the phosphate ore of Isüm. I. ROSHDESTVENSKII. *Ukrainskii Khem. Zhurnal* 2, Sci. Pt. 179-94; *Chem. Zentr.* 1928, I, 245.—This ore is so poor in  $\text{P}_2\text{O}_5$  that its manuf. into superphosphate is not profitable. By treatment with 0.05 N  $\text{H}_2\text{SO}_4$ , 0.15 N NaCl and 0.1 N  $\text{MgCl}_2$ , it is changed to a form which can be assimilated by plants. F. P. GRIFFITHS

The fertilizer action of sulfur. Recent experiments of the Institute of Agronomic Research. E. Roux. *Compt.-rend. acad. agr. France* 14, 616-21 (1928).—S alone causes an increase in yield in soils rich in org. matter even when these soils contain appreciable amts. of sulfate. On the whole, the results confirm those already obtained by other workers since 1913. S transformed in the soil to  $\text{H}_2\text{SO}_4$  may have a direct alimentary role; but it plays a role still more important in soils rich in org. matter by an active mobilization of microbial origin of nitrogenous reserves. It is under those conditions that it seems capable of practical application, notably in horticulture. A small quantity of very finely divided S is sufficient for obtaining a marked fertilizing action. E. F. SNYDER

Farm trials of artificial manure. W. A. ALBRECHT AND E. M. POIROT. *J. Am. Soc. Agron.* 20, 123-32 (1928).—For artificial manure making, the reagent should be applied at the rate of 150 lbs. per ton of straw and should consist of 45%  $(\text{NH}_4)_2\text{SO}_4$ , 40% limestone and 15% superphosphate. Applying the necessary reagent through the thrasher and putting the straw into flat piles of shallow depths make it possible to depend on the rainfall for moisture and to convert the straw into manure in ample time to be used with the least possible loss of bulk. This practice should encourage the utilization of common farm wastes to increase soil org. matter and to conserve soil fertility with no great expense. E. F. SNYDER

Effect of fertilizers on maintaining stands of alfalfa. B. A. BROWN. *J. Am. Soc. Agron.* 20, 109-17 (1928).—Field expts. are described on the effects of nitrogenous fertilizers,  $\text{P}_2\text{O}_5$  carriers and potash on alfalfa. On plots which received 4 tons of ground limestone per acre in 1914 and none since and which gave a  $p_H$  of 5.8 in 1921 and a CaO requirement of over 1000 lbs. in 1924, better stands of alfalfa have been obtained by applying 100 or 200 lbs. of KCl than by applying 3 addnl. tons of ground limestone, thereby decreasing the  $p_H$  acidity to 6.4 and the CaO requirement to 700 lbs. It is suggested that the relatively large % of  $\text{K}_2\text{O}$  in alfalfa and the assistance which  $\text{K}_2\text{O}$  is supposed to render in the synthesis and translocation of starch in plants may have been responsible for the marked effects of  $\text{K}_2\text{O}$  on the stands of alfalfa. E. F. SNYDER

Triethanolamine oleate for oil sprays. G. L. HOCKENYOS. *Ind. Eng. Chem.* 21, 647-8 (1929).—An excellent miscible oil may be made by boiling 5 pts. of oleic acid with 6 pts. of triethanolamine and adding 15 pts. of free oleic acid and 5 pts. of alc. This may then be dissolved in up to 40 pts. of light or 100 pts. of heavy paraffin oil. Preliminary expts. show no injury to plants other than the oily gloss which usually results from oil sprays. Good kills on mealy bug and red spider resulted both with oil emulsion alone and with oil emulsions having *p*-dichlorobenzene or  $\text{CCl}_4$  dissolved in the oil. The only plant injury was due to excessive dosage of the light flushing oil, which is not so highly refined as the other 2 oils. The most promising method of using the very light oils is to make a soln. of 3 pts. of triethanolamine, 4 pts. oleic acid, 6 pts.  $\text{CCl}_4$  and 30 pts. of oil. Such a soln. is uniform though cloudy. It does not settle out or sep. for several days and, although not miscible in  $\text{H}_2\text{O}$ , it is very easily emulsified. J. J. SKINNER

Apricot scab or shot hole: A synopsis of three years' work on control (with Bordeaux mixture and lime-sulfur) conducted in the Goulburn valley. S. FRSH. *J. Dept. Agr. Victoria* 27, 235-9 (1929); cf. C. A. 22, 1012. K. D. JACOB

The copper content of sugar-beet leaves treated with copper compounds, and changes in their oxalic acid content. M. FRIGERIO. *Giorn. chim. ind. applicata* 11, 67-9 (1929).—The Cu retained by leaves of beets sprayed with Cu salts as insecticide varies very much, depending among other things upon the amt. of rain, etc., subsequent to the spraying. The  $(\text{COOH})_2$  content, however, is quite const. (about 0.8-1.0%), but when the leaves are stored in silos before using as forage, the contents drop down to a mere trace, making it safe for cattle. A. W. CONTIERI

A chemical control for sweet potato wilt or stem rot. R. F. POOLE AND J. W. WOODSIDE. North Carolina Agr. Expt. Sta., *Tech. Bull.* 35, 18 pp. (1929).—The *Fusarium batatas*, the causal organism of sweet potato stem rot, rot root or yellows, is

controlled by dipping the roots and stems in Bordeaux mixt. A 20-20-25 Bordeaux mixt. and a 25% monohydrated  $\text{CuSO}_4$ -lime dust gave good results. J. J. SKINNER

Relation of soil fertility to vitamin A content of leaf lettuce (DYE, CRIST) 11E. The gravitational flow of fertilizers (DEMING, MEHRING) 13. Xanthates [for use in preparing insecticides or fungicides] (U. S. pat. 1,716,273) 10.  $\text{NaNO}_2$  from  $\text{NH}_4\text{NO}_3$  (Ger. pat. 476,145) 18.

ROBINSON, D. H., AND JARY, S. G.: *Agricultural Entomology*. London: Duckworth & Co. 314 pp. 15s., net. Reviewed in *J. Ministry Agr.* 36, 299(1929).

"Plant soil." RICHARD H. MORRIS, 3RD. U. S. 1,717,059, June 11. A "commercial plant soil" suitable for cultivating mushrooms is prepd. by distributing alk. material such as comminuted limestone and phosphate rock upon the surface of a bed of peat, planting soy beans or other legumes in the bed thus prepd. and allowing them to grow, turning the legume plants beneath the surface of the bed, allowing the mass to ferment until the plants are decomposed, and then shredding to break up the fibers.

Fertilizer. AMERICAN CYANAMID CO. Fr. 654,699, Jan. 25, 1924. A fertilizer is obtained by treating dry  $\text{NH}_4$  monophosphate with  $\text{NH}_3$  at 60-150° for a long time.

Fertilizers. EISEN-U. STAHLWERK HOESCH A.-G. Fr. 653,666, May 1, 1928. A fertilizer is made by Thomas slag or other phosphate slag in water, adding  $\text{HNO}_3$  and evapg. Other fertilizers may be added.

Fertilizers. I. G. FARBENIND. A.-G. Fr. 652,702, April 14, 1928. See Brit 292,068 (C. A. 23, 1462).

Fertilizers. I. G. FARBENIND. A.-G. Fr. 653,822, May 3, 1928. See Brit. 292,098 (C. A. 23, 1462).

Fertilizers. I. G. FARBENIND. A.-G. Fr. 654,017, May 9, 1928. See Brit 294,654 (C. A. 23, 1984).

Fertilizer. SOC. D'ÉTUDES CHIMIQUES POUR L'IND. Swiss 131,109, Jan. 3, 1928. Dry  $\text{Ca}_3(\text{PO}_4)_2$  and an acid K salt are intimately mixed to form a fertilizer giving sol. phosphates on contact with water. The example mentions  $\text{KHSO}_4$  and  $\text{Ca}_3(\text{PO}_4)_2$ . Cf. C. A. 23, 1984.

Insecticides. I. G. FARBENIND. A.-G. Fr. 654,416, May 18, 1928. Org. mono- and poly-sulfocyanides other than the monoaliphatic compds. are used in insecticide preps.

Insecticides. I. G. FARBENIND. A.-G. Fr. 654,419, May 18, 1928. Pyridine, quinoline, isoquinoline and their homologs are used as insecticides, particularly for use against weevils.

System for fumigating trees with insecticides in successive applications. RALPH M. JACKSON (one-half to Calif. Cyanide Co.). U. S. 1,715,925, June 4. The process is conducted so as to maintain an efficient insecticidal concn. of the fumigating agent throughout and to overlap the intervals of time between successive applications and for a sufficient time to destroy the pests present.

Disinfectant for seeds. I. G. FARBENIND. A.-G. Fr. 654,376, May 16, 1928. A disinfectant for seeds consists of a mixt. of arsenious and arsenic acids or their salts with phenols mercurized in the ring.

Disinfectant for seeds. I. G. FARBENIND. A.-G. Fr. 654,674, May 24, 1928. Mixts. of complex org. compds. of Hg sol. in alkali and salts of HI, ferricyanides or derivs of cyanamide are used as mordants for seeds. Examples are given of the use of *o*-cresol mercuryhydroxide with KI,  $\text{K}_3\text{Fe}(\text{CN})_6$  and Na cyanamide.

Weed killer. RING GES. CHEM. UNTERNEHMUNGEN M. B. H. and F. WEDERKIND Ger. 476,753, Dec. 19, 1926. A weed killer comprises an aromatic or hydroaromatic ketone or a mixt. of these in the liquid or gaseous state. The ketone may be mixed or emulsified with chlorinated hydrocarbons, cellulose lye, tannin or soap.

Vermin-destroying compositions. HERMANN BOLLMANN and BRUNO REWALD Ger. 476,293, Dec. 8, 1927. Vermin-destroying compns. to be sprayed on plants are improved by addn. of crude or purified lecithin, with or without a little alkali. The dispersion of the active substance is thus increased and its adhesion to the plant improved. A suitable compn. comprises vegetable lecithin 3, water 97 and  $\text{Na}_2\text{AsO}_4$  10 parts.

Vermin-destroying gas mixture. DEUTSCHE GOLD-UND SILBER-SCHNEIDANSTALT VOM ROESSLER. Ger. 476,427, May 23, 1928. A gas mixt. contg. HCN and about 5% of  $\text{CNCl}$  (the latter serving merely as a warning of accidental escape, etc.) is prepd. by

passing Cl into liquid HCN. The reaction is either effected in the presence of non-alk. or feebly alk. substances capable of combining with the HCl produced, *e. g.*,  $\text{Al}_2\text{O}_3$ ,  $\text{ZnO}$ ,  $\text{CaCO}_3$  or  $\text{NaHCO}_3$  or the mixt. is passed over such substances immediately after production. The presence of a small amt. of water facilitates the reaction.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

**Acceleration of alcoholic fermentation of cane molasses by the use of vegetable carbons and other inert substances.** WM. L. OWEN AND W. P. DENSON. *Centr. Bakt. Parasitenk.*, II Abt., 77, 481–523(1929).—Alcoholic fermentation of molasses solns. can be greatly accelerated by the addn. of small amts. of vegetable carbons. This occurs with solns. of the usual density but is more pronounced if the density is higher. The minute amt. of the accelerating substances required indicates catalysis, and the fact that substances presumed to carry positive charges are more active than negatively charged colloids indicates that the charge is of significance. The fact that the fermentation of some of the hexoses is accelerated more than that of others suggests that there may be some reaction between the sugars and the catalyst. A prior filtration of the molasses with C tends to decrease the action of the latter, when later used as an accelerator. This effect seems relatively greater when the H-ion concn. is below the fermentation optimum. Part of the effect of the C may be due to a stimulation of yeast growth. A very efficient C for this purpose has been prepd. from bagasse. There is a bibliography of 29 titles.

JOHN T. MYERS

**The colorimetric determination of the higher alcohols in spirits. Modification of the Komarowski-von Fellenberg method.** TH. VON FELLEBERG. *Mitt. Lebensm. Hyg.* 20, 16–29(1929); cf. *C. A.* 5, 2690.—Since *p*-hydroxybenzaldehyde gives clearer solns. and does not react with aldehydes of the fatty series, it is substituted for salicylaldehyde in the former method. The original should be consulted for numerous analytical details.

B. C. BRUNSTETTER

**Boulard's procedure for arresting fermentation at will.** CH. SCHWEIZER. *Mitt. Lebensm. Hyg.* 20, 30–4(1929); cf. *C. A.* 20, 3058.—Boulard's "immunization" of a fermenting grape wine against further fermentation by heating at 45° holds only for the yeast employed. No general protection against infection and refermentation is produced.

B. C. BRUNSTETTER

**Lactic acid fermentation.** ARTTURI I. VIRTANEN. *III. Nord. Kemistmötet* (Finland) 1926, 217–26(1928).—In Swedish. See *C. A.* 22, 1599.

A. R. ROSE

**The production of citric acid by fermentation process.** FREDERICK CHALLENGER. *Ind. Chemist* 5, 181–4(1929).—A very complete historical account is given of the various explanations that have been put forward to account for the mycological production of citric acid from glucose. Recent patent literature on the mycological production of citric acid is discussed. An excellent bibliography is included.

E. G. R. ARDAGH

**Krupp's stainless steel V2A in the brewing industry.** SCHOTTKY. *Deut. Essigind.* 33, 131–2, 139–40, 146–8, 157–8(1929).—An address dealing with the compn. and application of stainless (or rustless) steel in the brewing (fermentation) industry.

W. O. EMERY

**The determination of methanol in gentian brandy.** TH. VON FELLEBERG. *Mitt. Lebensm. Hyg.* 20, 42–4(1929).—The content of MeOH, detd. by Denige's method, in 29 samples of gentian brandies, varied from a trace to 2.9% (av. 1.46%).

B. C. BRUNSTETTER

**Stability and fermentability of wine yeast.** ERICH ARAUNER. *Pharm. Zig.* 74, 713(1929).—A discussion.

W. O. E.

**Molds and chemical manufacture.** HORACE T. HERRICK AND ORVILLE E. MAY. *Ind. Eng. Chem.* 21, 618–21(1929).—A general discussion based on the literature of the application of molds to prepn. of solvents and org. acids.

F. W. TANNER

**The quartz lamp as a detector in the food industries [examination of alcohol] (KÜHLEIN) 12. Purification of potable waters for industrial purposes [for fermentation industries] (DIÉNERT) 14. Heat-resistant races of yeast (RÖNNING) 11D.**

**Treatment of alcoholic liquids.** ERNST REINISCH. *Austrian* 112,976, Dec. 15, 1928. Alc. liquids such as wine, cognac, perfumes, etc., are aged or improved by pretreating the water used in their prepn. with ultra-violet light. The water may

also be aerated or treated with oxidizing agents. The product, after addn. of the water, may also be irradiated.

**Alcohol and glycerol.** E. I. DU PONT DE NEMOURS AND Co. Fr. 654,297, May 14, 1928. See U. S. 1,678,150 (C. A. 22, 3486).

**Glycerol.** E. I. DU PONT DE NEMOURS AND Co. Fr. 654,596, May 23, 1928. Glycerol is sepd. by distn. from different residues or vinasses by pulverizing the residue in the presence of a gaseous medium at a high temp. to vaporize the glycerol rapidly. The vessels used are lined with Cu or other catalytically inactive material. Cf. C. A. 23, 3479, Brit. 300,254.

**Fermentation vats.** CHARLES F. BROCK. Fr. 652,819, Feb. 8, 1928. Constructional details are described.

**Device for charging malt kilns.** WILHELM HARTMANN. Ger. 475,726, Oct. 16, 1925.

**Disinfecting beer vats, etc.** THEODOR ZERNER and ROBERT GLASS. Austrian 112,974, Dec. 15, 1928. Strips of material to be ignited and lowered into the vat are prepd. by drying, molding and cutting a paste prepd. from powd. S, a porous material such as pumice and waterglass.

**Plastic mass from yeast.** FRIEDRICH STEIN. Ger. 476,031, July 20, 1926. The yeast is mixed with the usual fillers, e. g., sawdust or gypsum, and also with brewery waste, e. g., malt dust or dried spent hops, and the mixt. is dried until it can be molded by pressing.

**Arresting glucolysis.** SCHERING-KAHLBAUM A.-G. Fr. 653,214, Jan. 4, 1928. The glucolysis of living cells such as yeast and anaërobic bacteria is arrested without impairing the respiration of the cells by treatment with org. F. compds. such as fluor-acetic, fluorbenzoic or fluorbenzenesulfonic acid. The process may be used in the *manuf. of beer* for tropical countries.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Vanillin as reagent for alkaloids.** A. I. PORTNOV. *Farm. Zhur.* 1929, 109-10. The method of van Italic and Steenhauer (C. A. 22, 842) is modified by the use of a glycerol soln. (0.1 g. vanillin in 10 cc. glycerol) instead of an alc. soln. of vanillin. Thus, a wider application of this reagent is made possible. The presence of antipyrine interferes with this reaction. R. BIELOUSS

**Neroli oil from neroli flowers of Calabria.** P. LUCISANO. *Boll. staz. sper. ind. Essenze* 3, 61-2(1928).—The neroli oil from flowers of Calabria shows identity with the oil from flowers of France, but not with the oil from Spain, Algiers and Sicily. Analysis of oil from samples of the flowering of May show:  $d_{15}^4$  0.8801, linalool acetate 31.05%, acid no. 0.8,  $[\alpha]_{15}^D + 5.60$ ,  $n_{15}^D$  1.4695, soly. 1:1.3 in 80% alc. G. A. BRAVO

**Preparation of a heart-active glucoside from *Convallaria majalis*.** L. WALTER KARRER. *Helv. Chim. Acta* 12, 506-11(1929).—Convallatoxin is prepd. from a kg. macerated flores convallariae leached with H<sub>2</sub>O. The soln. is treated with concd. Pb acetate soln., the filtrate from excess acetate with Na<sub>2</sub>HPO<sub>4</sub>, and added to 500 g. animal charcoal. The dried charcoal adsorbate is extd. 48 hrs. in a Soxhlet app. with CHCl<sub>3</sub>, and the ext. brought to dryness *in vacuo*. The oily crystal needles are dissolved in 150 cc. MeOH, filtered and shaken with petroleum ether. The MeOH soln. is evaporated to dryness *in vacuo*, the residue dissolved in 5-fold vol. of abs. EtOH, and this soln. poured into an 8-fold vol. dry Et<sub>2</sub>O. The ppt., recrystd. several times, m 212°. The F. D. (frog dose, i. e., the min. lethal dose per g. wt. of frog) is 1/3,500,000 g. G. L. CLARK

**Nicotine extraction.** G. BARNIER. *Rev. intern. tabacs.* 3, No. 18, 92-8(1927); *Intern. Rev. Science & Practice of Agr.* [N. S.] 18, 229T.—By the Schloesing method nicotine is extd. from tobacco by hot water and then extd. from the aq. soln. by means of kerosene. Nicotine-H<sub>2</sub>SO<sub>4</sub> is formed by treating the kerosene soln. with a 15% by vol. H<sub>2</sub>SO<sub>4</sub> soln. The method of producing this last reaction has been greatly improved. The sulfate is formed in a special app. where the contact of kerosene and acid takes place through a mass of gravel. The charged kerosene percolates through the gravel, which lies on a false perforated bottom in a leaden tank contg. the acid soln. A second passage of the kerosene through another similar tank removes the last traces of nicotine. The gravel used is siliceous and is between 20 and 50 meshes per dm. in size. H. L. D.

**Nicotine and its applications.** ALTFETER. *Metallbörse* 19, 1069-70, 1125-6 (1929).—A review, with special references to patents concerned. W. C. EBAUGH

**Occurrence of our toxic solanaceous leaves in cut drugs and their recognition.** P. N. SCHÜRHOFF. *Apoth.-Ztg.* 44, 651-3 (1929).—Reference is had to specific cases of harm resulting from the use of certain drugs contaminated with solanaceous leaves, and to the necessity of microscopic control of any questionable product. Photomicrographic preps. of *Belladonna*, *Hyoscyamus* and *Stramonium* are presented showing their characteristic structure. W. O. E.

**Indole.** H. STANLEY REDGROVE. *Perfumery Essential Oil Record* 20, 161-4 (1929).—A general review of its history, properties and occurrence, methods of prepn., principal tests and application in the perfume industry. W. O. E.

**Tegin and its application in pharmacy and cosmetics.** JOSEF GERT. *Pharm. Post* 62, 271-3 (1929).—This is a new salve base, wax-like in character, an org. ester, very similar to the natural fats and readily compounded with substances like S, resorcinol, camphor, talc,  $\text{TiO}_2$ , ichthyol, tar,  $\text{CH}_2\text{O}$ , etc. Various formulas for prep. cosmetic creams are given. W. O. E.

**Johann Philipp Bronner.** ERNST JUNDT. *Süddeut. Apoth.-Ztg.* 69, 10-3 (1929).—An obituary and account of the life and activities of this apothecary (1792-1846). W. O. E.

**Vegetable nostrums.** W. PEYER AND H. IMHOF. *Süddeut. Apoth.-Ztg.* 69, 31-4 (1929). W. O. E.

**History of apothecaries of the margrave city of Bayreuth. II. Mohren apothecary.** W. VON BROCKE AND HANS MAYER. *Süddeut. Apoth.-Ztg.* 69, 46-8 (1929).—An historical treatment of this apothecary, founded in 1672, and illustrating certain app. and containers of that period. III. Residence and palace apothecary. HANS MAYER. *Ibid* 260-2. W. O. E.

**Examination of Peru balsam by means of capillary pictures and the quartz lamp.** C. A. ROTHENHEIM. *Pharm.-Ztg.* 74, 712-3 (1929).—A continuation of the work of Rapp. W. O. E.

**Specific gravity determination via D. A. B. 6.** F. WOLTER. *Süddeut. Apoth.-Ztg.* 69, 63 (1929).—A discussion of the official Ger. method. W. O. E.

**New medicants and pharmaceutical specialties of the fourth quarter of 1928.** F. ZERNIK. *Süddeut. Apoth.-Ztg.* 69, 129-32 (1929).—A compilation. W. O. E.

**When is the preparation of a medicinal mixture patentable?** EMIL MÜLLER. *Z. angew. Chem.* 42, 551 (1929).—Only such mixts. and processes leading thereto as show unexpected therapeutic properties are patentable. W. C. EBAUGH

**The essential oils and oil content of native Hungarian thyme.** BÉLA GAAL. *Ber. ungar. pharm. Ges.* 2, 217-47 (1926); *Chem. Zentr.* 1928, I, 2019.—Several wild thymes were examd. for essential oil content: *Th. brachyphyllus* 0.887% with 31.13% thymol; *Th. Marschallianus* 0.539-0.580% oil contg. 32.99% thymol; *Th. clivorum* Lyka 0.191% oil. C. R. FELLERS

**Ionone.** FRANCISCO HERNÁNDEZ, JUAN JAUMÁ AND LUIS VERDERAU. *Quim. e ind.* 4, 301-9 (1927); *Chem. Zentr.* 1928, I, 1954.—The production, manuf. and properties of lemongrass oil, citral, pseudoionone and ionone are discussed. Citral was isolated from lemongrass oil by the use of  $\text{NaHSO}_3$ . Syntheses of ionone and pseudoionone are given. Com. ionone may be sepd. into  $\alpha$ - and  $\beta$ -ionone. The b. p. curve of  $\alpha$ - and  $\beta$ -ionone between 3 and 9 mm. pressure is given. C. R. FELLERS

**Local anesthetic S. F. 147.** O. WINTERSTEIN. *Münch. med. Wochschr.* 74, 1746-9 (1927); *Chem. Zentr.* 1928, I, 90-1.—S. F. 147 is *N,N*-diethyleucinol ester of  $p$ -aminobenzoic acid. It is less toxic than cocaine but about 2.5 times as toxic as novocaine. For man it is somewhat less toxic than tutocaine. As a local anesthetic it is better than novocaine or tutocaine. FRANCIS P. GRIFFITHS

**Coumarin and umbelliferone-methyl ether in lavender products.** ALBERT ELLMER. *Riechstoffind.* 1927, 206-10, 220-2; *Chem. Zentr.* 1928, I, 268.—Extn. of lavender oil with  $\text{C}_6\text{H}_6$ , EtOH and then treatment with concd.  $\text{Ba(OH)}_2$  gave 3.4% coumarin and 0.9% umbelliferone methyl ether. Distd. oil gave only 0.8% coumarin. The larger yield by cold extrn. is possibly due to enzyme action on the glucosides. A method for sepg. and estg. coumarin by means of  $\text{Ba(OH)}_2$  soln. is described. F. P. G.

**Composition of the volatile oils of *Siler trilobum*.** B. N. RUTOVSKII AND K. GUSSEVA. *Riechstoffind.* 1927, 230; *Chem. Zentr.* 1928, I, 267.—The oil from a no. of samples had a yield of 3.27%,  $d_{20}$  0.8886,  $\alpha_D$  -131.65°,  $n_D^{20}$  1.4862, acid no. 0.05, ester no. 41.58, ester no. after acetylation 59.3. It contained *d*-limonene 55%, tetrabromide m. 103°, and *d*-perillaldehyde 40%, semicarbazone m. 197°, oxime m. 102°. Azulene and  $\alpha$ -pinene were also thought to be present. F. P. GRIFFITHS

**Citronellal.** H. I. WATERMAN AND E. B. ELSBACH. *Bull. soc. chim.* **45**, 137-40 (1929); cf. C. A. **22**, 3628.—The data published by Verley (C. A. **23**, 95) are criticized. The correct values are  $b$ ,  $49.6^\circ$ , calcd. by the Clapeyron equation, or  $50.8^\circ$ , calcd. by Duhring's rule, or  $51^\circ$ , observed by W.;  $n_D^{20}$  1.4458,  $n_D^{20}$  1.4485,  $n_F^{20}$  1.4553,  $n_D^{20}$  1.4610,  $d_4^{20}$  0.855.

ALBERT L. HENNE

**Alkaline media and their effect upon Bacillus acidophilus and its products in the mouth.** BERNARD B. BADANES. *Dental Cosmos* **71**, 618-24(1929).—*B. acidophilus* and related species grow more readily in an alk. medium. Neutralization of the acids, which they form, does not inhibit the activity of the bacteria and their enzymes. Introduction of alk. solns. or dentifrices into the mouth temporarily renders the saliva alk. and obtunds sensitiveness or pain in the teeth, but the saliva soon returns to its normal reaction. The suggestions are made that secret formulae for dentifrices be discouraged, and that the formula for toothpaste be standardized by the dental profession and included in the next revision of the U. S. P.

JOSEPH S. HEPBURN

**Essential oil of Juniperus excelsa.** G. V. FIGULEVSKII AND YU. N. LOVYAGIN. *Trans. Sci. Chem.-Pharm. Inst.* (Moscow) **1927**, No. 17, 151-158.—The table in the German summary gives the const. of the four fractions obtained. Fractions I and II were combined and fractionated again and the new fractions subjected to various analyses: table II gives the b. p. and yields; table III gives the optical properties of the fractions. The fraction b.  $155.5-156^\circ$  was distd. over Na and the presence of pinene was demonstrated by the fact that pinene nitrosochloride was obtained. A crystal. substance from fraction III gave the following const.: m. p.  $83.5-84^\circ$ ,  $[\alpha]_D + 5.26^\circ$ ;  $[\alpha]_D + 7.11^\circ$ ;  $[\alpha]_F + 9.49^\circ$ ;  $[\alpha]_F + 11.72^\circ$ ;  $[\alpha]_F/[\alpha]_C = 2.82$ . Crystallographic examn. indicated the presence of cedrol.

J. S. JOFFE

**The biological assay of ergot preparations.** M. AIAZZI-MANCINI. *Boll. soc. ital. biol. sper.* **4**, 221-2(1929).—The Broom-Clark method can be used only for assaying the alkaloids of ergot; the other active principles, histamine, tyramine and acetylcholine, which also act on the muscle of the rabbit uterus, cannot be detd. by this method.

PETER MASUCCI

**Physiologic assays of aconite.** ANDRÉE MALMANCHE AND MAURICE-MARIE JANOT. *Bull. sci. pharmacol.* **36**, 273-84(1929).—A description is given of the biologic assays for aconitine, benzoyleaconine and aconine based on the action on living animal tissue and the detn. of the minimal lethal dose.

A. E. MEYER

**Studies on the chemistry of tobacco. I. The water of tobacco.** N. I. GAVRILOV AND B. B. EYSLINA. *Biochem. Z.* **208**, 79-90(1929).—The shortcomings of the usual procedure of detg. the moisture content of tobacco by drying at  $95^\circ$  are pointed out. Various other methods are studied critically, such as distg. off the  $H_2O$  from an org. solvent (toluene) mixed with the tobacco, the amt. of  $H_2O$  being detd. volumetrically; by treatment with Grignard's reagent or by drying the tobacco in a current of dry air. Various grades of tobacco are tested. The percent of moisture is within the range of 11-13.

S. MORGULIS

**Microchemical determination of morphine. I. Morphine determination in pure solutions.** PETER FLEISCHMANN. *Biochem. Z.* **208**, 368-91(1929).—The pptn. reagent is made by boiling gently 17.4626 g. molybdic acid and 13.5190 g. anhyd.  $Na_2CO_3$  in 60 cc.  $H_2O$  until soln. is complete, then boiling briskly for a short time. After cooling this is dild. with 40 cc.  $H_2O$ , mixed with 30 cc.  $M/3$  phosphate soln. (1.3617 g.  $KH_2PO_4$  and 4.1566 g.  $Na_2HPO_4$  in 100 cc.) and dild. to 150 cc. One cc. of this reagent should redden phenolphthalein with not more than 0.2 cc. 0.1 N NaOH. In special 8 cc. centrifuge tubes each contg. 5 cc. of the unknown sample and of standards with 0.2 and 1.0 mg. morphine-HCl, the pptn. is carried out by adding 1 cc. 2 N HCl (exact), then drop by drop, 1 cc. of the pptg. reagent. After repeated shaking the tubes are centrifuged 20 mins. later, and the fluid is removed as nearly completely as possible. The ppt. is washed in 0.025 N  $H_2SO_4$  and again centrifuged. The ppt. is dissolved in concd.  $H_2SO_4$ , the quantity required being detd. by a special procedure; all tubes are placed at the same time for 1 hr. in a water bath at  $50^\circ$ . The solns. are of a blue-violet color, the intensity of which is compared in a colorimeter. The method of calcn. is fully discussed.

S. MORGULIS

**Bismuth and its use in pharmaceutical industry.** A. KUFFERATH. *Chem.-tech. Rundschau* **44**, 567(1929).—A brief review of the use in pharmacy of Bi preps., i. e., Bi nitrate, subnitrate, subgallate and subsalicylate. Mention is also made of the Bi compd. of tribromophenol (Xeroform), Bi tannate (Tannismut), oxyiodogallate (Airol), oxyiodopyrogallate, oxybenzoate (Bismogenol), Casbis and Bi  $NH_4$  citrate (Wismulen).

F. PICKERING

**Examination of "dry" magnesium chloride.** PH. CHAPELLE AND E. REGNOULT. *J. pharm. chim.* [8], 8, 171-3(1928).—Examn. of 6 com. samples of "pure, dry  $MgCl_2$ " to be used in the prepn. of solns. intended for injection showed that they were *not anhyd.* They contained 46.0, 44.6, 47.6, 44.6, 40.4, 37.9%  $H_2O$ , corresponding to the compn.  $MgCl_2 = 4.5 H_2O$ . S. WALDBOTT

**The laudanum of Sydenham.** M. BAGROS. *J. pharm. chim.* [8], 8, 263-4(1928).—This prepn. of the French Codex should be classed among the tinctures, notwithstanding its low alc. content (30%). The tabulated directions for prepg. dil. alcohols (90-50%) should accordingly be extended to include diln. to 30%. S. WALDBOTT

**Determination of chloral in sirup of chloral.** P. ANDRON. *J. pharm. chim.* [8], 8, 453-5(1928); cf. *C. A.* 21, 2045.—Rejoinder to François (*C. A.* 22, 1652). Using the technic of F., A. finds that addn. of *sucrose* to a 1% aq.  $CCl_3CHO \cdot H_2O$  soln. causes a loss of 8.2% in titration with NaOH. P. FLEURY AND M. MALMY. *Ibid* 537-42.—A critical exptl. review of the preceding papers. The *speed* of the reaction between chloral and alkali is considerably influenced by *sucrose* and by *temp.* To obtain exact results in the assay of chloral by the technic of F., a temp. not below 21° is essential. S. WALDBOTT

**Determination of chloral in sirup of chloral.** CH. LORMAND. *J. pharm. chim.* [8], 9, 151-3(1929); cf. preceding abstr.—To 10 g. of sirup of chloral (contg. 0.5 g. crystd. chloral) add a soln. of  $AgNO_3$  4 g., KOH 5 g.,  $NH_4OH$  (Codex) 50 cc., and allow to stand 24 hrs. Then heat on the waterbath to remove excess of  $NH_3$ , slightly acidify with  $HNO_3$ , dil. to about 100 cc., again heat, and collect, filter and weigh the  $AgCl$  formed. Chloral hydrate =  $AgCl \times 0.3844$ . Exact results are obtained with this method, which may prove useful in detg. Cl in org. compds. generally. S. W.

**Action of Schiff's reagent on pyrimidone.** A. VALDIGUIÉ. *J. pharm. chim.* [8], 8, 506-10(1928).—An intensely red soln. is formed upon adding a few drops of Schiff's reagent (A) to an aq. or alc. soln. of pyrimidone (B) or to its salts with HCl or  $H_2SO_4$ , to its camphorate or salicylate. Heat, also exposure to air, accentuates the color, which is permanent to light, sol. in  $H_2O$ , EtOH, insol. in  $Et_2O$  and  $C_6H_6$ . In  $CHCl_3$  it is slightly sol. with a bluish tint. Strong acids, alkalis,  $NH_4OH$  or  $SnCl_2$  destroy it. For this reason, excess of  $SO_2$  must be avoided in the prepn. of A. When the liquid, decolorized by  $SnCl_2$  and HCl, is agitated with NaAcO, the color is restored. A pink color is still visible in a diln. of 2 mg. of B in 10 cc. (1:5000) when 3-4 drops of A are added. The mechanism of the reaction is not yet known. S. WALDBOTT

**Plaster of Paris, estimation of the time of setting, behavior of overheated plaster and rational conditions of mixing.** P. BRUÈRE. *J. pharm. chim.* [8], 8, 606-13(1928).—Suggestions for adoption in the next Formulary of the military hospitals concerning plaster of Paris (A) ( $CaSO_4 \cdot 0.5 H_2O$ ; cf. French Codex). To est. the *time of setting*, spread 100 parts of A rapidly over the surface of 60 cc.  $H_2O$  (theory, 18.63 cc.) in a glass dish 8-10 cm. diam., mix uniformly with a bone spatula, then invert the magma upon a glass plate. Setting begins when the edges of a furrow cut into the surface no longer tend to coalesce; setting is ended when the mass no longer yields to gentle pressure, or when on cutting it breaks off into fragments. The interval should not exceed 12 mins., nor the total time 15 mins. To study the *temp. phenomena* of setting, mix 100 g. of A with 60 cc.  $H_2O$  in a rubber cup, stir with a thermometer and note the rise of temp. from min. to min. The results are plotted in curves. With normal A, the interval of setting was 7 mins., and ended in a total of 11 mins. The temp. continued to rise to a short max. (29°+) for 12 mins. after the setting; the total rise of temp. was 13° in 23 mins. The rising curve shows a distinct horizontal "landing" immediately before the setting begins. With normal A contg. 2% of overheated A (>180°), the total rise of temp. was 14° in 21 mins.; here the max. temp. (31°) was const. for 4 mins., probably on account of delay in setting. With A contg. 2% of *accelerators* (alum, soap, cf. Canals, *C. A.* 10, 2468), the rise was 17° in 13 mins., to a short max. of 33°, a temp. probably not easily tolerated by the patient. In the mixing of A with  $H_2O$ , excess of  $H_2O$  counteracting the setting from a supersatd. soln. and undue stirring creating crystal "seeds" should be equally avoided. S. WALDBOTT

**A preliminary report on the chemistry of Phytolacca.** GLENN L. JENKINS. *J. Am. Pharm. Assoc.* 18, 573-6(1929).—The air-dried root of *Phytolacca americana* contained moisture 9.0 and ash 9.4%, of which 71.3% was acid-sol. The ash was bluish green and contained K, Na, Ca, Fe, Si, Al, Mg and Mn combined as sulfate, chloride and phosphate. Petr. ether (b. p. 40-52°) extd. 1.75;  $Et_2O$ , 1.45;  $CHCl_3$ , 1.88; EtOH, 14.55; and  $(CH_3)_2O$ , 3.65%. The petr. ether ext. is an oily mass with characteristic odor and taste. An unknown alkaloid (0.16%) was obtained as a yellowish, gummy, non-crystallizable varnish. The volatile oil (0.08%) had a characteristic odor and a pungent

taste. The root contained  $\text{KNO}_3$  0.21%. A resin and fat-like substance were found and reserved for further study. L. E. WARREN

Influence of the absolute reaction of the soil on the formation and composition of the essential oil of *Artemisia dracunculus* (DEEL, DEEL) 15. A study of the composition of Na bismuth tartrate (YOE, MORE) 6. Isopropyl alcohol (Bijlsma) 11H. Bleaching, washing and disinfectant material (Ger. pat. 476,180) 18. Soaps, cosmetics, disinfectants, etc. (Ger. pat. 476,261) 27. Polysulfide ester of aromatic acids [for use in therapy] (Swiss pats. 131,284 to 131,290) 10. Treatment of alcoholic liquids (Austrian pat. 112,976) 16. Protection of organic compounds against lower organisms (Ger. pat. 475,703) 10.

BIECHLE, MAX: Anleitung zur Erkennung und Prüfung der Arzneimittel des Deutschen Arzneibuches, zugl. e. Leitf. f. Apothekenrevisoren. Auf Grund d 6 Ausg. d. Deutschen Arzneibuches edited by Richard Brieger. 16th ed. (2nd ed. under new editing). Berlin: J. Springer. 754 pp. Linen, M. 17.50.

Therapeutic organic phosphorus-containing product from corn "steepwater." THEODORE B. WAGNER. U. S. 1,716,286, June 4. Steepwater, obtained from corn, is treated with slaked lime and the resultant ppt. is collected.

Use of cinchophen medicinally. MOSES L. CROSSLEY (to Calco Chemical Co.). U. S. 1,716,686, June 11. The therapeutic properties of cinchophen are improved by its use in admixture with a Mg compd. such as  $\text{MgCl}_2$ .

Colloidal solutions. CHEMISCHE FABRIK VON HEYDEN A.-G. (Carl H. von Hoessle, inventor). Ger. 476,926, Dec. 23, 1922. Addn. to 432,717. Colloidal solns. of metal and metalloid compds. in oils, fats, waxes and paraffins for ointment bases are prepd. by the action of acid or acid-forming substances such as  $\text{H}_2\text{S}$ ,  $\text{HCl}$  gas or I on the organosols of the metals or their oxides with exclusion of water.

Anthraquinone glucoside. I. G. FARBENIND. A.-G. (Friedrich Kayser and Karl Schranz, inventors). Ger. 475,938, July 31, 1926. Water-sol. anthraquinone glucoside is obtained from the ext. of certain drugs by treatment with metal hydroxide and evapd. the filtrate to dryness. Thus, cascara sagrada is extd. with 96% alc. The ext. is evapd. to dryness and the residue dissolved in water. Freshly pptd.  $\text{Fe}(\text{OH})_3$  is added and the mixt. stirred for 2-3 hours until no turbidity is shown with  $\text{NaCl}$  soln. The soln. is filtered and evapd. to dryness *in vacuo*. Other examples are given.

Isobutylallylbarbituric acid. CHEM. FAB. VORM. SANDOZ. Swiss 130,848, Sept. 12, 1927. Addn. to 122,692. A deriv. of this acid is prepd. by melting the acid with 1-phenyl-2,3-dimethyl-5-pyrazolone in mol. proportions. The new compd. m. 68-70°, and is used in therapy as a *hypnotic*.

Immunizing products from pathogenic microorganisms. NEWELL S. FERRY (to Parke-Davis & Co.). U. S. 1,717,198, June 11. Pathogenic microorganisms such as typhoid bacillus or pneumococcus are grown on substantially solid culture media, removed from the media and suspended in physiologic salt soln., agitated to wash the antigens from the bacterial cells and centrifuged to sep. the liquid from sediment; the washing liquid is retained for immunizing purposes. Cf. C. A. 23, 1724.

Iodine hormone preparations. GEORG EICHELBAUM. Ger. 476,717, Dec. 1, 1922. Hormone preps. with an accurately fixed I content are obtained by treating hormone-bearing secretory glands, or exts. therefrom, with small quantities of alc. soln. of I at suitable temps. until the desired amt. of I is taken up, and carefully drying. Examples mention ovary prepn., thymus gland and animal testes.

Active substances from male internal secretory organs. SOC. ANON. POUR L'IND. CHIM. A BALE. Swiss 130,635, Sept. 30, 1927. Addn. to 120,097. The ext. of such organs or the distillate of the ext. is purified by treating with sapon. agents with exclusion of acid; the resulting soap is removed. In the example, testicular ext. is dissolved in alc. and sapond. with  $\text{KOH}$ .

Nicotine. GENERAL-DIREKTION DER OESTERREICHISCHE TABAKREGIE. Fr. 653,610, April 30, 1928. An app. is described for removing nicotine from tobacco by a current of warm air or gas. Cf. C. A. 23, 934, 1218.

Perfumes. HEINE & Co. A.-G. Fr. 653,859, May 4, 1928. Acetic esters disubstituted by unsatd. groups, ketones, unsatd. acids, unsatd. acid esters or lactones are added to known perfumes.

Dentifrice. MENDEL DONCHI. U. S. 1,716,035, June 4. Activated vegetable charcoal is used with about 7 or 8 times as much kieselguhr, with or without other ingredients such as soap,  $\text{NaHCO}_3$ , orris, glycerol, saccharin and essential oils.

**Disinfectant.** ASPHALTFABRIK RUDOW. WILHELM SCHLIEMANN A.-G. Ger. 475,947, March 11, 1927. A disinfecting agent is formed by dissolving monochloroxylylene in water, soap or other solvents or dispersing agents. A table showing the action of the disinfectant on various bacteria is given.

**Disinfectant.** C. H. BOEHRINGER SOHN. Ger. 476,467, June 21, 1925. See Brit. 253,918 (C. A. 21, 2534).

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

**Defeating hydrochloric acid corrosion in chemical processing.** SIDNEY SCHEIN. *Chem. Met. Eng.* 36, 355-7(1929).—Materials of construction to resist HCl in tanks, filters, driers, ventilators, drains and buildings are described. E. M. SYMMES

**Use of lead in sulfuric acid manufacture.** A. E. MARSHALL. *Trans. Am. Inst. Chem. Eng.* 20, 149-65(1928).—Historical and a review of the present uses of Pb in  $H_2SO_4$  and other manuf. E. M. SYMMES

**Salts of the Dead Sea.** BRUNO WÄESER. *Metallbörse* 19, 789-90(1929).—Proposals made in 1927 for the formation of an alkali industry using brine from the Dead Sea are criticized unfavorably; such an industry would not be able to compete with German and French alkali (potash) plants. W. C. EBAUGH

**The exploitation of the Dead Sea.** I. MELAMEDE. *Discovery* 10, 128-31, 165-7 (1929).—An analysis of Dead Sea water is given. A solar evapn. scheme for recovery of KCl, MgBr<sub>2</sub> and other salts from Dead Sea brine is outlined. E. I. S.

**Extraction of aluminum oxide from South Dakota cretaceous shales.** RALPH MELAVEN. *Black Hills Eng.* 17, 178-88(1929).—The time is approaching when bauxite deposits will be exhausted. Investigations were made to find means whereby  $SiO_2$  could be removed from shale and  $Al_2O_3$  recovered for subsequent treatment, and to develop a method of extg.  $Al_2O_3$  not requiring removal of  $SiO_2$  even though present in large amts. The literature deals with pottery clays, not shales, e. g., cretaceous shales of South Dakota. Grinding, roasting at 800° for 1.5 hrs. and extn. with dil.  $H_2SO_4$  gives up to 100% extn. of  $Al_2O_3$ . The excess acid can be recovered. Today the cost of such a process is prohibitive because the  $Al_2O_3$  content is too low to compete with bauxite. E. M. SYMMES

**Manufacture of manganese borate.** V. V. ERIN. *J. Chem. Ind. (Moscow)* 6, 254(1929).—The following method is recommended for manuf. of Mn borate used as drier in oil paints and linoleum: A mixt. of 9 parts finely ground pyrolusite and 1 part ground, non-caking coal is heated to 800-900°;  $MnO_2 + C = MnO + CO$ . The MnO yield is about 85%. The hot melt is boiled with a 5-10% excess of 20%  $H_2SO_4$  until MnO dissolves completely, requiring about 1 hr. The soln., filtered through asbestos, must be completely free from Fe, for which purpose the Fe salt is oxidized to Fe<sup>+++</sup> salt by boiling the soln. 30 mins. with a 10% excess of  $HNO_3$ , then heated to 50° and a  $Na_2CO_3$  soln. is added in small portions. After pptg. all Fe the soln. contains  $Na_2SO_4$ , which does not interfere, and  $MnSO_4$ , which does not begin to ppt. until all Fe has been eliminated. The soln. is settled, siphoned off, filtered and treated cold with a 4% borax soln. The end point is detd. by the disappearance of cloudiness when Mn soln. is added to the filtered soln. After settling, the liquid is siphoned off, the ppt. centrifuged, filter-pressed and dried first at 50°, then at 110° until completely dry. BERNARD NELSON

**Problem of the Chili saltpeter industry.** BRUNO WÄESER. *Metallbörse* 19, 845-6 (1929).—Data are now presented showing the extraordinary growth of the synthetic N industry. The Chilian product must be scientifically exploited in order to maintain its position. W. C. EBAUGH

**Leucite industry from the chemicophysical point of view.** N. PARRAVANO. *Giorn. chim. ind. applicata* 10, 501-11(1928).—The importance of the Blanc process for the utilization of Italian leucite (C. A. 19, 1616) is shown by the fact that the laval masses of six extinct volcanoes of Central and Southern Italy contain 105,340 million tons of material, representing 8786 million tons of potash. The leucite, sepd. electromagnetically from the basaltic mass, is treated with HCl or  $HNO_3$ , the products being  $SiO_2$  and a soln. contg. Al and K chlorides or nitrates. Results are now given of detns. of the variation in soly. of these different salts with the temp. and acid concn., and diagrams are shown for the systems: KCl (nitrate)- $AlCl_3$  (nitrate)-HCl (nitric)- $H_2O$  at various temps. The heating curves of  $AlCl_3$ ,  $6H_2O$  and  $Al(NO_3)_3$ ,  $6H_2O$  are also

given. Investigation of the x-ray spectra shows that the  $\text{Al}_2\text{O}_3$  obtained by heating these salts differs at low temps. from that derived from bauxite by the Bayer process, but becomes identical with the latter when heated; indications that the dehydration of hydrated alumina occurs by stages are obtained. B. C. A.

**Magnesite from Jugo-Slavia.** G. PETUNNIKOV. *Metallbörse* 19, 594-5(1929).—Three native companies, one English and one French corporation are working deposits of  $\text{MgCO}_3$  in Jugo-Slavia, producing magnesite comparable to the Greek material. Much of it runs over 97%  $\text{MgCO}_3$ , with about 1.5-2.0%  $\text{CaCO}_3$  and correspondingly small amts. of  $\text{SiO}_2$ ,  $\text{Al}_2\text{O}_3$  and  $\text{Fe}_2\text{O}_3$ . W. C. EBAUGH

**New uses for cadmium.** FRANK. *Chem.-tech. Rundschau* 44, 175-6(1929).—Cd now finds use as an anti-corrosive material, in the form of its sulfide or selenide as a pigment, as the bromide in light-sensitive gelatin films and in special alloys with Cu, Al, Pb-Zn, Au and Hg. E. PICKERING

**Convenient chlorine carrier supplied by new product.** R. E. GAGE. *Chem. Met. Eng.* 36, 295-6(1929).—A new high-test Ca hypochlorite contg. 60% "available Cl" as compared with 0-40% "available Cl" in com. bleaching powder is described. The new product approaches the formula  $\text{Ca}(\text{OCl})_2$ . It is of uniform compn. and maintains this uniformity over long periods, even when stored under tropical conditions. It is sol. in cold  $\text{H}_2\text{O}$ , giving all its available Cl. It is non-deliquescent and does not cake. A. WHITE

**Helium in New Zealand.** C. COLERIDGE FARR AND M. N. ROGERS. *New Zealand J. Sci. Tech.* 10, 300-8(1929).—By use of the analytical method of Cady and McFarlane (*C. A.* 2, 386), a He survey has been made of the New Zealand gas wells. All but 3 of some 81 samples showed He in concns. of 0.002 to 0.12%. A. S. CARTER

**The purification of magnesium.** FRIEDR. VOGEL. *Metallbörse* 19, 453-5(1929).—To det. the cause of black spots in Mg, assumed to be either C, Mg carbide, Mg nitride, Mg suboxide, finely divided Mg, etc., a pure Mg sample was heated in currents of  $\text{H}_2\text{O}$ , O,  $\text{CO}_2$  and  $\text{SO}_2$ , singly or in mixts. With  $\text{H}_2\text{O}$  and O only white  $\text{MgO}$  formed; with  $\text{CO}_2$  no ignition occurred, but the residue was black and had increased in wt. With 1 vol. O in about 20 vol.  $\text{CO}_2$ , ignition occurred, but with no formation of CO, the residue was black and amorphous, surrounded by  $\text{MgO}$ .  $\text{SO}_2$  used instead of  $\text{CO}_2$  gave a gray-black mass covered with white oxide. With H, volatilization of a black substance occurred, which decomposed the glass tube at higher temps. The end point in all cases indicated the formation of  $\text{MgO}$ , soot-like C and volatile Mg hydride (with H). From the above expts. a better purification of Mg than the old process of heating with a current of H was evolved, viz., by using a mixt. of the alkali earth chlorides, fluorides and  $\text{MgO}$ , a mixt. known to the trade as Elrasal (cf. Ger. patents 237,791 and 232,581). W. C. EBAUGH

**Retrospect and prospect in the nitrogen industry.** CHAPLIN TYLER. *Chem. Markets* 24, 587-90(1929). E. J. C.

**Structure and analysis of bleaching earths.** O. ECKART. *Seifensieder-Ztg.* 56, 149-51(1929).—L. Kalusky's conclusion (*C. A.* 23, 3054) that fuller's earth is crystalline is erroneous; its property of aging and its manner of giving off  $\text{H}_2\text{O}$  are characteristic of amorphous substances, like  $\text{SiO}_2$  gel and activated C. The conclusions drawn from analyses of raw and activated earths are also doubtful because the Bavarian deposits, the principal source of these earths, vary so much and even in the same pits; the fact that several pits are worked simultaneously, makes it difficult to trace any given sample through its process to the final delivery. Errors are also pointed out in K.'s calcs. P. ESCHER

**Adsorption phenomena and decolorizing earths.** L. VALLI-DOUAU. *Chimie & industrie Special No.*, 289-92(Feb., 1929).—A brief review of the nature of decolorizing earths, of the mechanism of adsorption, of their action on mineral oils and of the activation of decolorizing earths. A. PAPINEAU-COUTURE

**Adhesive from beet pulp.** V. V. YANOVSKII. *Nauch. Zapiski Sakharnoi Prom.* 7, 333-40(1929).—An adhesive can be successfully manufactured from pulp of beet-sugar factories. The best results were obtained by treating steam-dried pulp with 3% of HCl or  $\text{H}_2\text{SO}_4$  figured on wt. of dry substances in pulp. The viscosity of pulp adhesive is 7 times greater than "GUMMI" of the same concn. and increases sharply upon further concn. of the soln. Adhesiveness of the product is very high and for normal concns. exceeds the best joiner's glue. V. E. BAIKOW

**Preparation of luminescent substances (ZHUKOV) 3. Stainless Fe and its application to the manufacture and transportation of  $\text{HNO}_3$  (MIRCHILL) 9.**

Wissenschaftlichen Veröffentlichungen aus dem Siemens-Konzern. Band VIII, Heft 1. Beryllium-Arbeiten. Berlin: V D I Buchhandlung. M. 32.

**Pure hydrochloric acid.** VEREIN FÜR CHEM. UND METALLURG. PRODUKTION. Ger. 476,597, Feb. 7, 1926. Pure HCl is obtained from impure NaCl by treating a soln. of the latter with Cl and filtering through active C before treating with acid in the usual way.

**Hydrocyanic acid.** I. G. FARBENIND. A.-G. (Wilhelm Michael and Wilhelm Goetz, inventors). Ger. 475,556, July 7, 1925. HCN is prepd. by the catalytic decompn. of  $\text{HCONH}_2$  at high temps. The oxides of the alk. earths, or halides, carbonates and silicates with water of crystn., or active C may be used as the catalyzer. In the examples the  $\text{HCONH}_2$  is heated to  $400^\circ$  or  $450^\circ$ .

**Container for hydrofluoric acid.** FELIX SINGER. Ger. 476,596, April 8, 1927. A porous ceramic container is rendered capable of holding HF by impregnation with paraffin.

**Nitric and sulfuric acids.** ARMAND G. VAUGUÉ. Fr. 654,055, May 10, 1928. Nitrous or sulfuric vapors are recovered and concd. by damping the vapors before recovery by a liquid current in which they are progressively emulsified and which is sent under feeble pressure into a layer of filtering water contg. neutral or catalytic substances whereby soln. of the gas is obtained with rapid supersatn.

**Sulfuric acid.** MANSFELD A.-G. FÜR BERGBAU UND HÜTTENBETRIEB, HANS KREBS and ROLF BORCHERS. Fr. 653,371, April 24, 1928. In the manuf. of  $\text{H}_2\text{SO}_4$ , Fe is used in place of Pb in the plant, Fe being taken to include steel and alloys of Fe.

**Phosphoric acid.** SOC. DES PHOSPHATES TUNISIENS. Fr. 654,954, May 29, 1928. Phosphoric acid is prepd. by charging a mixt. composed of a mineral phosphate, silica and fuel into a tower mounted above the hearth of a heating chamber in which the charge is submitted to the action of the flames; the air descending with the charge being heated serves to burn the fuel and assures the oxidation of the P gases formed.

**Titanic acid.** I. G. FARBENIND. A.-G. Fr. 653,985, May 8, 1928. A white titanic acid, which is resistant to incandescence, is obtained by a second disintegration and hydrolysis of the basic titanic salt from the usual disintegration and hydrolysis of a Ti ore.

**Apparatus for producing solid carbon dioxide.** AKT.-GES. DER MASCHINEN-FABRIKEN ESCHER WYSS & CIE. Swiss 131,443, Jan. 18, 1928. Details are given.

**Nitric oxide.** GEORGE LUTZ. Ger. 475,882, April 21, 1927. Fluid fuel is mixed with N and O under a pressure of 50–100 atm. and burned over contact agents such as W or Ti.

**Oxides of nitrogen.** ELEKTRIZITÄTWERK LONZA. Fr. 653,431, April 25, 1928. Oxides of N either in the production of  $\text{HNO}_3$  by an elec. arc or by oxidation of  $\text{NH}_3$  are absorbed by  $\text{HNO}_3$  of gradually increasing concn. and at temps. between  $-20^\circ$  to  $-30^\circ$ .

**Compounds of oxygen and nitrogen.** LEO BERL. Ger. 476,855, Feb. 25, 1928. Compds. of N and O are obtained by the catalytic oxidation of  $\text{NH}_3$  salts, especially sulfites, by  $\text{NO}_2$  or the mixt. of NO and O obtained by the thermal dissocn. of  $\text{NO}_2$ .

**Sulfur trioxide.** JESSE G. MELENDY (to General Chemical Co.). U. S. 1,716,498, June 11.  $\text{SO}_3$  is subjected to catalytic oxidation in sep. adiabatic stages; the temp. of the gases entering the conversion stages is controlled by pos. cooling, and the conversion in all but the initial stage is caused to proceed only to that point at which the reaction rate begins rapidly to fall off; the reaction is carried to equil. only in the final converter.

**Catalytic synthesis of ammonia.** SOC. ANON. IND. AMMONIACA. Fr. 654,804, May 24, 1928. The catalysts are given the form of turnings to increase the exposed surface and are distributed in the furnace in horizontal zones, in each of which the size of the catalyst increases toward the bottom of the furnace. Fr. 654,806 describes a suitable furnace for the synthesis.

**Catalyst for ammonia synthesis.** SOCIÉTÉ L'AIR LIQUIDE, SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS GEORGES CLAUDE. Ger. 476,380, Oct. 14, 1920. See Brit. 153,254 (C. A. 15, 929).

**Ammonia condenser.** JACOB H. BECKMAN. U. S. 1,716, 681, June 11. Structural features.

**Combustion of ammonia.** HARRY PAULING. Fr. 653,202, Oct. 21, 1927. The mixt. of  $\text{NH}_3$  and air or O is distributed over the catalyst by a no. of diffuser chambers arranged with the parts of larger cross section toward the catalyst.

**Formation of salts.** ROBERT TERN. Fr. 654,373, May 16, 1928. Salts are formed dry by bringing the starting materials together in a colloidal state, mixing them in a colloid mill and heating them in an inclined rotating cylinder, the gaseous products of the reaction being obtained in an electro-filter and the residue in a heating vessel in an anhyd. state. An example is given of the prepn. of  $\text{NH}_4\text{Cl}$  from  $(\text{NH}_4)_2\text{SO}_4$  and  $\text{NaCl}$ .

**Hydrated sesquioxides.** I. G. FARBENIND. A.-G. Fr. 653,119, April 19, 1928. Hydrated sesquioxides of Ni and Co are made by dissolving the corresponding carbonate in water and treating it while stirring with hypochlorite lye as free as possible from alkali and contg. about 150 g. of active Cl per l.

**Phosphates.** I. G. FARBENIND. A.-G. Fr. 655,062, June 1, 1928. In the treatment of crude phosphates with  $\text{H}_2\text{SO}_4$ , an easily separable  $\text{CaSO}_4$  is obtained by carrying out the reaction in the presence of metaphosphoric acid or one of its salts.

**Aluminum chloride.** HENRY BLUMENBERG, JR. U. S. 1,716,102, June 4. A mixt. of Al sulfide and a chloride of an alkali-forming metal such as KCl is dehydrated, a carbonaceous material such as coal or heavy fuel oil is added, and the mixt. is heated in a closed retort to effect fractional volatilization of  $\text{AlCl}_3$  vapors which are condensed Cf. C. A. 22, 483.

**Aluminum silicate decolorizing agents.** JOHN C. MERRILL and HENRY S. MONTGOMERY. U. S. 1,716,828, June 11. In prepg. an Al silicate clay for use as a decolorizing medium, it is treated with a soln. of an electrolyte, which does not change the chem. constitution of the clay, pressed, dried and ground.

**Ammonium sulfate.** STANLEY ROBSON. Fr. 653,164, April 20, 1928.  $(\text{NH}_4)_2\text{SO}_4$  is prepd. by uniting  $\text{NH}_3$ ,  $\text{SO}_3$  produced by the oxidation of  $\text{SO}_2$  with a catalyst, and water, all in the form of gas or vapor. Any 2 may be united before the addn. of the 3rd. If the  $\text{SO}_3$  contains unchanged  $\text{SO}_2$ ,  $(\text{NH}_4)_2\text{SO}_3$  is also formed. Cf. C. A. 23, 3547.

**Ammonium sulfate.** UNION CHIMIQUE BELGE. Fr. 654,567, May 22, 1928.  $(\text{NH}_4)_2\text{SO}_4$  is produced by washing combustion gases such as gases from industrial furnaces with an ammoniacal soln. to absorb  $\text{CO}_2$ , the gases being first cooled, then treated in a continuous manner with the soln. which is afterwards brought in contact with finely divided  $\text{CaSO}_4$  and reused.

**Di-ammonium phosphate.** GUY H. BUCHANAN (to American Cyanamid Co.). U. S. 1,716,415, June 11. A soln. of acid phosphatic material is caused to react with  $\text{NH}_3$  at the b. p., the temp. is reduced to below  $90^\circ$  before the end of the reaction to produce  $(\text{NH}_4)_2\text{HPO}_4$  and the product is pptd. by cooling.

**Barium carbide.** JOSÉ YLLA-CONTE. Fr. 654,966, May 30, 1928. Compds. of Ba (oxide, hydrate or carbonate) are mixed with coal and fired in a furnace, a stream of O or CO being passed through to maintain the necessary heat for the production of  $\text{BaC}_2$ .

**Barium hydrate.** RHENANIA-KUNHEIM VEREIN CHEMISCHER FABRIKEN A.-G. Fr. 653,346, April 23, 1928.  $\text{Ba}(\text{OH})_2$  is prepd. by the hydrolysis of silicates of Ba, which have been wet-ground to a fine degree. The grinding may be continued during the heating for hydrolysis.

**Calcium cyanamide.** COMPAGNIE DE L'AZOTE ET DES FERTILISANTS S. A. Ger. 476,516, Nov. 8, 1924.  $\text{CNNCa}$  soln. is prepd. from crude  $\text{CNNCa}$  by using water satd. with  $\text{CO}_2$ . The  $\text{CNNCa}$  is added in small quantities, each quantity being added when the evolution of  $\text{H}_2\text{S}$  due to the prior amt. ceases.

**Calcium tartrate.** ALPHONSE V. DRIVON. Fr. 653,050, Oct. 1, 1927. Wine lees are treated at  $65^\circ$  with  $\text{H}_2\text{SO}_4$ , then with  $\text{HCl}$ , dild.; the clear liquid is drawn off and filtered, treated with  $\text{CaCO}_3$  to ppt. the tartrate; the deposit which remains after the liquid is withdrawn from the first dildn. is dild. again and the clear liquid is used for the first dildn. of a next batch.

**Carbon disulfide.** I. G. FARBENIND. A.-G. (Matthias Pier and Karl Winkler, inventors). Ger. 476,598, Jan. 13, 1927. See Fr. 648,889 (C. A. 23, 3314).

**Carbon disulfide.** I. G. FARBENIND. A.-G. Fr. 654,955, May 29, 1928. In the manuf. of  $\text{CS}_2$  the liquid S passes first into supplementary chambers filled with re-factory substances and running the length of the main retort.

**Basic copper sulfate.** HUGO HOFMANN (to American Bemberg Corp.). U. S. 1,716,492, June 11. In producing a product which is suitable for use in dissolving cellulose, use is made of Cu hydroxide (contg. 42% water) 100,  $(\text{NH}_4)_2\text{SO}_4$  72, aq.  $\text{NH}_3$  (0.909 sp. gr.)  $80^\circ$  and  $60^\circ$  B $\phi$ .  $\text{H}_2\text{SO}_4$  92 parts.

**Ferric oxide.** I. G. FARBENIND. A.-G. Fr. 652,846, Mar. 20, 1928. Finely divided  $\text{Fe}_2\text{O}_3$  is obtained by heating the hydrate in alk. soln. at a temp. above  $100^\circ$ .

A soln. of a ferric salt may be pptd. by adding more than the necessary amt. of a basic substance and heating the mixt. under pressure to 100–150°. Cf. C. A. 23, 3058.

**Mercury thiocyanate.** I. G. FARBENIND. A.-G. (Oskar Neubert, Karl Schrang and Georg Wesenberg, inventors). Ger. 475,533, June 9, 1925. Colloidal solns. of  $\text{Hg}(\text{CNS})_2$  are prepd. by mixing a soln. of a Hg salt with a thiocyanate soln. in presence of a protective colloid. Thus, 40 parts albumose is dissolved in 360 parts water and 220 parts NaOH added. To the filtrate is added 20% solns. of KCNS 120 parts and  $(\text{AcO})_2\text{Hg}$  192 parts. The resulting colloidal soln. of  $\text{Hg}(\text{CNS})_2$  is sepd. by dialysis. If evapd. to dryness *in vacuo*, the  $\text{Hg}(\text{CNS})_2$  is obtained as a powder, which will form a colloidal soln. with water.

**Phosphorus pentasulfide.** PAUL DUTOIT. Swiss 131,096, Dec. 1, 1927.  $\text{P}_2\text{S}_5$  is prepd. by heating a mixt. of powd. S and  $\text{Fe}_2\text{P}$  to 700–800°. The S is preferably obtained by heating pyrites.

**Potassium carbonate.** ROBERT D. PIKE, LEO V. STECK and ROSS CUMMINGS (Steck and Cummings to Pike). U. S. 1,716,663, June 11. In sepg. the Na and K contents of carbonate brine, the brine is passed over a K zeolite and the zeolite is regenerated with a K salt soln.

**Sodium borate.** SCHERING-KAHLBAUM A.-G. Ger. 476,956, June 9, 1927. A  $\text{Na}_2\text{BO}_3$  soln. is entirely freed from heavy metals by adding a small quantity of  $\text{BaCl}_2$ ; it is allowed to stand and the ppt. sepd.

**Sodium perborate.** HECTOR R. CARVETH (to Roessler & Hasslachier Chemical Co.). U. S. 1,716,874, June 11. See Brit. 297,777 (C. A. 23, 2791).

**Sodium nitrate; ammonium chloride.** I. G. FARBENIND. A.-G. (Philipp Osswald, inventor). Ger. 476,254, Nov. 1, 1924. A mixt. of  $\text{NaNO}_3$  and  $\text{NH}_4\text{Cl}$  obtained by double decompn. from  $\text{NH}_4\text{NO}_3$  and NaCl is sepd. into its components by a differential settling process, which is preferably carried out directly in the medium in which the double decompn. occurs. Thus, the decompn. may be effected in an aq. soln. of sp. gr. 1.4 comprising  $\text{NaNO}_3$ ,  $\text{NH}_4\text{Cl}$  and  $\text{NH}_4\text{NO}_3$ ; a plant is described wherein this soln. is used cyclically, the soln. passing from a high-level tank to a reaction vessel, wherein  $\text{NH}_4\text{NO}_3$  and NaCl are added, thence to a settling vessel of known type and back again to the high-level tank.

**Sodium nitrate from ammonium nitrate.** ALEXANDER E. MOSER and ILVA LIBINSON. Ger. 476,145, Jan. 30, 1926. A soln. of  $\text{NH}_4\text{NO}_3$  and  $\text{NaHCO}_3$  is heated to 70–75°, whereby  $\text{NaNO}_3$  is formed and a mixt. of  $\text{NH}_3$ ,  $\text{CO}_2$  and  $\text{H}_2\text{O}$  is evolved, which is absorbed in a satd. soln. of NaCl at 30°.  $\text{NaHCO}_3$  for use again is so obtained, together with a mother liquor, which may be treated with  $\text{CaCl}_2$  soln., filtered and evapd. to give an impure  $\text{NH}_4\text{Cl}$  suitable as a fertilizer, or which may be treated with  $\text{Ca}(\text{OH})_2$  for recovery of  $\text{NH}_3$ .

**Granulating sodium sulfide, etc.** KALI-CHEMIE A.-G. (Friedrich Ritsberg, inventor). Ger. 476,218, Feb. 11, 1928. Addn. to 424,193. According to Ger. 424,193, pieces of predetd. size and shape are prepd. from  $\text{Na}_2\text{S}$  and like substances by allowing drops of the molten substance to fall on to a surface of metal, celluloid, ebonite, etc., maintained at a temp. below the m. p. of the substance. This method is now modified by pretreating the surface with highly viscous substances, e. g., suitable oils or fats, in order to prevent spreading of the drops. A sufficiently thin film may be obtained by applying the oil in soln., e. g., cylinder oil in benzine, and evapg. the solvent, or the oil may be applied at a high temp.

**Composition for producing hypochlorite solutions.** MAURICE C. TAYLOR (to Mathieson Alkali Works). U. S. 1,716,014, June 4. An alkali metal compd. forming an alk. aq. soln. such as  $\text{Na}_2\text{CO}_3$  or  $\text{Na}_3\text{PO}_4$  is mixed with a hypochlorite-forming chloramine such as "*p*-toluene-sulfon-benzoyl-nitrogen chloride," which is sol. in the aq. soln. of the alkali metal compd. used.

**Cryolite.** VEREINIGTE ALUMINIUM-WERKE A.-G. Fr. 653,584, April 28, 1928. Cryolite is obtained by treating a soln. of HF and  $\text{H}_2\text{SiF}_6$  obtained by means of F compds. of little value contg.  $\text{SiO}_2$  and by means of  $\text{H}_2\text{SO}_4$  with KF or  $\text{K}_2\text{CO}_3$  or both, sepg. the pure HF from the  $\text{K}_2\text{SiF}_6$  and decomposing the  $\text{K}_2\text{SiF}_6$  with  $\text{K}_2\text{CO}_3$ , reacting the soln. with  $\text{Na}_2\text{CO}_3$ , which gives NaF and  $\text{K}_2\text{CO}_3$ , mixing the pure HF with  $\text{Al}_2\text{O}_3$  and adding NaF obtained above, which gives a pure cryolite suitable for the manuf. of Al.

**Hydrogen.** MARIA CASALE-SACCHI. Swiss 131,095, July 27, 1927, Austrian 112,972, Dec. 15, 1928. H is prepd. from liquid  $\text{H}_2\text{O}$  and CO in presence of a catalyzer at temps. below the crit. temp. and at pressures higher than the vapor pressure of water. The catalyzer is a metal, metallic oxide or metallic salt of a weak inorg. acid, or a mixt.

of these. The catalyzer is carried by the water, which descends a suitable column while the CO ascends.

**Hydrogen from methane.** SOC. DES MINES DE LENS. Fr. 654,277, Oct. 14, 1927. Gases rich in H are obtained from gases rich in  $\text{CH}_4$  by passing lighting gas, coke-oven gas or the like on to a layer of coke or poor coal carried to incandescence by a blast of air. An app. is described.

**Hydrogen-nitrogen mixtures.** LUIGI CASALE. U. S. 1,716,813, June 11. Mixts. suitable for use in  $\text{NH}_3$  synthesis are obtained by distg. liquid air to obtain gaseous N, passing the residual O into a combustion chamber and utilizing it with steam for converting a hydrocarbon material into CO and H, converting the CO to  $\text{CO}_2$ , removing the latter, and adding the gaseous N to the H thus obtained. An arrangement of app. is described.

**Precipitation of hafnium and zirconium.** NAAMLOOZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN (Jan H. de Boer and Anton E. van Arkel, inventors). Ger. 476,099, Oct. 27, 1925. See Brit. 260,062 (C. A. 21, 3317).

**Phosphorus.** I. G. FARBENIND. A.-G. Fr. 653,440, April 25, 1928. P is displaced from combination with Fe by Si. Thus, Fe-P is mixed with Si, Fe-Si or mixts. giving Si, the amt. employed being such that an Fe-Si commercially usable is obtained. The P which escapes is condensed.

**Phosphorus.** SOC. ITALIANA PER LE IND. MINERARIE ED CHIMICHE. Fr. 653,759, April 17, 1928. Phosphate ores or bones are treated with an acid such as HCl in the presence of a metal (Fe, Al, etc.) and  $\text{SiO}_2$  for the recovery of P. An app. is described.

**Catalysts for reduction or hydrogenation.** I. G. FARBENIND. A.-G. Fr. 33,928, July 25, 1927. See Brit. 286,123 (C. A. 23, 247).

**Adsorbing agents containing silica.** GERHARD E. VAN NES. U. S. 1,715,439, June 4. In decolorizing liquids such as cane molasses, there is formed in the liquid to be decolorized an adsorbing agent contg. silica, by adding to the liquid a sol. silicate, a basic substance such as milk of lime and an acid substance, *e. g.*,  $\text{CO}_2$ , which is capable of reacting with the added basic substance to form a ppt.

**Plastic composition.** GOTTWALD SCHWARZ and LUDWIG SACHS. Austrian 112,735, Nov. 15, 1928. A plastic and elastic compn. for stopping the ears comprises unvulcanized rubber, balata or the like with or without mineral fillers, *e. g.*, talc or lithopone.

**Plastic compositions.** WORLDECHO, LTD. Fr. 653,007, April 18, 1928. Articles such as *gramophone disks* are molded from a plastic compn. contg.  $\beta$ -naphthol or the diamine 80, PhOH or resorcinol 60,  $\text{CH}_2\text{O}$  100, petroleum 80,  $\text{Na}_2\text{SO}_4$  10 parts as well as the necessary amt. of a resin made, *e. g.*, from an alc. soln. of gum lac 15-30, colophony 5-15 and sandarac 5-15 parts.

**Plastic material.** MARIE A. LEMATRE. Fr. 652,884, April 14, 1928. A plastic material contains glycerol 750, gelatin 700, carnauba wax 520 and  $\text{ZnO}$  200 g.

**Moldable composition.** JOHN T. COLLINS. U. S. 1,716,623, June 11. A compn. suitable for molding under heat and pressure comprises finely sepd. fibers such as paper-making pulp together with a gummy deriv. such as may be obtained from "black liquor" by pptn. with acid. A phenol-condensation product also may be added.

**Molded articles of indurated fiber.** HORACE H. CLARK (to Clark Fibre Products Corp.). U. S. 1,717,092, June 11. Pulp formed from old cotton cloth is digested in an aq. soln. contg. about 5% NaOH and about 3%  $\text{Na}_2\text{CO}_3$  for about 4 hrs. under a pressure of 30-50 lbs. per sq. in.; a blank is formed from the pulp by flowing it into a mold having perforated walls through which most of the water passes; the blank is dried and impregnated with an indurating liquid such as  $\text{ZnCl}_2$  soln. and is finally compacted and shaped under pressure.

**Kneading device for the production of artificial horn and similar plastic masses.** EUGEN STICH. Ger. 476,748, Sept. 2, 1927.

**Artificial horn.** AKALIT KUNSTHORNWERKE A.-G. Austrian 112,821, Feb. 15, 1928. Artificial horn made from albuminous material, particularly casein, is hardened with  $\text{HCONHCH}_2\text{OH}$  or its homologs. These substances liberate  $\text{CH}_2\text{O}$  under the conditions of temp. and pressure usually employed for hardening.

**Condensation products of aldehydes with urea and thiourea.** KUNSTHARZFABRIK. FRITZ POLLAK, G. M. B. H. Fr. 654,554, May 22, 1928. See Brit. 291,366, C. A. 23, 1227.

**Condensation products of phenol and formaldehyde.** CHEM. FAB. KURT ALBERT, G. M. B. H. Ger. 475,865, Oct. 5, 1918. Condensation products from PhOH and polymers of HCHO, which are liquid at ordinary temps. and stable to heating, are prepd. by heating 1 mol. PhOH with considerable excess (at least  $1\frac{1}{2}$  mol.) of stable polymerized HCHO until complete soln. occurs. The HCHO polymer should not react exothermally or

have a catalytic action at ordinary temps. on the PhOH. Homologs of PhOH may be used. The example mentions cresol and gives the heating temp. as 80–90°.

**Casein.** WM. H. SHERRFIELD. U. S. 1,716,799, June 11. In the manuf. of acid-ptd. casein, acid is added to milk under conditions which will cause formation of a gran curd, the mixt. is agitated while passing through a portion of the app. to complete the reaction, whey is sepd. from the curd immediately after cessation of the agitation, water is added to the curd, and the curd is agitated with the water to effect washing while passing through a sufficient length of the app. used (which is described).

**Furfural reaction product.** WALTER O. SNELLING. U. S. 1,716,606, June 11. Furfural, HCl and water are mixed and allowed to stand until a solid non-resinous reaction product forms which may be used in making crayons, porous C, decolorizing material, etc.

**Burning limestone.** CARL J. WRIGHT (to Combustion Utilities Corp.). U. S. 1,716,572, June 11. Limestone is advanced continuously downwardly in a column through a shaft kiln and is decomposed by contact with a mixt. of superheated steam and CO<sub>2</sub> introduced circumferentially into the mid-portion of the column; the product is cooled by steam introduced at the base of the column and passed upwardly; the vol. of satd. steam thus introduced is controlled to maintain the temp. of the lime at the foot of the column only slightly above the dissocn. temp. of Ca(OH)<sub>2</sub>. An arrangement of app. is described.

**Treatment of fuller's earth, etc.** RUDOLPH RAPHAEL ROSENBAUM. Ger. 476,398, Dec. 17, 1927. See Brit. 284,327 (C. A. 22, 4739).

**Flotation apparatus for refining graphite.** EUGÈNE G. GALPIE. Fr. 653,192, May 18, 1926.

**Filtering material.** SOC. DES ÉLECTRODES DE LA SAVOIE. Fr. 652,778. Sept. 28, 1927. Filtering materials are made having a basis of SiC or fused Al<sub>2</sub>O<sub>3</sub> of the desired size of grain. Substances capable of liberating volatile products by combustion, distn. or decompn. and binding agents are incorporated with the SiC, etc., before molding and baking.

**Bleaching, washing and disinfectant material.** C. F. BOEHRINGER & SOEHNE, G. M. B. H. Ger. 476,180, Dec. 16, 1926. A soln. for immediate use in bleaching, etc., is prepd. by treating with an alk. soln. an adsorbent, *e. g.*, silica gel, which has been charged with Cl. The use of solns. of alkali carbonates or bicarbonates is advantageous, as free HClO is then obtained in soln.

**Dry-washing composition.** CARRARA CHEMISCH-PHARMAZEUTISCHE FABRIKATION PAUL DORFF. Ger. 476,151, Aug. 14, 1925. An emulsion prepd. by treating a suitable wax, *e. g.*, beeswax, with alkalies is mixed with so much abrasive, *e. g.*, marble dust, that a paste is produced, which crumbles when rubbed between the hands.

**Furniture polish.** ERNST NEUHAUSER. Swiss 130,701, Aug. 15, 1927. A furniture polish contains ceresin 150 g., carnauba wax 50 g., paraffin 200 g. and oil of turpentine 700 g., mixed to a cream.

**Wood filling and polishing composition.** WILLIAM F. GOWELL. U. S. 1,717,023, June 11. Turpentine 1 gal., paraffin 0.5 lb., PbO 1 lb. and ammonia 1 oz.

**Projection screens.** ARTHUR C. PAYNE (to Trans-Lux Daylight Picture Screen Corp.). U. S. 1,715,381, June 4. The gum or resinous material is removed from a sheet of georgette crepe, the sheet is stretched and while stretched is placed upon a body of gelatinous plastic material such as described in U. S. 1,151,602 contg. glycerol and gelatin with which its incorporation is effected by capillary action.

**Colored smoke clouds.** JOHN C. SAVAGE. U. S. 1,716,797, June 11. A coloration medium such as a dye dissolved in oil and CCl<sub>4</sub> is vaporized without combustion and ejected into the atm. in conjunction with a smoke base neutral to the coloration medium, such as exhaust engine gases or steam.

**Printing processes.** GIUSTO MANETTI, PRIMO BENAGLIA and MATTIA LUCH-SINGER. Fr. 652,703, April 14, 1928. Pictures are produced in one or more colors on metallic surfaces by printing with transparent colors, so that the picture is illuminated by reflections of the metallic base, and the colors have max. intensity and brilliance. Surfaces to be printed on may be gilded or otherwise treated with metal, the metal or gilded surface being covered with a thin layer of more or less transparent substances, such as lacs or varnishes having a base of nitrocellulose, cellulose, resin or drying oils.

**Protective coating.** RAYMOND BERIN. Fr. 654,238, Jan. 12, 1927. Containers are protected against the action of gasoline, oil, alcs., etc., by a coating contg. cellulose acetate and a soln. of a formo-phenolic substance.

**Rust-loosening composition.** FRANK M. BOYNTON. U. S. 1,715 589, June 4. A

of these. The catalyzer is carried by the water, which descends a suitable column while the CO ascends.

**Hydrogen from methane.** SOC. DES MINES DE LENS. Fr. 654,277, Oct. 14, 1927. Gases rich in H are obtained from gases rich in  $\text{CH}_4$  by passing lighting gas, coke-oven gas or the like on to a layer of coke or poor coal carried to incandescence by a blast of air. An app. is described.

**Hydrogen-nitrogen mixtures.** LUIGI CASALE. U. S. 1,716,813, June 11. Mixts. suitable for use in  $\text{NH}_3$  synthesis are obtained by distg. liquid air to obtain gaseous N, passing the residual O into a combustion chamber and utilizing it with steam for converting a hydrocarbon material into CO and H, converting the CO to  $\text{CO}_2$ , removing the latter, and adding the gaseous N to the H thus obtained. An arrangement of app. is described.

**Precipitation of hafnium and zirconium.** NAAMLÖÖZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN (Jan H. de Boer and Anton E. van Arkel, inventors). Ger 476,099, Oct. 27, 1925. See Brit. 260,062 (C. A. 21, 3317).

**Phosphorus.** I. G. FARBERIND. A.-G. Fr. 653,440, April 25, 1928. P is displaced from combination with Fe by Si. Thus, Fe-P is mixed with Si, Fe-Si or mixts. giving Si, the amt. employed being such that an Fe-Si commercially usable is obtained. The P which escapes is condensed.

**Phosphorus.** SOC. ITALIANA PER LE IND. MINERARIE ED CHIMICHE. Fr. 653,759, April 17, 1928. Phosphate ores or bones are treated with an acid such as HCl in the presence of a metal (Fe, Al, etc.) and  $\text{SiO}_2$  for the recovery of P. An app. is described.

**Catalysts for reduction or hydrogenation.** I. G. FARBERIND. A.-G. Fr. 33,928, July 25, 1927. See Brit. 286,123 (C. A. 23, 247).

**Adsorbing agents containing silica.** GERHARD E. VAN NES. U. S. 1,715,439, June 4. In decolorizing liquids such as cane molasses, there is formed in the liquid to be decolorized an adsorbing agent contg. silica, by adding to the liquid a sol. silicate, a basic substance such as milk of lime and an acid substance, *e. g.*,  $\text{CO}_2$ , which is capable of reacting with the added basic substance to form a ppt.

**Plastic composition.** GOTTWALD SCHWARZ and LUDWIG SACHS. Austrian 112,735, Nov. 15, 1928. A plastic and elastic compn. for stopping the ears comprises unvulcanized rubber, balata or the like with or without mineral fillers, *e. g.*, talc or lithopone.

**Plastic compositions.** WORLDECHO, LTD. Fr. 653,007, April 18, 1928. Articles such as gramophone disks are molded from a plastic compn. contg.  $\beta$ -naphthol or the diamine 80, PhOH or resorcinol 60,  $\text{CH}_2\text{O}$  100, petroleum 80,  $\text{Na}_2\text{SO}_4$  10 parts as well as the necessary amt. of a resin made, *e. g.*, from an alc. soln. of gum lac 15-30, colophony 5-15 and sandarac 5-15 parts.

**Plastic material.** MARIE A. LEMATRE. Fr. 652,884, April 14, 1928. A plastic material contains glycerol 750, gelatin 700, carnauba wax 520 and  $\text{ZnO}$  200 g.

**Moldable composition.** JOHN T. COLLINS. U. S. 1,716,623, June 11. A compn. suitable for molding under heat and pressure comprises finely sepd. fibers such as paper-making pulp together with a gummy deriv. such as may be obtained from "black liquor" by pptn. with acid. A phenol-condensation product also may be added.

**Molded articles of indurated fiber.** HORACE H. CLARK (to Clark Fibre Products Corp.). U. S. 1,717,092, June 11. Pulp formed from old cotton cloth is digested in an aq. soln. contg. about 5% NaOH and about 3%  $\text{Na}_2\text{CO}_3$  for about 4 hrs. under a pressure of 30-50 lbs. per sq. in.; a blank is formed from the pulp by flowing it into a mold having perforated walls through which most of the water passes; the blank is dried and impregnated with an indurating liquid such as  $\text{ZnCl}_2$  soln. and is finally compacted and shaped under pressure.

**Kneading device for the production of artificial horn and similar plastic masses.** EUGEN STICH. Ger. 476,748, Sept. 2, 1927.

**Artificial horn.** AKALIT KUNSTHORNWERKE A.-G. Austrian 112,821, Feb. 15, 1928. Artificial horn made from albuminous material, particularly casein, is hardened with  $\text{HCONHCH}_2\text{OH}$  or its homologs. These substances liberate  $\text{CH}_2\text{O}$  under the conditions of temp. and pressure usually employed for hardening.

**Condensation products of aldehydes with urea and thiourea.** KUNSTHARZFABRIK. FRITZ POLLAK, G. M. B. H. Fr. 654,554, May 22, 1928. See Brit. 291,366, C. A. 23, 1227.

**Condensation products of phenol and formaldehyde.** CHEM. FAB. KURT ALBERT, G. M. B. H. Ger. 475,865, Oct. 5, 1918. Condensation products from PhOH and polymers of HCHO, which are liquid at ordinary temps. and stable to heating, are prepd. by heating 1 mol. PhOH with considerable excess (at least  $1\frac{1}{4}$  mol.) of stable polymerized HCHO until complete soln. occurs. The HCHO polymer should not react exothermally or

have a catalytic action at ordinary temps. on the PhOH. Homologs of PhOH may be used. The example mentions cresol and gives the heating temp. as 80–90°.

**Casein.** WM. H. SHEFFIELD. U. S. 1,716,799, June 11. In the manuf. of acid-ptd. casein, acid is added to milk under conditions which will cause formation of a gran curd, the mixt. is agitated while passing through a portion of the app. to complete the reaction, whey is sepd. from the curd immediately after cessation of the agitation, water is added to the curd, and the curd is agitated with the water to effect washing while passing through a sufficient length of the app. used (which is described).

**Furfural reaction product.** WALTER O. SNELLING. U. S. 1,716,606, June 11. Furfural, HCl and water are mixed and allowed to stand until a solid non-resinous reaction product forms which may be used in making crayons, porous C, decolorizing material, etc.

**Burning limestone.** CARL J. WRIGHT (to Combustion Utilities Corp.). U. S. 1,716,572, June 11. Limestone is advanced continuously downwardly in a column through a shaft kiln and is decomposed by contact with a mixt. of superheated steam and CO<sub>2</sub> introduced circumferentially into the mid-portion of the column; the product is cooled by steam introduced at the base of the column and passed upwardly; the vol. of satd. steam thus introduced is controlled to maintain the temp. of the lime at the foot of the column only slightly above the dissocn. temp. of Ca(OH)<sub>2</sub>. An arrangement of app. is described.

**Treatment of fuller's earth, etc.** RUDOLPH RAPHAEL ROSENBAUM. Ger. 476,398, Dec. 17, 1927. See Brit. 284,327 (C. A. 22, 4739).

**Flotation apparatus for refining graphite.** EUGÈNE G. GALPIE. Fr. 653,192, May 18, 1926.

**Filtering material.** SOC. DES ÉLECTRODES DE LA SAVOIE. Fr. 652,778. Sept. 28, 1927. Filtering materials are made having a basis of SiC or fused Al<sub>2</sub>O<sub>3</sub> of the desired size of grain. Substances capable of liberating volatile products by combustion, distn. or decompn. and binding agents are incorporated with the SiC, etc., before molding and baking.

**Bleaching, washing and disinfectant material.** C. F. BOEHRINGER & SOEHNE, G. M. B. H. Ger. 476,180, Dec. 16, 1926. A soln. for immediate use in bleaching, etc., is prepd. by treating with an alk. soln. an adsorbent, *e. g.*, silica gel, which has been charged with Cl. The use of solns. of alkali carbonates or bicarbonates is advantageous, as free HClO is then obtained in soln.

**Dry-washing composition.** CARRARA CHEMISCH-PHARMAZEUTISCHE FABRIKATION PAUL DORFF. Ger. 476,151, Aug. 14, 1925. An emulsion prepd. by treating a suitable wax, *e. g.*, beeswax, with alkalies is mixed with so much abrasive, *e. g.*, marble dust, that a paste is produced, which crumbles when rubbed between the hands.

**Furniture polish.** ERNST NEUHAUSER. Swiss 130,701, Aug. 15, 1927. A furniture polish contains ceresin 150 g., carnauba wax 50 g., paraffin 200 g. and oil of turpentine 700 g., mixed to a cream.

**Wood filling and polishing composition.** WILLIAM F. GOWELL. U. S. 1,717,023, June 11. Turpentine 1 gal., paraffin 0.5 lb., PbO 1 lb. and ammonia 1 oz.

**Projection screens.** ARTHUR C. PAYNE (to Trans-Lux Daylight Picture Screen Corp.). U. S. 1,715,381, June 4. The gum or resinous material is removed from a sheet of georgette crepe, the sheet is stretched and while stretched is placed upon a body of gelatinous plastic material such as described in U. S. 1,151,502 contg.-glycerol and gelatin with which its incorporation is effected by capillary action.

**Colored smoke clouds.** JOHN C. SAVAGE. U. S. 1,716,797, June 11. A coloration medium such as a dye dissolved in oil and CCl<sub>4</sub> is vaporized without combustion and ejected into the atm. in conjunction with a smoke base neutral to the coloration medium, such as exhaust engine gases or steam.

**Printing processes.** GIUSTO MANETTI, PRIMO BENAGLIA and MATTIA LUCHSINGER. Fr. 652,703, April 14, 1928. Pictures are produced in one or more colors on metallic surfaces by printing with transparent colors, so that the picture is illuminated by reflections of the metallic base, and the colors have max. intensity and brilliance. Surfaces to be printed on may be gilded or otherwise treated with metal, the metal or gilded surface being covered with a thin layer of more or less transparent substances, such as lacs or varnishes having a base of nitrocellulose, cellulose, resin or drying oils.

**Protective coating.** RAYMOND BEHIN. Fr. 654,238, Jan. 12, 1927. Containers are protected against the action of gasoline, oil, alcs., etc., by a coating contg. cellulose acetate and a soln. of a formo-phenolic substance.

**Rust-loosening composition.** FRANK M. BOYNTON. U. S. 1,715,589, June 4. A

compn. suitable for loosening rust on nut threads or other articles comprises  $C_2H_2Cl_4$  about 55, "varnolene" about 35 and kerosene about 10%.

**Embossing dies.** EBER G. KNAPP. U. S. 1,715,763, June 4. An inked impression of the matter to be duplicated is produced on chalk board, the impression is dusted with pulverized rosin, the board is heated to fuse the rosin and ink of the impression and is further subjected to treatment (suitably with "chloride of lime" soln.) to dissolve the chalk.

**Gut.** OTTO GERNGROSS. Ger. 476,551, Jan. 7, 1927. Animal gut is treated to a fermenting process before its manuf. into cat-gut or "silk." Pancreatic juice is mentioned as the fermenting agent in the example.

**Fire-extinguishing solution.** RALPH W. AUSTIN. U. S. 1,716,476, June 11.  $K_2CO_3$  is dissolved in a soln. of com.  $CaCl_2$  to form a liquid for "anti-freezing" extinguishers.

## 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON AND C. H. KERR

**Progress in the glass industry.** ANON. *Pottery Gaz.* 54, 363-72(1929).—A review of the manufacturing progress made in recent years in the glass bottle industry with a description of the various types of automatic machines used as well as plate and sheet glass, cooking glassware and anti-glacé glasses. R. A. HEINDL

**The composition of glass.** OSZKAR KNAPP. *Chem. Rundschau Mitteleuropa u. Balkan* 4, 155-6(1927); *Chem. Zentr.* 1928, I, 243.—K. defines the term glass in a technical sense by means of phase diagrams. FRANCIS P. GRIFFITHS

**The manufacture of laminated glass.** W. R. LYTTELTON. *Pottery Gaz.* 54, 274-6(1929).—L. reviews the pioneer work by Woods and also Benedictus on the strengthening of glass with a view to prevent or lessen its shattering effect under impact. An outline of the present-day manuf. methods is given together with some of the difficulties encountered, especially with the cellulose and gelatin sheets either on account of their becoming brittle or discoloring with age under the action of certain light rays. R. A. HEINDL

**The annealing of glass as a function of the temperature.** ANDRÉ THURET. *Chimie & industrie Special No.*, 488(Feb., 1929).—The annealing of glass was studied by means of the change in d.; the curves obtained showed that: (1) the rate of annealing increases with the temp.; (2) for each temp. the degree of annealing is limited, and decreases with the annealing temp., irrespective of the time of annealing. A. P.-C

**Study of the properties of simple enamel glasses.** A. I. ANDREWS. *J. Am. Ceram. Soc.* 12, 390-4(1929).—The systems  $Na_2O-B_2O_3-SiO_2$  and  $Na_2O-PbO-SiO_2$  were studied for acid resistance. Increase in  $SiO_2$  in general improves acid resistance. The effects of  $Na_2O$ ,  $B_2O_3$  and  $PbO$  are dependent upon the compn. to which those oxides are added. Some show considerable promise as acid-proof enamels. C. H. KERR

Glass. SOC. ANON DES MANUFACTURES DES GLACES ET PRODUITS CHIMIQUES DE SAINT-GOBAIN, CHAUNY & CIREY. Ger. 476,744, May 29, 1925. Molten glass in the furnace is clarified by a current of hot gas blown over the glass at a place where, owing to the construction of the furnace, the depth of the glass is small.

Special glass. RÖHM & HAAS A.-G. Fr. 654,357, May 16, 1928. Polymerized or polymerizable unsatd. org. compds. are united to glass, etc., to form splinterless compd. sheets. Examples of compds. used are methyl cinnamate and ethyl crotonate.

Glass wool. CHEMISCHE FABRIK STOCKERAU FELIX POLLAK. Fr. 652,712, April 14, 1928. The glass is heated to the temp. required for spinning by elec. resistance. Cf. C. A. 23, 683.

Glass-blowing machine. VITREA A.-G. Ger. 476,160, Nov. 28, 1916.

Glass-melting tank and associated apparatus for making plate glass. CHESTER E. HENDERSON (to Pittsburgh Plate Glass Co.). U. S. 1,716,312, June 4.

Electric furnace for glass-making. ARMAND A. P. C. LAPOINTE. Fr. 654,219, April 25, 1928.

Annealing furnace for glass, etc. THERMAL ENGINEERING CORP. Fr. 654,763, April 27, 1928.

Annealing furnace for rolled glass. NAAMLÖÖZE VENNOOTSCHAP MIJ. TOT BEHEER EN EXPLOIT. VAN OCTROOIEN. Ger. 476,927, May 17, 1928.

Glass furnace for drawing continuous sheets of glass. JULES J. QUERTINMONT. U. S. 1,715,568, June 4. Structural features.

Glass furnace for use with bottle-forming apparatus of the suction type. THOMAS C. MOORSHEAD (to United Glass Bottle Manufacturers, Ltd.). U. S. 1,716,456, June 11.

Ceramics. KOMMANDIT-GES. MULLIEZ FRÈRES & Co. Ger. 475,722, April 12, 1927. Imitation marble is prepd. by superposing layers of ground material of dry or slightly damp powder in a mold; the layers have furrows contg. powder to impart the veined effect when the whole sets.

Ceramic products. SCHEIDHAUER & GIESSENG A.-G. Fr. 33,876, Jan. 10, 1927. Addn. to 626,365. In the production of ceramic products from non-plastic substances a small proportion of the raw material in colloidal soln. is used as binding means for the substance in granular form.

Metallized ceramic products. RENÉ É. BRENNER. Fr. 652,748, Sept. 21, 1927. An oxide of a metal or metals (Cu, Sn, etc.) is incorporated along with the necessary C for its reduction with ceramic material, made into a paste and molded into hollow open articles. These are baked in a reducing atm. and afterward dipped in a bath of  $CuSO_4$  and  $(NH_4)_2SO_4$  made feebly acid with  $H_2SO_4$ , in which they form the cathode of an electrolytic bath having an insol. anode. Cu is deposited on the exterior while Cu is dissolved from the interior.

Apparatus for series-drying ceramic articles. JOSEF DENGLER. Fr. 654,388, May 16, 1928.

Refractory material. LOUIS J. TROSTEL (to General Refractories Co.). U. S. 1,716,395, June 11. Cyanite is added to a highly aluminous clay mixt. and the mass is shaped and heated to produce a refractory article such as furnace brick of substantially constant volume.

Refractory composition. THOMAS S. CURTIS (to Pacific-Southwest Trust & Savings Bank). U. S. 1,715,449, June 4. A compn. suitable for making refractory brick, etc., consists of the reaction product of a mixt. of MgO and Fe oxide contg. 35-50% of the Fe oxide. The material is heated sufficiently to cause reaction and sintering.

Enameling metals. HANS EDLER. Fr. 654,016, May 9, 1928. Metals to be

enameled or otherwise coated are heated to the required temp. by Foucault currents produced in the exterior layer of the metal.

Furnace for melting materials for enamel coatings. STETTINER CHAMOTTE-FABRICK A.-G. VORM. DIDIER. Ger. 475,511, May 26, 1928. Structural details are given.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Cement flour. ANON. *Cement & Cement Manuf.* 2, 132-6(1929).—A description of an air elutriation device. RAYMOND WILSON

The flourometer: an apparatus for determining the fineness of cements. G. BAIRE. *Chimie & industrie Special No.*, 472-3 (Feb., 1929).—A brief description of the Mayntz-Petersen flourometer, in which the fineness is detd. by an air-elutriation test. Generally speaking, cement leaving a 12% residue on a sieve having 4900 meshes per sq. cm. will leave 38% residue in the flourometer after blowing air for 15 mins. under a pressure of 6 cm. of turpentine, and a cement leaving 2% residue on a 4900-mesh sieve will leave 25.4% residue in the flourometer under the same conditions; but the results can vary with the nature of the cement and of the grinding equipment. A. P.-C

Critical examination of the methods of testing and analyzing cements. PAUL ERCULISSE. *Chimie & industrie Special No.*, 475-87(Feb., 1929).—From a crit. discussion of the methods of testing and analyzing cements, in the light of a knowledge of their compn. and of the mechanism of their setting (which are critically reviewed), E. considers that the evolution of methods for the testing and analysis of cements should be along the following lines: (1) express the results of chem. analysis by means of a formula indicating the stoichiometrical relationships; (2) as regards mech. tests, use sand of definite size of grains, and make a more fluid mortar contg. a little less sand than is used at present and exactly the amt. of water theoretically required for setting, the mortar being prepd. on a shaking table under specified conditions instead of being mixed by hand; (3) study the reactivity by LeChatelier's method. A. P.-C.

Effect of temperature on the setting times of cements and on the strength of cements, mortars and concrete. W. N. THOMAS AND N. DAVEY. Dept. Sci. Ind. Research, *Building Research, Special Rept. No.* 13, 38 pp.(1929).—The setting time in certain cements varies from 20 hrs. at 0° to 4.3 hrs. at 21.1°. A combination of 6 cements varied from 11.7 hrs. at 0° to 5.1 hrs. at 21.1°. There appears to be no direct connection between the setting times and the variations of these setting times with temp.; 2 cements may have the same setting times at 16° and be widely different at 3°. Lowering the temp. from 16 to 3° had a different effect upon various rapid hardening portland cements ranging for initial set from a decrease of 73% to an increase of 217%; for final set, from a decrease of 30% to an increase of 165%. Different aluminous cements also react very differently to temp. and considerable heat is evolved during their setting and hardening. 1:2:4 concrete cylinders of portland cement showed 28-day compression strengths of 2910 lbs. per sq. in. when molded at 25° and 3245 at 11° with the same curing temps. of 16°. By curing 1:2:4 portland cement concrete at 35.3° higher strengths were obtained than at 22.1°. A bibliography is included. H. C. PARISH

Concrete roads in Cardiff (Wales). G. H. WHITAKER. *Munic. Eng. Sanit. Record* 82, 392-4(1928).—A detailed description of their construction is given. C. H. BADGER

How to remove stains from concrete. ANON. *Concrete* 34, No. 6, 31-4(1929).—A compilation of instructions for removing iron, copper, tobacco, fire, oil and other stains from concrete. RAYMOND WILSON

Chemistry of bituminous highway construction; petroleum asphalt. PREVOST HUBBARD. *J. Soc. Chem. Ind.* 48, 108-12T(1929).—The stability test is made on compressed cylindrical briquets of the paving mixt. (sand, mineral filler and asphalt), 2 ins. in diam., by placing the briquet in a cylindrical mold and detg. the max. load developed in forcing the mixt. through a circular-bottom orifice 1 1/4 ins. in diam. The test is made at 60° which represents approx. the most severe temp. attained by asphalt paving mixts. under service conditions in temperate zones. Results are expressed directly in lbs. max. load registered by a dynamometer or spring balance. A drawing of the app. is given. The results so far obtained indicate no practical difference between asphalts produced from Mid-Continent, Mexican, Colombian and Venezuelan petroleums. Large differences in stability of paving mixts. have been noted when

sands from different sources were used although the particle sizes were comparable and no differences in angularity were perceptible under the microscope. The differences seem to be due to adsorption as shown by the following data:

Sand	Stability	Mesh	Asphalt absorbed per 1000 g.
Potomac River	Very high	40-50	0.18
		100-200	0.36
New York (crane)	High	40-50	0.14
		100-200	0.30
Platte River	Very low	40-50	0.10
		100-200	0.20

It would seem that absorption plays an important part insofar as stability of the paving mixt. is concerned. However, if the sands are mixed with a lubricant (castor oil) instead of asphalt, the stability values of such mixts. should be approx. the same. Such was not found to be the case and it is evident that adsorption is not the sole controlling factor in the stability of paving mixts. It is of interest to note that among the factors affecting stability of asphalt paving mixts. the exact penetration of the asphalt within ordinary specification limits is of relatively minor importance. Far greater differences in stability of the mixt. may be caused by variation in sand and mineral filler and normal variations in proportions of filler and asphalt than in the penetration of the asphalt itself within the usual ten-point limit specified. A brief treatment is given of the fluid asphalt products used primarily for surface treatment (excluding asphalt emulsions).

A. J. MONACK

A study of sulfur as a wood preservative. E. F. ENGLISH. *J. S. African Inst. Eng.* 27, 127-41(1929).—Round sticks of *Pinus pinaster*, *Eucalyptus saligna* and *Acacia mollissima* were impregnated with molten S by the open-tank method. The max. absorptions were 23, 17 and 8 lbs. of S per cu. ft., resp. Complete penetration of the sapwood was obtained in each case. Hardness and compression tests on oven-dry pieces of *Euc. saligna*, *Cryptomeria japonica* and *P. pinaster* treated with S showed in general an increase in hardness and a decrease in compression strength as compared with untreated control pieces. The rate of absorption of water vapor is decreased by S treatment and the moisture equil. point is slightly lower. Immersion tests indicated that impregnated S has practically no waterproofing effect. Test pieces treated with S and S contg. 5% naphthalene and untreated controls were exposed to fungus and termite attack by burial in soil and placing in a mine near Pretoria. After 2 years, the treated pieces were sound, whereas the controls were almost destroyed by termites. The same applies to the pieces placed in the mine with reference to fungus attack. S is objectionable for treatment of mine timbers on account of its inflammability and resulting evolution of SO<sub>2</sub>.

ALFRED L. KAMMERER

Density of wood substance, adsorption by wood and permeability of wood. ALFRED J. STAMM. *J. Phys. Chem.* 33, 398-414(1929).—The apparent d. of wood and its constituents is detd. by the pycnometer method using H<sub>2</sub>O, org. liquids and H<sub>2</sub>O solns. as displacing media and the "true" d. by using He in a gas displacement app. The size of the wood particles has no influence on their d. With org. liquids the apparent d. increases with increasing polarity of the liquids, whereas their ds., viscosities and compressibilities have apparently no effect. "True" ds., as obtained by the He displacement method for different species, heartwood only, are: Alaska cedar, 1.536; Sitka spruce, 1.522; western yellow pine, 1.520; yellow poplar, 1.508; red fir, 1.518; western red cedar, 1.503; redwood (extd.), 1.495; redwood (not extd.), 1.484. These values are smaller than those obtained in H<sub>2</sub>O and larger than those in org. liquids. The differences are due to either adsorption compression, as in the case of H<sub>2</sub>O, or a lack of complete penetration, as with C<sub>7</sub>H<sub>8</sub>. The adsorption compression for H<sub>2</sub>O on wood as calcd. from these differences is 433 atm.; hence the effective thickness of the adsorbed H<sub>2</sub>O film is 30 mol. layers or 9.2 mμ, and the total adsorbing surface per g. of wood 310,000 sq. cm. Microscopically only about 0.6% of this surface is visible (cf. C. A. 23, 1931). An increase of the temp. causes a decrease of the d. value, the cubical temp. coeff. being  $3.7 \times 10^{-4}$  per degree for Sitka spruce and practically equal for all species. Different species show differences in d. due to known variations in chem. compn., because the d. of both cotton and Cross-Bevan cellulose is higher and of lignin lower than that of the wood substance itself. H<sub>2</sub>O solns. cause a decrease of the wood d. with increasing concn. of the solute in a parabolic fashion; the depression is greater and different for electrolytes as compared with nonelectrolytes. Evidently this is a function of the total no. of ions plus undissoc. mols. The exceptionally great depression of KOH

is probably a result of its considerable positive adsorption, while the acids and salts show only a negligible negative or hydrolytic adsorption, resp. The decrease in the apparent d. of wood substance with increasing concn. seems to be caused by the decrease of surface adsorption compression and the decrease in penetration of the soln. into wood. In a similar way, the wood substance is less permeable to highly polarized org. liquids.

J. WIERTELAK

An unusual college monument (BONINE) 8.

**Cement.** AMME-LUTHER WERKE BRAUNSCHWEIG DER "MIAG" MÜHLENBAU- UND INDUSTRIE A.-G. Ger. 476,849, Jan. 28, 1927. Portland cement is colored by mixing and burning it with metallic oxides or salts. Cf. C. A. 22, 4756.

**Cement.** CARL PONTOPPIDAN. Fr. 653,695, May 2, 1928. See Brit. 293,035 (C. A. 23, 1489).

**Cement.** SOC. COMMERCIALE DES CEMENTS DE LA CROISSETTE. S. A. Swiss 131,050, Nov. 1, 1928. A hydraulic cement comprises portland cement (about 10%), slag (about 70%) and lime (about 30%).

**Aluminous cement.** ERNEST MARTIN. U. S. 1,716,527, June 11. Before an aluminous cement-forming mixt. is heated, it is incorporated with a catalyzer consisting of a small proportion at least of NaCl which facilitates the formation of hydraulic aluminates.

**Cellular concrete.** JOHN A. RICE (to Bubblestone Co.). U. S. 1,717,319, June 11. A slurry including foam is used such as may be prepd. from sand, cement and a Ca caseinate compn. and during the preliminary part of the setting period at least, the material is subjected to gas pressure which serves to regulate the size of the air cells in the product.

**Faced concrete units.** WILLIAM R. TUCKER. U. S. 1,716,094, June 4. The facing aggregate is partially submerged in water on the bottom of the mold, the water is allowed to freeze, the mold is filled with cold, dense, freshly mixed concrete, the ice is then melted and the resulting excess water is removed. Cf. C. A. 23, 2265.

**Apparatus for incorporating a foam with plastic materials such as concrete mixtures.** ERIC M. RICKARD and JOHN A. RICE (to Bubblestone Co.). U. S. 1,716,932, June 11.

**Artificial stone.** LUDWIG FIALA. Austrian 112,979, Dec. 15, 1928. The manuf. of artificial stone by pressing or molding a mixt. of blast-furnace slag and CaO is improved by correlating the addn. of water to the mixt. and the pressing or molding of the mixt. so that the slaking heat of the CaO is available during the hardening process.

**Artificial stone.** EMIL TELTSCHIK & Co. Ger. 475,859, Dec. 11, 1927. Articles having the appearance of petrified wood are prepd. from Mg cements with ground ivory nut, mixed with alk. or acid liquids, as filling material.

**Marble substitute.** KAREL ŠRÍCHA, JOHANN KNEIFL and JOSEF HURÁČEK. Swiss 130,650, Aug. 25, 1927. A marble-like surface is obtained by cold coating a smooth plate with a mixt. of Na<sub>2</sub>SO<sub>4</sub>, KCl, water glass, water and coloring matter, and polishing the surface of the layer when dry.

**Building material.** GUSTAVE F. JANLET and OSWALD PARDOEN. Fr. 651,770, May 5, 1928. Powd. asbestos is mixed with a mineral having a lamellar structure, stearin, vegetable gum and linseed oil. To prevent a too rapid hardening by the oxidation of the linseed oil, alc. or ether may be added.

**Porous building material.** GEORG O. RICHTER & SCHÄDEL. Fr. 654,765, May 3, 1928. Activated Al powder which liberates a gas in contact with water is used for making a porous building material.

**Plastic material for building purposes.** BAILEY F. WILLIAMSON (to Stone Homes Process, Inc.). U. S. 1,716,749, June 11. A material which, when set is capable of being sawed and of holding nails, comprises Florida shell rock contg. about 95% CaCl<sub>2</sub> crushed so that about 90% will pass through a screen of between a 1 in. and a 2 in. mesh, with a binder comprising 5-15% each of lime and hydraulic cement.

**Roofing and facing material.** FRANZ WINKLER. Austrian 113,143, Dec. 15, 1928. Material of the known kind prepd. by mixing clay or loam with asbestos fibers and water or waterglass is improved by combing while pasty so that the asbestos fibers lie in one direction.

**Treating sheet roofing material with molten asphalt.** AUGUST E. SCHUTTE (to Flint-Kote Co.). U. S. 1,715,392, June 4. The surface of the sheet material is scraped while immersed in a molten asphalt bath, to remove adhering gas bubbles. An app. is described.

**Floor covering.** KARL SCHNEBLE. Swiss 131,023, Oct. 6, 1927. Addn. to 128,176

(C. A. 23, 2265). Floors are covered by a plastic mass made by mixing cork, kieselguhr, cement and water.

Colored tiles. AMI RAY. U. S. 1,716,706, June 11. A sheet of ferrous metal is subjected, in a closed receptacle, to the action of gas from dry distn. of coal, coated with a water-insol. rust-proofing material such as asphalt and then treated with a finely ground mineral coloring material which is preheated to above the m. p. of the asphalt or like coating and is subjected to pressure to embed it in the asphalt coating with portions exposed to form a surface coloring.

Preservative for wood. GINO FRANCIOSI. Austrian 112,983, Dec. 15, 1928. A mixt. of a coal-tar oil with peat tar is used. Up to one-third of the peat tar may be replaced by lignite tar. The mixt. may be emulsified in an aq. soln. of  $\text{ZnCl}_2$ .

## 21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER

Notes on recent developments in fuel technology. R. WIGGINTON. *Fuel in Science and Practice* 8, 151-2, 201-3(1929).—Brief reviews of the following subjects: the Ruhr coking industry, the origin of petroleum, the W-Mo thermocouple, fuel in Japan, producer gas from waste wood, fluorescence of coals and oil shales.

D. A. REYNOLDS

Fuel tests and plant operation. M. DOLCH. *Proc. 2nd Intern. Conference Bituminous Coal* 2, 425-55(1928); cf. C. A. 23, 3325.—A moisture detn. is proposed, based upon the fact that coal mixed with abs. EtOH causes a change in concn. of the latter, and the amt. of  $\text{H}_2\text{O}$  taken up may be detd. quickly by a cryohydric method, noting the temp. at which a kerosene-EtOH soln. becomes turbid. The method takes 8 mins., as against 45 mins. for the xylene process and about 2 hrs. for the standard drying and weighing detn., and the accuracy attained is excellent. For coal analysis a method claimed to be superior to either the ordinary proximate or ultimate analysis is proposed. About 20 g. of sample, reduced to pea size, is placed in a special steel retort provided with an outlet or delivery tube and a tightly fitting cover carrying an inlet tube reaching to near the bottom of the retort. The retort is heated in a resistance furnace to  $105^\circ$  while N or  $\text{CO}_2$  is passed through it slowly;  $\text{H}_2\text{O}$  expelled is caught and weighed. The gas current is stopped and the temp. is then raised slowly to  $530^\circ$ , and the low-temp. or primary tar and the gas are collected. The distn. is continued to  $1000$ - $1100^\circ$  and the tar and gas are again collected and kept sep. from the above. From analyses of the products collected or from detns. in a calorimeter, their calorific values are calcd. This makes it possible to tell how much of the total heat comes from the gaseous, liquid (tar) and solid (coke) portions derived from the coal, a more valuable kind of information for the power or heating plant manager than results from ordinary analyses. Illustrative calcs. are given.

W. C. EBAUGH

Mining and fuel laboratories at Nottingham. W. H. McMILLAN. *Colliery Guardian* 138, 2201-3(1929).—Description of University College labs. E. J. C.

Fuel problems of the iron and steel industry. EDGAR C. EVANS. *Proc. 2nd Intern. Conference Bituminous Coal* 2, 633-56(1928); cf. C. A. 22, 2534, 2908.

W. C. EBAUGH

The use of methanol and ethanol as fuels in internal-combustion engines. M. LOUIS. *Chimie & Industrie Special No.*, 312-29(Feb., 1929).—Action of heat on the air-fuel mixts.—The formation of aldehydes below  $300^\circ$  is insignificant (not over 0.1%); the production of AcH increases very rapidly from  $400^\circ$  (1.5%) to  $440^\circ$  (8.9%), and much more slowly at higher temps. (10.8% at  $510^\circ$ ); there is a certain concordance between the reduction in the rate of formation of AcH and the production of AcOH, but the resp. amts. of aldehyde and acid show that the aldehyde is not oxidized quantitatively to acid. The curves of production of  $\text{CH}_2\text{O}$  and  $\text{HCOOH}$  show that MeOH is more resistant to the action of heat than EtOH. The curves obtained with EtOH or MeOH contg. 40%  $\text{H}_2\text{O}$  are similar to those of the anhyd. alcs., but the amts. of aldehydes, and especially of acids, are much smaller. The results of corrosion tests on the metals generally used in explosion engines (semi-hard steel, cast Fe, brass, Cu, cast bronze, cast phosphor bronze, Al, duralumin and Mg) are given in detail and lead to the following conclusions: The alcs. do not exhibit any specific corrosion of the metals at high temp., being similar to ordinary gasoline in this respect; acetic and formic acids and aldehydes in the amts. used (1%) cause no appreciable corrosion; as a rule, air alone is somewhat less corrosive than the air-alc. mixts., showing that there is not

only oxidation but also probably carburization; the mechanism of the attack varies with the different metals, and was shown fairly clearly from the photomicrographs (which are given). Corrosion tests in the cold (which are not yet completed) indicate that certain metals, particularly Mg and its alloys and Pb, are fairly rapidly attacked by MeOH, the action being apparently due to a reaction between the metal and MeOH, rather than to oxidation. Hence, while MeOH does not seem liable to corrode the engine parts in use, its storage in metal containers may cause trouble. A. P. C.

**Low-temperature carbonization.** DAVID BROWNLIE. *Petroleum Times* 21, 625-7 (1929).—A discussion of the more interesting retorting processes being used in Great Britain with a brief description of their chief features. M. B. HART

**A new method of low-temperature carbonization applicable to agglutinating coals.** CH. AB-DER-HALDEN. *Chimie & industrie Special No.*, 208-12 (Feb., 1929).—Coals having a very low softening or m. p. can be successfully carbonized without excessive power consumption or excessive production of dust (which would be entrained in the tar and from which it would be difficult to sep.) by first drying at about 200° and then rapidly heating above the softening point (about 500°), which requires that it be heated in thin layers (about 10 mm.). This contention is confirmed by the results of tests (which are given). A lab. retort for carbonizing in accordance with this principle is described, and a com. app. is now being perfected. A. PAPINEAU-COUTURE

**Present status of the technic of the low-temperature carbonization of coal and lignite.** CH. BERTHELOT. *Chimie & industrie Special No.*, 205-7 (Feb., 1929); cf. C. A. 23, 2267.—A brief discussion of the possibilities of utilization of the 3 products obtained by low-temp. carbonization: semi-coke, primary tar, gas. A. PAPINEAU-COUTURE

**Coal in 1927.** F. G. TRYON, O. E. KIESSLING AND L. MANN. *Bur. Mines, Mineral Resources of the U. S. 1927*, Pt. II, 327-509 (Preprint No. 27, published May 18, 1929). E. H.

**Analyses of West Virginia coals.** *Bur. Mines, Tech. Paper No. 405*, 343 pp. (1928). **Geology of coal formations in W. Va.** J. BRIAN EBY. *Ibid* 1-5.—W. Va. coal-bearing rocks belong to the Carboniferous system. The subdivision of the system into 3 series, 2 groups and 13 formations is shown in tabular form. Another table gives the names of the principal coal beds and their thickness. Production of bituminous coal in W. Va. has increased from 42,923,708 long tons in 1910 to 143,509,340 long tons in 1926. **Characteristics and distribution of coals.** J. W. PAUL. *Ibid* 6-8.—The characteristics of the coal from the different fields (Northern, Kanawha, New River, Pocahontas and Tug River, and Kanawha-Thacker districts), their special fields of usefulness, for gas or coke manuf., steam generation, or for domestic heating, and the principal markets to which the different fields ship most of their coal are stated. **Mining methods and transportation.** J. W. PAUL. *Ibid* 9-10. **Analyses of mine samples.** A. C. FIELDNER, H. M. COOPER AND F. D. OSGOOD. *Ibid* 11-191.—Proximate and ultimate analyses, the latter on (1) as received, (2) moisture-free and (3) moisture- and ash-free bases, the heating values in calories and in B. t. u., and when made, the softening temp. of the ash are tabulated by counties for about 3000 mine samples of typical W. Va. coals. Volatile matter runs from 30 to 46% in coals from the northern W. Va. fields, around 13 to 20% for the Southern coal beds; ash from 2.5 to 11% usually between 3 and 7%; B. t. u. per lb. coal from approx. 12,500 to 15,860; S from 0.5 to 5%, many samples below 1%; N 1 to 1.8%; H 4.4 to 5.1%; O 1.8 to 13.7% generally lower than 4%, but certain fields run 5 to 8% O. Fusibility of ash from W. Va. coals varies from the low fusing ash (2000° to 2200°F.) of Sewickly and Pittsburgh coals in the northern fields through medium fusible ash (2200-2600°F.) from Preston Co. coals to the refractory ash (2600° to 3000°F.) of the Pocahontas No. 3 coal. **Description of samples.** C. W. OWINGS AND J. N. GEYER. *Ibid* 192-271.—For some of the coal samples field notes describe the coal bed worked, its characteristics, places where the samples were taken and the general condition of mining; references state pages where analyses are given. **Analyses of delivered coal.** N. H. SNYDER. *Ibid* 272-319.—The relative value of analyses of "mine samples" and of "delivered samples," the methods of sampling in each case and interpretations of the analyses are discussed. Proximate analyses, individual and av., calorific values, date and place of delivery are tabulated for some 1700 items showing: (1) yearly av. analyses of samples representing coal delivered for Government use; analyses of samples collected by samplers from the Bureau of Mines; (2) as coal was being loaded into railroad cars at mine tipples, some washed coals included; (3) at tidewater shipping piers as coals were being loaded into vessels; (4) at the sampling plant of the Sewalls Point Coal Exchange (Inc.) at Sewall point, Va. W. W. HODGE

**The maceration method in the microscopic examination of coal.** H. BODE. *Berg-*

*Tech.* 21, 205(1928); *Fuel in Science & Practice* 8, 86-90(1929).—Maceration of bituminous coals is best effected by oxidation with Schulze's soln. ( $\text{KClO}_3$  in  $\text{HNO}_3$ ), and removal of the ulmic substances thus formed by soln. in  $\text{NH}_4\text{OH}$ . This treatment isolates the waxes, resins, fats, cutin and fusain of coal. Microscopic examn. of these residual substances enables the classification of the coal according to both rank and constitution.

D. A. REYNOLDS

Some aspects of the hydrogenation of coal. J. IVON GRAHAM. *Proc. 2nd Intern. Conference Bituminous Coal* 2, 456-84(1928).—A review, with special attention to work done at the Mining Research Lab., Univ. of Birmingham. "The extension of our knowledge of the action of H under high pressure upon coal, either with or without a catalyst, has . . . given justification for the optimistic view held by the supporters of this method of treatment in regard to the eventual com. success of the process. The surest way to realization of this lies . . . in the continuation of researches in which coal is not considered simply as a black mass contg. so much C, H, O, etc., but rather as a mixt. of mol. complexes, each of which will behave in a definite way when subjected to hydrogenation, distn. or oxidation."

W. C. EBAUGH

A new method for the direct determination of the best temperature of hydrogenation for bituminous coals. J. P. AREND. *Proc. 2nd Intern. Conference Bituminous Coal* 2, 485-90(1928).—Coal in powd. form has its expansion curve detd. by means of a sample 25 mm. high placed in a 15-mm. diam.  $\text{SiO}_2$  tube, heated in an elec. furnace, and connected with a lever multiplying device. The first deviation of the expansion curve indicates the first appreciable attack of hydrogenation. The mol. decompn. progresses, and at the temp. when the rate of expansion reaches its max., hydrogenation gives the greatest yields in oils and always the max. of light gasoline. Curves showing the total expansion and the expansion velocity are given. The very pronounced max. of the latter indicates the most intense moment of mol. decompn., and at the corresponding temp. the hydrogenation yields the max. of oils and light gasoline. After the temp. of the max. speed of decompn. has been passed, the light gasolines diminish quickly.

W. C. EBAUGH

Microscopical and chemical investigations of the banded coals of the Ruhr district. H. WINTER. *Glückauf* 64, 653-8(1928); cf. *C. A.* 22, 3973.—Previous work on the banded constituents of coal, their effects on coking properties, plant and other particles found in them and the differences between the English and German systems of naming the bands are briefly discussed. The microscopic appearances of the bands and the microscopically distinguishable entities as found in the vitrain, clarain, durain and fusain of five different types of coals, from high-volatile gas to lean, from the Ruhr district are described and illustrated with 35 photomicrographs. The % available H and the ratio of C to H in the vitrain, clarain, durain and fusain of the 5 coals are tabulated. Conclusions are that the dull coal does not always have a higher content of H and of available H than does the bright coal; the C:H ratio of the pure coal rises in each of the 4 visible constituents with increasing age of the coal, being, resp., for vitrain, clarain, durain and fusain, 16.4, 15.8, 18.8 and 26.3 for one of the gas coals and 22.7, 22.1, 23.2 and 31.7 for the bands in the lean coal. It is recommended that "Vitrain" be universally adopted in Germany to designate all the bright coal (Glanzkohle). The structure of vitrain arises from the embedding of plant residues in an at one time colloidal soln. of humic matter which later went through coagulation processes. The structure and origin of fusain can also be explained through gasification processes (swelling and coking) where the decompn. temp. was reached through the spontaneous heating in sep. places in the coal peat layers.

W. W. HODGE

Investigations on the coking qualities of the layer materials of bituminous banded coals of the Ruhr district. R. KATTWINKEL. *Glückauf* 64, 79-83(1928).—As a basis for later screening and flotation tests, many coking expts. were carried out with fat and gas coals from the Ruhr district. The appearances of the layers of vitrain, clarain, fusain and durain in the coals and seams from which they were obtained are described. Photomicrographs of the 4 constituents after being ground, their % moisture, volatile matter, coke, ash and sp. gr. are given. The gas coal supplied the durain; the fat coal furnished the vitrain, clarain and fusain. Crucible coking tests were made using synthetic mixts. of 2 constituents, viz., vitrain + fusain, 100% + 0%; 90% + 10%; 80% + 20% . . . . to 100% fusain. Similar series of tests were made using clarain + fusain, durain + fusain, vitrain + durain, clarain + durain, vitrain + clarain. Expts. were also performed to det. the differences in coking properties of the fines and the coarse particles of each of the 4 constituents, alone and in 10 and 20% mixts. Photo-illustrations show the great variations in appearances of all the coke buttons formed. The caking index nos. (*C. A.* 20, 1510, 3344) for the cokes are tabulated and results discussed.

Clarain had much less coking power than vitrain; hence clarain must be a transition material toward durain. Fusain and durain had practically no coking properties, but did not hinder the coking property in a mixt. with bright coal, unless present in amts. greater than 20%. Screen seprns. of the materials powd. for analyses gave 86% fines (dust) for fusain, and only 35% dust for the vitrain, clarain and durain. The coking power of the "dust" in the latter 3 portions of coals is markedly greater than that of the coarse particles, but with fusain the reverse holds true: the coarse particles are somewhat coking but the dust is totally devoid of this property. If 10 to 20% fusain dust is mixed with vitrain and clarain, a poor coke always results, especially so the larger the amt. of clarain present. Good coking coals consist chiefly of vitrain and a fusain content up to 20% has only slight effect on its coking property. A bibliography follows the article.

D. A. REYNOLDS

A new method for the determination of melting processes in ash. KARL BUNTE. *Proc. 2nd Intern. Conference Bituminous Coal* 2, 231-40(1928).—Ash is composed of (a) ash ingredients, rich in alkalies coming from vegetable matter forming the coal originally, (b) deposited ingredients, i. e., calcareous, siliceous and argillaceous substances, (c) infiltrated ash constituents, like carbonates, sulfates and  $\text{FeS}_2$  and (d) stony material. These 4 kinds of ash may have a completely different character, and it is not evident that the behavior of ash is characteristic for a certain coal bed or district. After burning coal carefully, one can recognize stones and slate distinct from dispersed ash. In prepg. samples grinding and mixing are used, increasing the probability that ash constituents may influence one another to a great extent, in comparison to technical firing. The melting process depends upon the surrounding atm. and oxidation conditions. Detg. ash fusions by the cone method is therefore of little value. A new method involves the use of a C-resistance furnace with a vertical tube into which is put a sample 25 mm. in diam. and height, with provision for regulated increase of temp. A mech recording device shows changes in vol. of the sample until it becomes 7 mm thick. Fusion curves so obtained are divisible into 3 groups, showing fundamentally different melting processes. Curves are given for different types of ash. In some ash samples halting points were shown to be due to secondary reactions of the constituents, especially the fusion of alk. from the org. part with the mineral substances present. Behavior of ash in practice corresponds with that indicated for it by the curve.

W. C. EBAUGH

Gas purification in relation to coal sulfur. F. W. SPERR, JR. *Proc. 2nd Intern Conference Bituminous Coal* 2, 37-64(1928).—Can coals of high-S content be used for gas-making without the necessity of washing them? By the use of liquid purification plants, e. g., Seaboard process of absorption of  $\text{H}_2\text{S}$  in 1-3%  $\text{Na}_2\text{CO}_3$  soln. and later regeneration of absorbent by blowing air through it, it is often possible to employ coal contg. more than 1.5% S for gas-making, rather than natural or prepd. coals contg. 1% or less. If high org. S (chiefly  $\text{CS}_2$  and  $\text{C}_2\text{H}_4\text{S}$ ) be present in gas, a S-recovery process employing Fe compds., Ni catalyst or "Thylox" may have to be used, or scrubbing with petroleum oil resorted to, as these methods are efficient not only for S purification, but also for other impurities like HCN, etc. A discussion of costs shows that even producer gas can sometimes be purified so as to make gas from high-S coal suitable for use in the glass, steel, refractories and other industries. In comparing the relative economies of removing S by coal washing or by the application of liquid purification to producer gas made from unwashed coal, the principal question is the efficiency of the coal-washing process. The latter will be much the cheaper where it can accomplish a reduction of the coal S to 1% or less. However, many coals cannot be washed with the necessary efficiency, and there are many cases where such coals can be obtained at a low enough cost to warrant their use for making producer gas from which  $\text{H}_2\text{S}$  is removed by liquid purification.

Carburetion of combustible gas with butane and propane-butane mixtures with particular reference to the carburetion of water gas. WILLIAM W. ODELL. *Bur. Mines, Bull.* 294, 94 pp. (1929).—See *C. A.* 22, 1034. E. C. M.

Blau gas. L. DAL PRATO. *Russ. min. met. ital.* 69, 24-7 (1929).—The manuf. of Blau gas is described, as are some of its industrial uses other than as a fuel, as in the production of synthetic EtOH ( $\text{CH}_2\text{Cl}$ )<sub>2</sub>, and other org. compds., through ethylene; and as a substitute for acetylene in metal cutting or welding processes. A. W. C.

Flue-gas losses. WILHELM GUMZ. *Feuerungstech.* 17, 109-12, 123-5 (1929).—The % of heat lost in the flue gas from coal may be represented within 0.5% by the formula:  $[0.0051 + (0.6281/C)]t$ , where  $C$  is the  $\text{CO}_2$  percentage in the flue gas by Orsat analysis, and  $t$  is the temp. difference between flue gas and air. Similar formulas apply to brown coal, but the consts. are affected by the water content. E. W. T.

Problems in natural gas research. N. A. SMITH AND E. L. RAWLINS. *Oil & Gas J.* 27, No. 51, 210, 213-4 (1929).—Several of the more important opportunities are outlined in which research should be carried out in the field of producing and utilizing natural gas, such as water encroachment, measuring, transmission leakage, more efficient utilization through manuf. of alcs. and other chemicals, liquefied gas and carbon black. In order to carry out such an extensive program in an efficient way, it is recommended that a large organization like the Natural Gas Division of the American Gas Assoc. direct the work. M. B. HART

Recoverable hydrocarbons from natural gas and their relation to the composition of commercial motor fuel. STEWART P. COLEMAN. *Trans. Am. Inst. Chem. Eng.* 20, 79-93 (1928).—All hydrocarbons higher than  $\text{C}_4\text{H}_{10}$  should be recovered as motor fuel. The proportion of  $\text{C}_4\text{H}_{10}$  recovered should depend upon compn. of the gas, relative value of  $\text{C}_4\text{H}_{10}$  as fuel gas or motor fuel, cost of recovery and relation between  $\text{C}_4\text{H}_{10}$  content of the final motor fuel blend and evapn. loss. E. M. SYMMES

Hydrogen sulfide. D. L. JACOBSON. *Oil & Gas J.* 27, No. 46, 116, 119, 122 (1929).—The removal of free  $\text{H}_2\text{S}$  from natural or refinery gases by the Koppers Co. Seaboard process brings them mostly within legal requirements for com. purposes. The troubles caused by this impurity in pipes, valves, engines and compressors are avoided by washing the gases with a weak soln. of  $\text{Na}_2\text{CO}_3$ , according to the Seaboard process. Other processes developed by this company for the recovery of S are much more expensive and not economical for natural gas or refinery gas. M. B. HART

New cracking method is perfected. J. A. YUNKER. *Oil & Gas J.* 27, No. 51, 111, 236, 238 (1929).—Natural gas is broken down completely into  $\text{H}_2$  and C black in a water-gas generator by blasting a coke bed to a temp. above that of the decompn. of  $\text{CH}_4$ . The air is then shut off and natural gas introduced instead of steam. Because of the increasing demand for  $\text{H}_2$  for  $\text{NH}_3$  synthesis, the process is believed valuable. M. B. HART

Cracking of tar acids from coal. JACQUES C. MORRELL AND GUSTAV EGLOFF. *Proc. 2nd Intern. Conference Bituminous Coal* 2, 580-613 (1928).—The sources, compn., methods of treatment and uses of tar acids are outlined, and data obtained from an extensive series of expts. upon such acids and their distn. products follow. W. C. E.

The reducing zone of normal flame. MARCEL PIETTE. *Acetylene J.* 30, 115-6 (1928).—Attention is called to the so-called gray zone, hitherto overlooked in the literature, between the inner cone and the outer envelope of the oxy-acetylene welding flame. This zone, contg. unburned CO and  $\text{H}_2$ , exists when speed of departure exceeds speed of combustion. It is never clearly outlined and disappears when  $\text{O}_2$  is in sufficient excess. It has marked reducing effects. F. S. GRANGER

Ultra-violet spectroscopy of the flames of motor fuels. IV. The practical utilization of a small quartz-prism spectrograph for the determination of lead tetraethyl in gasoline. G. L. CLARK AND H. A. SMITH. *J. Phys. Chem.* 33, 659-75 (1929); cf. *C. A.* 21, 2779.—The flexibility, accuracy and simplicity of a small quartz-prism spectrograph have been demonstrated, as applied to chem. and industrial problems, particularly the estn. of  $\text{PbEt}_4$  in gasoline and of its effect upon a detonation flame. A simple and inexpensive Hg arc and housing adapted for spectroscopic use, and a successful combined still burner for liquid fuels are described; they serve as permanent equipment for analyses of this type. In the system of analysis developed from the small spectra, 5 g. of Pb per 1,000,000 cc. of gasoline has been detected. From the standard spectra, made from solns. of known concn., it is possible to estimate larger quantities with a high degree of accuracy. Seventeen lines in the flame spectrum of Pb have been identified and measured; one additional emission line has been discovered in the flame spectrum of

Pb for the first time ( $\lambda$  2167). The band positions, structures and intensities have been compared for flames, under exactly the same conditions, of gasoline, gasoline plus ethylene bromide, gasoline plus  $\text{PbEt}_4$ , gasoline plus aniline, benzene, alc., acetone, ether and carburetted water gas in the cones of primary, secondary and tertiary combustion. Further evidence is obtained that the detonation suppressor action of  $\text{PbEt}_4$  is not due to this compd. as such but to the process of its decompn. and to the disintegration products.

A. WHITE

Improvements in sieves and dust removers. C. FÖRDERREUTHER. *Arch. Wärme-wirt.* 10, 213-7(1929).—In a discussion of the factors affecting the action of dust removers, F. suggests: an intimate mixt. of powd. coal and air in a burner may be secured by splitting the stream of powder and air, and directing the streams against each other in an enlarged space; dust could be better removed if inertia and gravitation could be made to assist each other; the removal of dust from a centrifugal separator could be accomplished by letting it pass through perforations in the wall, along with a little air. A few small-scale tests are described, and some suggested designs are shown.

Dry quenching plants for coke. R. W. MÜLLER. *Z. oesterr. Ver. Gas Wasserfuch.* 68, 221-3(1928).—The intensive development of processes for the dry quenching of coke and certain organizations which are promoting such processes, especially the licensing agreements of the firm of Sulzer, are mentioned. Outline elevation drawings, descriptions of construction and mechanisms used and methods of operation are given of dry quenching plants for 2 types of gas works: one with 10 vertical retorts producing 100 tons of coke per day, the other a battery of ovens with a daily capacity of 200 tons of coke. The hot coke is conveyed by car or travelling grab-bucket crane and emptied into a quenching chamber equipped with a quickly closing lid which is hermetically sealed by a water valve. Calcns are given for the steam generated with the heat saved by quenching coke in this manner. A no. of cities are named whose gas works have installed dry quenching units. For the Zurich Gas Works with a yearly production of 50,000 tons of coke, by adopting dry quenching of the coke an annual saving of 2200 tons of fuel is estd.

W. W. HODGE

Metallurgical coke, gas coke and semi-coke from coking coals. M. DOLCH AND E. RINDTORFF. *Glückauf* 64, 301-9(1928).—A searching investigation was made on the properties of cokes produced from coking coals by different processes. Kinds of cokes used were: 2 metallurgical, 1 gas (Frankfurt-West process) and 2 semi-cokes (made 1 each in K. S. G. and C. T. G. retorts). The mixts. of coals used in making the cokes, plants in which manufactured, analyses of the cokes for % moisture, ash, fixed C. and volatile matter, and heating value of each coke and of the pure coals from which each coke was derived are given. Volatile matters of the high-temp. cokes were 0.1, 0.2 and 0.4%; of the semi-cokes, 12.3 and 18.7%. Marked differences in the fuel properties of the cokes may be due to the % volatile matter, but that assumption would not always hold. Sep. portions of each coke were crushed, placed in a quartz tube, heated in an elec. furnace and the gases evolved collected in fractions: below 550°, to 750° to 950° to 1150-1200°. The app. is described with the aid of drawings (C. A. 22, 2047). The yields and analyses of each of the fractions of gases are tabulated; these are also shown graphically. Calcd. to 100 kg. coke the yields of gas in cu. m. and the proportion of the total heating value of the coke contained in the gas evolved were, resp., for 2 metallurgical cokes, 5660, 1.9; and 1620, 0.54; for the gas coke 4710, 1.5; and for 2 semi-cokes, 33,100, 19.0; 24,100, 11.8. Approx. 75% of the gases from the high-temp. cokes came off above 950° and were mostly H and CO; from the semi-cokes considerable gas was evolved below 750° and again above 950°, composed mainly of H, CO, and 10-11%  $\text{CH}_4$ . Heating values of the gases from the high-temp. cokes were: 2492, 2385 and 2414; from the semi-cokes 3875 and 3386 cal./cu. m. Tables of data and graphs show the relative reactivities of 4 of the cokes as detd. by their reduction at 800° of  $\text{CO}_2$  to CO: semi-coke 82.7, gas coke 68.9, metallurgical cokes (Stinnes) 60.6 and (Prosper) 45.3. The fineness of the cokes had a marked effect on their reactivity, and no definite relation was observed between a cokes reactivity and either the proportion of the total heating value of the coke contained in the gas evolved or its yield of gas. The apparent sp. gr. of the cokes varied from 0.83 to 0.87, but 7 photographs of cokes of natural size and 7 photomicrographs of cokes at low magnifications show decided differences in the cellular structure of the cokes. In further investigations on cokes the making of thin microscopic sections may yield valuable data as to the changes taking place during the coking processes.

**Liquid fuels from gases.** CURT EPNER. Fr. 654,449, May 19, 1928. Liquid motor fuels are obtained from  $\text{CH}_4$ ,  $\text{C}_2\text{H}_6$ ,  $\text{C}_4\text{H}_{10}$ , etc., coming from "cracking" operations, coke ovens, or low-temp. distn., by passing the gases through an a. c. field of high tension, and frequency above 500, preferably of the order of 10,000 periods at a temp. beyond the b. p. of the products obtained. The product may be fractionated, hydrogenated or polymerized. Cf. C. A. 23, 2020.

**Motor fuel.** SOC. INTERNATIONALE DES COMBUSTIBLES LIQUIDES. (Deutsche Bergin A.-G. für Köhle und Erdölchemie, applicants in Germany). Fr. 653,133, Apr. 20, 1928. Oils, particularly for motor fuel, are extd. by heating fecal matter and liquid manure under pressure in the presence of H and with the addn. of alk. oxide of Fe as a catalyst.

**Low-temperature distillation of fuel.** ADELSON ABRASSART. Fr. 653,932, May 7, 1928. See Brit. 290,205 (C. A. 23, 959).

**Destructive distillation.** METALLGES. A.-G. (Otto Hubmann, inventor). Ger. 476,318, Oct. 24, 1924. The fuel descends a shaft into which are introduced a heating gas for the distn. and a gas for cooling the coke produced. The gas inlets are arranged close together at a point within the shaft, and gas outlets are provided and operated so that the distn. gases and some of the cooling gas are withdrawn at the top of the

shaft, while the cooling gas is withdrawn for the most part from the side. The used cooling gas may be further heated and used for the distn.

**Fuel briquets.** STANLEY W. CARPENTER and GERALD N. WHITE. Ger. 476,971, Aug. 16, 1925. A binding material for fuel briquets is obtained by treating undecomposed vegetable matter with an aerobic fermentation and treating the resulting pectin compds. with the necessary amt. of alkali to form a colloidal soln.

**Briquets.** DEUTSCHE ERDÖL-A.-G. Ger. 475,864, Aug. 7, 1926. A method and app. for drying and cooling fuel briquets by one or more air currents are described.

**Briquetting fuels, ores, etc.** KOKS- UND HALBKOKS-BRIKETTIERUNGS, G. M. B. H. (Ludwig Weber, inventor.) Ger. 476,319, July 25, 1926. The binding agent is a mixt. of clay with decalcified and evapd. sulfite cellulose lye. It may be prepd. by mixing the constituents in water so that an emulsified product results, or alternatively the constituents may be mixed dry with the material to be briquetted and the mixt. kneaded in an atm. of steam. The pressed briquets may be rendered more resistant by heating in known manner.

**Berginization of carbonaceous material.** SOC. INTERNATIONALE DES COMBUSTIBLES LIQUIDES. (Deutsche Bergin A.-G. für Köhle und Erdölchemie, applicants in Germany.) Fr. 653,134, Apr. 20, 1928. Lignite, tars, etc., contg. water, are heated under pressure without elimination of water, with the addnl. oil necessary for berginization; the water is displaced and forms a layer which may be removed and the remaining paste is removed to a high-pressure vessel for treatment. Cf. C. A. 23, 690.

**Low-temperature carbonization.** I. G. FARBENIND. A.-G. Fr. 653,024, Apr. 19, 1928. Coal, particularly coal dust or in fine grains, is mixed with hydrocarbons or their derivs. or the hydrogenation products of coal, tar, mineral oils, etc., or the distn. or extrn. products of coal, and carbonized at a low temp. The carbonization may be carried out in the presence of a catalyst.

**Method and apparatus for compressing and then pulverizing bituminous raw materials.** OTTO SPRENGER PATENTVERWERTUNG JIROTKA. Swiss 130,654, Mar. 29, 1926. Details are given.

**Coal-distilling plant with inner heating.** METALLGESELLSCHAFT A.-G. Ger. 476,580, Oct. 25, 1925. Details of operation are given.

**Drying tubes for lignite.** BÜTTNER-WERKE A.-G. (Carl Ludwig and Fritz Zerres, inventors). Ger. 475,801, Aug. 4, 1927. The tubes are arranged in concentric layers round a central chamber and the heating gas circulates among the interstices of the tubes.

**Hydrocarbon derivatives.** I. G. FARBENIND. A.-G. Fr. 654,316, May 15, 1928. Oxygenated, sulfurized hydrocarbons are prepd. from the waste gases from the hydrogenation of coal, tars, mineral oils, etc., by carrying these gases with the addn. of O or S or compds. yielding them, preferably in the presence of catalysts, to a temp. not sufficiently high to cause decompn. of the  $\text{CH}_4$ . The products may be polymerized to compds. of high mol. wt. An example is given of the recovery by washing with benzene of the waste gases from the hydrogenation of coal and treatment thereof with  $\text{MnO}_2$  at  $700^\circ$ . The product contains higher fatty acids,  $\text{AcOH}$ ,  $\text{AcH}$  and various ketones, also propylene and butylene.  $\text{MnO}_2$  may be replaced by  $\text{ZnO}$  or  $\text{CaO}$ .

**Hydrocarbons and derivatives.** I. G. FARBENIND. A.-G. Fr. 654,534, May 22, 1928. Processes in which gases or vapors are directed on to solids for the production of hydrocarbons or their derivs. such as in the hydrogenation under pressure of coal, etc., or in the carbonization of bituminous substances, the gases or vapors are given a speed in the reaction chamber higher than they would have by simple passage through the chamber, either by imparting a pulsatory movement, or by leading back a part of the gas in the chamber in a closed cycle.

**Apparatus for the automatic removal of gases from wells.** AKTIEN-GESELLSCHAFT ADOLF GUGGENBUHL VORM. GUGGENBUHL & MÜLLER. Swiss 131,303, April 19, 1928.

**Gas purification.** HARALD NIELSEN and BRYAN LAING. Fr. 654,769, May 5, 1928. Dust particles are sep'd. from gas coming from the distn. of coal by spraying with tar or like liquid the walls of the usual cyclone or other dust separator.

**Treatment of coke-oven gases.** C. OTTO & CO., G. M. B. H. Ger. 476,226, Feb. 8, 1928. A part of the gases passing to the cooler is sprayed with water so that their temp. is reduced to  $150^\circ$ , and these gases are mixed with the unsprayed remainder so that the mixt. passing to the cooler has a temp. of  $200\text{--}300^\circ$ . In this way sufficient tar oil is pptd. in the conduit leading to the cooler to avoid incrustations of thick tar, while sufficient tar oil is left in the gases to avoid blockage of the cooler by  $\text{C}_{10}\text{H}_8$ .

**Coal gas.** GAS FÜR LINDE'S EISMASCHINEN A.-G. Ger. 476,844, May 23, 1927. Gases from the distn. of coal have the  $\text{NH}_3$ , N oxides and water vapor removed before

being sepd. by cooling to low temps., to avoid the formation of explosive or resinous compds. The sepg. app. is composed of Cu or Cu alloys coated with Sn.

**Gas from coal and oil.** WALTER E. TRENT (to Trent Process Corp.). U. S. 1,716,673, June 11. Comminuted coal and oil are formed into a bonded mass through which a plurality of passageways are provided and heated gases are directed through these passageways and against their walls to effect vaporization and gasification. An app. is described.

**Apparatus for producing oil gas.** FRANK T. NEWITT, SIMEON H. LAPLANT and LEWIS I. TURNER (to L. T. N. Mfg. & Development System). U. S. 1,715,775-6, June 4. Structural features.

**Mixed water gas and oil gas.** WILLIAM D. WILCOX. U. S. 1,716,676, June 11. Fuel in a generator is blasted with air admitted at an upper level of the generator and the blast gases are passed downwardly and into a regenerator which is heated by burning the blast gases in it; steam is passed into the base of the generator and up through the fuel bed for an interval to generate water gas and reduce the temp. of the blasted fuel, the resulting water gas is withdrawn from the upper end of the generator, and steam and oil are then admitted to the upper part of the regenerator and vaporized by passing downwardly through the regenerator; the heated steam and oil mixt. is then passed through the heated fuel in the generator to form mixed water gas and oil gas which are withdrawn from the upper part of the generator. An app. is described.

**Water gas and oil from oil shale.** AUGUST SCHILLING, RICHARD SACHSE, DIMITRI LIAMIN and THEOFIEL CALLAERT. U. S. 1,716,667, June 11. A confined body of shale is ignited at its upper surface, air for combustion is admitted above the ignited body and steam and combustion gases are drawn downwardly through the shale to produce water gas and hydrocarbon vapors; the water gas is employed to generate steam used in the process, hydrocarbons are condensed and recovered and the supply of air for combustion is automatically controlled in accord with the temp. of the water gas. An app. is described.

**Increasing the viscosity and lubricating power of oils.** I. G. FARHENIND. A.-G. Fr. 654,314, May 15, 1928. The viscosity of tar oils, mineral, vegetable or animal oils is increased and their lubricating power increased by the addn. of montan wax bleached by oxidation.

**Gas producers.** WALTER M. CROSS. Fr. 653,424, Apr. 25, 1928. See Brit. 289,491 (C. A. 23, 692).

**Gas producer for inferior quality fuel.** STETTINER CHAMOTTE-FABRIK A.-G. Fr. 654,345, May 15, 1928.

**Gas-producer construction for motor vehicles.** EARL N. PERCY. U. S. 1,716,084, June 4.

**Gas retort.** HEINRICH KOPPERS (to Koppers Development Corp.). U. S. 1,716,643, June 11.

**Vertical gas retorts.** INDUGAS INDUSTRIE & GASOFEN-BAUGES M. B. H. Fr. 654,369 and 654,370, May 16, 1928.

**Combined wet and dry closure for gas retorts or chambers.** INDUGAS IND. & GASOFEN-BAUGES M. B. H. Ger. 476,582, June 1, 1924.

**Chamber retort for producing gas and coke.** C. OTTO & Co., G. M. B. H. Ger. 476,512, Aug. 3, 1927. The method of operation is described.

**Method of filling a chamber furnace for the production of gas and coke.** C. OTTO & Co., G. M. B. H. Ger. 476,729, Nov. 10, 1927. Details of the method are given.

**Absorbing ammonia and hydrogen sulfide from gases.** I. G. FARHENIND. A.-G. (Christian Hansen, inventor.) Ger. 476,382, Jan. 9, 1927. See Can. 284,390 (C. A. 23, 691).

**Elimination of hydrogen sulfide from gases.** FRANZ FISCHER. Fr. 653,503, Apr. 27, 1928. See Brit. 289,885 (C. A. 23, 780).

**Desulfurizing gases.** I. G. FARHENIND. A.-G. (Gustav Wietzel, Josef Jannek, and Fritz Fried, inventors.) Ger. 476,286, Apr. 15, 1927. Gases contg. reducing constituents are freed from S compds. by mixing them with sufficient O to oxidize the S compds. and passing the mixt. over a catalyst comprising an alloy or compd. of an earth metal or heavy metal with a "metalloid" (other than O) of the 4th, 5th or 6th periodic group. An amt. of  $\text{NH}_3$  sufficient to combine with the  $\text{SO}_2$  or  $\text{SO}_3$  is supplied (if not already present) before or after the oxidation. Suitable catalysts are the carbides, silicides, nitrides, phosphides and sulfides of Fe, Ni, Co, Cu and Al, or alloys of these metals with Ti, Zr or Sb. Examples are given. A suitable catalyst can be prepd. also by impregnating coke with a concd. soln. of  $\text{Ni}(\text{NO}_3)_2$  and heating.

Apparatus for desulfurizing distillation gases. SOC. INTERNATIONALE DES PRO-  
CÉDÉS PRUDHOMME-HOUDRY. Fr. 654,240-1-2, Oct. 6, 1927.

Distillation of tar. THE BARRETT CO. Fr. 653,524, Apr. 27, 1928. See Brit.  
289,832 (C. A. 23, 961).

Apparatus for cooling coke. STEWART R. ILLINGWORTH (to Illingworth Car-  
bonization Co., Ltd.). U. S. 1,716,727, June 11. Structural features.

Charging coke ovens. C. OTTO & CO., G. M. B. H. Ger. 476,021, June 5, 1927.  
The coal is discharged from a wagon by a no. of worms, each communicating with a  
distributing tube, the tubes extending into the oven through holes in the top and being  
adapted to move to and fro. An indifferent gas, e. g., waste oven gases, is supplied  
under pressure to the distributing tubes during the charging.

Regenerative coke oven with horizontal flues. SEMET-SOLVAY CO. Ger. 476,020,  
June 19, 1925.

## 22.-PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

Petroleum in 1927. G. R. HOPKINS AND A. B. COONS. Bur. Mines, *Mineral  
Resources of the U. S. 1927*, Pt. II, 511-93 (preprint No. 28, published May 25, 1929).

Petroleum refineries in foreign countries, 1929. ANON. *Bur. Foreign & Domestic  
Commerce Trade Information Bull.* No. 623, 44 pp.(1929).

Petroleum as a raw material for chemistry and the chemical industries. I.  
PINEAU. *Chimie & industrie* Special No., 123-7 (Feb., 1929).—An address outlining the  
progress already made in the extn. of valuable products from petroleum and the work  
still to be done.

Discrepancies in calculating petroleum cargoes. W. MÖLLER-FERNAU. *Petro-  
leum Times* 21, 589-90(1929).—Various discrepancies in the system of calcg. petroleum  
cargoes are pointed out and the only correct figures for petroleum tables presented.

Hydrogenation of petroleum promises revolutionary development for American  
industry. S. D. KIRKPATRICK. *Chem. Met. Eng.* 36, 332-3(1929).

The fractional distillation of petroleum products. A. FICHOUX. *Chimie & in-  
dustrie* Special No., 234-51 (Feb., 1929).—A general description of the present status  
of the industry in those countries having a well-developed petroleum-refining industry,  
the progress of the last few years, and the present tendencies and possibilities of im-  
provement.

Theory of cracking petroleum. H. A. WILSON. *Proc. Roy. Soc. (London)* A124,  
16-45(1929).—Previous papers designated as EI and EII (cf. C. A. 22, 902 and 4335,  
resp.), give the foundation upon which a method is now constructed for calcg. the  
liquid, vapor, gas, gasoline and unsatd. fractions, which come out of the reaction cham-  
ber in a cracking operation. It is assumed (justified by agreement between calcd. and  
observed results) that the oil remains in the reaction chamber long enough for chem.  
equil. to be established. The theory has been developed only to include oils composed  
of paraffin and unsatd. hydrocarbons. It is assumed that no coke is formed, though  
the formation of a percentage of coke can easily be taken into account. The compn.  
of the oil entering the reaction chamber is represented by  $CH_{x_1}$ , in which  $x_1$  is the number  
of H atoms to one atom of C. The compn. of the liquid coming out of the chamber  
is represented by  $CH_{x'}$ , and that of the vapor by  $CH_{x''}$ . From the previous argument,  
in the vapor of a mixt. of unsatd. and paraffin hydrocarbons in equil., the molar quan-  
tities of the members of each homologous series present form a geometric series for  
which the ratio between successive terms is  $f$ . The wt. of oil coming out as liquid is  
represented by  $q$ . The molar fraction of the vapor which is composed of unsaturates  
is represented by  $y$ . EI gives charts from which can be obtained values of  $f$  for vapor  
and liquid at a given temp. and pressure. The value of  $y$  in both phases can then be  
calcd. from a formula worked out in EII. From  $f$  and  $y$ ,  $x$  for the vapor and  $x'$  for the  
liquid can be calcd.; and with  $x_1$ ,  $x$  and  $x'$  known,  $q$ , the fraction of liquid, may be  
found. The theory of chem. equil. is now shown to be the same for the mixt. of liquid  
hydrocarbons as shown by EI for the vapor. The percentages by wt. of the individual  
paraffins in the vapor of compn.  $CH_{x_1}$ , in which  $x$  varied from 2.2 to 2.8, were calcd.  
in EI. By the same formula the percentages of all the hydrocarbons in the liquid

have now been calcd. for values of C from 1 to 15 and of  $x$ , 2.05, 2.10 and 2.15. The "gasoline" fraction is the sum of the percentages of compds. from  $C_5$  to  $C_{12}$  plus enough  $C_3H_8$  and  $C_4H_{10}$  to give a mixt., the vapor pressure of which is equal to 1 atm. at 104° F. The remainder of the 4 lightest hydrocarbons constitutes the "gas" in the liquid. Percentages of gasoline and gas in vapor and in liquid were tabulated for pressures of 7.5, 15, 30 and 60 atm. and for temps. from 750° to 1050° F. After applying a correction for unsaturates in the gasoline and gas, a table of 16 sections was compiled, giving the calcd. fractions of liquid, gasoline, gas and unsaturates from 4 hypothetical oils cracked at 4 different pressures and at from 6 to 9 different temps. The 4 oils correspond in compn. roughly to heavy crude or fuel oil, crude oil, gas oil and kerosene. In liquid-phase cracking the ratio of gasoline to gas is between 7 and 3 and increases with the pressure. The calcd. value of the unsatd. fraction increases with the temp. rapidly and decreases with the pressure. In vapor-phase cracking the theoretical yield of the unsatd. fraction when the oil is just vaporized is: from oil  $CH_{2.25}$ , 17%; oil  $CH_{2.2}$ , 26%; oil  $CH_{2.15}$ , 32%; oil  $CH_{2.1}$ , 39%; it is nearly independent of the pressure. At higher temps. it theoretically approaches values of 39, 41, 43 and 46% from oils of the same compn. The effect of coke formation upon the compn. of the oil produced and upon equil., the time necessary for the oil to remain in the reaction chamber, and the influence of returning the formed gas to the oil are discussed. EMMA E. CRANDAL

**Some aspects of cracking.** A. E. DUNSTAN AND R. PITKETHLY. *Ind. Eng. Chem.* 21, 643-7(1929).—The formation of coke in cracking is minimized in an invention described by which the oil is kept in highly turbulent motion by surges rapidly imparted to it by a pump as it moves through the heating coil. Liquid-phase cracking may be regarded as the means of quantity production; cracking in the vapor phase yields the material for blending to produce a high-antiknock motor fuel. A lab. app. for observing directly what takes place in cracking has been devised. EMMA E. CRANDAL

**Cracking plant.** P. TRUSDELL. *Natl. Petroleum News* 21, No. 14, 73-6(1929).—The tube and tank units of the S. O. Co. (Ohio) run 1500 hrs. without a shutdown because of the use of 3 soaking drums used in rotation. When coke becomes troublesome, a drum is disconnected and cleaned. The fact that no repairs have been made on tubes or furnace is ascribed to the low temp. in the combustion chambers (max. 1300°F.). Three products are made: (1) gasoline, with a yield of 62% on the gas oil charged, which needs only a caustic-soda wash for finishing and has a very low gum test (5 mg. per 100 cc.) and high antiknock quality; (2) furnace distillate, which is between a heavy kerosene and a light gas oil; and (3) a viscous fuel oil of 6 A. P. I. gravity. The yield of gasoline can be increased by recycling the second cut.

M. B. HART

**Patent protection and cracking industry development in Germany.** HANS MAGNUS. *Erdöl u. Teer* 5, 207-8(1929).—A review.

F. S. GRANGER

**Cracking in the vapor phase.** N. F. SEDUIKH. *Neftyanoe Khozaystvo* 15, 677-91 (1928).—A complete review of American methods; a number of references are given.

A. A. BOEHLINGK

**Modern liquid-phase cracking plant has become a whole refinery.** G. C. HARGROVE. *Natl. Petroleum News* 21, No. 18, 76, 78(1929).—Liquid-phase cracking has been developed so that units built by the M. W. Kellogg Co. using a standard Cross hot-oil recirculating cracking plant for direct charge or together with a high-pressure pipe still can handle every type of cracking stock and also use crude oils with normal gasoline content, producing straight-run gasoline, kerosene and cracked gasoline in one continuous operation. The most recent development is a non-residuum operation, which will give an increased yield from practically any liquid cracking stock.

M. B. HART

**Design new type of refinery still.** L. DE FLOREZ. *Oil & Gas J.* 27, No. 50, 154, 162, 164-5, 169(1929).—An outline of general still construction with regard to heat utilization is followed by a description of a vertical tube still in which the combustion flame heats first a series of tubes by radiation and then another series by convection. The heat is more evenly distributed and the burning of tubes through excessive local heating is avoided. The air-fuel mixt. can be adjusted to the theoretical proportion necessary for complete combustion.

M. B. HART

**The refining of light oil with silica gel at Rochester, N. Y.** RUFUS E. FULREADER. *Ind. Eng. Chem.* 21, 691-3(1929).—Light oil from the manuf. of coal gas and water gas at Rochester, N. Y. is freed from gumming and S compds. by percolating upward through silica gel after removing whatever  $H_2O$  is present by means of a min. of  $H_2SO_4$ . The process is made continuous by the use of two percolators in turn. The spent gel is reactivated by gas heat and superheated steam.

EMMA E. CRANDAL

**The distillation of Esthonian oil shales.** ANON. *Petroleum Times* 21, 665-6 (1929).—A shale distn. method developed by Kulshinsky, Technical Director of Eesti Kivioli, Ltd., consists in placing oil shale in small wagonettes which are passed through a tunnel oven. Oil gases generated in the tunnel are sucked back through the shale whereby distn. is effected. Permanent gases are burnt in the furnace of the oven.

M. B. HART

**Chemical composition of crude oils.** A. N. SAKHANOV AND R. A. VIRABYANTZ *Neftyanoe Khozyaistvo* 15, 316-38(1928); cf. *C. A.* 23, 507.—A critical review is given of methods for the detn. of unsatd., aromatic, naphthene and paraffin hydrocarbons in gasoline and kerosene fractions of crude oil.

A. A. BOEHLINGK

**Refining crude oil from Dundee sand.** W. F. FARAGHER AND J. C. MORRELL. *Oil & Gas J.* 27, No. 49, 108, 110, 113, 116, 121(1929).—The difficulty of refining Dundee crude oil in a profitable manner led to the development of a method which produces a satisfactory motor fuel by blending the straight-run light naphtha with the cracked gasoline made from the topped crude oil or from the reduced crude oil. The cracking process also makes possible a complete utilization of the hitherto unprofitable crude oil. Numerous distn. tests of crude oil and distillates are reported.

M. B. HART

**Propylene from crude oil.** A. DOBRYANSKII, B. ARKHANGELSKII AND R. STEPAN YAN. *Neftyanoe Khozyaistvo* 15, 46-52(1928).—Cuts from gasoline (148-156°), kerosene (198-202°), solar oil (initial b. p. 305°), spindle oil (initial b. p. 350°) and cylinder oil (initial b. p. 500°) were cracked by passing 100 g. at a rate of 0.31 g. per min. through a Cu tube heated to 550-750°. The gas was collected over H<sub>2</sub>O and analyzed. Solar oil gave the highest yield of C<sub>3</sub>H<sub>6</sub> (about 13 g.), the optimum temp. being 600-650°. The C<sub>3</sub>H<sub>6</sub> is decomposed at higher temp., increasing the C<sub>2</sub>H<sub>4</sub> formation. The yield of C<sub>3</sub>H<sub>6</sub> could not be increased by using Ni or Fe as catalysts but Cu acted favorably. The gasoline cut (250 g.) was passed 5 times in succession through the heated tube, giving 23 g. of C<sub>3</sub>H<sub>6</sub> at 550°. The highest yield was obtained in the third cycle.

A. A. BOEHLINGK

**Absorption oils in plant operation.** A. J. HUTCHINSON. *Oil & Gas J.* 27, No. 51, 208, 214(1929).—Vapor pressure calcns. show that light oils are best suited for absorbing media in gasoline-absorption plants. Fractionating columns are necessary to prevent part of the absorbing oil from distg. over with the gasoline. Some plants now use oil of 325°F. initial b. p. and 425°F. end point.

M. B. HART

**Oil-field emulsions. III.** L. C. UREN. *Natl. Petroleum News* 21, No. 20, 61-2, 64-6, 68(1929); cf. *C. A.* 23, 3336.—A discussion of methods and equipment used in breaking crude-oil emulsions, including gravity settling, heat treatment, elec. treatment, chem. treatment, centrifugal process and filtration methods.

M. B. H.

**Specification fuel oil produced from heavy cracked residuum.** R. T. GOODWIN. *Natl. Petroleum News* 21, No. 20, 80-1, 83-5(1929).—The Goodwin process of stabilizing cracked fuel oil produces Bunker oil and a carbonaceous residue, which can be used as a briquet binder or refinery fuel. Spent H<sub>2</sub>SO<sub>4</sub> or acid oil is added to the partly cooled oil in accurately measured quantity and under carefully regulated conditions. The thoroughly agitated mixt. passes into a Dorr flocculator, and then into a Dorr thickener from which Bunker C fuel or a better grade is obtained as overflow, while the sediment is removed by a pump. By filtering the latter through a Dorrco continuous vacuum filter, half of the stabilized oil in this slurry may be recovered.

M. B. HART

**Fuel oil from Dubbs units.** W. T. ZIEGENHAIN. *Oil & Gas J.* 27, No. 47, 130 (1929).—The White Star Refining Co. runs hot residuum from its Dubbs units to 3 vertical 10' × 20' settling tanks in which C settles; the clear oil is drawn off and marketed as fuel oil. The C residue is ground and fed by gravity to burners.

M. B. H.

**Mazout distillation in Germany and a new process developed by the Azneft for extracting oil out of heavy bottoms.** K. V. KOSTRIN. *Neftyanoe Khozyaistvo* 15, 658-63(1928).—A Baku-Sabunchi mazout vacuum-distd. (80% vacuum) in batch stills gave the following fractions: gas oil (distd. off separately), 17.7%; heavv solar oil, 18.3%; machine oil distillate, 25.2%; cylinder oil distillate, 4.4%; "redistillate," 3.4%; bottoms, 29.0%; and loss, 2%. The fractions were collected separately. The redistillate was then redistd. under vacuum, whereby up to 25% of H<sub>2</sub>O was sep'd. (all H<sub>2</sub>O from the steam used in the vacuum distn. of the above fraction is collected in the redistillate, the other fractions being free from H<sub>2</sub>O), and the following oil fractions were recovered: 74.8% of solar oil, 9.3% of spindle oil, 10.1% of machine oil, 3.9% of residue, the loss amounting to 1.9%. The f. p. of the machine oil is -6° to -7° as compared with -15° for the same oil distd. at Baku; this difference is due, as shown by expts., to the small quantity of steam used in the distn. in Germany as against 50% and more used in Baku. The following process was then worked out in Baku: Heavy

lubricating-oil bottoms were mixed with solar oil (1:1) and the mixt. was distd., giving 22.4% of machine-oil distillate and 43.3% of residue, the distillate having a sp. gr. of 0.9145, a viscosity of  $E_{60}$  6.86, and a flash (Brenken) of 209°. Three % of  $H_2SO_4$  was needed for the treating process to produce a good quality of machine oil. The solar oil acts evidently as a carrier for the heavy oil contained in the bottoms.

A. A. BOEHTLINGK

**Products of decomposition in the distillation of mazout.** S. A. VISHETRAVSKII. *Neftyanoe Khozyaistvo* 14, 769-71(1928).—Some cracked oils are obtained on distg. mazout in vacuum stills, more in the first and last stills than in the intermediate ones; this is due to overheating the oil. The following remedies are recommended: the use of more steam, which acts as a vapor carrier, to keep down the oil temp., or the atomization of the oil in the stills, whereby the oil, due to thin layers present, is not so likely to be overheated.

A. A. BOEHTLINGK

**The rotary dispersion of mineral oils of various origins.** EDMOND VELLINGER. *Chimie & industrie Special No.*, 268-70(Feb., 1929).—The rotary dispersion of mineral oils varies with both their origin and treatment. When an active oil is distd. in a cathodic vacuum, the dispersion of the fractions increases with the distn. temp. When the values of the rotary power of the fractions are plotted on a Darms diagram, the straight lines obtained for some oils converge to a common pt. of intersection, showing that the oil contains two active compds., one of which is *l*-rotatory; the proportions of the two compds. vary with the distn. temp. When the straight lines do not converge to a common pt., the oil probably contains more than 2 active compds. with different dispersions.

A. PAPINEAU-COUTURE

**The chemical refining of mineral oils.** G. HUGEL AND M. STONESCU. *Chimie & industrie Special No.*, 302-4(Feb., 1929).—The action of concd.  $H_2SO_4$  varies according to the nature of the asphalt: soft asphalt is dissolved by  $H_2SO_4$  or conversely it causes the  $H_2SO_4$  to dissolve in the oil; slow chem. reactions which change the properties of the asphalt ensue. Hard asphalt is flocculated by concd.  $H_2SO_4$ ; this reaction is irreversible, as is shown by the fact that the asphalt has lost the power to form a colloidal soln. with the oil. In addn. to this flocculation there are chem. reactions, particularly oxidation reactions; the liberation of  $SO_2$  is much greater from hard asphalt solns. than from soft asphalt solns.

A. PAPINEAU-COUTURE

**Mineral oil and graphite lubricate press fits.** N. L. REA. *Power* 69, 782(1929).—Use of lard oil for pressing shafts into couplings or rotors results in rusting. Pure mineral oil plus graphite give good results.

D. B. DILL

**Predicting viscosity of lubricating oil blends.** O. G. WILSON, JR. *Natl. Petroleum News* 21, No. 21, 87-9, 91-2(1929).—The viscosities of all 3 possible binary combinations of high- and low-viscosity paraffin and naphthene oils were studied; formulas and charts are presented for the calcn. of the viscosities for blends of each type. M. B. H.

**Trend toward higher viscosity oils for motors not justified.** CH. MCLEAN. *Oil & Gas. J.* 27, No. 51, 206, 232, 235(1929).—The tendency to use higher viscosity motor oils is not justified and is caused only by sales competition. Oil of very high viscosity causes considerable loss of power and may even cause wear of tight-fitting bearings due to its inability to penetrate to the bearing surfaces. Present motor construction favoring seven-bearing crankshafts does not require such a heavy oil as that using three-bearing crankshafts. Crankshaft ventilation decreases diln. of the oil. M. B. HART

**West Texas may furnish important lubricating oil raw material.** P. TRUESDELL. *Natl. Petroleum News* 21, No. 19, 69, 71-2(1929).—Lubricating oils of high viscosity at high temps. can be manufactured cheaply from crude oil produced in Pecos County, West Texas. This crude oil contains no wax but has many characteristics of a paraffin-base crude. The gasoline produced by direct distn. has a high antiknock value (equiv. to 47% of benzene in mixt. with Pennsylvania straight-run gasoline). The crude oil is practically free from salt and completely free from  $CaCl_2$  or  $MgCl_2$ . Most of the S is present in a rather stable form.

M. B. HART

**Analysis of lubricating oils by distillation in cathodic vacuum.** P. ISELTIN. *Chimie & industrie Special No.*, 265-7(Feb., 1929).—I. suggests that a distn. test in cathodic vacuum be applied to lubricating oils as ordinary distn. is used for many petroleum products. The app. used consists of an Engler flask with condenser, a receptacle provided with a distributing valve so that the fractions can be received in 6 small beakers, and a Hg-vapor pump giving a vacuum of 0.001 mm. Means were subsequently added for passing into the oil a current of an inert gas (preferably H) to insure agitation and uniform distn. The amt. of gas introduced may be regulated so that the abs. pressure beyond the receiver does not exceed a few tenths of a mm. An experienced operator can carry out only 2 distns. a day, but the method could probably be developed for

technical control. It can readily distinguish between different types of oils, such as transformer oils, machine oils, crankcase oils and cylinder oils. The method is described in detail. A. PAPINEAU-COUTURE

The care of switch oil. W. E. WARNER. *Power Plant Eng.* 33, 473 (1929).—Decomposition which takes place in service with the liberation of C and H requires that a very highly refined mineral oil with high dielectric strength, high specific resistance and low sludging value be used. Switch oil should be inspected frequently and, if traces of  $H_2O$  or C are present, the oil should be treated for their removal. D. K. FRENCH

New reconditioning apparatus for transformer and switch oil. F. RUEDEBERG. *AEG Progress* 5, 129-32 (1929).—Portable oil-reconditioning plant, types KEF 10 and KEF 50 of AEG are described. Schematic layout and working diagrams are given. E. I. S.

Investigation of cooling oils in making gears. A. WALLICHS AND K. KREKELER. *Z. Ver. deut. Ing.* 73, 643-7 (1929). A. WHITE

Insulating oils. N. A. BUTKOV. *Izvestiya Teplotekh. Inst. (Trans. Thermo-Tech. Inst.)* (Russia) 1928, No. 6, 3-6.—See C. A. 23, 966. A. A. BOEHLINGK

Transformer insulating materials. W. HAMMERSCHMIDT. *Z. angew. Chem.* 42, 523-5 (1929).—Properties of colophonium, rosin-oil and American asphalt, and of mixtures made from them, were studied and results plotted on 3-coördinate system. Graphs are given for the relative insulating power, dropping (softening) point and acid number of such mixtures. The influence of the rosin oil on such substances is marked. W. C. E.

Testing transmission grease. E. N. KLEMGARD. *Petroleum Age* 23, No. 5, 30-1, 75-7, 79 (1929).—Methods are indicated for determining the consistency of transmission greases. Factors bearing on the consistency of greases and the nature of differences between transmission grease and transmission oil are pointed out. Testing apparatus is shown and described. M. B. HART

Control gasoline and fuel oil quality in cokeless cracking process. P. TRUESDELL. *Natl. Petroleum News* 21, No. 18, 69-70, 72-3 (1929).—A new cracking plant of the Gulf Refining Co. at Bayonne, N. J. uses the principle of heating by radiation according to the de Florez method. No coke is formed; cracking can be conducted to yield products of vapor-phase or liquid-phase type; and the quality and characteristics of the products can be changed by varying temperatures and pressures. Any type of charging stock can be used. M. B. HART

Determination of unsaturated and aromatic hydrocarbons in light oils and motor spirits. ALEX. B. MANNING. *J. Chem. Soc.* 1929, 1014-20.—The percentage of aromatic hydrocarbons in light oil or motor spirits containing no unsaturated hydrocarbons may be determined by vaporizing the sample completely at atmospheric temperature in a U-tube and drawing the vapor into a potash bulb filled with 98%  $H_2SO_4$  containing 2 or 3% of  $Ag_2SO_4$ . When unsaturated hydrocarbons are present, the aromatic and unsaturated hydrocarbons are both absorbed in a nitrating mixture consisting of 98%  $H_2SO_4$  containing 10% of  $HNO_3$  or 16% of  $KNO_3$ . The tube is weighed and nitration is completed by heating 2-3 hours on the water bath. The nitroaromatic hydrocarbons are extracted with 10% NaOH solution and the corresponding percentage of aromatic hydrocarbons calculated by a factor, which is an average for  $C_6H_6$ ,  $C_7H_8$  and  $C_8H_{10}$ . Unsaturated hydrocarbons are found by difference. In both methods a correction must be applied for paraffins absorbed by the acid. EMMA F. CRANDALL

Determination of unsaturated and aromatic hydrocarbons in gasoline. S. S. NAMEYKIN AND E. A. ROBINSON. *Neftyanoe Khozyaistvo* 14, 775-9 (1929).—All unsaturated hydrocarbons are removed from gasoline when it is treated with 98%  $H_2SO_4$  at 0° for 30 minutes. This was proved by detours of the I number and the O number. Aromatic hydrocarbons are only partly removed at the above temperature when treating with 97-97.5%  $H_2SO_4$ ; the extent of the removal depending on the character of the aromatic hydrocarbons; it is lowest for benzene, which is followed by toluene and xylene. A. A. BOEHLINGK

Vapor pressure data on motor gasoline. OSCAR C. BRIDGEMAN, ELIZABETH W. ALDRICH AND HOBART S. WHITE. *J. Soc. Automotive Eng.* 24, 488-97 (1929).—A method and apparatus are described for removing dissolved gases from dried gasolines without apparently affecting the  $C_4H_{10}$  content and otherwise changing their composition. Vapor-pressure measurements, using a small bubble of vapor, were made on 10 motor gasolines over a considerable temperature range. The normal bubble points of the gasolines are the same as the 10% A. S. T. M. temperature (corrected for loss). Initial liquid temperatures in the A. S. T. M. distillation were also found to be equivalent to the 10% A. S. T. M. vapor temperatures and to the normal bubble points obtained from the vapor-pressure data. M. B. H.

Studies on the inflammability of hydrocarbons. A. JEUFRÖY. *Chimie & industrie* Special No., 271 (Feb., 1929).—Sheet metal (Fe or Ni) 0.5 or 1 mm. thick and 45 mm. X 140 mm. was heated electrically, the temperature being measured by an Fe-constantan thermo-

couple soldered to the metal. The temps. to which the metal had to be heated to cause ignition of drops of various liquids were as follows:  $C_6H_6$ , 760°;  $C_7H_8$ , 765°; EtOH, 690°; light tar distillate, 650°; cyclohexane, 607°; Roumanian aviation gasoline, 585°;  $C_8H_{18}$ , 585°;  $C_{10}H_{22}$ , 585°;  $C_7H_{16}$ , 570°; gasoline from shale oil, 560°; green mineral oil, 525°; yellow mineral oil, 505°; and dimethylcyclohexene, 445°. The same ignition temps. were obtained by vaporizing the liquids and passing the vapors over the heated metal.

A. PAPINEAU-COUTURE

**Antiknock ratings of pure hydrocarbons.** S. F. BIRCH AND R. STANSFIELD. *Nature* 123, 639(1929).—Nash and Howes (*C. A.* 23, 3337), thought that a discrepancy between their antiknock rating of trimethylethylene and diamylene and that of B. and S. (*C. A.* 23, 2813) was explained by the fact that the figures in the one case represented the effect of 20% concn. by vol., in the other, 20% by wt. This was disproved by B. and S., as well as the suggestion that they had not taken sufficient precaution to prevent the difference in volatility between the 2 hydrocarbons from influencing their results through the air-fuel ratio. Both parties favor the use of a common supply of the hydrocarbons to be tested.

EMMA E. CRANDAL

**Treatment and utilization of liquid [petroleum] fuels.** AUFHÄUSER. *Z. Ver. deut. Ing.* 73, 651-2(1929).

A. WHITE

**U. S. motor fuel specifications.** P. TRUESDELL. *Natl. Petroleum News* 21, No. 13, 64(1929).—The wide difference of operating conditions for motor fuels requires an elastic specification in order to insure easy starting and to prevent vapor lock. This is possible by omitting the lower temp. limit for the 10% point, leaving the Government the right to set a lower limit on special orders. Since, according to general opinion the 10% point governs both vapor lock and easy starting, a further step is suggested by fixing the upper limit for the 10% point. For the rare cases where a gasoline of such specifications would not serve the purpose, domestic aviation gasoline can be used. Troubles arising from state specifications for winter gasoline are pointed out.

M. B. HART

**U. S. motor specifications.** H. C. DICKINSON. *Natl. Petroleum News* 21, No. 13, 65(1929).—A change in the specifications for U. S. motor fuel is necessary on account of a better knowledge of the properties required. The proposed new specification with a lower limit on the 10% point in order to prevent vapor lock represents closely the av. of gasolines of highest volatility listed in the last Bureau of Mines survey and excludes no acceptable com. product. An optional raising of the lower limit will meet the special requirements.

M. B. HART

**Determining value of pipe coatings.** K. H. LOGAN. *Oil & Gas J.* 27, No. 50, 33, 87, 90, 94(1929).—Accelerated tests for pipe coatings as conducted by the Bur. of Standards consist in exposing the central portion of the coated pipe to moist soil and measuring from time to time with a microammeter the current produced by a dry cell. The resistance of the coating is then computed.

M. B. HART

**Carbon black.** ANON. *Refiner Natural Gasoline Mfr.* 8, No. 2, 87 (1929).—The General Atlas Chemical Co. produces "Gastex," a carbon black, by a smokeless process from sulfurous natural gas. "Gastex" has but 50% of the color of carbon black produced by the channel process; apparent density, 0.384; actual sp. gr., 1.82; ash, 0.08%; moisture, 0.1-0.3%; and acetone ext., 0.2-0.6%.

M. B. HART

**Fire protection by inert gases.** L. C. UREN. *Natl. Petroleum News* 21, No. 17, 59-60, 63(1929).—Practical tests have proved that the fire hazard in oil reservoirs is considerably reduced by keeping the vapor space constantly filled with scrubbed boiler-flue gas, which is supplied at a pressure slightly above atm. The excess gas escapes through standpipes of the reservoir. Explosions are possible only if the tank atm. contains less than 10% of flue gas.

M. B. HART

**Ceresin.** EWALD A. ALTMANN. *Chem.-tech. Ind.* 29, 337-9(1928).—This is a short description of the various products usually sold under the name of ceresin.

A. L. H.

**Emulsified asphalts (asphalt emulsions).** EDGAR S. ROSS. *J. Soc. Chem. Ind.* 48, 112-4T(1929).—A complete review.

A. J. MONACK

**Report on asphalts in south central part of Department of Boyaca.** E. GROSSE. *Bol. minas y petroleos* (Bogota) 1, 99-113(1929).—Petroleum asphalt deposit located at Boyaca, Macheta, Tuta, Paipa, Pesca, La Puerta, Sogamoso, Topaga, Corrales and San Francisco mine are described individually. They are regarded as oxidized petroleum.

E. I. S.

**Modern wood distillation.** M. M. QUINN. *Chem. Markets* 24, 594-6(1929).

BAILEY, I. W., AND SPOEHR, H.: *Role of Research in the Development of Forestry in North America*. New York: The Macmillan Co. 118 pp. \$1.50.

*Standard Methods of Testing Petroleum and Its Products*. 2nd ed. London Inst. of Petroleum Technologists. 7s. 6d. net.

*Purification of petroleum, etc.* REFINERS, LTD. Fr. 653,833, May 3, 1928. See Can. 284,602 (C. A. 23, 970).

*Distilling petroleum, tar, oils, etc.* OTTO ELSTERMANN and ANTON BAUMHÖR. Fr. 654,054, May 10, 1928. A construction of distg. plant having distn. chambers superimposed in a column is described.

*Converting petroleum oils.* WALTER M. CROSS (to Gasoline Products Co.). U. S. 1,717,007, June 11. Oil is heated in a coil and then collected in a larger mass while under pressure sufficient to maintain the oil in liquid phase; a combustion-supporting gas such as air or O is added to the body of oil to raise its temp. above that of the oil in the heating coil. App. is described. Cf. C. A. 23, 968.

*Cracking petroleum oil.* CARBON P. DUBBS (to Universal Oil Products Co.). U. S. 1,716,306, June 4. After introducing oil to a still, a portion of the oil is passed to succeeding stills, the temp. of which is progressively higher; vapors from each still are independently discharged to a reflux condenser and reflux condensates produced in one still are passed directly to a succeeding still of higher temp. An arrangement of app. is described. Cf. C. A. 23, 273.

*Cracking petroleum, etc.* MICHAEL MELAMID. Fr. 653,102, Apr. 19, 1928. Petroleum, petroleum products or tars and the like are converted into products of lower b. p. by injection along with steam into gas producers contg. hot coke or coal and in which the formation of water gas has already commenced.

*Hydrocarbons.* LASZLO AUER. Fr. 652,796, Oct. 4, 1926. Substances contg. unsatd. hydrocarbons have their viscosity increased or diminished by reacting with electrolytes such as mineral or org. acids, their metallic salts, or organo-metallic compds. Heat and pressure may be employed. The reacting mass may be submitted to the action of ultra-violet rays. In an example, linseed oil, colza oil or mineral oil is heated to 300-350° under reduced pressure with Co linolate and KCNS. The products obtained find application in the *varnish, rubber, soap and candle industry*.

*Purifying hydrocarbons.* THOMAS B. KIMBALL. Fr. 654,860, May 25, 1928. See Brit. 291,379 (C. A. 23, 1260).

*"Cracking" hydrocarbons.* IRA W. HENRY. Fr. 654,622, May 21, 1928. Liquid or fluid hydrocarbons are submitted to the action of an oscillating electromagnetic field of high frequency, without sparking. Blocks of refractory material in elec. contact with one another are fixed in the space contg. the liquid and forming a secondary short-circuit. H and O obtained by dissocn. of superheated steam are introduced into the retort.

*Cracking hydrocarbons.* SINCLAIR REFINING Co. Ger. 475,836, Mar. 8, 1925. The oil is distd. under pressure and is vaporized in pipes heated by flue-gases. The pipes are supplied from the lower part of a container having a sieve and a layer of absorbing material. As the oil above the sieve becomes rich in tar, it is removed and fresh oil added so that the tar content never approaches satn. point. Cf. C. A. 23, 3569.

*Cracking hydrocarbon oils.* JOHN C. BLACK. U. S. 1,715,980, June 4. In order

to crack crude oil residuum with production of a relatively small quantity of low b. p. hydrocarbons, a larger quantity of hydrocarbons of higher b. p. and a residuum suitable for use as fuel oil, the residuum is passed through a series of cracking coils under pressure and at a temp. sufficient to "lightly crack" it; further destructive decompn. is prevented by the introduction of a cooler hydrocarbon oil into the final passes of the last cracking coil. An arrangement of app. is described. Cf. C. A. 23, 2290.

**Cracking hydrocarbon oils.** RUDOLPH C. OSTERSTROM and CARY R. WAGNER. Fr. 654,282, May 15, 1928. In cracking hydrocarbon oils the vapors are raised almost instantaneously to a conversion temp. about 535°. The oil is first heated to 315–420° and then suddenly to 535°, the conversion being completed in less than 2 secs. above this temp. and at a pressure of 2 kg. per sq. cm. Steam is added to the vapors before heating to 535°, and a metal oxide having 2 stages of oxidation such as FeO is used as catalyst. An app. is described.

**Apparatus for cracking hydrocarbon oils.** LUIS DE FLOREZ (to Texas Co.), U. S. 1,715,643, June 4. Vaporizing pipes extend downwardly in a heating chamber with their portions which are most highly heated of less cross sectional area than the portions which are less highly heated; material under treatment is supplied through the less highly heated to the more highly heated portions. Various other structural features of the app. also are described.

**Apparatus for refining hydrocarbon oils by filtration through fuller's earth.** ELMER H. PAYNE (to Standard Oil Co. of Ind.). U. S. 1,716,974, June 11.

**Apparatus for treating hydrocarbon oils with aluminum chloride.** WILLIAM F. DOWNS. U. S. 1,716,372, June 11. A still is provided with a propeller-blade stirrer near its bottom and agitating devices above this in the main portion of the still and is connected with a condenser contg. filtering material. Various structural details are described.

**Apparatus for distilling hydrocarbon oils under pressure.** LYMAN C. HUFF (to Universal Oil Products Co.). U. S. 1,716,136, June 4. Steam is fed first through conduits exterior to a still bottom and protecting it from undue heating by combustion gases, the steam thence passes to conduits within the still and adjacent to its bottom and is discharged through perforations in the last-mentioned conduits so that the steam flows against the inner surface of the still bottom and prevents deposition of coke deposits.

**Vacuum distillation of hydrocarbon oils.** JOHN C. BLACK. U. S. 1,717,002, June 11. In order to produce, under reduced pressure, a reduced lubricating oil stock, with scpn. of an intermediate distillate and lower boiling hydrocarbons and water, from a mixt. contg. these, such as crude paraffinic oil distillate, the reducing and distg. operation is effected under a partial vacuum greater than 24 in. Hg; the mixt. is circulated through heating tubes and an evaporator, a portion of the hydrocarbons is heated to vaporizing temp. and steam is introduced; a sufficiently reduced pressure is maintained to avoid decomposition or cracking of the hydrocarbons; lower b. p. hydrocarbons are passed into a fractionating tower together with the steam and brought into counter-current with condensate of the intermediate distillate; lower b. p. hydrocarbons and water are separately condensed and collected. App. is described.

**Distilling hydrocarbon oils by heat from a submerged combustion burner within the oil.** CARLETON ELLIS (to Ellis-Foster Co.). U. S. 1,716,433, June 11. An app. is described.

**Method and apparatus for the distillation of bituminous materials.** JOHANNES SCHULTE. Ger. 476,660, Dec. 17, 1926. Details of arrangement are given.

**"Sweetening" hydrocarbon oils.** MAX G. PAULUS (to Standard Oil Co. of Ind.). U. S. 1,716,973, June 11. In order to remove S compds. from hydrocarbon oils they are treated with H<sub>2</sub>S and then with "doctor"; the entire treatment is carried out with exclusion of air. App. is described.

**Cracking heavy oils.** JENKINS PETROLEUM PROCESS CO. Fr. 653,916, May 5, 1928. Gasoline is obtained by cracking heavy oils by circulating them rapidly by forced circulation in a tubular heater while imparting a whirling movement to the oil so that at each passage through the tubes the crude oil is heated only a little at a time and the loss of heat from one passage to the next is negligible so that the temp., pressure, dispersion of solids and liberation of gasoline vapors are const. throughout the heater.

**Fractionating shale-oil vapors and generating power.** CLARENCE F. HIRSHFELD. U. S. 1,716,130, June 4. Mixed vapors of different condensing points such as those from shale oil are expanded in successive stages in an app., which is described, to generate power; condensed fractions from the different stages are separately collected.

**Apparatus for distilling mineral oils and tars in several steps.** HANS MAGNUS. Fr. 654,729, Mar. 22, 1928.

**Refining mineral oil.** HENRY BLUMENBERG, JR. U. S. 1,716,103, June 4. Oil such as cracked gasoline is treated with an Al sulfite; the mixt. is heated to about 70° and volatile constituents are distd. The treatment serves to effect decolorization and deodorization. Cf. C. A. 23, 1501.

**Refining mineral lubricating oils.** EDWIN D. GRAY, EARLE L. SCOFIELD and EDWARD C. DEFOR (to Standard Oil Co. of Calif.). U. S. 1,716,632, June 11. The oil is treated with H<sub>2</sub>SO<sub>4</sub> and settled; the sludge is removed; the oil is then passed upwardly through a bed of sawdust and the filtered oil is neutralized.

**Purifying used lubricating oils.** MARTIN CZARNY and FRANK C. FROLANDER. U. S. 1,717,096, June 11. In purifying oils contg. liquid impurities adapted for use in connection with an internal combustion engine, the liquid impurities are abstracted from the oil by capillary action, *e. g.*, by a cotton wick. An app. is described.

**Lubricant.** GEORGE W. GRAY (to Texas Co.). U. S. 1,716,310, June 4. A lubricant suitable for use on railway-track curves comprises cylinder-stock residuum about 60 and residual oil derived from an asphalt base crude petroleum about 40%.

**Separating wax from lubricating oils by double centrifuging.** GEORGE F. OLSEN. U. S. 1,715,670, June 4. Various details of operation and arrangement of app. are described.

**Viscous oils.** I. G. FARBERIND. A.-G. Fr. 654,650, May 1928. Very viscous oils are prepd. from mineral or tar oils or from products from "cracking" or hydrogenation under pressure of coal, etc., by submitting these oils or products to the action of alternating elec. currents of frequency above 500 periods per sec., preferably in the absence of compds. capable of being ionized. Cf. C. A. 23, 3341.

**Emulsifiers and stabilizers.** NAAMLOOZE VENNOOTSCHAP DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Fr. 655,044, May 31, 1928. Emulsifiers and stabilizers for insol. or difficulty sol. substances, such as oils, tar, S or rubber, are obtained by transforming higher aromatic or hydroaromatic compds. into sulfonic acids having a mol. wt. above 250.

**Paraffin wax.** AKTIEBOLAGET SEPARATOR-NOBEL. Fr. 654,531, May 22, 1928. See Brit. 296,805 (C. A. 23, 2567).

**Motor fuel containing denatured alcohol and miscible oxidized kerosene.** JOSEPH H. JAMES (to Clarence P. Byrnes, trustee). U. S. 1,716,272, June 4.

**Absorbing noxious substances from combustion gases.** JACOB BILSKY (name now changed to John G. Billings). U. S. 1,716,479, June 11. Gases such as those from "antiknock" motor fuels are passed through a device contg. sep. layers of material, one of which contains Cu<sub>2</sub>Cl<sub>2</sub> and Pd chloride for absorbing CO; another layer contains (CH<sub>3</sub>)<sub>2</sub>N<sub>2</sub>; other absorbents also may be used. U. S. 1,716,480 relates to structural features of a device for treating gases for internal combustion engines with absorbents. U. S. 1,716,481 specifies removal of heavy metal compds. from exhaust gases by passing them through material contg. Na chromate.

**Separation and recovery of gases and vapors by use of solid absorbents.** ALBERT GODEL (to Soc. de recherches et d'exploitations petroliferes). U. S. 1,717,103, June 11. An app. is described suitable for recovery of gasoline from gases and in which regeneration of the absorbent by heat is effected in 2 distinct periods, the first period having for its object the heating of the absorbent mass, without appreciable humidification, by the aid of convection currents created in the gas within the mass, and the second period having for its object the distn. of the absorbed product by the introduction of steam. Cf. C. A. 22, 1418.

**Distilling wood.** RALPH H. TWINING (to Cleveland-Cliffs Iron Co.). U. S. 1,716,745, June 11. The vapors issuing from a wood distn. retort are subjected to countercurrent scrubbing with hot crude-pyroligneous acid obtained from the distn. and from which the tar has been settled. An arrangement of app. is described.

**Milling device for producing charcoal powder.** MAX KÖNIG. Ger. 476,526, Feb. 7, 1928.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

1,4-Dioxan [as solvent] (REID, HOFMANN) 13. Density of wood substances, adsorption by wood and permeability of wood (STAMM) 20. Constitution of cellulose xanthates (LANGE) 10. Mixing apparatus [for use in manufacture of paper pulp] (Ger.

pat. 476,338) 1. Purifying liquids by osmosis [of NaOH solutions, from viscose manufacture] (Austrian pat. 112,961) 13. Basic Cu sulfate [for dissolving cellulose] (U. S. pat. 1,716,492) 18. Moldable composition (U. S. pat. 1,716,623) 18.

**Cellulose.** BROR N. SGERFELT. Fr. 653,285, Apr. 21, 1928. In the production of cellulose by boiling cellulosic substances in acid or alk. liquor in a digester and washing the cellulose obtained in diffusers, the strongest residual liquor from the diffusers, after concn. if necessary, is used for addn. to fresh liquor for the digester to obtain the amt. necessary for boiling. The first washing of the digested paste is carried out with residual liquor having a sp. gr. not below 1.09.

**Cellulose.** I. G. FARBENIND. A.-G. Fr. 653,817, May 3, 1928. Swelling of cellulose or cellulose products such as paper or vulcanized fiber is lessened by impregnation with aq. or freely alk. solns. of condensation products such as artificial resins or substances producing them and treating with  $\text{CH}_2\text{O}$  to render them insol. Cf. C. A. 23, 3097.

**Cellulose.** STECKBORN KUNSTSEIDE. A.-G. Swiss 131,108, July 30, 1927. A mat surface is obtained on cellulose by using a viscose solvent which is decomposed on contact with the acid pptg. bath to deposit minute solid particles on the coagulating viscose. Examples mention  $\beta$ -naphthol and  $\text{CS}_2$  as the solvents.

**Alkali cellulose.** NEUR GLANZSTOFF-WERKE A.-G. Ger. 476,255, Feb. 14, 1925. The cellulose is treated with used caustic alkali lyes and then with fresh lye. The treatment may be applied in a no. of stages with lyes of successively increasing NaOH and decreasing hemicellulose content.

**Cellulose and paper from straw, esparto, reeds, etc.** ERIK L. RINMAN. U. S. 1,716,006, June 4. See Brit. 269,154 (C. A. 22, 1474).

**Saccharification of cellulose.** HEINRICH SCHOLLER. Fr. 654,072, May 10, 1928. See Brit. 273,317 (C. A. 22, 2056).

**Saccharification of cellulose.** SOC. D'ÉTUDES CHIM. POUR L'IND. Fr. 653,419, Apr. 26, 1928. See Swiss 127,238 (C. A. 23, 1268).

**Nitrocellulose.** HERCULES POWDER CO. Fr. 653,489, Apr. 26, 1928. An app. is described for the digestion of nitrocellulose to reduce its viscosity, increase its stability and purify it, in which the washed nitrocellulose and water are caused to pass through a coil of small cross section with a narrowing opening. Cf. C. A. 23, 1750.

**Cellulose esters.** KODAK-PATHÉ (SOC. ANON. FRANÇAISE). Fr. 653,742, Mar. 28, 1928. See Brit. 287,880 (C. A. 23, 512).

**Cellulose ethers and esters.** I. G. FARBENIND. A.-G. Fr. 653,297, Apr. 21, 1928. Films, fibers, etc., are made from solns. of cellulose ethers or esters which contain  $\text{CS}_2$  as an essential ingredient of the mixt. of solvents used. Thus, films with 20-25% more solidity than films from  $\text{C}_6\text{H}_6$  soln. and the same extensibility are obtained from an 8% soln. of triethylcellulose in a mixt. contg.  $\text{CS}_2$  92 and  $\text{C}_6\text{H}_6$  8%. Films with 3 times the extensibility of those from acetone soln. and the same solidity are obtained from a 7% soln. of triethylcellulose in a mixt. contg.  $\text{CS}_2$  96 and acetone 4%.

**Organic esters of cellulose.** HANS T. CLARKE and CARL J. MALM (to Eastman Kodak Co.). U. S. 1,716,422, June 11. In prepg. material such as cotton for esterification such as acetylation, the raw cellulosic material is mercerized with an aq. alk. bath, and dehydrated with a substantially anhyd. neutral org. liquid such as MeOH and ether.

**Use of cellulose esters in wrappers of cigars.** WERNER THIRLE. U. S. 1,716,250, June 4. Cigars are formed with a wrapper of comminuted tobacco leaves mixed with a soln. of cellulose acetate or other suitable cellulose ester or similar combustible binder.

**Ethyl cellulose composition for films, etc.** STEWART J. CARROLL (to Eastman Kodak Co.). U. S. 1,716,418, June 11. A compn. is specified comprising water-insol. ethyl cellulose 100, tribromophenol 20 and more than 300 parts of a common solvent such as MeOAc 90 and MeOH 10% contg. sufficient inorg. alkali to give the compn. a  $p_H$  above 7. U. S. 1,716,419 specifies a similar compn. in which bromocamphor (substantially free from uncombined Br and HBr) is used instead of tribromophenol. U. S. 1,716,420 also relates to similar compns.

**Sheets, slabs and molded articles of celluloid and similar materials.** GUSTAV LEYSIEFFER. U. S. 1,716,379, June 11. Relatively thin sheets from which sufficient solvent has been removed to prevent welding of the sheets under normal conditions of temp. and pressure but still capable of being welded under heat and pressure are thus welded and residual solvent is then removed by drying for a short time at a high temp.

**Ethers of carbohydrates.** LEON LUXENFELD. Ger. 475,884, Apr. 27, 1921.

Ethers of such carbohydrates as cellulose, starch and dextrin are prep'd. by mixing the starting materials with caustic alkali into a homogeneous whole and treating with alkylating, arylating or aralkylating agents. Thus, finely powd. NaOH is thoroughly mixed with finely divided cellulose before being treated with the above-mentioned agents.

**Derivatives of cork.** I. G. FARBENIND. A.-G. Fr. 653,909, May 5, 1928. Cork is put in suspension in a neutral medium and caused to react with org. or inorg. acid radicals in the manner proposed for cellulose. Thus, powd. cork in suspension in PhCl is boiled with  $\text{Ac}_2\text{O}$ , giving a product contg. 38.5% AcOH chemically combined. Similar products contg. 56% of lauric acid and 14% of phosphoric acid are obtained.

**Drying chamber for cellulose sheets.** HERMANN HAAS. Ger. 475,800, Feb. 23, 1928. Details of arrangement are given.

**Production of hollow ware and foils from cellulose esters by dipping the molds in coagulating agent and running in the esters.** KURT BRATRING. Ger. 476,961, Mar. 20, 1925.

**Recovering fibers from liquids.** ADOLF M. R. KARLSTRÖM. U. S. 1,717,223, June 11. Liquids such as back-water from cellulose, paper or wood-grinding mills, from which fiber is to be recovered, are introduced, in admixture with gas such as air, into a tank in an upwardly directed current and a reduced pressure is maintained in the tank so that fibers are lifted up to the surface by adhering gas bubbles, whence they are sep'd. An app. is described.

**Vulcanized fiber.** I. G. FARBENIND. A.-G. Fr. 654,411, May 18, 1928. The quality of vulcanized fiber is improved by soaking it in solns. of org. compds. capable of forming insol. products, and forming these compds. in the fiber. The fiber may be first swelled by heating with water and removing the water afterwards. Examples are given of the formation in the fiber of urea condensation products,  $\text{PhOH}\cdot\text{CH}_2\text{O}$  resins, etc.

**Artificial fibers, films, etc.** I. G. FARBENIND. A.-G. Fr. 653,583, Apr. 28, 1928. Cellulose ethers are ppt'd. from their solns. to form films, etc., by using solvents which have a high soly. in the hydrocarbons which are used as pptg. baths. In examples solns of cellulose Et ether in (1)  $\text{CS}_2$  and  $\text{Et}_2\text{O}$ , (2)  $\text{CS}_2$  and BuOH, (3)  $\text{CS}_2$  and  $\text{C}_6\text{H}_6$ , (4)  $\text{Et}_2\text{O}$  and benzine are ppt'd. by a bath of paraffin oil at  $15^\circ$ .

**Viscose films.** FELDMÜHLE, PAPIER- UND ZELLSTOFFWERKE A.-G. Fr. 654,063, 654,064, 654,065, May 10, 1928. See Brit. 290,252-3-4 (C. A. 23, 981).

**Spinning cell for forming threads of cellulose esters or ethers.** MELITTA KLEIN (to Ruth-Aldo Co.). U. S. 1,716,781, June 11.

**Spinning device for artificial textile fibers.** SYNTHETA A.-G. Swiss 130,385, Feb. 1, 1928. The spinning nozzles are provided with cooling ducts to counteract excessive heating due to the spinning head heating chamber.

**Apparatus for treating artificial silk on perforated bobbins with liquids.** I. G. FARBENIND. A.-G. Fr. 654,668, May 24 1928.

**Artificial filaments.** BERNARD LOEWE. Ger. 476,005, Apr. 4, 1923. See Brit 213,908 (C. A. 18, 2610).

**Apparatus for spinning artificial threads or filaments.** HENRY DREYFUS. Fr. 654,062, May 10, 1928. In dry spinning artificial silk, etc., particularly in downward spinning, the spinning chamber is tapered towards the spinning nozzles or has a plate with holes corresponding with the spinning nozzles, or has an inverted funnel-shaped member whereby max. evapn. effect of the air or gas used is obtained.

**Artificial silk.** ERNEST S. JOHNSON. Fr. 652,947, Apr. 17, 1928. A thread of artificial silk is made up of a central core or cores of a pliable non-metallic substance such as beeswax, paraffin, palm oil, wood oil, resins, gums, etc., surrounded by a cellulose compn. adhering thereto.

**Artificial silk.** ALSA S. A. Fr. 653,337, Apr. 23, 1928. In the production of very light artificial silk, from viscose formed with hollow fibers, coagulating baths contg. a large proportion of  $\text{ZnSO}_4$  (about 6%) are used.

**Artificial silk.** THE NUERA ART-SILK Co., LTD. Fr. 653,856, May 4, 1928. In spinning artificial silk of fine "titres" on centrifugal frames the thread passing on to the delivering roller is sprayed with water.

**Artificial silk.** GRUNERT & GIANNETTI. Ger. 475,871, Dec. 25, 1926. In the method of spinning artificial silk by employing one or more baths, the baths are subjected to air or gas currents to form large bubbles which absorb the smaller bubbles already in the liquid and facilitate their removal. Cf. C. A. 23, 705.

**Artificial silk.** GRUNERT & GIANNETTI. Ger. 475,923, Feb. 6, 1927. The spinning heads are fitted with an acidifying device.

**Artificial silk.** NAAMLOOZE VENNOOTSCHAP NEDERLANDSCHE KUNSTZIJDEFABRIEK. Ger. 476,786, Dec. 31, 1926. Cellulose soln. is dry-spun through fine openings in a chamber with a slowly rising gas which keeps the temp. even.

**Wood pulp.** FRANS K. L. SCHOUTEN. U. S. 1,717,266, June 11. Comminuted wood is subjected to "dry refining" with sufficient friction to vaporize its normal water content, and is then subjected to "wet refining" in mixt. with added water controlled as to quantity so as to permit the frictional heat incident to the refining to elevate the temp. of the mixt. to such a point as to give the pulp a "not ground" character.

**Paper.** JOHN A. HEANY (to World Bestos Corp.). U. S. 1,716,776, June 11. Raw stock is formed into a web, the web is satd. with a moistening and binding soln. such as a starch or dextrin soln. and is compressed and stretched between calendering rolls, and then dried.

**Paper.** SIEBENHIRTNER CHEM. INDUSTRIE-WERK, G. M. B. H. Austrian 113,000, Dec. 15, 1928. Addn. to 111,709. The method of Austrian 111,709 (cf. Brit. 287,559, C. A. 23, 515) is modified by using a "light metal" or alk. earth metal salt, especially a Ba salt, instead of a heavy metal salt.

**Paper.** HANS MÜHLENBEIN. Ger. 476,583, Dec. 24, 1921. Paper pulp is made from vegetable fibers by treating chemically with alkali or acid and oxidizing agent, without pressure-heating, simultaneously with the pulverizing.

**Apparatus for agitating paper pulp.** JOSEPH E. BOND. U. S. 1,716,294-5-6-7-8-9, June 4. Structural features.

**Apparatus for beating paper pulp.** JAMES T. MURPHY. U. S. 1,716,898, June 11. Structural features.

**Apparatus for beating paper pulp.** RALPH WOOD (to Scott Paper Co.). U. S. 1,716,407, June 11. Structural features.

**Paper-making apparatus.** ALONZO ALDRICH and EARL E. BERRY (to Beloit Iron Works). U. S. 1,715,528-9-30-1, June 4. Structural features.

**Paper-making apparatus.** WILLIAM H. MILLSPAUGH. U. S. 1,715,615, June 4. Structural features.

**Highly porous paper-like material.** KIRKE L. MOSES. U. S. 1,716,654, June 11. In producing a paper-like web of sufficient porosity to permit it to be satd. with a filling material contg. rubber and water but having so little strength that it will hardly hold together when wet, the material is strengthened as by incorporation of a latex soln. applied by spraying and is then impregnated with additional filling material.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

**Report of Explosives Division, Department of Mines, Canada, for 1928.** ANON. 19 pp., Ottawa, 1929.—But one fatal accident occurred in manuf. during the year. This took place in an open ditch beside a catch-box from a settling tank on Jan. 23 when the nitroglycerin, which had escaped to the ditch, was frozen and an assumption is that the man slipped and struck the oversensitive crystals with a scoop. The man was at the time engaged in cleaning-out the catch-box by absorbing the nitroglycerin mud with sawdust. The bag in which this mixt. had been placed was recovered intact. A fire on Sept. 13 was caused by the rapid reaction ensuing on mixing  $\text{Na}_2\text{O}$  with D.N.T. A glaze mill was struck by lightning May 22 and blown up. Molten niter cake dropped by chance beside a niter house set fire to the latter. A steam-heater dynamite-store house was blown up, probably as a result of over-heating. Many instances of mislaid, lost, or abandoned explosives are recorded, such as "ten cases of dynamite were fired abandoned in the bush" apparently by disappointed miners. C. E. M.

**The testing of explosives for use in fiery coal mines.** JOCELYN F. THORPE, *et al.* Safety in Mines Research Board, *Paper No. 51*, 50 pp. (1929).—This investigation sought to ascertain if the methods used in making the official Tests for Permitted Explosives could be improved. The proposed new method is given. The most definite conclusions are to use  $\text{CH}_4$ , fire damp, as the standard gas in testing, and to require that all shots fired in coal mines shall be stemmed.

CHARLES E. MUNROE

**Effect of substituting ethylene glycol dinitrate in permissible explosives.** G. ST. J. PERROTT and J. E. TIFFANY. Bur. Mines, *Repts. of Investigations No. 2935*, 5 pp. (1929).—Comparisons between samples of permissible explosives in which 25% of the explosive oil had been replaced by 25% of ethylene glycol dinitrate and samples in which no change had been made show that the substitution does not have any marked

effect but it does tend to increase the rate of detonation and to increase slightly the sensitiveness by the halved cartridge method, but not to affect the unit deflactive charge, or the limit charge to such an extent that samples contg. the dinitrate should be considered any less safe for use in coal mines.

CHARLES E. MUNROE

**Velocity of propagation of flames in gas mixtures.** W. LINDNER. *Z. Ver. deut. Ing.* 73, 648-50 (1929).—L. investigated the effect of inerts, namely, N, He, A and CO<sub>2</sub>, on the velocity of flame propagation in mixts. of CO and O by the soap bubble method. The inerts lower or raise the velocity of flame propagation depending on the compn. of the mixt., CO<sub>2</sub> lowering it in all cases studied. Rates for mixts. of CH<sub>4</sub> and O without inerts were also measured. The equation  $S = K_f(F)^{n_1}(O_2)^{n_2}$  is offered as a means of calcg. velocity of flame propagation.  $S$  is velocity in cm./sec.,  $K_f$  is the proportionality factor depending on the combustible gas,  $F$  is the partial pressure of the combustible gas in atms.,  $O_2$  is the partial pressure of the oxygen in atms. and  $n_1$  and  $n_2$  are the coeffs. of  $F$  and  $O_2$ , resp., in the chem. equation:  $n_1F + n_2O_2 = xCO_2 + yH_2O$ .

A. WHITE

**Ignition temperatures of mixtures of carbon monoxide and air.** M. PRETTE AND P. LAFFITTE. *Compt. rend.* 188, 1403-5 (1929).—CO contents between 10 and 40% ignite at about 655°, then the ignition temp. rises rapidly, reaching 727° when the CO content becomes 92.9%. Contrary to the case of H, the presence of small quantities of gases of combustion does not alter the ignition temp. of CO. The presence of H<sub>2</sub>O vapor or H reduces appreciably the temp. of ignition of CO and air. E. M. SYMMES

**Influence of gel structure upon the technology of smokeless powder manufacture.** FRED OLSEN. *Colloid Symposium Monograph* 6, 253-64 (1928).—Speed of burning and resultant accuracy of fire depend on the "web" of the grains, i. e., the distance between the interior perforations. This, in turn, depends on gel structure which controls shrinkage during drying. Mixing light and heavy web grains aids uniform firing results.

JEROME ALEXANDER

**Relative aging properties of gelatin dynamites containing nitroglycerin and ethylene glycol dinitrate.** A. B. COATES AND G. ST. J. PERROTT. *Bur. Mines, Repts. of Investigations* No. 2923, 7 pp. (1929).—Firing tests were made of gelatin dynamites of different strengths and dynamites otherwise like the first-mentioned except that 50% of the nitroglycerin oil used in each was replaced by ethylene glycol dinitrate. The propulsive strength is the same for both and is unaffected by age. The sensitiveness to sympathetic detonation is slightly greater for dynamites contg. (CH<sub>2</sub>ONO)<sub>2</sub>. The rate of detonation, with some exceptions, is slightly higher for dynamites contg. (CH<sub>2</sub>ONO)<sub>2</sub> when unconfined; there is a slightly greater increase of rate when primed with 40% straight nitroglycerin dynamite. The aging qualities are slightly better.

CHARLES E. MUNROE

**The evolution of the miners' safety lamp.** T. SHEPPARD. *Colliery Guardian* 138, 2106-9 (1929).

E. J. C.

**Explosions in coal mines and permitted explosives: Historical record (NATHAN)**  
21. Diffusion apparatus for indicating the presence of combustible, explosive or poisonous gases (Austrian pat. 112,720) 1.

**Explosives.** MEXCO, LTD. Ger. 476,531, Sept. 4, 1924. An explosive cartridge for blasting contains chlorate or perchlorate in porous containers so packed that hydrocarbons such as petrolcum, paraffin oil, kerosene and the like can be used as the fuel. Cf. C. A. 23, 1272.

**Propellant explosive.** JOHN B. FIDLAR. U. S. 1,716,434, June 11. A propellant powder is formed of nitrocellulose 35, nitroglycerin 25, dinitrotoluene 5, trinitrotoluene 20 and flame reducing materials such as corn starch and black powder ingredients 10 parts.

**Quick-burning "delay powder."** WILLIAM T. INGRAHAM. U. S. 1,716,313, June 4. Hg fulminate is mixed with about 10% of black powder.

**Nitration apparatus, especially for nitroglycerin.** OTTO SCHULZE. Ger. 476,003, Feb. 12, 1927. The upper part of the nitration vessel is made of glass and supports a removable rose-head made of acid-resistant light metal.

**Miner's benzene safety lamp for testing air for the presence of methane.** HANS FLEISSNER. U. S. 1,716,374, June 11. A metallic strip is mounted vertically inside the lamp casing so as to be exposed to the flame and when the height of the flame is increased due to the presence of CH<sub>4</sub> the strip is heated to incandescence and shows an incandescent patch proportionate to the quantity of methane present. Various details are described.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**Dyes and their application—recent technical progress.** L. J. HOOLEY. *Chem. Age* (London) 20, Dyestuffs Mo. Suppl. 45-6(1929); cf. C. A. 23, 1752. E. J. C. Making the dyeing "like sample." NOEL D. WHITE. *Cotton* 93, 683-5(1929). R. K. W.

**Preparing the goods for dyeing.** *Cotton* 93, 839-41, 853(1929).—Practical. R. K. W.

**Dyeing raw stock cotton in circulating machines.** SHERMAN CONVERSE. *Cotton* 93, 614-6, 676(1929); *Dyer, Calico Printer* 61, 231-3(1929).—Practical. R. K. W.

**Dyeing cotton plushes and velours.** GEORGE RICE. *Dyer, Calico Printer* 61, 214-5(1929).—Practical. RUBY K. WORNER

**Redyeing weather-worn (wool) garments.** R. TREBOR. *Dyer, Calico Printer* 61, 269(1929).—Directions are given. RUBY K. WORNER

**Shoddy dyeing.** J. NEWSOME. *Dyer, Calico Printer* 61, 216-7(1929).—Practical. RUBY K. WORNER

**Notes on the desizing, washing, bleaching and dyeing of cellulose acetate rayon.** Degumming of natural silk in presence of acetate rayon. JORRE. *Tiba* 6, 279, 281, 559-65, 661, 663, 905-9, 1119-23, 1261-5(1928); 7, 13-9(1929); *Russa* 3, 147, 149, 303, 305, 381, 383, 617, 619, 749-53, 1013-7, 1299, 1301, 1463, 1465(1928); 4, 35, 37 (1929).—Practical operating directions are given for the processing of cellulose acetate rayon. A. PAPINEAU-COUTURE

**Test shows effect of constant standard humidity in the cotton mill.** CHARLES H. FORSAITH. *Textile World* 75, 3589, 3593(1929).—The % of regain was detd. for samples of cotton taken before and after each step in the process of manuf. The results of maintaining a const. humidity throughout the mill were very slight, if any, losses due to regain, better and more uniform-running work, better working conditions and increased production. **Wool Year Book, 1929.** Compiled by the Editor of Textile Mercury, Manchester, and others. London: Industrial Newspapers, Ltd. 684 pp. 7s. 6d. Reviewed in *J. Textile Inst.* 20, 113; *Textile World* 75, No. 25, 49(1929).

**Dyes.** I. G. FARBENIND. A.-G. Fr. 654,536, May 22, 1928. Dyes are prepd. by causing halodibenzanthrones or haloisodibenzanthrones or their derivs. to react with aromatic polynuclear compds. such as aminoanthraquinones or their derivs. with or without solvents, diluents, catalysts or acid-fixing agents. Thus, tetrabromodibenzanthrone

is boiled with 1-aminoanthraquinone in  $\text{PhNO}_2$  in the presence of  $\text{CuCO}_3$  and  $\text{NaOAc}$ , giving a product which dyes cotton gray to blue-black shades. Several other examples are given.

**Dyes.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Swiss 130,700, Jan. 11, 1928. Polymethine dyes are prep'd. by condensing cyclic ammonium bases with orthoformate in the presence of tertiary aromatic bases of the type dialkylaniline. In the example 2, 3, 3-trimethylindoleninium methiodide is stirred at 115–120° with orthoformate and dimethylaniline.

**Dye.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Swiss 131,100, Aug. 4, 1927. A dye is produced by the interaction of  $\text{PhCHO}$ ,  $\text{NaHSO}_3$ , and 1,4,5,8-tetraaminoanthraquinone. The dye gives a blue aq. soln. which colors acetate silk in fast tones of the same color.

**Direct dyes.** BRITISH DVESTUFFS CORP., LTD. Fr. 654,414, May 18, 1928. See Brit. 296,803 (C. A. 23, 2578).

**Azo dyes.** BRITISH DVESTUFFS CORP., LTD. Fr. 653,031, Apr. 19, 1928. See Brit. 294,922 (C. A. 23, 2039).

**Azo dyes.** BRITISH DVESTUFFS CORP., LTD. Fr. 653,029, Apr. 19, 1928. Azo dyes are obtained by coupling tetrazotized 4,4'-diaminodiphenylmono-, di- or trisulfide with 2 mol. proportions of an aminonaphtholsulfonic acid or *N*-substituted deriv. thereof, or with 1 mol. proportion of such an acid and 1 mol. proportion of any coupling component. Several examples are given and a table of components, giving the colors obtained on viscose silk. The dyes may also be used on vegetable or animal fiber.

**Azo dyes.** I. G. FARBERIND. A.-G. Fr. 652,909, Apr. 16, 1928. Azo dyes which may be treated with metallic salts are prep'd. by coupling with any 2,3-hydroxynaphtho-arylamides, diazotized aminohydroxyazo compds. obtained by coupling *o*-hydroxydiazoo compds. and their substitution products with an amine also diazotizable and substituted. In an example the dye obtained from diazotized *o*-aminophenol and amino-hydroquinone dimethyl ether is diazotized and cotton, previously treated with 2,3-hydroxynaphtho- $\beta$ -naphthylamide, is dipped into the diazo soln., giving a deep black which may be heightened by treatment with metallic salts.

**Azo dyes.** I. G. FARBERIND. A.-G. Fr. 653,201, Oct. 17, 1927. New azo dyes are prep'd. by coupling the diazo compds. of *o*-aminonaphthol or its diazotizable derivs. with 1-naphthol-8-sulfonic acid. In examples, a dye giving red shades on wool is obtained by diazotizing 1-amino-2-naphthol-4-sulfonic acid and coupling with 1-naphthol-8-sulfonic acid; after-chroming gives greenish blue shades on wool. The dye obtained from 1-naphthol-8-sulfonic acid and the diazonitrated compd. of 1-amino-2-naphthol-4-sulfonic is after-chromed to dye wool in fast black shades.

**Azo dyes.** I. G. FARBERIND. A.-G. Fr. 653,231, Feb. 20, 1928. Azo dyes are prep'd. by coupling tetrazo compds. of those diamines which have in the position *o*- to the amino groups carboxylic groups, with 2 mols. of acetoaceticarylidesulfonic acids, or by coupling the diazo compds. of those amines which have a carboxylic group in the position *o*- to the amino group with 1 mol. of acetoaceticarylidesulfonic acid and then producing a diazo dye. In examples tetrazotized 4,4'-diaminodiphenylurea-3,3'-dicarboxylic acid is coupled with the Na salt of acetoacetic-*o*-chloranilidesulfonic acid. The product dyes viscose in pure yellow shades and cotton a greenish yellow. It may be after-treated with Cu salts. 5-Nitro-2-aminobenzoic acid is diazotized and coupled with acetoacetic-*o*-anisidesulfonic acid. The nitro group is reduced and transformed by treatment with  $\text{COCl}_2$  into the symmetrical urea. The purified dye dyes viscose and cotton a golden yellow. The symmetrical thiourea compd. is obtained if  $\text{CSCl}_2$  is used instead of  $\text{COCl}_2$ .

**Azo dyes.** I. G. FARBERIND. A.-G. Fr. 654,071, May 10, 1928. See Brit 290,253 (C. A. 23, 990).

**Azo dyes.** I. G. FARBERIND. A.-G. Fr. 654,418, May 18, 1928. Azo dyes contg. an acetoacetic acid chloride in the mol. are treated with arylaminosulfonic acids or their derivs. for the production of new azo dyes. An example is given of a dye obtained by treating 4-chloro-2-nitrobenzenazoacetoacetic acid dissolved in  $\text{PhCl}$ , with 2-anisidine-4-sulfonic acid in pyridine.

**Azo dyes.** I. G. FARBERIND. A.-G. Fr. 654,466, May 19, 1928. Basic azo dyes are prep'd. by forming the azo dye by the combination of a diazotized non-sulfonated aminoarylenethiazolic compd. with a non-sulfonated azo component, and introducing into the thiazolic group, before or after the formation of the dye, a quaternary group by the action of a dialkyl sulfate or an arylsulfonic acid ester. Thus, dehydrothio-*p*-toluidineazo-1-phenyl-3-methyl-5-pyrazolone is boiled in  $\text{PhCl}$  with  $\text{Me}_2\text{SO}_4$ , giving

a product which dyes mordanted cotton a reddish yellow color. Several other examples are given.

**Azo dye.** I. G. FARBENIND. A.-G. (W. Hentrich, Rudolf Knoche and Paul Virck, inventors). Ger. 475,685, Dec. 24, 1926. A monoazo dye is prepd. by combining the diazo compd. of 4-nitro-1-aminobenzene-2-sulfonic acid or its substitution products, or 5-nitro-2-aminobenzene- $\omega$ -sulfonic acid, or the sulfonic acids of 4-nitro-1-aminonaphthalene, with 4'-hydroxyphenyl-2-aminonaphthalene or its substitution products. A table of constituents and colors of the resulting dyes is given.

**Azo dyes.** I. G. FARBENIND. A.-G. (W. Hentrich and Eugen Rimele, inventors). Ger. 476,079, Oct. 27, 1926. Azo dyes are prepd. by coupling with suitable components the diazo compds. from 2-amino-1-carboxybenzenesulfonamides or their derivs. or substitution products. The products may be chromed, coppered, etc., in the known way either in substance or on the fiber. The examples describe the prepn. of the dyes from the following compds.: (1) 2-amino-1-carboxybenzene-5-sulfon-2'-aniside (I) and 1-naphthol-5-sulfonic acid, (yellow-red shades on wool, made bordeaux by after-chroming); (2) I and 2-phenylamino-8-naphthol-6-sulfonic acid, (red-brown shades, made brown-black by after-chroming); (3) 2-amino-1-carboxybenzene-5-sulfonanilide (II) and the pyrazolone from 2-amino-1-phenol-4-sulfo-6-carboxylic acid (yellow-red shades, made greenish yellow by after-chroming or coppering); (4) II and 2-aminonaphthalene-7-sulfonic acid (reddish orange shades, made bordeaux by after-chroming; the Cr compd. gives violet shades when used as a size color); (5) the Cu compd. of the dye 2-amino-1-carboxybenzene-5-sulfonamide (III) and 1-acetyl-amino-8-naphthol-3,6-disulfonic acid (wine-red shades); (6) the Cr compd. of the dye III and 2-aminonaphthalene-7-sulfonic acid (red-violet shades when used as a size color); (7) the Cu compds. of the dyes 2-amino-1-carboxybenzene-5-sulfon-4'-toluide (IV) and 2-naphthol-8-sulfonic acid (orange shades), IV and 1-naphthol-4-sulfonic acid (copper-red shades), IV and 2-naphthol-6-sulfonic acid (red-brown shades), and IV and 3-methyl-1-(4'-sulfophenyl)-5-pyrazolone (greenish yellow shades). The compd. I is prepd. by treating the reaction product of *o*-chlorobenzoic acid and  $\text{ClSO}_3\text{H}$  with *o*-anisidine and replacing the nuclear Cl with  $\text{NH}_2$  by heating with  $\text{NH}_3$  under pressure.

**Azo dye.** I. G. FARBENIND. A.-G. (W. Hentrich and Ludwig Zeh, inventors). Ger. 476,809, Mar. 2, 1926. An azo dye is prepd. by coupling *o*-hydroxydiazocompds. with 1,8-naphthylenediamine or its derivs. and converting to perimidine derivs. In an example the diazo compd. from 6-nitro-2-amino-1-hydroxybenzene-4-sulfonic acid is added to an aq. soln. of 1,8-naphthylenediamine-4-sulfonic acid. The dye is sepd. from the liquid in the usual way and treated with warm water, NaOH and  $\text{AcONa}$ .  $\text{COCl}_2$  is led in at  $40^\circ$ . When the absorption of  $\text{COCl}_2$  is complete, the dihydropyrimidone-(2)-deriv. formed is salted out. Other examples are given.

**Azo dye.** I. G. FARBENIND. A.-G. (Myrtill Kahn, inventor). Ger. 476,810, Oct. 23, 1926. A trisazo dye is prepd. by combining the tetrazo compd. of the intermediate substance from a *p*-diamine and an aminonaphtholsulfonic acid with 2 mols. of a hydroxyethyl-*m*-diamine, or with one mol. of this and 1 mol. of a component of another series. In the example, *p*-phenylenediamine-2-amino-8-naphthol-6-sulfonic acid is converted to the tetrazo compd. and hydroxyethyl-*m*-phenylenediamine added.

**Azo dye.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 130,698, Aug. 13, 1927. A Cr-contg. azo dye is obtained by treating the dye from diazotized 6-nitro-2-amino-1-phenol-4-sulfonic acid and  $\beta$ -naphthol with  $\text{Cr}(\text{OH})_3$ . The dye colors silk a fast blue-black in  $\text{AcOH}$  baths.

**Azo dye.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 130,699, Sept. 17, 1927. A Cr-contg. dye is prepd. by the action of the dye from diazotized 6-nitro-2-aminophenol-4-sulfonic acid and  $\beta$ -naphthol on the Cr compd. of the dye from 1-amino-2-hydroxy-naphthalene-4-sulfonic acid and  $\alpha$ -naphthol. The dye colors wool and silk in fast blue tones in  $\text{H}_2\text{SO}_4$  baths.

**Azo dye.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 131,098, Sept. 10, 1927. A metallic polyazo dye is prepd. by treating the dye from 2 mols. diazotized 4-chloro-2-amino-1-phenol and 1 mol. 5,5'-dihydroxy-2,2'-dinaphthylamine-7,7'-disulfonic acid first with one-half the quantity of Cr agent necessary for complete chroming, and then with sufficient Cu agent for complete satn. of the metallizable groups. The dye colors cotton a fast blue in a neutral or alk. bath.

**Azo dye.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 131,099, Sept. 24, 1927. A Cu azo dye is prepd. by treating the dye from diazotized 5-nitro-2-amino-1-phenol and 2-(*o*-anisidyl)amino-5-hydroxynaphthalene-7-sulfonic acid with the products obtained from the action of  $\text{Cu}(\text{OH})_2$  on glycerol in presence of caustic alkali. The dye colors cotton in light-fast blue tones in a neutral bath.

**Azo dyes.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Fr. 653,931, May 7, 1928. See Brit. 290,179 (C. A. 23, 1279).

**Monoazo dyes.** I. G. FARBENIND. A.-G. Fr. 653,914, May 5, 1928. Yellow monoazo dyes are prepd. by coupling a diazo compd. of anilinemonosulfonic acid with 1-(2'-chloro-5'-sulfophenyl)-3-methyl-5-pyrazolene (I). Examples are given of the coupling with (I) of diazotized sulfanilic acid, and *o*-sulfobenzenediazonium chloride. A list of other substances which may be diazotized and coupled is also given. Cf. C. A. 23, 2301.

**Chromium azo dye.** I. G. FARBENIND. A.-G. (Hans Krzikalla, inventor). Ger. 475,686, Jan. 30, 1927. A black Cr-contg. azo dye is prepd. from 45 parts of the monoazo dye from diazotized picramic acid and Na 2,4-naphtholsulfonate treated with 600 parts water, 20 parts of a paste contg. 26% Cr<sub>2</sub>O<sub>3</sub> and 10 parts 85% HCOOH. The dye is salted out in the usual way. Cf. C. A. 23, 3105.

**Chromium azo dyes.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Fr. 653,132, Apr. 20, 1928; Swiss 130,837, Aug. 19, 1927. See Brit. 295,944 (C. A. 23, 2301).

**Chromium azo dye.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Swiss 130,902, Aug. 27, 1927. The Cr compd. of the dye obtained from 1-amino-2-hydroxynaphthalene-4-sulfonic acid and  $\alpha$ -naphthol is allowed to react with the Cr compd. of the dye 5-[(5-carboxy-4,3-cresyl)(2,6-dichlorophenyl)methylene]-2,5-dihydro-2-keto-*m*-toluic acid

**Chromium azo dye.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Swiss 130,903, Sept. 3, 1927. The dye obtained by the alk. coupling of diazotized 5-nitro-2-aminophenol and 2-amino-5-hydroxynaphthalene-7-sulfonic acid is heated with CrO<sub>2</sub>F<sub>2</sub> in a reflux. The dye colors wool and silk blue in acid baths and cotton the same color in alk. baths.

**Chromium azo dye.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Swiss 130,904, Sept. 23, 1927. The dye from diazotized 1-amino-2-hydroxynaphthalene-4-sulfonic acid and  $\alpha$ -naphthol is chromed with alkali chromite, nitrated and then reduced, *e. g.*, with Na<sub>2</sub>S. The dye colors wool and silk in fast steel-blue tones.

**Chromium azo dyes.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Swiss 131,251 to 131,259, Apr. 23, 1927. Addns. to 128,006 (C. A. 23, 2042). Cr azo dyes are prepd. by chroming the *o*-hydroxyazo dyes obtained by combining diazotized 5-nitro-2-amino-1-phenol or a chloro deriv., with aminohydroxynaphthalenesulfonic acid derivs. such as 2-(4'-ethoxy)-phenylamino-5-hydroxynaphthalene-7-sulfonic acid. The dyes color cotton in fast green-blue-violet tones.

**Chromium azo dyes.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Swiss 131,260 to 131,262, May 7, 1927. Addns. to 128,228, (C. A. 23, 2300). Cr and S azo dyes are prepd. by sulfurizing the chromed dye from diazotized 1,2-aminonaphthol-4-sulfonic acid and  $\alpha$ -naphthol or 5,8-dichloro-1-naphthol in the presence of EtOH or AmOH. The dyes color cotton in light- and wash-fast blue-gray tones.

**Trisazo dyes.** HENRY JORDAN (to E. I. Du Pont De Nemours & Co.). U. S. 1,716,063, June 4. Gray to blue-green and green trisazo dyes are made by diazotizing a disazo compd. prepd. by coupling an aromatic diazo-azo compd. to a 1,8-aminonaphthol compd. having a free amino group attached to the nucleus and coupling the resulting diazo compd. to an acylacetylride, aryl pyrazolone or alkyl ketole. Several examples are given. Cf. C. A. 22, 2846.

**Trisazo dyes.** HAROLD E. WOODWARD (to E. I. Du Pont de Nemours & Co.). U. S. 1,716,098, June 4. Various examples are given of dyes suitable for dyeing cotton, rayon or silk blue or violet shades, which may be prepd. by diazotizing the amino azo compd. prepd. from an aromatic aminosulfonic acid and an aromatic amine or an amino ether, to which amine or ether coupling can take place in the position *p* to the amino group, coupling the resulting diazo azo compd. to *p*-aminobenzoyl-2-amino-5-naphthol-7-sulfonic acid, diazotizing the resulting disazo compd. and coupling with J acid (2-amino-5-naphthol-7-sulfonic acid).

**Trisazo dyes.** I. G. FARBENIND. A.-G. (Hugo Schweitzer, inventor). Ger. 476,080, Feb. 27, 1926. Addn. to 450,998. See Brit. 287,232 (C. A. 23, 525).

**Vat dyes.** I. G. FARBENIND. A.-G. (Walter Mieg, inventor). Ger. 470,550, Jan. 22, 1927. Addn. to 451,495. Vat dyes are prepd. by heating 1-aminoanthraquinone or its derivs. with a halide of Al in the presence of an org. base and in the presence or absence of water. The presence or absence of water may det. the nature of the product. Thus, by heating 1-aminoanthraquinone with AlCl<sub>3</sub> in the presence of dry pyridine, an orange vat dye of unknown constitution is obtained, but if pyridine contg. a small amt. of water is used, the product obtained under otherwise similar conditions is 1,1'-diamino-2,2'-dianthraquinonyl. Detailed examples of these preps. are given. A further example in which 1-amino-6-chloroanthraquinone is treated is given also.

**Vat dyes.** I. G. FARBENIND. A.-G. (Max A. Kunz, Guido Frhr. von Rosenberg and

Eduard Goffarjé, inventors). Ger. 475,687, Aug. 14, 1926. Vat dyes of the anthraquinone series are prepd. by condensing *o*-aminohydroxyanthraquinone with anthraquinonealdehyde or anthraquinone derivs. with aldehydic properties, by heating in presence or absence of solvent. Alternatively, anthraquinone derivs. with one or more oxazole groups, *e. g.*, anthraquinone-1,2-isoxazole, are prepd. by substituting the  $\mu$ -C atom with an anthraquinone residue. Examples are given.

**Vat dyes.** I. G. FARBENIND. A.-G. (Arthur Lüttringhaus and Filip Kacer, inventors). Ger. 475,688, Mar. 11, 1927. A vat dye of the anthraquinone series is prepd. by subjecting bis(2'-carboxy-1'-anthraquinonyl-2,6(or 2,7)-dimercaptoanthraquinone to a ring-closing treatment. Thus, 10 parts bis(2'-carboxy-1'-anthraquinonyl)-2,7-dimercaptoanthraquinone is digested with 200 parts trichlorobenzene. The ring-closing process is completed in about 6-7 hours. The product is a yellow powder which can be used for dyeing without further purification. Another example is given.

**Vat dye.** I. G. FARBENIND. A.-G. (Walter Mieg and Albert Job, inventors). Ger. 475,766, May 28, 1926. A vat dye of the anthraquinone series is prepd. by nitrating diphtaloylacridone and reducing to form the amino deriv. which may then be acylated. Thus, 3,4,5,6-diphtaloylacridone (prepd. according to the method of 268,219) is heated to 80-90° with 80% HNO<sub>3</sub>. The yellow-brown crystals obtained can be used directly as a dye or can be converted to the amino deriv. by treatment with NaHS in presence of alc. Treatment of the amino deriv. with PhNO<sub>2</sub> and benzoyl chloride gives the benzoyl deriv. Another example is given. Cf. C. A. 23, 991.

**Vat dyes.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Ger. 476,411, Sept. 27, 1927. Vat dyes of the anthraquinone series contg. 1 or more triazine rings, *i. e.*, dyes of the kind prepd. from aminoanthraquinones and cyanuric chloride, are purified with aq. solns. of hypochlorites. Examples are given.

**Vat dye.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Swiss 131,269 to 131,272, June 8, 1927. Addns. to 129,589 (C. A. 23, 2833). A vat dye deriv. is prepd. by treating leuco-dihalothiindigo or the leuco compd. of indigo with mono-halo AcOH. Examples are given.

**Vat dyes with perylene nucleus.** MAXIMILIAN P. SCHMIDT and WILHELM NEUGEBAUER (to Grasselli Dyestuff Corp.). U. S. 1,715,430, June 4. A dye producing violet-blue tints on cotton from a blue vat is formed by condensing the diimide of dichloro-*perylene*carboxylic acid with phenol and generally similar dyes are also obtained by condensation of various similar perylene nucleus compds. with hydrocarbon derivs. contg. a substituent such as —OH, —SH or —NH<sub>2</sub>. The condensation is preferably effected in the presence of a small quantity of an acid-binding substance such as KOH. Several examples are given.

**Dry pigment dyes.** BRITISH DYESTUFFS CORP., LTD. Fr. 654,745, Apr. 10, 1928. Dry pigment dyes in a fine state of division are obtained by drying a paste of the dye contg. a Ba or other resin or naphthenate insol. in water.

**Halogen-free dye.** FELICE BENSÀ. Swiss 131,101, Aug. 8, 1927. A halogen-free dye is prepd. by heating diacetyldihaloperylene with a metallic cyanide in presence of an org. solvent. In an example the perylene deriv. was heated with CuCN to 190-200° with pyridine. In NaHS baths, it colors cotton red.

**Anthraquinone dyes.** I. G. FARBENIND. A.-G. Fr. 653,701, May 2, 1928. Dyes are obtained by causing hydroxyalkylamines to react with 1,4-dihydroxyanthraquinones or their leuco derivs. or with anthraquinones contg. neg. substituents such as halogens, NO<sub>2</sub> and MeO groups. The products may be sulfonated. In an example  $\alpha$ -chloroanthraquinone is heated with a 20% soln. of hydroxyethylamine in pyridine. The dye is isolated by diln. with MeOH. The SO<sub>3</sub>H deriv. dyes wool red. In the same way 1,4-dihydroxyethyldiaminoanthraquinone is obtained from quinizarin. Other dyes of the same series may be obtained from 1,4,5-trihydroxy- and 1,4,5,8-tetrahydroxyanthraquinone. The unsulfonated compds. dye acetate silk in variable shades. Cf. C. A. 23, 2043.

**Sulfur dyes.** I. G. FARBENIND. A.-G. (Alfred Bergdolt, Theodor Nocken and Wilhelm Neelmeier, inventors). Ger. 475,575, Aug. 21, 1926. S dyes are prepd. by melting indophenol or leucoindophenol with polysulfides with addn. of Cu salt. The indophenol is prepd. by the oxidation of ethers of *p*-hydroxyaryl-1-naphthylamino-monosulfonic acid and *p*-aminophenol, and subsequent reduction. Thus, 31.6 kg. 1-*p*-anisylamino-4-*p*-hydroxyphenylaminonaphthalene-8-sulfonic acid, obtained by the oxidation of *p*-anisyl-1-naphthylamine-8-sulfonic acid and *p*-aminophenol and subsequent reduction to the leuco compd., is dissolved in 125 l. alc. S (32 kg.), 100% Na<sub>2</sub>SO<sub>4</sub> (25 kg.) and CuSO<sub>4</sub> (5 kg.) are added and the mass is digested for 60 hrs. in a reflux condenser. The dye is obtained by distn. with alc., extg. with water and is isolated in the usual way. It colors cotton in green shades in Na<sub>2</sub>S baths. Other examples are given.

**Sulfurized dyes.** I. G. FARBENIND. A.-G. Fr. 653,785, May 1, 1928. Sulfurized dyes are prepd. by heating to 240–300° for several hrs. binaphthylene dioxide with S, halides of S or both and with or without diluents. In an example using S, a dye is obtained which dyes cotton brownish red.

**Brominated 4,4'-dimethyl-6,6'-dichlorothioindigo.** THE NEWPORT CO. Fr. 654,943, May 29, 1928. See Brit. 292,904 (C. A. 23, 1510).

**Anthraquinone derivative.** SOC. ANON. POUR L'IND. CHIM. A BÂLE. Swiss 131,358, Aug. 26, 1926.  $\text{CH}_3\text{CHO}$ , 1-amino-4-anilinoanthraquinone and  $\text{HCOOH}$  are allowed to interact at about 20° to produce the deriv., which is employed for coloring varnish and as an intermediate for other dyes.

**Anthraquinone derivatives.** I. G. FARBENIND. A.-G. Fr. 653,614, Apr. 30, 1928. Condensation products which are *intermediates for dyes* are prepd. by treating aminoanthraquinones, their derivs. or substitution products with alc. alkali at a temp. below 100° in the presence of an oxidizing agent. Thus, 1-aminoanthraquinone is refluxed in a 25% soln. of KOH in alc. while a current of air is introduced; dark brown crystals sep. Compds. may also be prepd. from 2-aminoanthraquinone and 1-aminoanthraquinone-2-sulfonic acid.

**Naphthoquinone derivatives.** I. G. FARBENIND. A.-G. Fr. 654,906, May 26, 1928. See Brit. 291,340 (C. A. 23, 1283).

**Dyes and intermediates.** BRITISH DYESTUFFS CORP., LTD. Fr. 654,005, May 9, 1928. 1-Anilineanthraquinone-2-carboxylic acid is chlorinated in 1 or 2 stages, by heating with  $\text{SOCl}_2$  or  $\text{PCl}_5$  in an org. solvent of high b. p. such as trichlorobenzene whereby the  $\text{COOH}$  group is converted into  $\text{COCl}$ , and then raising the temp. to 180–190° whereby further chlorination takes place and vat dyes are formed. 1-*p*-Tolueno and 1- $\beta$ -naphthylaminoanthraquinone-2-carboxylic acid may be similarly treated.

**Intermediates and dyes.** BRITISH DYESTUFFS CORP., LTD. Fr. 654,813, May 24, 1928. Diaryl sulfones of the type  $\text{contg. SO}_2\text{Ar, OH and COOH}$  in the 1, 2 and 3 positions and substituted in the 5 or in the 5 and 6 or 4 positions, in which Ar denotes an aromatic group, with or without other substituents, are prepd. by condensing 3-carboxy-2-hydroxyaryl-1-sulfonic-5-substituted or 5,6- or 5,4-disubstituted, either with an aromatic nitro compd. having a reactive halogen or with a *p*-quinone monooxime or dioxime. Azo dyes are obtained by diazotizing the above aminodiaryl sulfones and coupling with a coupling component, by acting on a diaminodiaryl sulfone with nitrous acid or by coupling a diazotized aminoazo compd. with a *m*-diaminodiaryl sulfone prepd. in the above manner. Several examples are given.

**Intermediates for dyes.** BRITISH DYESTUFFS CORP., LTD. Fr. 653,595, Apr. 30, 1928. 1,8-Naphthasultone sulfonamides are prepd. by converting 1,8-naphthasultone with P halides to sulfonyl halides which are treated with  $\text{NH}_3$  or an amine in the absence of much water. The products when treated with alkalis give 1-naphthol-8-sulfonic acid sulfonamides, or with  $\text{NH}_3$  soln. give di- or poly-sulfonamide derivs. of  $\alpha$ -naphthol. In examples, 1,8-naphthasultone-3-sulfonic acid is converted to the sulfonyl chloride by  $\text{PCl}_5$ ,  $\text{PCl}_3$  or  $\text{PBr}_5$  and thence to 1,8-naphthasultone-3-sulfonamide and 3-sulfonyl anilide, from which 1-naphthol-3,8-disulfonamide and 1-naphthol-3-sulfonanilide-8-sulfonic acid are prepd.

**Leuco preparations.** J. R. GEIGY. A. G. Swiss 131,083, Aug. 13, 1927. See Brit. 276,023 (C. A. 22, 2471).

**Dyeing with vat dyes.** OBERMAIER & CIE. Ger. 476,267, June 25, 1926. The goods and the bath are surrounded with a non-oxidizing gas until the bath is withdrawn. An app. is described.

**Dyeing textiles.** HENRY DREYFUS. Fr. 653,555, Apr. 28, 1928. Textiles of (or *contg.*) cellulose acetate or other derivs. of cellulose are dyed by projecting on to the material a liquid *contg.* the dye dissolved therein, with or without a swelling agent, the liquid being afterwards evapd. Examples of dyeing are given.

**Dyeing textiles.** NAAMLooZE VENNOOTSCHAP NEDERLANDSCHE KUNSTZIJDEFABRIEK. Ger. 475,879, Dec. 31, 1924. Textiles are given several colors, or have differing glosses imparted to their surfaces, by pptg. S in finely divided form on portions of the fabric and immersing in a dye or finishing bath. Thus, a fabric with a S-*contg.* cotton warp and a S-free cotton weft is immersed in a bath *contg.* alizarin 0.05, NaOH 0.1,  $\text{Al}_2(\text{SO}_4)_3$  1, and  $\text{Na}_2\text{S}$  2% and heated to boiling until the liquor is exhausted. Another example is given.

**Dyeing textiles.** TWO-TONE CORPORATION. Ger. 475,826, Feb. 6, 1925. Thin permeable textiles, especially silk goods, are dyed by placing them in a container and spraying with atomized dye liquor. Cf. C. A. 22, 4258.

**Method of dyeing hanks of yarn.** PAUL MISSY. Ger. 476,659, Sept. 14, 1924.

The hanks are rotated over rollers and sprayed without immersion in the dye. The method is especially applicable to vat, S and O dyes.

**Dyeing yarns and fabrics.** GEORGE H. ELLIS (to Celanese Corp. of America). U. S. 1,716,720, June 11. In methods such as dyeing cellulose acetate and cotton in which strong alkali is usually employed, the latter is at least partially replaced by a sol. salt of a hydroxy compd. of the cyclic org. series such as an alkali metal phenolate, xylenolate, cresolate, resorcinolate, quinolate or naphtholate. Cf. C. A. 22, 1243.

**Dyeing and printing fibers.** HERMANN MÜLLER (to J. R. Geigy S. A.). U. S. 1,717,242, June 11. Ethylenethiodiglycol, which serves to effect fixation at ordinary temps., is introduced into a dyestuff soln., *e. g.*, into one comprising setocyanine,  $H_2O$ , HOAc, tannin and a thickener, and the soln. is applied to fiber such as "acetate silk" without steaming.

**Dyeing animal fibers.** AUGUSTE ESCHACH and JEAN P. WORMS. U. S. 1,716 218, June 4. Silk, wool, leather or other animal fiber is subjected to the action of a sol. metal salt such as  $CuSO_4$  in the presence of nascent  $HNO_2$  at a temp. between atm. temp and about  $100^\circ$ .

**Dyeing cellulose acetate.** GEORGE H. ELLIS (to Celanese Corp. of America). U. S. 1,716,721, June 11. Relatively water-insol. org. compds. capable of coloring cellulose acetate such as 1-amino-4-methylaminoanthraquinone or similar compds. are used in the form of aq. dispersions prepd. by pretreating the compds. with a solubilizing agent comprising a sol. resin soap.

**Dyeing artificial silk.** DURAND & HUGUENIN A.-G. Fr. 33,853, July 7, 1927. Addn. to 571,264. Acetyl silk is dyed or printed with a soln. of an ester of a vat dye, dried, vaporized and afterwards developed by a prolonged oxidation at a high temp. Cf. C. A. 22, 2066.

**Apparatus for dyeing indigo or direct blue or black.** BENOIT BANCILLON. Fr. 653,727, Mar. 6, 1928.

**Dye vat and associated agitating apparatus.** GEORGE E. DRUM and JAMES H. SKITT (to Smith, Drum & Co.). U. S. 1,716 264, June 4. Structural features.

**Apparatus for dyeing thread on bobbins.** J. G. LINDNER. Fr. 652,948, Apr. 17, 1928.

**Support for bobbins during dyeing.** CAMILLE BUREL. Fr. 655,071, June 1, 1928.

**Apparatus for dyeing and lubricating thread as fed to a sewing machine.** ADOLPH F. FILSINGER. U. S. 1,715,649, June 4. Structural features.

**Yarn carrier for hank-yarn dyeing and washing apparatus.** ROBERT HAMPE. U. S. 1,716,128, June 4. Structural features.

**Apparatus for washing, bleaching and dyeing artificial silk in hanks or spinning cakes.** FR. KUTTNER, A.-G. Fr. 652,707, Apr. 14, 1928.

**Finishing textiles.** H. TH. BÖHME A.-G. Fr. 654,386, May 16, 1928. See Brit. 201,094 (C. A. 23, 1288).

**Sizing textiles.** ANDRÉ WEISS. Fr. 653,601, Apr. 30, 1928. Textiles of all kinds are sized by means of a product resulting from the sulfonation of a fatty material in the presence of a hydrocarbon, a gum, a resin and a tannin. Examples are given of the sulfonation of a mixt. of (1) castor oil 250, coconut oil 50, toluene 125, Mamrah gum 25, resin oil 50, sumac extract 10 kg., and (2) linseed oil 250, copra oil 50, stearic acid 25, xylene 50, white resin 60, tannin ( $28^\circ$  B $\acute{e}$ .) 25 kg.

**Sizing textiles.** SOC. POUR LA FABRICATION DE LA SOIE "RHODIASETA." Fr. 655,075, June 1, 1928. Textile fibers such as silk, cotton, wool or artificial silk are sized by treating with an oiling compn. consisting of an oxidized semi-drying oil emulsified in a soln. of soap, and afterwards dipping into a soln. of salts which ppt. the soap and the free fatty acids contained in the oil, and then drying.

**Treating textiles.** H. TH. BÖHME A.-G. Fr. 654,108, May 11, 1928. Products obtained by treating fats, oils or their acids with concd.  $H_2SO_4$  in the presence of org. or inorg. anhydrides or chlorides or very concd. org. acids are added to mercerization, carbonization, bleaching or vat-dyeing baths.

**Treating textile materials.** LEON LILIENFELD. Austrian 112,971, Dec. 15, 1928. Vegetable textile material is given a silky luster by treatment in the following way. It is first treated with  $CS_2$  and an alk. soln. so as to produce sol. cellulose xanthate on the material. It is then treated with a solvent for the xanthate, *e. g.*, NaOH soln., so as to remove at least a part of the xanthate. Finally, it is treated with a reagent capable of decomp. the xanthate.

**Treating textiles and leather.** H. TH. BÖHME A.-G. Fr. 654,624, May 23, 1928. The wetting and impregnating powers of liquors used for treating textiles and leather are increased by the addn. of heterocyclic bases and aromatic sulfonic acids having

aliphatic side chains. Examples are given of the use of (1) propylnaphthalenesulfonic acid or dibutylnaphthalenesulfonic acid and pyridine, (2) isopropyltetrahydronaphthalenesulfonic acid and tetrahydroquinoline.

**Waterproofing textiles.** WOLDEMAR HABERKORN. Fr. 654,968, May 30, 1928. Wool and silk are waterproofed by a soln. of  $\text{Al}(\text{OH})_3$  at about  $70^\circ$ , the  $\text{Al}(\text{OH})_3$  being 1-5% of the wt. of the material treated.

**Moth proofing.** I. G. FARBERIND. A.-G. Fr. 654,712, Feb. 20, 1928. See Brit. 285,825 (C. A. 23, 290).

**Washing textile goods.** EDGAR RIEHL and OTTO LIND (to Henkel & Cie. G. m. b. H.). U. S. 1,716,347, June 4. Washing is effected at temps. below  $70^\circ$  in an aq. liquid contg. soap, mild alk. compds. such as  $\text{Na}_2\text{HPO}_4$ , urea and urease, which serves to assist the cleansing. Cf. C. A. 22, 2472.

**Cleaning fabrics.** FORD H. MCBERTY (to DeLaval Separator Co.). U. S. 1,715,855, June 4. Clothes or fabrics are washed with a soln. of a cleaning liquid such as naphtha or  $\text{CCl}_4$  and paraffin which serves to improve the "sheen," ability to hold a crease and resistance to perspiration.

**Fulling liquors and emulsions for treating textile materials.** KARL DAIMLER, GERHARD BALLE and FRITZ JUST (to Grasselli Dyestuff Corp.). U. S. 1,715,410, June 4. Liquors and emulsions for treating animal textile materials have incorporated in them a sulfonic acid of the benzene or naphthalene series contg. a substituent of the aryl, aralkyl, cyclo-alkyl or acyl groups.

**Textile fibers.** RUDOLF TANDLER. Austrian 112,818, Oct. 15, 1928. Fibers which can be worked up into yarn, etc., are prepd. from animal skins, intestines and bladders by combined chem. and mech. treatment comprising (1) mashing with an acidified salt soln., e. g.,  $\text{NaCl}$ ,  $\text{Al}_2(\text{SO}_4)_3$  or  $\text{Na}_2\text{SO}_4$ , preferably after pretreatment with an alk. soln., e. g.,  $\text{Ca}(\text{OH})_2$ ,  $\text{Na}_2\text{S}$  or  $\text{NaOH}$ , (2) a 2-bath chroming process, (3) a mild treatment with fat, and (4) splitting and tearing.

**Vegetable fibers.** THE ABBEY SYNDICATE, LTD. and DINSHAW R. NANJL. Fr. 654,902, May 26, 1928. Brilliant fibers suitable for spinning are obtained by treating vegetable fibers such as linen, hemp or ramie, with a 1-4%  $\text{NaOH}$  soln. under a pressure of about 10 atm. for 20 to 60 mins. Bleaching may be carried out before or after the treatment.

**Mercerizing vegetable fibers.** SOC. ANON. CELLULOSE. Swiss 130,877, July 8, 1927. Jute, cotton, linen and like fibers are given a silky appearance by removing impurities, carding, opening the fibers and immersing in a bath of  $\text{NaOH}$  at  $20-35^\circ$ . The temp. of the bath rises owing to the reaction of the  $\text{NaOH}$  on the fibers which are removed at  $40-55^\circ$ , rinsed, immersed in a soap bath, and dried.

**Mercerizing.** LEON LILIENFELD. Ger. 476,595, May 20, 1924. See Brit. 231,804 (C. A. 19, 3600).

**Apparatus for charging silk with metallic compounds.** RENÉ CLAVEL. Fr. 654,748, Apr. 11, 1928.

**Artificial silk.** FRANZ J. GAHLERT. Fr. 654,406, May 18, 1928. In a complementary treatment of artificial silk in which the thread is passed through water and drawn, sizing agents such as lightly cooked starch, gum arabic or gelatin are added to the water to produce crepe effects.

**Artificial silk.** FORTUNÉ SÉVERIN. Fr. 654,260, Oct. 11, 1927. Craping of artificial silk is obtained by steeping it in a bath contg. water 100 l., glycerol 200 kg.,  $\text{H}_2\text{O}_2$  1 l., gum tragacanth 0.2 kg., and then passing it to a 2nd bath contg. 500 g of  $\text{HCOOH}$  in 100 l. of water, and drying.

**Apparatus for dehydrating viscose products such as artificial filaments or ribbons.** SAMUEL A. NEIDICH. U. S. 1,717,118, June 11. A closed retort is arranged for treatment of the material with a dehydrating agent such as alc. vapor which is condensed in the retort at the conclusion of the operation and before opening the retort so as to avoid loss of the treating agent by volatilization.

**Fabrics of thermoplastic cellulose derivatives.** THOMAS C. WOODMAN and WILLIAM A. DICKIE (to Celanese Corp. of America). U. S. 1,716,255, June 4. A fabric comprising filaments of material such as cellulose acetate is subjected to heat and pressure to flatten the filaments of the fabric in one direction and increase the impermeability of the material.

**Finishing and stiffening cellulose goods.** GEORGES HEBERLEIN (to Heberlein Patent Corp.). U. S. 1,717,315, June 11. Material such as cotton "mock voile" is treated with caustic alkali of at least  $15^\circ \text{Bé.}$  at a temp. between about  $0^\circ$  and about  $7^\circ$  for at least 20 sec., under tension. U. S. 1,717,316 specifies producing wool-like effects on vegetable fibrous material which has not been subjected to an alkali boiling.

by treating the material, *e. g.*, cotton, in a loose state with caustic alkali which will produce a swelling action on the vegetable fibers and continuing the treatment until full swelling and shrinkage has been effected, then stopping further effect of the alkali (suitably by washing) and drying without such stretching as would substantially reduce the attained shrinkage, and without subsection of the material to alkali boiling.

**Linen.** ÉTABLISSEMENTS AUGUSTE DESCAMPS (S. A. R. L.). Fr. 653,829, May 3, 1928. A tow capable of being spun is obtained from flax straw by breaking to obtain a green tow which is chemically treated and dried. The tow is submitted to one or more treatments with alkali lye in an autoclave, neutralized, oxidized, *e. g.*, with Na perborate, acidified with HCl and dried.

**Wooly effects on threads of acetylcellulose.** RENÉ CLAVEL. U. S. 1,716,423, June 11. Threads and yarns of acetylcellulose are treated with a soln. of a lower aliphatic acid such as an 8% HOAc soln. contg. 0.5% Turkey red oil at about the b. p. of the soln.

**Wool-like effects on cotton goods.** ALBERT BODMER (to Heberlein & Co. A.-G.). U. S. 1,717,322, June 11. The goods are treated with HNO<sub>3</sub>, denitrated to render them less sensitive to alkali prior to any finishing treatment in which alkali is used, and subsequently subjected to a finishing treatment in which alkali is used, as by dyeing in an alk. bath.

**Woolly fibers from waste jute.** JOSEPH VIALLET. Fr. 653,268, Apr. 3, 1928. Waste jute is treated in a bath contg. a small quantity of diastase and a product which will attack the starches and glue, then into the bath contg. K phosphate after which they are disintegrated while damp and sent to the mercerizing and bleaching baths, giving a product similar to wool.

**Bleaching furs.** STEIN FUR DYEING CO., INC. Fr. 653,922, May 5, 1928. Skins to be made up into furs are treated with an aq. soln. of H<sub>2</sub>O<sub>2</sub> contg. NH<sub>3</sub>. Fr. 653,923 describes the treatment of skins with H<sub>2</sub>O<sub>2</sub> and an org. reducing agent such as *o*-aminophenol, or *p*-phenylenediamine which may be chosen to give a desired tint to the finished fur.

**Decolorizing rags.** VIRGINIA SMELTING CO. Fr. 652,696, Apr. 14, 1928. Rags are decolorized by a compn. contg. approx. metallic Zn 28, SO<sub>2</sub> 40 and CH<sub>2</sub>O 1 part in sufficient water.

## 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

**The painting of inscriptions of the rolling stock of railroads.** A. LEMAIRE. *Peintures, pigments, vernis* 6, 779-81(1929); cf. C. A. 21, 181.—A review of the methods and app. B. HAMILTON

**Ocher and ochery earths.** R. M. SANTMYERS. Bur. of Mines, *Circ. No. 6132*, 20 pp. (1929).—Ocher or ochery earth is defined as "a natural mineral pigment composed largely of clay permeated with hydrated iron (ferric oxide)." It has a sp. gr. of about 3.5 and is classed according to color as: cream, gray, white, golden, green or red, ocher. Ordinary ocher rarely contains over 30% Fe<sub>2</sub>O<sub>3</sub>. Uses and specifications of the varieties are noted and the mining and beneficiation described. Domestic deposits and their mining and production are touched upon. In most cases operation is intermittent. French operation, the organization of the French industry and grades of ocher in its market are outlined. W. H. BOYNTON

**Natural mineral colors.** V. CHARRIN. *Peintures, pigments, vernis* 6, 748-55 (1929).—The natural mineral colors are discussed, including sienna, umber, green earths, ochres, iron oxide or minium of iron, and minium of aluminum. Sienna is naturally a very warm yellow. B. HAMILTON

**Linseed oil of Erythrea.** ANON. *Rass. econ. colonie* (Italy) 17, 139-41(1929).—The flax cultivated on the Erythrean upland is the *Linum usitatissimum* var. *humile*. The seeds contain moisture 7, nitrogenous matter 24, non-nitrogenous matter 30.8 and ash 3.4%. The oil obtained has  $d_{15}^{20}$  0.930-0.934,  $n_D^{20}$  —15° to —18°, sapon. no. 185-190, I no. (Hübl) 190,  $n_{25}^{25}$  81-4, acidity (oleic acid) 0.15-0.17%. G. A. B.

**Ink.** A. J. SCHILLBERG. *Svensk Parn. Tid.* 33, 201-6(1929).—300 g. gallnuts free from the finest particles is soaked in a mushy consistancy for 8 days; this is stirred well each day, and then poured on a percolator, 3 l. percolate being obtained. 25 g. concd. H<sub>2</sub>SO<sub>4</sub> and 120 g. FeSO<sub>4</sub>·7H<sub>2</sub>O in water plus 5 g. phenol and 15 g. phenyl blue are added in this order, are well mixed with the percolate and the whole is made up to 4.5 l. and set aside for 8 days before bottling. This makes an ink which does not

form sediment; it has been time tested over many years. Gum should also be added if "Copy" is required. The ink does not meet the state "normal ink" requirements. The following does: To 25 g. cane sugar in clear sirup warmed over free flame (caramelization being avoided) add 28.8 g.  $\text{FeCl}_3$ . When Fe reduction and evolution of HCl sets in, remove from flame and continue vigorous stirring to liberate excess HCl. Add warm water contg. 23.4 g. tannin, 7.7 g. gallic acid, and boil 3 mins., then add 30 g. gum (arabic?) and 1 g. phenol also in warm water and make up to 1 l. The aniline dye is added with the last liquid. This latter ink has not yet been time tested. Both inks flow very well but both attack steel pens. A. R. ROSE

**Analysis of varnish.** B. TYUTYUNNIKOV. *Masloboino Zhirovoe Delo* (Oil and Fat Ind. (Russia)) 1927, No. 1, 17-20; *Chem. Zentr.* 1928, I, 121; cf. *C. A.* 22, 4842. Various methods of testing varnish, which depend on 1 no., d. and drying time, are unreliable because it is possible to prepare mixed varnishes that have the properties of linseed oil. After mixing 30% sunflower-seed oil and 70% linseed oil with an air blast the product closely resembles pure linseed oil. The *heat test of Eibner*, which consists of observing the m. p. and decompn. p. of a dry film of varnish in a capillary tube, is very sensitive. The admixt. of 5% of other oil causes a lowering of 135-40° in m. p. The second test of Eibner, the detn. of the soly. of the oil film in ether, is unreliable. The *illumination test*, which depends upon reflection from the varnish film, is also unreliable. Further investigation is in progress. F. P. C.

**Practical methods for testing varnish.** A. VILA. *Peintures, pigments, vernis* 5, 730-2 (1928).—Directions are given for sampling and for detn. of color, ignition point, non-volatile matter, solidification and time of drying, viscosity, resistance to water and flexibility. B. HAMILTON

**Ethyl abietate.** ALAN C. JOHNSTON. *Ind. Eng. Chem.* 21, 688-9 (1929).—EtOH and Et abietate, when mixed, constitute a solvent for nitrocellulose, giving a plastic film. The alkyl esters of abietic acid are very sol. in 95% EtOH and dissolve ester gum and dammar gum readily, but Manila copal less readily. The prepn. of Et abietate is described. Et abietate is employed advantageously in lacquers, such films not being tacky, and it imparts good adhesive properties to the films. B. HAMILTON

1,4-Dioxan [as solvent] (REID, HOFMANN) 13. An improved simple viscometer for colored fluids (ROBINSON) 1. New uses for Cd [as pigment] (FRANK) 18. Higher terpene compounds. XXXVII. Agathidicarboxylic acid, the crystalline resin acid,  $\text{C}_{20}\text{H}_{30}\text{O}_4$ , of kauri, hard and soft Manila copals (RUZICKA, HOSKING) 10. Anthraquinone derivative [for coloring varnish] (Swiss pat. 131,358) 25. Treatment of chrome iron ore [pigment or enamel] (Ger. pat. 476,397) 9. Hydrocarbons [for varnish industry] (Fr. pat. 652,796) 22.

SPROXTON, F.: *Vernis et emaux cellulosiques*. Translated by A. Tissot. Paris Dunod. 196 pp. F. 36.

**Paint.** CAMILLE DEGUIDE. Fr. 654,381, May 16, 1928. See Brit. 291,355 (*C. A.* 23, 1293).

**Paint, etc.** KRAUSEWERK A.-G. Fr. 653,517, Apr. 27, 1928. Coloring substances after pptn. and washing are kept damp until the moment of being mixed with oils, lakes, etc., when the water is displaced with alc. and the mud obtained is mixed with the oils, etc.

**Paint containing metallic lead.** OSCAR BRANDENBERGER (to Zähler & Schiess & Co.). U. S. 1,717,140, June 11. See Brit. 276,643 (*C. A.* 22, 2474).

**Pigment.** JAMES B. PIERCE, JR. U. S. 1,715,384, June 4. Pptd.  $\text{BaSO}_4$  is suspended in a soln. contg. 200-500 g.  $\text{ZnSO}_4$  per liter and  $\text{H}_2\text{S}$  is passed into the suspension to form  $\text{ZnS}$  and  $\text{H}_2\text{SO}_4$ .

**Pigments.** TITANIUM, LTD. Fr. 653,301, Apr. 21, 1928. A white pigment is made by mixing a paste of Ti hydrate and a paste of blanc fixe made according to Fr. 611,661, preferably with the addn. of a little C, and heating to 650°. The proportion of  $\text{BaSO}_4$  to  $\text{TiO}_2$  in the heated mixt. is 7:3.

**Ferric oxide pigment.** I. G. FARBENIND. A.-G. Fr. 653,226, Feb. 14, 1928. In the reduction of aromatic nitro compds. by Fe and an acid, a ferric oxide, which is suitable for use as a pigment, is obtained by carrying out the reduction in the presence of hydrates, oxides or difficultly sol. basic salts of trivalent or quadrivalent metals such as Ca, Al, Ce, Th, La.

**Black copying ink.** I. G. FARBENIND. A.-G. (Paul H. Wolff, Curt Jochum and

August Stock, inventors). Ger. 475,689, Dec. 28, 1926. See Fr. 633,311 (*C. A.* 22, 3537).

**Counterfeiting oil paintings.** GEORG MASCHKE. Ger. 476,572, Feb. 8, 1927, and 476,573, May 20, 1927. The picture is printed on canvas coated with a white paste of heavy spar, prepd. chalk, potato flour, glycerin and castor oil emulsion. The paste may be sprayed on the canvas.

**Oil colors and lacquers.** WALTER ZIPPER. Fr. 654,621, May 19, 1928. Oil colors or lacquers for preventing oxidation of Fe are made from a varnish or a soln. of a resin to which are added (1) org. and (or) inorg. salts of metals such that in the presence of water these salts form an alk. electrolyte, and (2) metals which constitute with respect to Fe the anode in the alk. electrolyte formed. An example is given.

**Varnishes or lacquers.** AMERICAN CYANAMID CO. Fr. 654,912, May 26, 1928. Comps. suitable for lacquers or varnishes contain a cellulose ester and an ester of a hydroxyisovalphatic acid.

**Varnishes.** I. G. FARBENIND. A.-G. Fr. 33,924, July 23, 1927. Addn. to 608,301. Varnishes are colored by incorporating in them basic dyes which may also contain acid groups and besides complex acids such as phosphotungstic acid or their salts.

**Varnishes.** I. G. FARBENIND. A.-G. Fr. 653,025, Apr. 19, 1928. Non-inflammable nitrocellulose varnishes are prepd. by adding, to a soln. of nitrocellulose contg. the usual constituents,  $\text{CH}_2\text{Cl}_2$  or its mixts. with  $\text{C}_6\text{H}_4\text{Cl}_2$ , in proportion such that it equals or exceeds the total of all other liquids present. To prevent deposition of nitrocellulose it may be necessary to add cyclic ketones, cyclohexyl acetate, aliphatic alcs. or esters.

**Varnishes, films, etc.** I. G. FARBENIND. A.-G. Fr. 653,026, Apr. 19, 1928. Urea- $\text{CH}_2\text{O}$  condensation products, such as those described in Fr. 641,420, are used in the presence of solvents with increased proportions of nitrocellulose if vegetable oils, such as castor oil previously treated at  $170\text{--}180^\circ$  with an oxidizing gas, are added.

**Varnishing.** LONZA ELEKTIZITÄTSWERKE UND CHEM. FAB. A.-G. Swiss 130,739, July 15, 1927. In coating objects with lacs contg. cellulose esters, the injurious solvent is removed, as by heating or washing, after application of the last coat.

**Varnished or gilt characters.** C. H. GEORG HAASE. Ger. 475,908, Nov. 1, 1927. Cement letters or figures are smoothed with sandstone, coated successively with a soln. of cellulose or celluloid in acetone or  $\text{AcOEt}$ , and linseed-oil varnish, and treated with gold leaf or a further coat of varnish.

**Treating unsaturated compounds.** LASZLÖ AUER. Fr. 653,435, Apr. 25, 1928. Unsatt. compds. are treated with metals, oxides or hydrates or org. bases and at the same time or subsequently with compds. yielding S, the action of the latter being increased if necessary by a vulcanization accelerator. In examples, castor oil is treated with metallic Ca and afterwards heated to  $160^\circ$  with  $\text{Fe}_2\text{O}_3$ ,  $\text{PhNH}_2$  and S, giving a product which may be molded. Resin is heated with  $\text{SnO}_2$  and, after cooling, alc. and  $\text{S}_2\text{Cl}_2$  are added, giving a product which dissolves in turpentine and gasoline to form a varnish.

**Enameling apparatus.** HEINRICH C. JAQUET. Ger. 476,109, Oct. 28, 1927. Improvements are described in app. comprising an electrically heated crucible in which the enamel is melted and from which it is sprayed by compressed gas on to the surface to be enameled.

**Electrodes for heating apparatus [for enameled or lacquered metal objects].** HUNDT & WEBER G. M. B. H. Ger. 476,108, July 31, 1927. Addn. to 468,597. Electrodes for the app. of Ger. 468,597 (*C. A.* 23, 1294) are described.

**Colophony.** JOSEPH FILIPOWICZ. Fr. 653,962, May 8, 1928. Colophony is purified by extrn. of the colored portion thereof from solns. of colophony by means of Russian benzine.

**Artificial resin.** BAKELITE CORP. Fr. 653,004, Apr. 18, 1928. Resins are made by reacting a phenol and a fatty oil such as tung, linseed or rape oil and combining the product with a  $\text{CH}_2$ -contg. hardening agent such as  $\text{CH}_2\text{O}$  or hexamethylenetetramine, and a non-phenolic resin. A soln. of the product in turpentine is used as a varnish. Phosphoric acid or boric acid may be used as catalysts for the phenol-oil reaction, but these may be replaced by acid resins. Cf. *C. A.* 23, 2051.

**Artificial resins.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 33,936, July 27, 1927. Addn. to 604,198. See Brit. 275,219 (*C. A.* 22, 2282).

**Artificial resins.** I. G. FARBENIND. A.-G. Fr. 654,317, May 15, 1928. White or transparent products are obtained by fusing and hardening a mixt. of urea with solid polymers of  $\text{CH}_2\text{O}$  with the addn. of  $\text{NaOAc}$ , borax, etc., or a small amt. of a feeble

alkali. The production of a transparent product is favored by the addn. of thiocarbamide.

**Synthetic resins.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 654,175, Jan. 28, 1928. A resin is formed by the reaction between a polyhydric alc., an aromatic polybasic acid and one or more oxidizable fatty acids, particularly an acid derived from a drying oil such as oleostearic, linolic or linolenic acid. Examples are given in which chinawood, linseed or perilla oil is used. The solns. of the products in acetone, etc., form *varnishes*, and the resins themselves may be molded. Cf. C. A. 23, 3589.

**Phthalic-glyceride resin.** HENRY C. P. WEBER (to Westinghouse Elec. & Mfg. Co.) U. S. 1,715,688, June 4. A resin suitable for varnishes and for molding and insulating composites, is obtained by the combination of phenol-furfural resins with glycerol-phthalic anhydride resins; the product has properties which are superior to those of either of its constituents.

**Phenol-resin molding mixture.** LAWRENCE V. REDMAN and VICTOR H. TURKINGTON (to Bakelite Corp.). U. S. 1,716,665, June 11. A molding mixt. is formed comprising a potentially reactive phenolic resin, a filling material such as wood flour and an aldehyde of high b. p. such as furfural. A greater proportion of filling material than of phenolic resin is used and the product is given the requisite flowing property by the aldehyde of high b. p. The material is suitable for making molded articles.

**Ketone-aldehyde intermediate and resinous complex.** CARLETON ELLIS. U. S. 1,716,542, June 11. A substantially water-white sirupy product is obtained by the reaction of a ketone such as acetone with  $\text{CH}_2\text{O}$  in the presence of  $\text{Na}_3\text{PO}_4$ . This product may be used in making *lacquers*, etc. Several examples are given.

**Condensation products.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Swiss 131,274 to 131,276, June 16, 1927. Addns. to 129,592 (C. A. 23, 3589). See Brit. 292,168 (C. A. 23, 1518).

**Condensation products of phenol and formaldehyde.** KUNSTHARZFABRIK FRITZ POLLAK G. M. B. H. Fr. 653,354, Apr. 6, 1928. See Brit. 290,963, C. A. 23, 1294

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**New fatty acids resulting from hydrogenation.** S. TALANZEV. *Masloboino Zhirouoe Delo (Oil and Fat Ind. (Russia))* 1927, No. 1, 23-7; *Chem. Zentr.* 1928, I, 128; cf. C. A. 22, 3793, 4849.—Various isomers of oleic acid are formed upon hydrogenation of plant oils. Myddelton and Barry terms these "new acids of hydrogenation." They constitute about 45% of hydrogenated sunflower seed oil. The presence of these isomers results in a higher quality soap from plant oils. The less of unsatd acids which an oil contains the better is the resulting soap. The hydrogenation of the oil is not necessary as by heating at 100° or treating with NO polymerization occurs and a product results which is suitable for the prepn. of solid soap. FRANCIS P. GRIFFITHS.

**Fatty acid distillation.** D. K. MÜLLER. *Seifensieder-Ztg.* 56, 170-1 (1929).—A fatty acid distn. is advantageous for soap making, but may lead to losses if improperly handled. P. ESCHER.

**Cacao butter.** I. Determination of the unsaturated acids of pressed cacao butter. H. P. KAUFMANN. *Z. angew. Chem.* 42, 402-6 (1929).—Samples of pure pressed cacao butter from 19 different sources showed the following variations in consts. m p (clear) 33.0-35.8°,  $n_D^{40}$  1.4570-1.4575, I no. 34.9-37.6, thiocyanate no. 32.7-34.9, from the last 2 consts. the percentages of oleic and linolic glycerides are calcd., varying from 34.2 to 37.3 and from 2.4 to 4.3, resp. The highest I no. of the liquid unsatd acids was 103.1. By Hazura's method of oxidation with  $\text{KMnO}_4$  a tetrahydroxystearic acid was isolated, m. 156°, showing that it is linolic acid which accompanies oleic acid in cacao butter. Twenty-five references to the literature are given. P. ESCHER.

**New tests on cacao butter.** G. ISSOGLIO. *L'industria chimica* 4, 195-6 (1929).—When 1 g. cacao butter is added to 10 cc. of a soln. made of freshly distd.  $\text{C}_6\text{H}_5\text{NH}_2$ , 15 g.,  $(\text{CH}_3)_2\text{CO}$  55 g. and 95%  $\text{EtOH}$  33 cc., it dissolves completely on heating; on cooling it remains liquid for over 12 hrs., no crystals forming. However, if other fats, such as coconut oil, stearin, lard and paraffin, have been added as adulterants, they solidify and often form crystals. It is also noted that the difference between the m p. of the fatty acid and that of the glyceride of cacao butter is about 20°, which is much greater than that between those of the common adulterants. The following figures

give m. ps. of the fat and of the fatty acid, resp.: cacao butter 26–33°, 48–53°; bone marrow 21–22, 30; steer fat 43–45, 41–47; horse fat 25–39, 36–42; stearin from cotton 29–32, 38–42; coconut oil 20–38, 24–27; palm butter 27–43, 47–50; vegetable fat 35–53, 34–36. This property serves as confirmatory evidence, when the results of the soly. test are doubtful.

A. W. CONTIERI

**The fat of *Phoca sibirica* Gmel.** A. G. FRANK-KAMENETZKII. *Compt. rend. acad. sci. union rép. soviét. social.* 1929, 67–72.—There is an interdependence between the compn. of the fat of seals and the climatic conditions. The fat from *Phoca sibirica* Gmel. had  $d_{15}$  0.929, Zeiss refractometer at 20° 81.7, acidity in % of oleic acid 0.65, acid no. 1.3, ester no. 193.3, sapon. no. 194.6, Reichert-Meissl no. 0.8, Polenske no. 2.25, iodine no. 168.4, Gener's no. 95.6, non-saponifiable fraction 0.44%. The fatty acids had  $d_{15}$  0.915, neutralization no. 202.3, av. mol. wt. 276.5, iodine no. 159.8. These values are similar to those obtained on fat from other seals except in refraction and iodine no., which are higher in the fat of *Phoca sibirica* Gmel. The reason for such differences is that this seal, inhabiting the very cold Baikal Sea, forms and accumulates more unsatd. acids, which are chemically very active.

YETTA POROSOWSKY

**The causes of deterioration of fats and oils.** W. L. DAVIES. *Chem. Age* (London) 20, 489–92(1929).—Fat deterioration is mainly caused by oxidation or by microorganisms. The effects of temp., light, acidity, impurities and metallic catalysts are discussed. If microorganisms are present in fats no autocatalytic oxidation will occur. Deterioration of fat due to bacteria is not so marked as that due to higher organisms such as molds.

E. SCHERUBEL

**The analytical quartz lamp, Original Hanau, in the oil-works laboratory.** A. WAGNER. *Chem.-Ztg.* 53, 398–9(1929).—A table is given showing the luminescence, under the quartz lamp, of raw and refined vegetable oils and their mixts., solvents for extn. and extn. residues, resins, mineral oils, wood oil, glycerol and white pigments. The appearance of these various materials under the quartz lamp gives clues for their identification, purity and source.

E. SCHERUBEL

**Composition of the olive oil residues obtained by various methods of extraction of the oil.** M. BASSARÁN AND F. BAJO. *Ind. pecuaria* 28, No. 920, 539–42(1927); *Intern. Rev. Agr.* [N. S.] 19, 820.—The authors have analyzed many samples of olive oil residues obtained: (1) by the Acapulco-Quintanilla system; (2) by the mixed system Acapulco-Quintanilla and hydraulic press; (3) by hydraulic press; and have detd., using the coeffs. of digestibility established by Kellner's standards, the starch value and the fat-protein ratio, finding an av. 36.89% of starch value and 1:9.42 fat-protein ratio in the first case; 39.33 and 1:16.63%, resp., in the second case, and very similar compn. in the samples of the second and third case. They have compared the degree of oil exhaustion of the residues as obtained by these 3 systems, noting that the fat content of the residues (ether extn.) was, resp., 15.39, 9.02 and 11.31% in respect of the wt. of the residues and 2.41, 9.02 and 11.39 in respect of the wt. of the olives: in the first case, in fact, the residue did not contain stones; in the other two cases it did. Therefore the best exhaustion was obtained by the Acapulco-Quintanilla system, also taking into account the loss of fats caused by the sepn. of the stones, which amt. to 0.30% of the wt. of the olives (80% of pulp, 20% of stones).

H. L. D.

**Castor oil from Ukraine.** N. A. VALYASHKO AND M. A. NEKHAMKIN. *Farm. Zhur.* 1928, 240–7.—Statistics are given on the cultivation of the castor oil bean in Ukraine together with the chemical and physical consts. of the oil.

E. BIELOUSS

**Constituents of soy beans.** B. REWALD. *Seifensieder-Ztg.* 56, 156(1929); cf. C. A. 23, 477, 1769.—R. points out some errors in the calcn. of lecithin and reports the following as representing an av. analysis of the cake: protein 48.00,  $H_2O$  12.00, fat + lecithin 1.5, crude fiber 6.00, ash 6.00, N-free ext. 26.50%. Cf. following abstr.

P. ESCHER

**Constituents of soy beans.** B. REWALD. *Seifensieder-Ztg.* 56, 193–4(1929).—Holtz's calcn. of the % of phosphatides is wrong in principle. Cf. preceding abstr.

P. ESCHER

**Constituents of soy beans.** M. JAKES. *Seifensieder-Ztg.* 56, 186(1929).—J. objects to Holtz's method of calcg. the total P of the soy bean as lecithin, thereby obtaining too high results; it is better to det. the P in the ether ext. directly and to calc. lecithin from it.

P. ESCHER

**Constituents of soy beans.** E. HOLTZ. *Seifensieder-Ztg.* 56, 194(1929).—Lecithin is a colloid; it may vary in compn.; only certain groups may be extd. by ether; one or more extns. would not ext. all the lecithin from within the cells.

P. ESCHER

**Absorption capacity of fuller's earth.** HANS HELLER. *Allgem. Öl- u. Fett-Ztg.* 24, 599–600(1927); *Chem. Zentr.* 1928, I, 271.—The amt. of oil absorbed by fuller's earth

in the bleaching process is calcd. according to the equation  $x = A \cdot p / (100 - p)$ , where  $A$  = the fuller's earth used,  $p$  = the % oil contained in the earth after having been used in the filter press.

FRANCIS P. GRIFFITHS

**Acid soaps.** C. BERGELL AND N. BASKIN. *Seifensieder-Ztg.* **56**, 157-8 (1929).—(1) Fifty g. fat contg. 5 g. free fatty acids was boiled for 30 mins. under reflux with 100 g.  $H_2O$  contg. 2 g. soap, and allowed to settle hot for 30 mins. (2) The above procedure was carried out with addn. of 2 g.  $NaCl$ . (3) Four g.  $NaCl$  was used. The resulting products were analyzed for total fat, free fatty acids and combined fat. No. 1 had 14% free fatty acids associated with the soap; No. 2 had 28% and No. 3 had 30% associated with it. These results show that moist soap absorbs free fatty acids more strongly than neutral fat and that this absorption is much increased by the presence of  $NaCl$ .

P. ESCHER

**Acid soaps.** A. EISENSTEIN. *Seifensieder-Ztg.* **56**, 185-6 (1929).—When oil is refined by an excess of  $NaOH$ , the resulting soap is "wetted" by neutral oil, but when an insufficient amt. of  $NaOH$  is used, the remainder of the free fatty acids will "wet" the soap and a larger yield of neutral oil results.

P. ESCHER

**Ethanolamine soaps.** RALF B. TRUSLER. *Ind. Eng. Chem.* **21**, 685-7 (1929).—Mono-, di- and tri-ethanolamines are synthesized from  $NH_3$  and fundamentally are substituted  $NH_3$  compds. in which one or more H is replaced by the ethanol group,  $HO-CH_2-CH_2$ . Phys. and chem. properties are noted. Soaps made from fatty acids and the ethanolamines possess properties which may bring them into tech. importance. Among the prospective uses are: (1) as emulsifiers for vegetable, animal and mineral oils, (2) as thickeners for lubricating oils, (3) as detergents when incorporated in special compns., (4) as efficient dry-cleaning soaps in the form of oleates which are readily sol. in org. solvents, and (5) numerous possible industrial applications due to their great soly. in almost all liquids.

W. H. BOYNTON

**Soap lather.** I. L. ZAKARIAS. *Z. physik.-chem. Seifenforsch.* **1**, 54-6 (1928). cf. C. A. **23**, 3117.—A general discussion.

P. ESCHER

**Alkalinity of soap solutions as measured by indicators.** JAMES W. MCBAIN AND KATHLEEN HAY. *J. Chem. Soc.* **1929**, 589-601. — Very few indicators are of any value for the study of the alkyl. of soap solns. Detns. are recorded for solns. of pure K and Na soaps at  $20^\circ$  and  $90^\circ$  over a wide range of concn. All the results harmonize with the recognition of 2 factors: (1) that hydrolysis is a property of the free, simple, fatty ion, not of any other ion, mol. species or colloid; (2) that hydrolysis is chiefly due to the fatty acid formed being almost completely removed to form acid soap. Hence, all soap solns. are alk. and none contains even the minute amt. of free fatty acid required to sat. the  $H_2O$ . The results obtained support the conception that soap solns. are crystalloidal when sufficiently dil. and colloidal in higher concns. For example, on the addition of soap to  $H_2O$  the hydroxyl-ion concn. rises, passes through a flat max. and diminishes again as the soap soln. becomes concd. and the simple fatty ions are replaced by ionic micelles. The more colloidal the soap the sooner is the max. hydrolysis alkyl. attained.

E. SCHERUBEL

**Composition of washing compounds.** K. LÖFFL. *Seifensieder-Ztg.* **56**, 167-8 (1929).—The desirable qualities of toilet and laundry soaps are discussed. K favors toilet soaps contg. some lanolin, hydrocarbons, etc., and laundry soaps which contain some bleaching or other beneficial agent and are obtained by spraying.

P. E.

**Structure and analysis of bleaching earths (ECKART) 18.** Hydrocarbons [for soap and candle industry] (Fr. pat. 652,796) **22.** Increasing the viscosity and lubricating power of oils (Fr. pat. 654,314) **21.** Steam-heated apparatus for gravity separation of oil and water (U. S. pat. 1,716,934) **1.** Purifying oils with liquid  $SO_2$  (Ger. pat. 476,464) **13.**

**Apparatus for steam distilling fatty acids.** METALLBANK UND METALLURGISCHE GES. A.-G. Fr. 654,833, May 25, 1928.

**Apparatus for extracting oil from olives, etc.** SOC. JEANJEAN ET CASAS. Fr. 654,217, Apr. 20, 1928.

**Rendering castor oil miscible with mineral oil.** LOUIS J. REIZENSTEIN. U. S. 1,715,785, June 4. Castor oil is heated at atm. pressure with a metallic salt or compd. such as  $Al_2(SO_4)_3$  (suitably at a temp. of about  $200^\circ$ ) and then sep'd.

**Emulsions.** INDUSTRIAL PROCESSES DEVELOPMENT, LTD. Fr. 652,981, Apr. 18, 1928. Emulsions of solvents for fatty substances (preferably a chlorinated hydro-

carbon such as  $C_2H_5Cl_2$  or  $C_2HCl_3$ ) are obtained by means of an emulsifying agent such as Turkey red oil in the presence of bentonite. Cf. C. A. 23, 249.

**Suspensions and emulsions.** I. G. FARBENIND. A.-G. Fr. 652,843, Mar. 15, 1928. The products obtained by treating fatty acids of suint or suint itself with sulfonating agents while adding phenols as described in Fr. 645,819 (C. A. 23, 2057) are used for making emulsions or suspensions of oils, etc.

**Purifying wax.** A. RIEBECK'SCHE MONTANWERKE A.-G. Fr. 654,356, May 16, 1928. See Brit. 299,357 (C. A. 23, 3365).

**Soap.** ADOLF LETTERMANN. Fr. 653,126, Apr. 20, 1928. See Brit. 288,584 (C. A. 23, 727).

**Soap.** ADOLPHE HUMBEL and JULIE RIGOLET. Swiss 131,104, June 1, 1928. A soap is mixed with powd. marble and sol. silicates.

**Soap flakes.** ERNST FLAMMER and CHRISTIAN KELBER. U. S. 1,715,999-1,716,000, June 4. See Ger. 472,047 (C. A. 23, 2589).

**Atomizer for producing soap powder.** GEBR. KÖRTING A.-G. Ger. 476,959, Aug. 28, 1926.

**Soaps, cosmetics, disinfectants, etc.** CARL STIEPEL. Ger. 476,261, Feb. 1, 1925. The waxes, lanolin or glycerol usually employed in the manuf. of superfatted soap, shaving cream and certain cosmetics, disinfectants, cleansing compns., etc., are replaced by aliphatic alcohols having 16-20 C atoms in the mol., particularly by the alcohols obtainable from spermaceti, sperm oil and beeswax. Examples are given.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

**Colloidal chemistry in its relation with the sugar industry.** J. BERGE. *Bull. soc. chim. Belg.* 38, 31-46(1929).

ALBERT L. HENNE

**The velocity of crystallization of sucrose from its pure solutions.** B. G. SAVINOV. *Nauch. Zapiski Sakharnoi Prom.* 7, 416-29(1929).—It is common knowledge that temp. and supersatn. being equal, the velocity of crystn. increases when a supersatd. soln. is stirred. S. demonstrates the relationship between the velocity of crystn. and the amt. of agitation. Four large, well-shaped crystals of ascertained wt. and area were attached to the arms of an agitator and revolved at known rates in a supersatd. sucrose soln. for definite time intervals. Three solns. were used of supersatns. 1.025, 1.015 and 1.010, resp., and at a temp. of 50°. After every predetd. time interval the gain in wt. of the crystals was detd. The velocity of crystn. increased rapidly with the speed of agitation up to a certain point, 400 r. p. m., after which it became const. for any speed. Practically, such velocities of crystns. are not attainable except in the lab.

V. E. BAIKOW

**Low-temperature injury to stored sugar cane.** GEO. B. SARTORIS. *J. Agr. Research* 38, 195-203(1929).—The f. p. of sugar-cane juice varied from  $-0.468^{\circ}$  to  $-1.090^{\circ}$  in the top nodes; from  $-0.627^{\circ}$  to  $-1.157^{\circ}$  in the lower nodes; from  $-0.575^{\circ}$  to  $-0.814^{\circ}$  in the leaves and from  $-0.72^{\circ}$  to  $-1.64^{\circ}$  in whole mature canes.

A. L. MEHRING

**Improvement of beet-sugar products treated with activated carbon.** I. N. KAGANOV AND B. E. KRASILSHCHIKOV. *Nauch. Zapiski Sakharnoi Prom.* 6, 344-51(1928).—Use of activated carbon (5% of wt. of sugar in solution) decreased the color and increased the speed of crystn. The speed of crystn. of greens increased from 65.8 to 78.3% compared with the speed of crystn. of a pure sucrose solution of the same supersatn. Activated C increased the filtration rate of carbonated juice 53%; of diluted thick juice, 20%. Solns. treated with activated C boiled 3-7% faster than the untreated solns.

V. E. BAIKOW

The Cu content of sugar-beet leaves treated with Cu compounds, and changes in their oxalic acid content (FRIGERIO) 15. Adhesive from beet pulp (YANOVSKII) 18. Purification of waste waters from beet-sugar factories (WILSON, GARNER) 14. Sugar anhydrides. I. Galactosan  $< \alpha 1,5 > \beta 1,6$  (MICHEEL) 10. Unsaturated reduction products of sugars and their derivatives. XI. 2-Desoxycellobiose (celldesose) and derivatives of 2,3-bisdesoxycellobiose (BERGMANN, BREUERS) 10. Drying [beet slices] with waste gases (Austrian pat. 113,019) 13. Ethers of [cellulose] (Ger. pat. 475,884) 23. Adsorbing agents containing  $SiO_2$  [for molasses decolorization] (U. S. pat. 1,715,439) 18.

**Methods of Chemical Control for Cane Sugar Factories and Gur Refineries.** Seorahi, Gorakhpur, India: Sugar Technologists' Assocn. of India. London, 2 St. Dunstan's Hill: Norman Rodger. 10s. 6d. Reviewed in *Intern. Sugar J.* 31, 326 (1929).

**Sugar.** HERMANN CLAASSEN. Ger. 476,715, Sept. 11, 1927. See Brit. 296,985 (C. A. 23, 2595).

**Sugar.** SUGAR BEET & CROP DRIERS, LTD. Fr. 654,632, May 23, 1928. See Brit. 293,946 (C. A. 23, 1766-7).

## 29—LEATHER AND GLUE

ALLEN ROGERS

**The technology of tanning.** GEORGE D. McLAUGHLIN AND FRED O'FLAHERTY. *J. Chem. Education* 6, 1019-34(1929). E. J. C.

**Influence of acids upon the fixation of wattle tannin by hide powder.** ARTHUR W. THOMAS AND MARGARET W. KELLY. *Ind. Eng. Chem.* 21, 697-8(1929).—The rate of tanning of hide powder in wattle-bark liquors as a function of  $p_H$  value was measured for the following acids: acetic, succinic, lactic, formic, citric, tartaric, monochloro-acetic, oxalic and hydrochloric. In the  $p_H$  range 2.5 to 3.0, the rate of tanning, qualitatively, varied inversely proportionally to the dissociation constant of the acid used. J. A. WILSON

**Can the mastic plant which grows in Sardinia be used in industry?** A. SANNA AND G. REPETTO. *Boll. soc. ital. biol. sper.* 4, 273-7(1929).—The leaves of *Pistacia lentiscus*, which grows in Sardinia, contain enough tannin to make them a source of raw material for the production of tannin. The amount of tannin in the leaves reaches the maximum during the blossoming period and then rapidly diminishes. P. M.

**Synton tannage.** ARTHUR W. THOMAS AND MARGARET W. KELLY. *Ind. Eng. Chem.* 21, 698-701(1929).—Studies were made of the tanning actions of quebracho and wattle in the presence of the synton, Leukanol. The addition of synton causes an increased rate of tanning because of its acid reaction, but with many advantages over the use of acids, one of which is that the greater rate of fixation of tannin is not accompanied by a greatly decreased rate of penetration. The synton prevents "dead tanning" or casehardening. J. A. WILSON

**Effect of pretreatment upon hydrolysis of hide powder by saturated calcium hydroxide solutions.** ARTHUR W. THOMAS AND MARGARET W. KELLY. *Ind. Eng. Chem.* 21, 701-2(1929).—The thorough drying of hide powder causes it to become more susceptible to hydrolysis by limewater. Pretreatment of the hide powder with saturated  $\text{Na}_2\text{SO}_4$  solution caused it to hydrolyze in limewater to a lesser extent than pretreatment with water, but to a greater extent than pretreatment with saturated  $\text{NaCl}$  solution. It may be that the  $\text{NaCl}$  caused the removal of the more readily hydrolyzable material prior to treatment with limewater. J. A. WILSON

**Roller leathers.** J. W. LAMB. *Dyer, Calico Printer* 61, 273(1929).—The preparation of these leathers, which are used in the spinning of cotton, is described. R. K. W.

**Determination of the water content of glue and gelatin.** E. SAUER AND H. DILLENUS. *Z. angew. Chem.* 42, 552-5(1929); cf. C. A. 22, 3550.—A 50-80-g. sample of glue or gelatin is covered with 500 cc.  $\text{H}_2\text{O}$  and allowed to stand 24 hrs., then raised to  $70^\circ$  in a water bath for 30 mins., transferred to a 1000-cc. flask, kept at  $40^\circ$  and filled to the mark. After 1 hr. the solution is shaken thoroughly, a sample transferred to a 10-cc. graduated flask, brought to  $40^\circ$  in the thermostat, made up to the mark with the solution, and then poured into a flat Al evaporation dish provided with a cover or kept in a flat weighing bottle. It is dried at  $110^\circ$  to constant weight in an air-bath, about 15 hrs. being required. It is then cooled in a desiccator over  $\text{H}_2\text{SO}_4$ , and weighed in the closed weighing flask, as the glue is very hygroscopic. Comparison analyses prove the accuracy of the method proposed. W. C. EBAUGH

**Treating leather** (Fr. pat. 654,624) 25.

**Tanning.** ORTO RÖHM. Fr. 654,831, May 25, 1928. See Brit. 292,501 (C. A. 23, 1523).

**Leather tanning.** SOC. IND. DES APPLICATIONS CHIMIQUES, SOC. ANON. I. N. D. A. C. Ger. 476,678, June 26, 1928. The usual neutralizing and deliming bath for depilated

hides is improved by the addn. of about 1%  $\text{PhNO}_2$ . The examples mention 1%  $\text{PhNO}_2$  and 99%  $\text{AcOH}$ ,  $\text{HCOOH}$  or  $\text{PhOH}$ .

**Tanning fish skins.** RUDOLF TANDLER. Austrian 112,817, July 15, 1928. In the manuf. of leather from shark and ray skins, the treatments prior to tanning are conducted so that the pearly structure is retained in the final product. The preliminary treatments comprise liming, pickling and treating with an acid soln. of sufficient concn. to ext. only the inorg. constituents of the pearly nodules. An example is given. The skins are finally tanned intensively with mineral, vegetable or fatty agents.

**Treating skins.** PAUL FOURISCOT ET FILS. Fr. 653,519, Apr. 27, 1928. After tanning with S and after a 2nd tanning with quebracho and myrobalan, skins are treated with fatty substances such as castor or codfish oil to make them waterproof.

**Leather.** ROBERT H. PICKARD, DOROTHY J. LLOYD and ALBERT E. CAUNCE. U. S. 1,715,621, June 4. A pelt, hide or skin is at once immersed in a bath of acetone of full strength until it is in equil. with a mixt. of acetone and water of sp. gr. not greater than 0.81; the acetone is removed from the material and it is then subjected to an aq. tannin soln. U. S. 1,715,622 specifies effecting tanning by treating the material in dry condition with gaseous formaldehyde. U. S. 1,715,623 specifies producing a chrome-tanned leather that may be wet back by subjecting the leather in the wet-blue condition to the action of acetone.

**Preserving leather.** THE SALT UNION, LTD. Ger. 475,897, Sept. 14, 1926. Skins and hides are preserved by soaking in brine contg. at least 1%  $\text{CdCl}_2$  or  $\text{SnCl}_4$  or a mixt. of both. Cf. C. A. 22, 3801.

**Oil for use on leather.** ARMAN E. BECKER and ARTHUR B. BOEHM (to Standard Oil Development Co.). U. S. 1,715,892, June 4. A mineral lubricating oil is mixed with an oil-sol. sulfonate contg. free alkali; saponifiable fish oil is added to react with the alkali and the mixt. is heated and stirred to facilitate neutralization; it is cooled, settled and deposited impurities are sepd.

**Dyeing leather.** I. G. FARBENIND. A.-G. (Hans Grotowsky, inventor). Ger. 476,457, April 5, 1927. Leather is dyed with sulfonic or carboxylic acid of benzal-pyrazolones. The use of the condensation product from *p*-diethylaminobenzaldehyde and 1-(3'-methyl-4'-hydroxy-5'-carboxyphenyl)-3-methyl-5-pyrazolone is described in the example.

**Washable printings on leather.** CHARLES S. FRIEDMAN (to Soc. Anciens Etablissements A. Combe & Fils & Cie.). U. S. 1,716,120, June 4. A hide or skin is prepd. for the subsequent printing, steaming and fixing steps by tanning first with formol and then in a sumac bath.

**Apparatus for granulating animal glue, gelatin, etc.** AKTIEN-GESELLSCHAFT FÜR CHEMISCHE PRODUKTE VORM. H. SCHEIDEMANDEL. Ger. 476,328, May 29, 1926. Addn. to 437,346. The glue, etc., is forced by a piston along a cylinder, the end wall of which is formed of a double grating, and one part of which is reciprocated vertically and the other horizontally in directions transverse to the push of the piston. A rotary knife may be arranged on the delivery side of the grating.

**Gelatin from demineralized bone.** ALEXANDER HOWARD TOD. Ger. 476,611, Aug. 19, 1925. The softened bone is heated in an extn. app. with water at about 80° and the gelatin soln. drawn off from the top.

### 30—RUBBER AND ALLIED SUBSTANCES

C. C. DAVIS

Hydrocarbons [for rubber industry] (Fr. pat. 652,796) 22. Emulsifiers and stabilizers [for rubber] (Fr. pat. 655,044) 22.

**Rubber.** ARNOLD R. F. VAN DER MARK and HEIN KREMER. Ger. 476,998, Apr. 23, 1925. Rubber objects are prepd. from freshly coagulated rubber, and their walls expanded by gaseous, liquid or solid pressure media and vulcanized.

**Rubber latex.** I. G. FARBENIND. A.-G. Fr. 33,927, July 25, 1927. Addn. to 630,983. Coagulation of latex is prevented by adding alcs., ketones or hydrocarbons or their derivs. and by adding neutral or alk. salts of acids such as diarylphosphoric and methylsulfuric acids. Latex with the addn. of suitable dispersing agents may be vulcanized with  $\text{SO}_2$  and  $\text{H}_2\text{S}$ . Products having a basis of rubber and resins are prepd. by coagulating mixts. of alk. solns. of hydroxyaryl-formaldehyde condensation products and latex and hardening the product which seps.

**Treating latex.** VEEDIP, LTD. Fr. 652,695, Apr. 14, 1928. Latex contg.  $\text{NH}_3$  is thickened by the addn. of a small quantity of  $\text{ZnO}$ , preferably in a finely divided state. The  $\text{ZnO}$  is made into a paste with water and a few drops of  $\text{NH}_3$  and a little latex are added to produce a thick liquid which is added to the mass of latex. The latex is afterwards heated.

**Rubber articles from latex.** UGO PESTALOZZA (to Soc. Italiana Pirelli). U. S. 1,717,248, June 11. In forming tubes, sheets, gloves or other articles, there is added to latex such a quantity of  $\text{CaSO}_4$  or other suitable coagulating agent as will coagulate the latex solely at a temp. of  $70-100^\circ$ , the latex is then brought in contact with a mold and is heated through the mold to effect coagulation; the coagulated latex is then dried.

**Rubber articles.** THE ANODE RUBBER CO., LTD. Fr. 653,215, Jan. 25, 1928. In the production of rubber articles on molds by dipping or electrophoresis, ultra-accelerators are used which effect the complete vulcanization of the articles during drying. Suitable substances are diethylamine dithiocarbamate, furoic acid and dithiofurates and mercaptobenzothiazole. The vulcanization may be effected by heated air below  $112^\circ$ , or by dipping in hot water. An example is given. Cf. C. A. 23, 2604.

**Deposition of rubber.** THE ANODE RUBBER CO. (England), LTD. Fr. 654,809, May 24, 1928. In forming deposits or coatings from suspensions, particularly of rubber, in liquids, gel-forming substances such as gelatin, agar-agar, carrageen moss, albumins or  $\text{ZnCl}_2$  are added to the liquid. Electrolytes or coagulants may also be added. Deposits may be formed by several dippings, coagulation and drying taking place between each. Cf. C. A. 23, 3598.

**Electrodeposition of rubber or similar substances.** W. A. WILLIAMS. Brit. 299,738, June 28, 1927. Deposition is effected by inserting a pair of electrodes of different materials (such as a Zn anode and a C cathode provided with a depolarizer) into a latex which contains an electrolyte such as  $\text{NH}_4\text{Cl}$  which does not readily cause coagulation and which will not evolve any substance deleterious to the latex or the deposit but will enter into chem. reaction with the anode and act as an excitant of elec. current. A voltage is used which is insufficient to decompose the added electrolyte and such that the total difference of potential between the electrodes is not sufficient to effect electrolysis of water. Fillers, vulcanizing agents and accelerators, etc., may be added to the latex. Cf. C. A. 23, 3376.

**Stabilizing rubber.** SILESIA VEREIN CHEMISCHER FABRIKEN. Fr. 653,479, Apr. 26, 1928. Natural or artificial rubber is stabilized by the products of reaction of amines with polyhydroxyaldehydes such as sugar or with disocn. products of polysaccharides, alone or mixed together or with other stabilizers, an accelerator being used at the same time. Products which may be used are, the reaction product of (1) glucose and  $\alpha$ -naphthylamine,  $\text{PhNH}_2$ , *m*-toluylenediamine, urea or *m*-toluidine, (2) milk sugar and  $\alpha$ -naphthylamine, (3) invert sugar and  $\text{PhNH}_2$  or  $\alpha$ -naphthylamine.

**Rubber composition.** ARTHUR BIDDLE (to United Products Corp. of America) U. S. 1,716,478, June 11. A coating compn. suitable for use also as an insulating material, sealing, making molded articles, etc., comprises rubber 10 lbs. (as contained in latex), dispersed in 100 lbs. of a mixt. of petroleum, castor and linseed oils and 75 lbs. of a casein glue soln. having a 20% casein content. Cf. C. A. 23, 547.

**Rubber composition.** HERBERT A. WINKELMANN (to B. F. Goodrich Co.). U. S. 1,716,474, June 11. In reworking vulcanized scrap rubber, the comminuted material is masticated with a smaller proportion of crude rubber, admixed with pine tar and concd.  $\text{H}_2\text{SO}_4$  and heated to cause a vigorous exothermic reaction.

**Preserving rubber.** ALBERT M. CLIFFORD (to Goodyear Tire & Rubber Co) U. S. 1,717,093, June 11. About 1% of  $\beta$ -dinaphthol or other suitable substance of the general formula  $\text{HO}-\text{R}-\text{R}_1-\text{OH}$ , in which R and  $\text{R}_1$  are naphthyl groups is added to rubber to render it more resistant to oxidation or aging. Cf. C. A. 23, 2603-4.

**Sponge rubber.** REGINALD J. NOAR. U. S. 1,717,168, June 11. Fr. 655,020, May 31, 1928. See Brit. 284,938 (C. A. 22, 4877).

**Vulcanization of rubber.** METALLBANK UND METALLURGISCHE. GES. A.-G. Fr. 654,496, May 21, 1928. See Brit. 291,438 (C. A. 23, 1309).

# CHEMICAL ABSTRACTS

Vol. 23.

AUGUST 20, 1929

No. 16

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

**Improved reflex furnace.** ROBERT SAXON. *Chem. Age* (London) 20, No. 518, *Monthly Met. Sect.* 43(1929).—The furnace described in *C. A.* 23, 2115 is altered to produce higher temps. and a better utilization of the heat by inserting baffles, which preheat the gas and air and retard the vertical escape of heat. J. H. MOORE

**Protection of boilers and furnaces.** M. SEILLAN. *Rev. gén. élec.* 24, 79-82(1928); *Science Abstracts* 31B, 569.—S. refers to the advantages of graphite as an inert protective covering material for the interiors of boiler furnaces, etc. Hitherto, however, there has been difficulty in applying it to such purposes. Two new solns. have now been produced named "Neutron" and "Capol," by the use of which it is claimed that these difficulties have been surmounted. These contain graphite in a colloidal form and can be applied by a brush or a sprayer, like paint. Cases are mentioned where they have been applied with success. H. L. D.

**Present status of furnace and burner design for the use of pulverized fuel.** E. G. BAILEY. *Fuels and Steam Power* (A.S.M.E. Trans.), 50, No. 33, 187-98(1928).

E. I. S.

**Mechanical handling of materials in and about the chemical plant. II. Belt conveyors.** A. K. BURDITT AND W. F. SCHAPHORST. *Ind. Eng. Chem.* 21, 649-54 (1929); cf. *C. A.* 23, 3032.—Principles in design of belt conveyors, different belt and pulley types, power requirements, speeds and capacities are discussed. Illustrations, tables and formulas are given. G. H. VON FUCHS

**A new fractionating column.** G. PICHARD. *Ann. sci. agron.* 45, 358-61(1928).—

The apparatus is simple in construction, of small vol. and high efficiency. It consists essentially of 3 concentric tubes. The outside tube and the central tube are joined at their upper end by a fused joint (I) or a stopper (II). Between the two is a third tube which ends in a siphon to return the condensate to the distg. flask. This tube is supported by projections on the inside wall of the envelope. Form I is used for distn. under reduced pressure and form III for  $\text{NH}_3$  distn. The distance from A to B (I) is 260 mm., the walls are 1 mm. thick and the outside diam. 25, 19 and 12 mm., resp., which provides condensing surfaces of 144, 114 and 79 sq. mm. from outside to inside. The efficiency may be judged by the following distns.

(a) 500 cc. of 1% (by vol.) soln. of alc.; distn. of 0.1 of vol. removes 95% of the alc.; (b) 600 cc. of 15% soln. alc. (equiv. to 90 cc. pure alc.); when 104 cc. of this soln. is distd. off 83 cc. of original alc. is removed; when 127 cc. is distd. off 89 cc. of original alc. is removed. K. S. MARKLEY

**New apparatus materials for chemical industries.** A. KUFFERATH. *Chem.-tech. Rundschau* 44, 12, 49(1929).—Krupp introduced, in 1912, 2 types of non-rusting steels: the VM group contg. 13-15% Cr and a little Ni; the VA group contg. 18-25% Cr and more Ni than VM. The alloy V2A has a high resistance to acids, which is further increased by cooling rapidly from 1170°; m. 1400°; sp. gr. 7.86; heat cond. 0.04 or approx 1/3 that of Fe. This alloy can be cold pressed, rolled, drawn and welded. VA steel is not attacked by  $\text{HNO}_3$  (sp. gr. 1.04-1.40) at ordinary or boiling temp. or by fuming  $\text{HNO}_3$  (sp. gr. 1.52) below 20°, but is attacked at higher temps.; it is not attacked by a 1:1 mixt. of concd.  $\text{HNO}_3$  and concd.  $\text{H}_2\text{SO}_4$ , by concd.  $\text{H}_2\text{SO}_4$  (sp. gr. 1.84) at ordinary temp., by fuming  $\text{H}_2\text{SO}_4$  (free  $\text{SO}_3$  = 60%) at 70°, by  $\text{H}_3\text{PO}_4$  below 45% or by 80%

$H_2PO_4$  at  $60^\circ$ . It resists the action of most org. acids as well, but is attacked by some at higher temp. It is resistant to the action of alkalis, of many dissolved and molten salts, i. e., solns. of Al acetate,  $Al_2(SO_4)_3$ ,  $NH_4NO_3$ , Pb acetate,  $KNO_3$ ,  $KClO_3$ ,  $Cu(NO_3)_2$ ,  $MnCl_2$ ,  $Na_2SO_3$ ,  $ZnSO_4$ ,  $Na_2SO_4$ , of molten  $KNO_3$  and  $AgNO_3$ , and of concd.  $H_2O_2$ . For distn. of solns. of the latter in *vacuo* VA steel is better than Al app. On account of this notable resistance to reagents this steel is particularly suited for use in chem. app. and in containers. The properties and uses of *Monel metal* and *Haveg* are also described. E. PICKERING

**Apparatus for the determination of density of solids.** JEAN BARTHOLOMÉ *J. pharm. Belg.* 10, 319-22(1928).—The app. consists of a calibrated bell-jar glass cover, suitably fitted to a bronze-nickel disk, unaffected by heat, which may be substituted by one of "boromica." A water-tight system is obtained by means of a trace of petrolatum on the inner surface of the cover. The vol. of the solids is taken as the decrease in vol. of the system after the insertion of the solids. For solids lighter than water, another suitable liquid may be used, or the solids may be fixed to the disk by means of a little petrolatum. Other precautions are given as to temp., measuring vols., etc. The app. is then applied to the detn. of the density of the gluten of grain, the general method of sepn. being used. The density is an indication of the value of the gluten. There is a discussion of the controlling factors of the value of a grain. A. G. DU MEZ

**Foamless vacuum distillation.** R. KUMMER. *Chem.-tech. Rundschau* 44, 14 (1929).—A description and drawings of app. are given, which permits *vacuum distn.*, on a lab. scale, of org. substances without excessive foam formation. Its action depends on an automatic pressure control which permits intermittent and momentary influx of air. E. PICKERING

**Apparatus for fractional distillation under vacuum.** ARTHUR A. ASHWORTH. *J. Inst. Petroleum Tech.* 15, 211-3(1929).—This app. for fractionally distg. under vacuum avoids the difficulty of taking off fractions for test during distn. by a 2nd, graduated, receiving chamber under the 1st one, opening from it by a stopcock with wide bore, and itself provided with a stopcock opening to the air. When the desired fraction has collected in the 2nd receiver, the stopcock above it is closed and the fraction is forced out of the lower chamber by displacing with mercury. Withdrawal of the mercury leaves the lower chamber evacuated. EMMA E. CRANDAL

**Technical developments in the use of filling agents for wash towers.** G. WEISSENBERGER AND L. PIATTI. *Kautschuk* 5, 103-6(1929).—A review and discussion of recent developments, with references to certain patents. C. C. DAVIS

**A simplified gas generator.** GREGG M. EVANS. *J. Chem. Education* 6, 1147 (1929).—The gas generator described is readily assembled from three large reagent bottles and glass tubing. C. Z. ROSECRANS

**Apparatus for technical gas analyses.** O. BURKHARDT, A. FISCHER AND FR. FRANK *Gas u. Wasserfach* 72, 504-5(1929).—A new Orsat type of gas analysis app. is described, the special features of which are the provision of a 100-cc. buret for measuring gas and a 60-cc. buret for measuring gas for explosions, as well as the use of a palladium sol pipet for H detns. The latter has a capacity of 7 to 8 liters of H (180-200 cc. of soln.) and is not poisoned by CO. A complete analysis requires 30-60 min., according to the age of the palladium sol. The use of 50% glycerol soln. in the explosion pipet is very satisfactory but leads to high results if used in connection with copper-oxide slow combustion methods as drops of glycerol are carried over. In that case it is preferable to use a satd salt soln. acidified with dil. sulfuric acid in the buret to avoid errors in detg. CO, produced. R. W. RYAN

**A new flue-gas tester.** ADOLF GROSS. *Gas u. Wasserfach* 72, 479-80(1929), cf. C. A. 22, 4013.—This app. consists essentially of an absorption chamber, provided with a special stopcock and contg. slaked lime sufficient for 200-300 tests. The loss in vol. equivalent to the  $CO_2$  content of the gas is measured by the effect of the decrease in pressure on a diaphragm, provided with a calibrated screw which is turned until contact is made with the diaphragm, lighting a small lamp. The app. is very compact and easy to use. R. W. RYAN

**An accurate drop recorder.** O. S. GIBBS. *Science* 69, 649-50(1929); cf. *J. Lab. Clin. Med.* 12, 686(1927).—A soln. of 10%  $Na_2SO_4$  is displaced from a glass chamber and flows into a minute cup, through the bottom of which is a Pt needle to serve as an electrode. A Pt capillary, also to serve as an electrode, is connected with an evacuated reservoir, and is adjusted just above the Pt needle, so that drops are sucked from the cup through the capillary and into the reservoir. The size of drop measured depends upon the shape of the cup used, as well as upon the extent of evacuation and the size of the capillary. Measurement of as many as 600 drops per cc. is readily attained. W. D. LANGLEY

**Pipet for exact analysis of gases.** E. MOLES AND L. R. PIRE. *Anal. soc. españ. fis. quim. (Sec. tecnica)* 27, 107-9(1929). E. M. SYMMES

**Analytical balance for high temperatures.** TAKAYUKI SOMIYA. *J. Soc. Chem. Ind. (Japan)* 32, 249-53(1929); *Suppl. binding* 32, 75-6B.—A new, simple balance is described by which weighing continuously and accurately to 0.1 mg. is possible with the pointer of the balance always on the zero mark, even when the body is heated to temps. as high as 1300°. S. KONDO

**Modern analytical balances.** LUDWIG RAMBERG. *Svensk Kem. Tid.* 41, 106-19 (1929).—A general description of balances including some historical and some theoretical observations. Claims of sensitivity exceeding 0.01 mg. by makers of microbalances are questioned. A. R. ROSE

**Electrical instruments in the chemical industries.** B. P. ROMAINE. *Instruments* 2, 203-8(1929).—A review. J. H. MOORE

**Thermal elements for high temperatures in reducing atmospheres.** J. A. M. VAN LIEMPT. *Rec. trav. chim.* 48, 585-8(1929).—Since it is deemed advisable not to use Pt-PtRd elements for thermocouples for temps. above 1000° and since Pt is rendered very brittle by traces of Si, v. L. studied other elements in an attempt to find a satisfactory substitute. W-Mo, W-PtRd and Mo-PtRd elements were observed. The latter two were found to be satisfactory for use in reducing atms. They also furnished twice as great a thermal e. m. f. per degree as the Pt-PtRd couple for temps. between 1000° and 1600°. The W-Mo couple first showed a positive and then a negative e. m. f. L. L. QUILL

---

Air filter for refrigerating chambers, etc. (U. S. pat. 1,717,470) 13.

**Volumetric gas analysis apparatus.** J. G. DALOZ. *Brit.* 300,281, Nov. 10, 1927. Structural details.

**Gas-analysis apparatus.** ARTHUR B. CUNNINGHAM (to Republic Flow Meters Co.). U. S. 1,719,593, July 2. Various structural details are described of an app. adapted for detg. CO<sub>2</sub>. Cf. C. A. 22, 2689; 23, 551.

**Electromagnetic chemical balance.** HANTARO NAGAOKA and JOTO IKEBE (to Zoidan Hojin Rikagaku Kenkyujo). U. S. 1,717,462, June 18. Structural features.

**Carbide-feed acetylene generator.** CHARLES W. BECK. U. S. 1,719,162, July 2. Structural features.

**Catalytic apparatus.** A. O. JAEGER (to Selden Co.). *Brit.* 301,491, Dec. 2, 1927. In a converter of the Tentelew type, at least a part of the reaction mixt. is caused to flow substantially parallel to the catalyst tubes and in indirect heat exchange relation to them and then in reverse direction in intimate contact with the catalyst tubes, and then, after another reversal of direction, through the tubes themselves. The app. is described. Cf. C. A. 23, 2330.

**Colloid mill.** WM. EPPENBACH. *Fr.* 655,774, Nov. 22, 1927.

**Chemically resistant material suitable for conduits for liquids and gases.** WARREN F. BLECKER. U. S. 1,718,627, June 25. Conduits or similar articles are formed of graphite together with a fusible chemically resistant material such as S or pitch mixed to a point of satn.

**Distilling column.** VICTOR P. A. MARCHAND. *Fr.* 655,317, Apr. 30, 1928.

**Filters.** THE ANODE RUBBER CO. (England), LTD. *Fr.* 656,310, June 20, 1928. In filtering liquids such as *aq. dispersions of rubber* which tend to coagulate, the liquid is caused to pass through a fraction of the filtering surface moved intermittently or continuously transversely to the sense of flow of the liquid so that the point of passage of the liquid is displaced along the filtering surface.

**Apparatus for cleaning sand filter and the like.** J. PEEBLES. *Brit.* 301,006, Aug. 23, 1927.

**Drum for wet grinding.** FRIED. KRUPP GRUSONWERK A.-G. *Ger.* 477,135, June 28, 1927.

**Drying drum.** JOHANNES WEISS. *Ger.* 473,132, Oct. 6, 1926.

**Rotary or swinging vacuum drying drum.** AUGUSTINUS E. JONSSON. *Ger.* 477,418, Nov. 24, 1927.

**Homogenizer for rotating drum filter.** FILTERS PHILIPPE (SOC. ANON.) and ÉDOUARD HEIBIG. *Fr.* 656,069, June 18, 1928.

**Rotary suction drum filter construction.** H. NOTZ. *Brit.* 301,541, Sept. 1, 1927.

**Drying apparatus comprising concentric rotary drums.** JEAN B. VERNAY. *Ger.* 477,369, Oct. 25, 1927.

Means for removing the cake from filter drums. MASCHINENFABRIK BUCKAU R. WOLF A.-G. Ger. 477,493, Sept. 2, 1924.

Rotary-compartment drum apparatus for drying, charring or other treatments of ore, coal, shale or other loose materials. OTTO DOBBELSTEIN. U. S. 1,718,542-3-4, June 25. Structural features.

Vertical drying and dehydrating apparatus. MAX BAECHLER. U. S. 1,718,104, June 18. Structural features.

Drying or destructive distillation apparatus. LUDWIG HONIGMANN. Ger. 472,032, Jan. 16, 1927. Addn. to 466,925. The app. of Ger. 466,925 (C. A. 23, 3131) is elaborated by providing a casing in the upper half of the container for each of the conductive plates. Mixing of the heating gases with the distn. gases is thus avoided.

Air heater for drying installations. CORNEILLE LONGTON. Ger. 477,152, Apr. 12, 1928.

Tubular drier. ENGELBERT CALENIUS. Ger. 477,214, Feb. 27, 1926.

Apparatus for carrying out chemical reactions. MME. CASALE (NÉE MARIA SACCHI). Fr. 656,254, June 8, 1927. See Swiss 128,001 (C. A. 23, 1784).

Spray apparatus for mixing liquids and gases. KIRKHAM, HULETT and CHANDLER, LTD. Ger. 477,175, Apr. 30, 1926.

Apparatus for subliming volatile substances. THE NEW ZEALAND SULPHUR CO., LTD. Fr. 655,867, June 11, 1928.

Evaporator of the film type. BURTON S. HUGHES and STANLEY HUGHES. U. S. 1,717,927, June 18. Structural features.

Apparatus for detecting and estimating the presence of vapors, gas, smoke, etc. MAX BUCHHOLZ. Fr. 656,141, June 20, 1928.

Apparatus for condensing vapors by streams of liquid passed in the same direction. I. G. FARBERIND. A.-G. Brit. 301,430, Nov. 29, 1927. Structural features.

Apparatus for evaporating waste sulfite liquor or other liquids in bulk by direct contact with hot flue gases. S. H. LEDIN and J. O. NAUCLER. Brit. 300,590, Nov. 15, 1927.

Device for separating dust from gases by centrifugal force. A. STIEVENART. Brit. 300,921, Nov. 17, 1927.

Tubular heat-exchange apparatus. A.-G. BROWN, BOVERI ET CIE. Brit. 301,291, April 14, 1928. Structural features.

Tubular heat-exchange apparatus. AKTIEBOLAGET SVENSKA JÄRNVÄGSVERKSTADERNA. Brit. 301,426, Nov. 29, 1927. Structural features.

Heat-exchange apparatus suitable for conditioning air. JAMES POSEY (to Two-Season Process, Inc.). U. S. 1,719,080, July 2.

Apparatus for heating liquids or molten materials by submerged flames. O. BRUNLER. Brit. 300,819, Dec. 21, 1927. Various constructions are described suitable for use in cement manuf., in evapg. liquids to effect concn., etc.

Apparatus suitable for making carbon disulfide or for other chemical reactions. THOMAS GRISWOLD, JR. (to Dow Chemical Co.). U. S. 1,719,509, July 2. The app. comprises a separable reaction chamber and a metallic vaporizing pot mounted in a common setting in a position incapable of receiving refuse from the reaction chamber. Various structural details are described. Cf. C. A. 23, 2255.

Apparatus for separating mineral substances by gravity in water. THOMAS M. DAVIDSON. U. S. 1,719,171, July 2.

Apparatus for separation of mineral substances of different densities by use of air currents. W. R. CHAPMAN. Brit. 301,336, June 24, 1927. Structural features.

Apparatus for aerating sewage or other liquids. LLOYD LOGAN (to Koppers Co.). U. S. 1,717,713, June 18.

Apparatus for extracting gum, resin and oils from plants. UMBERTO BELLINI DELLE STELLE. Fr. 655,733, Oct. 18, 1927.

Apparatus for proportionate mixing of cleansing liquids, etc., with water flowing through a pipe. H. J. LLOYD. Brit. 300,341, Sept. 7, 1927. Structural features.

Apparatus for testing materials under tension or compression stresses, etc. A. ESAU. Brit. 300,564, Nov. 14, 1927.

\* Instrument for measuring turbidity or color of fluids. WM. G. EXTON. U. S. 1,717,702, June 18.

Apparatus for making test samples of slivers and like material. PAUL LATSCH. U. S. 1,719,061, July 2.

Baffle system for apparatus for separating oil and gas. MILLARD F. WATERS (to Smith Separator Co.). U. S. 1,718,013, June 18. Structural features.

Filter for oil. HERBERT A. THOMPSON (one-half to Swinney Bros., Ltd.). U. S. 1,719,346, July 2. Structural features.

- Wick filters for oil, etc.** SOC. ANON. DES PROCÉDÉS R. AUDUBERT (S. A. P. R. A.). Brit. 301,507, Dec. 2, 1927. Structural features.
- Furnaces** AMERICAN ENGINEERING Co. Fr. 655,482, June 7, 1928. Method of feeding fuel.
- Furnace.** E. C. LOESCHE. Ger. 477,211, Oct. 15, 1927. Materials to be burnt, sintered, roasted or distd. are forced upwards from below on to the furnace hearth, and a flame or an elec. arc is directed downwards on to the hearth. Cf. C. A. 23, 2857.
- Air preheater (plate type) for boiler furnaces.** SIEMENS-SCHUCKERTWERKE A.-G. (Martin Eule, inventor). Ger. 477,336, Feb. 2, 1926.
- Regenerative inversion furnace.** SOC. DES FOURS À HAUT RENDEMENTS. Fr. 656,251, June 10, 1926. Arrangements of burners, etc., are described.
- Low-temperature carbonization furnace.** INTERNATIONAL HOLDING DE DISTILLATION ET DE COKEFACTION À BASSE TEMP. ET MINIERE (HOLCOBAMI). Fr. 656,448, June 25, 1928.
- Retort furnace setting construction.** LOW TEMPERATURE CARBONISATION, LTD., and C. H. PARKER. Brit. 301,361, May 27, 1927.
- Grate with mechanical feed for furnaces.** AMERICAN ENGINEERING Co. Fr. 655,221, June 4, 1928.
- Tunnel annealing furnace construction.** BIRMINGHAM ELECTRIC FURNACES, LTD., and A. G. LOBLEY. Brit. 300,293, July 6, 1927.
- Furnace for annealing, heat treatment, etc.** CLIFFORD NELSON. U. S. 1,718,798, June 25. Structural features.
- Burners for liquid fuel.** PAUL LINKE. Fr. 656,278, Apr. 21, 1928. The construction of a fuel regulator is described.
- Burner for heavy liquid fuel.** JOANNY CHOIGNARD. Fr. 656,014, Nov. 3, 1927.
- Burners for powdered fuel.** HORACE A. MARSTON. Fr. 656,430, June 25, 1928.
- Burner for powdered coal.** BÜTTNER-WERKE A.-G. Fr. 655,779, Feb. 10, 1928.
- Burner for petroleum.** JOSEPH A. P. DE GUISE. Fr. 655,477, June 7, 1928.
- Burner for mazout.** MARCEL BRASSLER. Fr. 656,323, June 22, 1928.
- Double gas burner.** BURGER EISENWERKE G. M. B. H. Fr. 655,959, June 15, 1928.
- Röntgen-ray apparatus.** F. S. SMITH. Brit. 301,174, Oct. 27, 1927.
- Röntgen-ray apparatus.** SIEMENS-REINIGER-VEIFA GES. FÜR MEDIZINISCHE TECHNIK. Brit. 301,377, Nov. 28, 1927. Structural features.
- Röntgen-ray tubes and similar devices.** F. ROTHER. Brit. 300,547, Nov. 14, 1927. Electrons are released from a cold or incandescent cathode by spraying it with  $\alpha, \beta$  or  $\gamma$  particles from a vaporizable radioactive material. The anode of a Röntgen-ray tube or rectifier may comprise U or Th.
- X-ray tube with a filling of hydrogen or helium.** ALBERT BOUWERS and WILLIAM H. VAN DE S. BAKHUYZEN (to Naamlooze Vennootschap Philips' Gloeilampenfabrieken) U. S. 1,718,849, June 25.
- Temperature indicator for steam-supply pipes, etc.** NIELS CHRISTIANSEN (to Newport News Shipbuilding and Dry Dock Co.). U. S. 1,719,046, July 2. Mech. features.
- Thermostatic electric circuit closer (suitable for use as an alarm device).** OD TEEL. U. S. 1,717,529, June 18. Structural and elec. features.
- Thermostatic control device for electric circuits.** HERBERT J. SAUVAGE (to Electro Thermostatic Control Co.). U. S. 1,717,628, June 28.
- Thermostatic control for heating apparatus such as boiler furnaces.** ANDRÉ M. MERTZANOFF (to American Radiator Co.). U. S. 1,717,993, June 18.
- Thermostatic control for electric heating apparatus.** W. STUWE. Brit. 301,250, Feb. 13, 1928.
- Thermostatic control device for radiator shutters, etc.** F. W. MILLER. Brit. 300,345, Sept. 12, 1927.
- Thermostatic safety cut-off for gas burners.** N. T. SELLMAN (to Spencer Thermostat Co.). Brit. 300,507, Nov. 12, 1927.
- Thermostatic cut-off valve for gas burners.** K. BECK. Brit. 300,966, Nov. 21, 1927. Structural features.
- Thermostatic regulating apparatus for saltpeter baths used in drawing wire, etc.** EVERETT S. NEWCOMB (to Charles Engelhard, Inc.). U. S. 1,719,441, July 2. The supply of fuel to a heating burner is decreased when the temp. of the bath or in a surrounding chamber exceeds a certain point and is increased as the temp. falls.
- Bimetallic material for thermostats.** LAURENCE K. MARSHALL (to Spencer Thermostat Co.). U. S. 1,718,750, June 25. Material such as united Monel metal and

Ni steel is subjected to cold rolling a predetd. no. of passes to effect a certain reduction of cross section and heat-treated; then again it is cold rolled a greater no. of passes to reduce the cross section by a lesser quantity, again subjected to heat treatment at the same temp. as in the first heat treatment (suitably about 800°); this successive rolling and heating is continued until a product of desired thickness and temp. characteristics is obtained.

**Thermostatic electric switch.** H. D. DORFMAN (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 300,276, Nov. 10, 1927. Structural features.

**Thermally released electric switch.** C. H. CHAPMAN and G. R. TOWNSEND (to British Thomson-Houston Co., Ltd.). Brit. 301,425, Nov. 29, 1927. Structural features.

**Electric discharge devices.** NAAMLÖÖZE VENNOOTSCHAP PHILIPS' GLOEILAMPEN-FABRIEKEN and S. R. MULLARD. Brit. 300,403, Dec. 5, 1927. Tubes such as thermionic valves, x-ray tubes or gas-filled rectifiers have a piece of coherent Zr distinct from the cathode placed so that it is heated during the operation of the tube by heat generated in the tube and absorbs gaseous residues, etc.

**Electric discharge devices.** NAAMLÖÖZE VENNOOTSCHAP PHILIPS' GLOEILAMPEN-FABRIEKEN. Brit. 301,455, Nov. 30, 1927. An arc discharge tube suitable for use as a rectifier contains a Wehmelt cathode, a filling comprising Hg vapor and a gas such as H, N, CO or CO<sub>2</sub> and a small quantity of rare gas such as A. The cathode preferably has a core of refractory metal such as W on which a wire of lower m. p. metal such as Ni is wound, which is coated with a compd. such as BaO. Various details are given.

**Electric discharge lamps.** C. G. FOUND (to British Thomson-Houston Co., Ltd.) Brit. 301,433, Nov. 29, 1927. Various structural features are described of lamps which may have an anode of Fe, Al, Ni or Mo and a cathode of Ni coated with BaO preferably by applying BaCO<sub>3</sub> in a cellulose-compd. binder and heating to about the m. p. of Ni Cf. C. A. 23, 2856.

**Low-pressure mercury discharge tubes.** NAAMLÖÖZE VENNOOTSCHAP PHILIPS' GLOEILAMPEN-FABRIEKEN. Brit. 301,412, Aug. 29, 1927. Various structural features are described of elec. discharge tubes which may contain A or Ne in addn. to Hg vapor and which may be used for luminous purposes. In forming the tube, Mg or Ba is vaporized to remove detrimental gases or vapors.

**Electron-emitting cathodes.** HOWARD T. REEVE (to Western Electric Co.) U. S. 1,719,128, July 2. Cathodes such as those of thermionic devices are formed by making a core of Ba and Sr nickelites and Pt powder, heating the core to reduce the nickelites and working the product into filaments.

**Incandescent cathode for discharge tubes.** PIETER W. DOBBEN, JOHANNES G. W. MULDER and EKKO OOSTERHUIS (to Naamlöoze Vennootschap Philips' Gloeilampen-fabrieken). U. S. 1,718,123, June 18. A core of highly refractory metal such as W or Mo has helically wound on it another metal wire formed mainly of Ni and provided with a coating of high emissivity such as alk. earth oxide.

**Hot cathodes for electron tubes.** ALLGEMEINE ELEKTRICITÄTS-GES. and TELEFUNKEN GES. FÜR DRAHTLOSE TELEGRAPHIE M. B. H. (Ernst Friederich, Hans Rukop and Hellmut Simon, inventors). Ger. 477,232, June 23, 1922. The cathodes are made of difficultly fusible metal, especially W, contg. addns. of rare earth metals or Yt or Sc. The addns. may be derived from the oxides or other compds. of the metals, the compds. being reduced *in situ*, e. g., with hydrocarbons or reducing metal vapors.

**Exhausting vacuum tubes.** HERBERT L. METCALF (to Magnavox Co.). U. S. 1,719,773, July 2. The electrodes and "getters" are heated under low vacuum only, and the device is then subjected to pumping to the limit of a mol. pump and sealed off before the heat of processing has been lost.

## 2—GENERAL AND PHYSICAL CHEMISTRY

FREDERICK L. BROWNE

**Chemical science in Czechoslovakia.** J. G. F. DRUCE. *Science Progress* 24, 105-7 (1929).—The status of chemistry in Czechoslovakia in the past and at present is described.

**Recent advances in science: physics.** L. F. BATES. *Science Progress* 24, 5-15 (1929).—A review of recent work of physico-chem. interest.

**Cosmic chemistry.** S. ROSSELAND. *Tids. kemi og Bergvesen* 8, 121-5, 135-8 (1928).—A survey.

**Viscosity in the stars.** S. ROSSELAND. *Month. Not. Roy. Astron. Soc.* **89**, 49–53 (1928). H. L. D.

**Electrical conductivity of stellar matter.** S. CHAPMAN. *Month. Not. Roy. Astron. Soc.* **89**, 54–7 (1928). H. L. D.

**Mendelyev's periodic law.** P. PETRENKO-KRITCHENKO. *Ukrainskii Khem. Zhur.* **3**, Sci. Pt., 445–55 (1928); cf. *C. A.* **22**, 3574; **23**, 2092.—A connection is sought between Mendelyev's periodic law and the interrelations of elements or atomic groups within the mol. of compds. In the belief that the cumulative influence of the atoms and atomic groups finds expression in the chem. reactivity of the mol., reaction velocities are studied for exptl. evidence. The absolute velocities of reactions are affected by such extraneous factors as temp., concn., catalysis, substitution and rupture of mols., but the relative shapes of the reaction curves for different members of a series of reactants are not so affected and presumably depend upon definite chem. constns. It is shown, for example, that the character of the reaction curves remains unchanged on altering the temp., concn., solvent, introduction of halogen into Me or Et groups or of COOH or Et into Me. In substitution reactions of the halogen derivatives of  $C_2H_6$ , fission may also occur but it does not alter the character of the reaction curve; the breaking of the bond between C and the first halogen atom dominates the reaction, the fission of the next halogen atom and its consequences being of secondary importance. BERNARD NELSON

**A comparison of the atomic weights of terrestrial and meteoric nickel. III. The analysis of nickelous bromide.** GREGORY P. BAXTER AND SABURO ISHIMARU. *J. Am. Chem. Soc.* **51**, 1729–35 (1929).—Ni extd. from a new meteorite was found to have the same isotopic compn. as terrestrial Ni. The at. wt. of Ni is 58.694. M. D.

**The atomic weight of antimony from different sources.** R. K. MCPALPINE. *J. Am. Chem. Soc.* **51**, 1745–50 (1929).—The at. wt. of Sb obtained from Hungary and Bolivia is found identical, contradicting the results of Muzaffar (*C. A.* **17**, 3433).

MALCOLM DOLE

**Molecular structure and chemical linking.** F. HUND. *Physik. Z.* **29**, 851–2 (1928).—Preliminary. Two-center systems are considered with CN, LiH and  $He_2$  term schemes as examples. B. C. A.

**Improved dilution table for sulfuric acid.** J. P. ROGERS. *Industrial Chemist* **5**, 223–4 (1929).—Available diln. tables for  $H_2SO_4$  call for the addn. of a varying quantity of acid to a definite quantity of water or of a definite quantity of acid to a varying quantity of water, thus giving a varying quantity of the dil. soln. The table here given shows the quantities of acid and water necessary to produce a definite quantity of dil. acid of the required strength. E. H.

**Theory of ferromagnetism.** N. AKULOV. *Z. Physik* **54**, 582–7 (1929); cf. *C. A.* **23**, 764. GEORGE GLOCKLER

**The dielectric polarization of liquids. IV. The dependence of molar refraction upon concentration in mixtures.** C. P. SMYTH, F. W. ENGEL AND E. BRIGHT WILSON, JR. *J. Am. Chem. Soc.* **51**, 1736–44 (1929); cf. *C. A.* **22**, 4045.—The refractive indices  $n_D^{20}$  were measured for the binary mixts. of  $C_7H_{16}$  with  $CCl_4$ ,  $C_2H_5Br$ ,  $C_4H_9Br$ ,  $C_2H_5I$ ,  $C_2H_5OH$ ,  $C_6H_{11}$ ,  $C_4H_9Cl$ ,  $C_7H_{15}Br$  and  $C_4H_9OH$ , resp., and the systems:  $C_2H_5Br$ – $C_2H_5I$ ,  $C_4H_9Cl$ – $C_4H_9Br$ ,  $CCl_4$ – $C_4H_9OH$ ,  $C_4H_9Br$ – $C_4H_9OH$ ,  $C_2H_5Br$ – $C_2H_5OH$  and  $C_2H_5I$ – $C_2H_5OH$ . The mol. refractions calcd. from these data are independent of the concn. to within 0.07%, indicating that the contribution of induced electronic shifts to the polarization of a mol. of one of these substances is not noticeably affected by the surrounding mols. The mol. refraction of the alcs. studied is independent of the compn. and this fact is used as evidence against the hypothesis of an actual sharing of electrons between mols. when assocn. occurs. H. S. V. KLOOSTER

**Measurement of the dielectric constants of liquids, with a determination of the dielectric constant of benzene.** L. HARTSHORN AND D. A. OLIVER. *Proc. Roy. Soc. (London)* **A123**, 664–85 (1929).—The app. for the detn. of dielec. constns. of liquids has been improved to avoid previous errors, by modifications to insure that the air capacity of the test condenser is located entirely in air (no lines of force passing through the container, supports, etc.), and the liquid capacity is located entirely in liquid and geometrically identical with the air capacity. The value  $\epsilon_{20} = 2.2825 \pm 0.0005$  ( $\partial\epsilon/\partial t = -0.001958 \pm 0.00003$ ) was found for pure  $C_6H_6$ . A. S. CARTER

**Size of ions and its influence on the properties of salt-like compounds.** L. PAULING. *Z. Krist.* **67**, 377–404 (1928); cf. *C. A.* **22**, 2086.—The forces operating between ions are discussed from the point of view of quantum mechanics and a simple approx. expression is given for these forces as a function of the size of ions. The derivation of interionic distances to a first approximation by neglect of deviations from additivity is discussed. The influence of radius relationships on physical properties of the alkali halides, and on

the axial ratios of crystals of the rutile type and of anatase, is discussed, together with the question of the relative stabilities of the various crystal structures. B. C. A.

**Influence of tempering, moistening, and plasticizing on the conductivity of ionic crystals.** FRANZ QUITTNER AND ADOLF SMEKAL. *Z. physik. Chem., Abt. B*, **3**, 162-5 (1929); cf. *C. A.* **22**, 907, 1271.—Conductance effects predicted by the loose-space theory of crystals as a result of tempering, moistening and plastic deformation are obtained in the temp. range of loose-ion conduction with rock salt and silvite. Moistened rock-salt crystals undergo alterations of the crystal interior, which persist even after substantially complete drying, and enable one to understand the cohesion expts. of Joffé with moistened crystals. H. W. WALKER

**Conductivity of cuprous oxide.** HANS KOST. *Z. Physik* **54**, 367-71 (1929).—The rectifying properties of  $\text{Cu}_2\text{O}$  films on Cu plates is thought to be a sp. property of the  $\text{Cu}_2\text{O}$  crystals themselves. Cf. *C. A.* **21**, 14. GEORGE GLOCKLER

**The piezoelectric constant of quartz as a function of temperature.** A. ANDREEV, V. FRÉDERICKSZ AND I. KAZARNOVSKII. *Z. Physik* **54**, 477-83 (1929).—The piezoelec. const. depends only slightly on temp. between  $15^\circ$  and  $500^\circ$ . GEORGE GLOCKLER

**The crystal structure of strontium.** A. J. KING. *Proc. Nat. Acad. Sci.* **15**, 337-8 (1929); cf. *C. A.* **22**, 4288.—Measured powder spectrograms show that Sr has a face-centered cubic lattice or very similar structure with a unit cell contg. 4 atoms of unit edge equal to 6.075 Å. U. The calcd. d. is 2.58 as compared with 2.6 by direct measurement. The distance between Sr atoms is calcd. to be 4.295 Å. U. Strong fogging of the film was due to secondary radiation from Sr. H. W. WALKER

**Entropy change of gases during irreversible processes.** D. ENSKOG. *Z. Physik* **54**, 498-504 (1929).—Mathematical. GEORGE GLOCKLER

**The viscosity of liquids above their boiling points.** V. TOSHIKO TITANI. *Bull. Chem. Soc. Japan* **4**, 68-75 (1929); cf. *C. A.* **21**, 3781.—Recent data for ether and acetone enable T. to apply his equations (I and II of previous abstract) at low temp. They do not fit the data well. Eliminating  $\phi$  from these gives  $V_k^{1/3} - V^{1/3} = A(T_k - T)^{1/3}$ , where  $A = C/K$ .  $V_k$  is chosen to give best agreement with the data. This equation fits very well except at the critical temp., where errors of as much as 5% appear. V. F. H

**Viscosity of mercury.** F. SAUERWALD AND W. RADECKER. *Z. Physik* **54**, 844-7 (1929).—Preliminary expts. show that the present values of the viscosity of Hg are correct. GEORGE GLOCKLER

**Vapor pressure at low temperatures.** N. A. KOLOSOVSKII. *J. Russ. Phys.-Chem. Soc.* **60**, 1403-16 (1928).—Planck's formula:  $(d \log p/dT)_{T=0} = \text{const.}/0 = +\infty$  (from which  $S_g = S_l + \infty$ ) is obtained by the extrapolation of an empirical relationship to  $0^\circ\text{K}$ . Such extrapolation assumes that we are dealing with a continuous function and is therefore statistically correct only for a large no. of mols. From the kinetic-theory point of view, pressure is proportional to the no. of gas mols.  $n$ , or  $p = nRT/Nv = nkT/v$ , where  $k$  is Boltzmann's universal const. Substituting this in the integrated form of Planck's equation (cf. his *Vorlesungen über Thermodynamik*, p. 276, 1927), one has  $(C+1) \log T + (B/T) + DT = (A + 24.8687) + \log v - \log n$ . From the known values of  $A$ ,  $B$ ,  $C$  and  $D$ , and setting  $v = 1.5 \times 10^{24}$  l. (the vol. of Einstein's universe),  $n$  is found less than 1 for temps. above  $0^\circ\text{K}$ . in the case of  $\text{H}_2$ , Hg,  $\text{I}_2$ , PhH and Mo. Or,  $p$  is practically 0. In the neighborhood of these temps. and zero pressures the vapor pressure changes in jumps ("pressure quanta") each of which represents the pressure effect of a single mol. Since the free path is very large, temp. equil. between the gas and solid wall obtains only at the moment of impact, i. e. at certain very long intervals. Or  $dQ/dT = 0$  and  $dp/dT = 0$  at lim.  $T = 0$ . The methods of formal mathematics probably cannot be applied in the region where the laws of statistics no longer hold. It seems more nearly correct to consider such phenomena from a phys. (kinetic) standpoint. BASIL C. SOYENKOFF

**Molecular association. I. Relation between the vapor pressure of binary liquid mixtures and the polarity of the molecular constituents.** J. ERRERA. *Compt. rend.* **187**, 727-30 (1928); *Z. physik. Chem., Abt. A.*, **138**, 332-44.—The elec. forces existing between mols. in a binary liquid mixt. may be indicated from vapor-pressure measurements. The magnitude of vapor pressure gives a measure of total mol. assocn. as a function of the no. of free mols. while a measure of polarity only allows for the calcn. of dipolar assocn. Three classes of mixts. are made: (1) Vapor-pressure curves are either straight lines or convex with or without a max. and assocn. is not homopolar since the mols. are not polar. Polarity curves in this case are either straight lines or only weakly curved. (2) If one mol. species is non-polar, the other being polar, both polarization and vapor-pressure curves are either a straight line or convex with or without a max. This is due to the fact that dipolar assocn. is greater than homopolar assocn.

(3) If vapor-pressure curves are concave with or without a min. both mol. species are polar. Increase in temp. decreases assocn. forces and the curves tend to approach a straight line.

RAYMOND H. LAMBERT

**Molecular association. II.** The relation between the viscosity of binary liquid mixtures and the polarity of the molecular constituents. J. FERRERA. *Compt. rend.* 187, 1278-80 (1928); *Z. physik. Chem.*, Abt. A, 140, 273-80 (1929).—Two types of viscosity-compn. curves for binary liquid mixts. are distinguished. In case the curve is concave, at least one of the two components is nonpolar. If both are dipolar the curve is convex. The author lists many mixts. as obtained from the literature upon which he bases his claims. A discussion is given of the effect of polarity on the shape of the curve. An increase in temp. decreases the convexity or concavity of curves.

RAYMOND H. LAMBERT

**The vitreous state.** MICHEL O. SAMSOEN. *Bull. soc. encour. ind. nat.* 1929, 185-204; cf. *C. A.* 22, 1881.—S. gives *thermal dilatation curves* for bottle glass ( $\text{SiO}_2$ , 69.3;  $\text{Al}_2\text{O}_3$ , 2.2;  $\text{CaO}$ , 13.0;  $\text{Na}_2\text{O}$ , 14.1;  $\text{Fe}_2\text{O}_3$ , 1.0;  $\text{MnO}$ , 0.3%), an enamel ( $\text{B}_2\text{O}_3$ , 23.9;  $\text{PbO}$ , 76.1%), a glass contg.  $\text{B}_2\text{O}_3$ , 93.3% and  $\text{Na}_2\text{O}$ , 6.7% and  $\text{B}_2\text{O}_3$ . The following coeffs. of *linear dilatation* ( $\times 10^6$ ) of  $\text{B}_2\text{O}_3$  are given:  $0^\circ$ , 14.30;  $50^\circ$ , 14.75;  $100^\circ$ , 15.18;  $150^\circ$ , 15.65;  $200^\circ$ , 16.12;  $230^\circ$ , 16.41;  $250^\circ$ , 17.12. In all of the above cases there is regular dilatation until a certain temp., several dozen degrees below that of deformation, is reached. The dilatation is then considerably increased. Thermal dilatation curves for several org. glasses showed the same presence of a transformation point in each case. By means of the proper app. it was possible to det. the *cubical dilatation* of  $\text{B}_2\text{O}_3$  and the results were:  $100^\circ$ , 45.54;  $150^\circ$ , 46.95;  $200^\circ$ , 48.36;  $240^\circ$ , 49.80;  $250^\circ$ , 615.2;  $300^\circ$ , 627.9;  $330^\circ$ , 629.4;  $360^\circ$ ,  $631.5 \times 10^{-6}$ . The change in expansion seems to be an allotropic transformation. The transformation point for *lar* is  $14^\circ$ . The increase of vol. below  $14^\circ$  is given by,  $\Delta V = 1.35 \times 10^{-4}t + 0.23 \times 10^{-6}t^2$ ; above  $14^\circ$  by,  $\Delta V = 9.19 \times 10^{-4}(t - 14) + 7.1 \times 10^{-6}(t - 14)^2$ . The ratio of the coeffs. of dilatation before and after transformation is 5.85. The results for *rosin* are: below  $34^\circ$ ,  $\Delta V = 2.21 \times 10^{-4}t + 0.31 \times 10^{-6}t^2$ ; above  $34^\circ$ ,  $\Delta V = 7.40 \times 10^{-4}(t - 34) + 5.91 \times 10^{-6}(t - 34)^2$ ; ratio, 2.89; for *gum lac*: below  $46^\circ$ ,  $\Delta V = 2.73 \times 10^{-4}t + 0.39 \times 10^{-6}t^2$ ; above  $46^\circ$ ,  $\Delta V = 13.10 \times 10^{-4}(t - 46) + 0.62 \times 10^{-6}(t - 46)^2$ ; ratio, 4.08; for *cane sugar* (vitreous): below  $67^\circ$ ,  $\Delta V = 2.34 \times 10^{-4}t + 0.14 \times 10^{-6}t^2$ ; above  $67^\circ$ ,  $\Delta V = 5.02 \times 10^{-4}(t - 67) + 0.43 \times 10^{-6}(t - 67)^2$ ; ratio, 2.15; for *glycerol*: below  $-62^\circ$ ,  $\Delta V = 2.41 \times 10^{-4}t$ ; above  $-62^\circ$ ,  $\Delta V = 4.83 \times 10^{-4}(t + 62) + 0.49 \times 10^{-6}(t + 62)^2$ ; for glassy  $\text{Na}_2\text{S}_2\text{O}_3 \cdot 5\text{H}_2\text{O}$ : below  $-42^\circ$ ,  $\alpha = 2.10 \times 10^{-4}$ ; in the liquid state,  $\alpha = 3.62 \times 10^{-4}$ . Calorimetric measurements showed that in the case of industrial glasses there was always absorption of heat followed by an increase of sp. heat.  $\text{B}_2\text{O}_3$  shows a discontinuity in its sp.-heat curve at  $218^\circ$  corresponding to a heat of transformation of about 2.3 cal. The sp. heat changes from 0.32 below  $218^\circ$  to 0.34 above. The heating curve for amorphous glycerol gives values in the temp. range  $-40^\circ$  to  $-190^\circ$  and a discontinuity is found at  $-85^\circ$ . The following results were obtained for a series of glasses of the system  $\text{Na}_2\text{O}-\text{SiO}_2$ :

% $\text{SiO}_2$	Coeff. of dilatation at $20^\circ$	Transformation temp.	Coeff. of dilatation after transformation
49.2	$12.61 \times 10^{-6}$	$420^\circ$	$83 \times 10^{-6}$
53.0	15.55	390	72
55.0	18.78	345	65
57.0	18.52	355	60
60.0	15.50	420	59
63.0	13.80	445	50
66.2	13.45	460	42
70.0	12.85	355	37
75.0	11.06	350	32
82.5	10.02	420	20
85.3	9.05	445	17
92.0	7.07	540	11

It is evident that the additive law which is frequently used for glasses is not even approximated. The curve plotted with transformation temps. as ordinates and %  $\text{SiO}_2$  as abscissas shows a max. at  $460^\circ$ , corresponding exactly to the compn. of  $\text{Na}_2\text{O} \cdot 2\text{SiO}_2$ . The success of Schott's additive rule is due to the fact that definite compds. and pseudo-eutectics are absent in the field of commercial silicate glasses. S. concludes that there is for all bodies existing in the vitreous state a temp. or temp. interval in which a transformation occurs and manifests itself by discontinuities in all physical properties. The

transformation temp. seems to depend only on the viscosity and the transformation occurs when the viscosity is  $10^{12.7}$  poises.

**Studies on glass. III. Dielectric constants of glassy and liquid glucose.** FRANCIS R. CATTOIR AND GEORGE S. PARKS. *J. Phys. Chem.* **33**, 879-82(1929); cf. *C. A.* **22**, 4296.—An elec. resonance method was used for the detn. of the dielec. consts. (Jackson, *C. A.* **16**, 2250). The dielec. cell consisted of 2 coaxial cylinders of Cu, resting vertically in a large Pyrex test tube. This cell was introduced into a 3-liter Dewar jar, equipped with an outer metal jacket which was grounded. The jar was filled with transformer oil for measurement above  $0^\circ$  and with kerosene cooled with solid  $\text{CO}_2$  for work below this temp. The app. was calibrated by means of air,  $\text{CCl}_4$ ,  $\text{CHCl}_3$ , *n*-propyl alc., acetone, EtOH and nitrobenzene. The following values were found for the dielec. consts. of glassy and liquid glucose: (1) Temps. ( $^\circ\text{K.}$ ) increasing; frequency,  $10^6$  cycles per sec.:  $200.0^\circ$ , 3.8;  $209.0^\circ$ , 3.9;  $220.0^\circ$ , 4.0;  $225.0^\circ$ , 4.1;  $232.0^\circ$ , 4.2;  $243.0^\circ$ , 4.3;  $253.0^\circ$ , 4.4;  $260.0^\circ$ , 4.6;  $270.5^\circ$ , 4.7;  $279.1^\circ$ , 4.9;  $284.1^\circ$ , 5.0;  $289.9^\circ$ , 5.4;  $294.3^\circ$ , 5.4;  $299.0^\circ$ , 5.7;  $302.9^\circ$ , 6.3;  $307.9^\circ$ , 6.8;  $322.5^\circ$ , 9.1;  $331.1^\circ$ , 11.2;  $342.2^\circ$ , 14.0;  $352.9^\circ$ , 18.0;  $362.8^\circ$ , 21.7;  $374.1^\circ$ , 23.7;  $382.0^\circ$ , 23.7;  $393.0^\circ$ , 23.0;  $408.0^\circ$ , 22.0;  $413.0^\circ$ , 21.6;  $423.0^\circ$ , 21.0. (2) Temps. ( $^\circ\text{K.}$ ) decreasing; frequency,  $10^6$  cycles per sec.:  $369.9^\circ$ , 23.8;  $368.1^\circ$ , 23.8;  $357.9^\circ$ , 21.5;  $343.7^\circ$ , 15.5;  $333.7^\circ$ , 12.3;  $316.9^\circ$ , 8.0;  $312.1^\circ$ , 7.5;  $303.3^\circ$ , 6.2;  $289.6^\circ$ , 5.2. The abs. error of the dielec. consts. is estimated to be less than 4%.

**Refractive indices of a mesomorphic substance in the solid state.** MILLIE J. ZADOC-KAHN. *Compt. rend.* **187**, 1138-9(1928).—Measurements of the 3 principal  $n$ 's of solid *p*-azoxyanisole, crystd. from light petroleum, for  $\lambda$  0.5893, 0.5780 and 0.5460, have shown that the birefringence is one of the highest known, ( $n_o - n_p$ ) being 0.634, 0.649 and 0.696, resp. The prism method was used, 3 prisms being cut with a microtome and arranged so that in the position of min. deviation each prism furnished 2 out of the 3 indices.

**Capillarity. XI. Diffusion and concentration displacement in capillaries.** KARL SCHULTZE. *Kolloid-Z.* **48**, 15-25(1929); cf. *C. A.* **23**, 3387.—With the aid of his unique system of formulation S. discusses his exptl. data on concn. displacement and crystn. in capillaries.

**The meaning of the adsorption of ions by colloid particles in coagulation by electrolytes.** H. FREUNDLICH, K. JOACHIMSOHN AND G. ETTISCH. *Z. physik. Chem., Abt. A.* **141**, 249-69(1929).—The coagulation value of various electrolytes on  $\text{As}_2\text{S}_3$  and Au sols and the amts. of cations and anions adsorbed at the flocculation point were detd. Equiv. amts. were not adsorbed, but nearly equal amts. of H ion were released in all cases. Monomol. layers of adsorbed ions were found. Freundlich's theories were found inadequate to explain all the observed facts.

**The influence of certain chemical and physical factors on the activity of charcoal.** E. V. ALEKSEEVSKII AND A. I. AVGUSTINIK. *J. Russ. Phys.-Chem. Soc.* **61**, 151-41 (1929).—Samples of wood and animal C were kept in 0.1 *N*  $\text{UO}_2(\text{NO}_3)_2$ ,  $\text{Th}(\text{NO}_3)_4$  or  $10^{-7}$  g./l.  $\text{RaBr}_2$  for 24 hr., dried at  $110^\circ$  and sealed in ampoules each contg. about 1 g. The latter were broken under 0.1 *N* AcOH, and the soln. was titrated after 24 hr. Other samples were opened, with vigorous shaking, in  $\text{C}_2\text{H}_2$ ; equil. was reached in 15-20 min. and the vol. of adsorbed gas was read off. Treatment with the above salt solns was found to decrease the adsorbing capacity of C for AcOH and  $\text{C}_2\text{H}_2$ , especially so in the case of  $\text{Th}(\text{NO}_3)_4$ . Dry birch wood was heated on the water bath for 20 hr. with 0.1 *N* and with 2 *N* solns. of  $\text{Fe}(\text{NO}_3)_3$ ,  $\text{Co}(\text{NO}_3)_2$ ,  $\text{Ni}(\text{NO}_3)_2$ ,  $\text{UO}(\text{NO}_3)_2$ ,  $\text{Th}(\text{NO}_3)_4$ ,  $\text{KNO}_3$ ,  $\text{K}_2\text{CO}_3$ ,  $\text{KOH}$ ,  $\text{K}_2\text{SiO}_3$  and  $\text{ZnCl}_2$ . The wood was filtered off, dried at  $110^\circ$  and carbonized in a current of pure  $\text{N}_2$  at  $800-850^\circ$ . Weighed samples (0.4-1.2 g.) were sealed. Some of the wood was also carbonized after treatment with distd.  $\text{H}_2\text{O}$  instead of any of the above salt solns.  $\text{H}_2\text{O}$ -treated C adsorbed  $\text{C}_2\text{H}_2$  better than salt-treated; weak salt solns. yielded more active preps. than concd.; Ni favored adsorption most of the metals of Fe group, and Th was a better activator than U. Indigo carmine was best adsorbed by Co- and Fe-treated C; U was more effective than Th, and concd. solns. more than dil. solns. of the same salts. Ni was the best activator towards PhH vapor; in all other cases treatment with concd. salt solns. decreased the adsorbing capacity of C; U favored adsorption more than Th. In the case of AcOH, dil. solns. of  $\text{Ni}(\text{NO}_3)_2$  worked best while Co, U and Th in concd. soln. rendered C inactive. Fe, KOH and  $\text{H}_2\text{O}$  proved the best activators for PhOH adsorption; U decreased the activity of C; treatment with dil. salt solns. gave more active preps. than treatment with the concd. solns. Irradiation of the C with ultra-violet light arrests the adsorption of  $\text{C}_2\text{H}_2$  and AcOH. Irradiation of  $\text{C}_2\text{H}_2$  has no effect on adsorption. Sunlight has no effect.

**The chemical effects of high-frequency sound waves. II. A study of emulsifying action.** WM. T. RICHARDS. *J. Am. Chem. Soc.* **51**, 1724-9(1929).—Emulsions produced

by sound waves are due largely to action at the walls of the vessel. Rupture of blood cells, small unicellular organisms, and the like by the direct action of sound waves in liquids is questioned.

A. L. ELDER

**Emulsions: stability, area per molecule in the interfacial film, distribution of sizes, and the oriented-wedge theory.** WM. D. HARKINS AND NORVIL BEEMAN. *J. Am. Chem. Soc.* **51**, 1674-94(1929); cf. *C. A.* **22**, 721.—The sizes of droplets in emulsions were detd. by a statistical method by means of a projection app. in conjunction with a microscope. Na, K and Cs soaps formed emulsions, the particles of which had approx. the same diams. Variation of the hydrocarbon chains of soaps had little effect upon the distribution of particles except in K chaulmoograte, in which the number of the smallest drops was greatly increased above that for the oleate or stearate. No evidence was found to indicate that the interfacial film ever becomes thicker than monomolecular.

A. L. ELDER

**A study of semicolloid solutions.** A. G. KNIGA. *J. Russ. Phys.-Chem. Soc.* **61**, 197-211(1929).—Graham's tungstic acid sol exhibits the properties of a semicolloid, *i. e.*, marked diffusibility, stability toward electrolytes, no Tyndall cone, etc. The sol was prepd by adding slowly, in the cold, 25 cc. 0.5 *N*  $\text{HNO}_3$  to 25 cc. 0.5 *N*  $\text{Na}_2\text{WO}_4$  and dialysis against 10 vols. of  $\text{H}_2\text{O}$ . When the addn. is carried out at  $90^\circ$  a more diffusible sol results. The  $n_D$  of  $\text{Na}_2\text{WO}_4\text{-HCl}$  sols is greater than calcd. for the mixt. of the components, when  $n_D$  is plotted against cc. of added  $\text{HCl}$ , the curve exhibits a sharp change in slope to nearly horizontal. This break corresponds to a transition from complex formation to the colloid stage. The time increase in viscosity served as a measure of the interaction between  $\text{HCl}$  and  $\text{Na}_2\text{WO}_4$ . Excess of acid accelerated the reaction while diln. retarded it. The addn. of alkali chlorides accelerated the reaction in the order  $\text{K} > \text{Na} > \text{Li}$ . The nature of the viscosity-time curve indicates an autocatalytic process reaching max velocity in the colloid phase. The action of electrolytes was tested on a sol (1) prepd according to Graham, and another one (2) obtained at the b. p. and from greater concns. of the reagents. Both preps. when dialyzed until free from  $\text{Cl}^-$  ion failed to show a Tyndall cone. When ultrafiltered, the first was retained by the collodion membrane and the second passed through. Concns. of electrolytes necessary to effect complete coagulation in 24 hr. were detd. Larger concns. were required in the case of sol 1. Activity of cations depended on their valence. Pptn. by salts of Na, K and Li was reversible. A tolerance zone was noted in the case of Zr and Th salts. Addn. of  $\text{EtOH}$  sensitized the sol towards Li, Na, K, Ca and Ba ions, did not influence the action of Al and Ce salts, and protected against Zr and Th ions. A reversible ultrafilterable sol showed a very slight increase in cond. on standing 10 days. A coarser dispersion, exhibiting the Tyndall cone and easily coagulable by electrolytes, increased about 1.5 times in cond. after 10 days. This increase is attributed to the decompn. of polyacids of general formula  $n\text{H}_2\text{WO}_4.m\text{WO}_3$ .

B. SOVENKOFF

**Use of tartaric acid in the synthesis of electronegative sols.** III. Adsorption of sodium tartrate and sodium succinate by aluminum hydroxide. A. DUMANSKII AND A. YAKOVLEV. *Kolloid-Z.* **48**, 151-4(1929).—See *C. A.* **23**, 1333. E. C. M.

**Influence of electrolytes on the viscosity of colloid sols.** N. R. DHAR AND S. GHOSH. *Kolloid-Z.* **48**, 43-9(1929); cf. *C. A.* **22**, 2094.—Viscosity measurements of more than 30 sols showed that the addn. of electrolytes lowered the viscosity. The viscosity of a sol is always lowered when ions with the same charge as the sol are adsorbed. Viscosity increases as the sol is purified, and the sensitivity to added electrolyte is greatest with pure sols. The greater the charge of the sol, the lower the viscosity and the lower the degree of hydration. The stability of a sol does not depend upon the degree of hydration.

L. F. MAREK

**The macroscopic method of determining the cataphoretic velocity of colloid particles.** A. E. ALIEV AND A. F. GERASIMOV. *J. Russ. Phys.-Chem. Soc.* **61**, 275-7(1929).—The moving boundary method gave reproducible results in the case of collargol when the added electrolyte ( $\text{Na}_2\text{CO}_3$ ) did not contain the highly mobile H and OH ions. B. S.

**Electrokinetic migration velocity, peptization and stability of coarse dispersed systems.** A. v. BUZAGH. *Kolloid-Z.* **48**, 33-43(1929).—The cataphoretic migration velocity of (1) animal charcoal in picric acid soln., (2) kaolin in picric acid solns. and (3) bentonite in  $\text{NaOH}$  soln. were measured under varying conditions of electrolyte and solid-phase concns. In all 3 cases the migration velocity at const. solid-phase concn. passed through a max. with increasing electrolyte concn. Also with const. electrolyte concn. the migration velocity passed through a max. with increasing solid phase concn. These 2 effects are interrelated through the charge induced on the particle by adsorbed electrolyte (peptizer). The degree of peptization, *i. e.*, the relative amt. of solid phase held in suspension, was measured with varying solid-phase concns. and found to pass

through a max. for all concns. of the peptizer used. In pure  $H_2O$  the cataphoretic migration velocity of the particles was independent of solid-phase concn. and the degree of peptization was const. for small, and decreased with increased solid-phase concn.

**Kinetic experiments in the system: colloidal iron hydroxide-hydrochloric acid-water.** ERICH HEYMANN. *Kolloid-Z.* **48**, 25-33(1929); cf. *C. A.* **23**, 3389. By measurement of cond. changes as well as concn. of the molecularly dispersed Fe, during the aging of  $FeCl_3$  solns., with and without OH addn., it was detd. that addn. of  $Fe(OH)_3$  strongly accelerates the slow hydrolysis of the  $FeCl_3$ . This effect is limited to  $Fe(OH)_3$ , as  $Al(OH)_3$  does not accelerate. In accord with the viewpoint of Wiegner and Muller, it followed from the expts. that the assemblage of the primary hydrolysis products of  $FeCl_3$  is autocatalytic in nature. The soln. of  $Fe(OH)_3$  particles in HCl is not monomol., but is of a higher order. From this, in accord with Herzfeld's principal, it follows that the reaction takes place in the intermicellar soln. of the colloid particles as well as on the surface of the particles. The hydrolysis of  $NaH_2AlO_4$  was found to be accelerated by the hydrolysis product,  $AlO.OH$ .

**Contributions to general colloid chemistry. XXIV. Conductivity of colloidal salts and mobility of colloids.** WO. PAULI, F. VALKÓ and NORBERT WEINGARTEN. *Kolloid-Z.* **48**, 1-10(1929); cf. *C. A.* **22**, 4028.—The Hittorf method is applicable to colloids for the detn. of the av. colloid mobility per charge, when the charge, mass and mobility distribution do not conflict with the defined conditions, when, e. g., ions of higher mobility and low equiv. wt. are not present in essentially the same amt. as are ions of low mobility and high equiv. wt. The decrease in colloid-ion mobility in an  $Al(OH)_3$  sol on exchange of the oppositely charged Cl ion by  $SO_4$  ion was ascertained and evaluated with the aid of conductivities. The change in colloid-ion mobility in an  $Al(OH)_3$  sol on mixing with HCl and  $H_2SO_4$  was ascertained and discussed together with other electrochem. values. The increase in colloid-ion mobility in an  $Al(OH)_3$  sol with diln. was ascertained. Sols were produced from  $AlCl_3$  by incomplete pptn. of the Cl ion with  $Ag_2O$  and characterized electrochemically.

**The electrical charge on silver iodide in saturated silver iodide solution.** E. LANGE and P. W. CRANE. *Z. physik. Chem., Abt. A*, **141**, 225-48(1929).—The potential of  $AgI$  in satd. soln. has been detd. as  $-4 \pm 1$  mv. The isoelec. point is at approx  $4 \times 10^{-9} N$  in  $Ag$  ion. The theory of ion deformation is used to explain this as well as other exptl. colloid phenomena.

**Grain growth in silver halide precipitates.** S. E. SHEPPARD and R. H. LAMBERT. *Colloid Symposium Monograph* **6**, 265-82(1928).—In ppt. formation, there is first inception or nucleation of the new phase followed by grain growth due to accretion or to aggregation. From the exptl. results it is concluded that "in the first stage of digestion the process of Ostwald ripening is occurring, grains below a certain size are dissolving and grains above a certain size growing by accretion from soln. This process proceeds to exhaustion of the grains whose soly. is appreciably different from that of the largest." A new type of grain growth then appears, due to recrystn. within the aggregates produced by collisions and coalescence. It is also concluded that the type of size-frequency distribution is independent of bromide concn. (solubilizer) and time; probably of temp. also.

**The synthesis and properties of the colloidal hydroxides from metallic aluminum and magnesium.** I. A. YAKOVLEV. *J. Russ. Phys.-Chem. Soc.* **60**, 1551-5(1928).— $Al_2O_3$  and  $MgO$  sols were prepd. by leaving the powdered metal in contact with  $H_2$  under distd.  $H_2O$  for 6-12 hr. The concn. of  $Al$  sols was 1.5-5.04 g.  $Al_2O_3$  per 1 whole  $Mg$  sols were more concd. and often formed gels. The  $Al(OH)_3$  sol was positively charged, could be coagulated by  $KCl$ ,  $NaCl$ ,  $K_2SO_4$ ,  $CaCl_2$ , etc., and varied in particle size (detd. ultramicroscopically) between 45 and  $64\mu$ . Its adsorbing capacity for Na tartrate and succinate was smaller than that of an  $Al(OH)_3$  sol prepd. according to Graham

**The preparation of water-soluble colloidal bismuth and arsenic.** A. F. GERASIMOV. *J. Russ. Phys.-Chem. Soc.* **61**, 269-74(1929).—To Paal's lysalbinic acid soln is added  $AcOH$  until the ppt. redissolves. To the warm mixt. is added a satd. soln. of  $BiOCl$  in HCl of sp. gr. 1.182 followed by a few drops of HCl to redissolve the ppt. The reduction is effected by a slight excess of 25%  $H_3PO_3$  and is complete in 10-15 min. at  $80^\circ$ . The sol is cooled, centrifuged and the supernatant liquid poured off 3-4 times. A few drops of 20%  $NaOH$  brings the colloid again into soln. When more lysalbinic acid is added followed by alkali to complete soln., the resulting  $Bi$  sols can be evapd. to a black powder contg. 17.9%  $Bi$  and sol. in  $H_2O$  with a neg. charge. White sediment is produced on contact with atm.  $O_2$ . Arsenic sols are most easily prepd. as follows. A mixt. of 1 g.

$As_2O_3$  and 8 cc. HCl sp. gr. 1.182 is shaken, allowed to stand for several hr. (to complete liquefaction of  $As_2O_3$ ) and poured into 50 cc. of acidified Paal's mixt. on a water bath. A slight excess of  $H_2PO_2$  is added, the reduction requiring 15 min. The mixt. is allowed to cool and neutralized with  $Na_2CO_3$  to cause complete pptn., centrifuged and the sediment washed. Soln. is effected by a few drops of 20% NaOH; the resulting sol on evapn. gives a water-sol. powder contg. 23–27% As. The aq. solns. are negatively charged and less readily oxidized by air than the Bi sols. B. SOYENKOFF

**Preparation of negatively charged sols by means of tartaric acid.** IV. A. DUMANSKII AND A. YAKOVLEV. *J. Russ. Phys.-Chem. Soc.* 61, 213–5 (1929); *Kolloid-Z.* 48, 155–6.—The adsorption of Na *d*- and *i*-tartrate by a mech. suspension of  $Al_2O_3$  follows the usual isotherm. In concd. solns. (above 0.4 *N*) of Na *d*-tartrate there is gel formation accompanied by an abrupt change in the adsorption curve consts. Na *i*-tartrate is much less adsorbed, possibly because of steric hindrance. V. **Preparation of sulfide sols.** A. DUMANSKII AND A. BUNTIN. *J. Russ. Phys.-Chem. Soc.* 61, 279–314.—Solns. of Pb tartrate in KOH and aq.  $H_2S$  were mixed and allowed to stand for 25 days; stable sols resulted from 0.000132 *M*  $PbC_4H_4O_6$  plus less than the equiv. amt. of  $H_2S$  in an equal vol. of soln. Addn. of NaOH hastened pptn. while the use of weaker alkali ( $NH_4OH$ ) as the solvent for Pb tartrate increased the stability of the resulting sols. When the relative amts. of Pb and  $H_2S$  as well as the final concn. of the sol are kept const., the degree of aggregation and the color intensity increase with the concn. of  $H_2S$  added. Conductance measurements indicate that the formation of PbS proceeds to completion only in the presence of an excess of  $H_2S$ ; when less than the equiv. amt. of  $H_2S$  is added, complexes result. Spectrophotometric studies showed that the color intensity was not proportional to the amt. of added  $H_2S$ . A sol stable for months resulted from 1.035 g. Pb (as tartrate) and 0.385 g.  $NH_3$  in 100 cc.  $H_2O$ , and 0.1530 g.  $H_2S$  in another 100 cc.  $H_2O$ . When dialyzed in the absence of  $CO_2$  to a sp. conductance of  $1.2 \times 10^{-5}$ , the dispersed phase contained less Pb and S than calcd. for PbS. Dil. acids, NaOH, KOH, NaCl,  $Na_2C_4H_4O_6$ ,  $NH_4Cl$ ,  $CaCl_2$ ,  $BaCl_2$ ,  $K_2CrO_4$ ,  $AgNO_3$  and  $AlCl_3$  coagulated the sol;  $NH_4OH$  had no action. Sn sols were prepd. from a soln. of  $Sn(OH)_4$  in tartaric acid (17.6 g. Sn and 24.0 g.  $C_4H_4O_6$  per l.) and aq.  $H_2S$  (1–3 g./l.). Stable reddish yellow sols resulted in the majority of cases, in about 1 hr. after mixing the reagents. The condensation proceeded more rapidly in presence of an excess of  $H_2S$ . Stability increases with the acidity; gelation occurs in neutral media while in alk. media (in presence of  $NH_4OH$ ) colloid aggregates are not formed. A sol prepd. from equal vols. of the above reagents was negatively charged. The dry residue from evapn. contd. more Sn than calcd. for  $SnS_2$ . Alkalies acted as peptizing agents; salt solns. coagulated the colloid. To prep. colloidal  $Fe_2S_3$ , a hot 60% soln. of tartaric acid was satd. with washed  $Fe(OH)_3$ , made alk. with 25%  $NH_4OH$ , dild. 4–32 times and aq.  $H_2S$  (0.00369 g./cc.) added. Gels sepd. in 2 days which underwent rapid synecresis. Addn. of  $NH_4OH$  hastens coagulation. A sol stable for months was obtained by satg. the  $Fe(OH)_3$  soln. with  $H_2S$ . It could be dialyzed against dil.  $H_2S$ , but on dialysis against  $H_2O$  deposited S and passed into an electroneg.  $Fe_2O_3$  sol. The sulfide sol was negatively charged, easily coagulable by salts, and on warming pptd.  $Fe(OH)_3$  and S. The compn. of the dispersed phase approached that of  $Fe_2S_3$ . A NiS sol stable for 2 months was obtained by satg. with  $H_2S$  an ammoniacal tartaric acid soln. of  $Ni(OH)_2$  (0.703 g. Ni, 0.15 g.  $C_4H_4O_6$  and 0.96 g.  $NH_4OH$  per 100 cc.). Dialysis against  $H_2O$  oxidized the sol. The dispersed phase was chiefly NiS. Colloidal  $As_2S_3$  and  $ZnS$  did not adsorb Na tartrate. The formation of sulfide sols in presence of tartaric acid can be regarded as a reaction between the alk. sulfides and sparsely ionized complex metallic compds. which is not influenced by the alkali tartrates formed as the by-products. The protective action of electronegative hydrated oxides may also play a part. B. SOYENKOFF

**Mechanical coagulation of goethite sol.** H. FREUNDLICH AND S. LOEBMANN. *Kolloidchem. Beihefte* 28, 391–406 (1929); cf. *C. A.* 23, 1040.—A quant. study of mech. coagulation of a  $FeO(OH)$  sol was made. The sol was prepd. by addn. of perhydrol to  $Fe(CO)_5$  followed by centrifuging. Coagulation took place in a carefully cleaned stirring app. Samples were withdrawn from time to time. The coagulated particles were sepd. by centrifuging, and the concn. of the supernatant sol was detd. by the Zimmermann-Reinhard method. Equal amts. were coagulated in unit time per unit vol., at const. stirring velocities. Eventually coagulation ceased. The residual sol could not be coagulated by further stirring. The same results were obtained when the acidic lab. air was excluded. The velocity of coagulation is a quadratic function of the velocity of stirring. Changes in optical properties took place during coagulation. Evidence is given to show that the coagulation took place at the interface sol-air. The velocity of coagulation passes through a min. upon addn. of electrolytes in increasing amts. Propyl

alc. in small concns. favors coagulation; in larger amts. it delays it. Isoamyl alc. at all concns. favors, while MeOH inhibits coagulation.

**Lyophilic colloids.** H. R. KRUYT AND H. LIER. *Kolloidchem. Beihefte* 28, 407-50 (1929).—Viscometric detns. were carried out on casein sols prepd. by addn. of acid or alkali to casein made according to van Slyke. The alk. sols were examd. in the absence of  $\text{CO}_2$ . The law of Poiseuille held for all sols examd. The  $p_H$  of all sols was detd. The viscosity max. occurred at  $p_H$  2.6 and 11.5. The acid sols were less stable. Addn. of neutral salts gave an electroviscous effect at const.  $p_H$ . The valence of the cation is decisive for alk. sols, that of the anion for acid sols. Dehydration expts. demonstrated irregular series at const.  $p_H$ , and lyotropic influences. Dehydration by acetone or alc. is abnormal in acid sols. Casein sols are unstable between  $p_H$  3.5 and 6.5. This region includes the isoelec. point. Only electrolytes of the type NaOH and HCl peptized casein. The mechanism of peptization is discussed.

FRANK URBAN

**Influence of electrolytes and nonelectrolytes upon the optical activity and relative resistance to shear of gelatin systems.** J. R. FANSELOW. *Colloid Symposium Monograph* 6, 237-52 (1928).—Numerous curves are given showing influence of temp and concn. on systems at various H-ion activities; of different acids; of several 0.1 N K salts; of various ions on the acid side of the isoelec. point; of varying amts. of salts, of nonelectrolytes and tanning agents. The sol-gel transformation is discussed. Despite complications, F. concludes "that the behavior of gelatin systems can be better explained by the laws obtained from the behavior of highly dispersed heterogeneous systems than by the classical laws of stoichiometry."

JEROME ALEXANDER

**The action of sodium chloride on collargol.** G. S. VOZDVIZHENSII AND A. F. GERASIMOV. *J. Russ. Phys.-Chem. Soc.* 61, 193-6 (1929).—The protective action of NaCl against AcOH diminishes with increasing concn. of Paal's albumin mixt., especially with undialyzed collargol. The collargol diffusates were concd. and used instead of Paal's mixt. in the prepn. of colloidal Ag. The protective action of NaCl on the resulting sol increased strongly with the latter's diln., the effect being equally marked with the samples of the sol previously freed from electrolytes by dialysis. Conclusion: Paal's mixt. contains albuminous substances whose adsorption by colloidal Ag increases with their concn., thus preventing the access of NaCl to the colloidal particles.

B. S.

**The protective action of colloidal silicic acid and hydrated tin oxide on silver sols.** A. V. DUMANSKII AND P. A. SHERSHNEV. *J. Russ. Phys.-Chem. Soc.* 60, 1593-600 (1928).—Ag sols were prepd. by reduction of 0.02%  $\text{AgNO}_3$  by HCHO. They remained stable for 30-40 hr. when dialyzed against water if adjusted to an optimum alky. by the addn. of 0.04 N NaOH. The sols contain particles of varying size when viewed through an ultramicroscope. Colloidal  $\text{SiO}_2$  was prepd. by the addn. of tartaric acid to  $\text{K}_2\text{SiO}_3$  which was negatively charged. The sol was rendered alk. to litmus with NaOH, and HCHO added followed by 0.02%  $\text{AgNO}_3$ . Protected Ag sols resulted which exhibited a Tyndall cone but no discrete particles under the ultramicroscope. The  $p_H$  varied between 10.4 and 11.2. Small amts. of  $\text{SnO}_2$  sol caused coagulation in a few min. while an excess exerted a similar protecting action. The color of Ag- $\text{SiO}_2$  sols was uniformly brown while the color of unprotected sols varied from light orange to violet. Spectrophotometric mixts. show that for protected and for highly dispersed Ag sols the light absorption declines continuously with the frequency while unprotected sols contg. coarse particles show a max. at 550-580 $\mu$ .

**Studies of organophilic colloids.** G. S. WHITBY, J. G. McNALLY AND W. GALLAY. *Colloid Symposium Monograph* 6, 225-36 (1928).—Expts. are described to det. whether solvation or structure is chiefly responsible for the high viscosity of org. sols. It appears that the less solvent bound in a sol, the less of a precipitant is needed to produce sepn. The following are also considered: viscosity-temp. relations; swelling and viscosity; polymerization; elastic properties; chem. constitution.

JEROME ALEXANDER

**The influence of liquids on molded cellulose hydrate.** WERNER LÜDKE. *Kolloid-Z.* 47, 341-51 (1929).—The change in strength of cellulose hydrate (synthetic fibers and strips of cellophan) when impregnated with other substances is studied. After contact with org. liquids the strength is greater than when placed in water or solns. of electrolytes. By adding a trace of water to the org. liquids the strength decreases until it reaches the value obtained with water. The chief influence of the liquids depends on their water content, their conduct toward water, and their ability to effect swelling. The change in strength approx. parallels the surface tension, the liquid with the lowest surface tension, ether, giving the greatest increase in strength, and that with the highest surface tension, water, the least.

R. I. RUSH

**Syneresis.** S. LIPATOV. *Kolloid-Z.* 48, 62-3 (1929); cf. *C. A.* 22, 4314; 23, 2090.—A reply to Kuhn (*C. A.* 23, 1553).

L. F. MAREK

**Diffusion of aspherical particles.** R. GANS. *Ann. Physik* [4], **87**, 935-47 (1928).—Mathematical. Equations for the diffusion of oblate and prolate particles are worked out. B. C. A.

**The partition coefficient of substances miscible in all proportions.** S. G. MOKRUSHIN. *J. Russ. Phys.-Chem. Soc.* **60**, 1633-9 (1928).—For a substance of unlimited soly. in 2 immiscible liquids, the kinetic equil. across the liquid boundary is detd. by the soly. attraction of individual polar groups. For dipoles, the coeff. of partition should be either 0.5, 1 or 2. Deviations from these values are attributed to mutual soly. of the 2 liquid solvents, "polypolar" structure of solute mols., solvation, dissocn., etc. B. SOYENKOFF

**The removal of carbon dioxide from gas mixtures by pressure scrubbing.** R. NITZSCHMANN. *Metallbörse* **18**, 1909-10 (1928).—Equations are derived, Henry's law being assumed, by which one can calc. the gas vol. changes and min.  $H_2O$  requirements for the complete removal of  $CO_2$  from gas mixts. by scrubbing at elevated pressures. E.g., the min.  $H_2O$  requirement to remove  $CO_2$  completely from a gas mixt. contg. 34.88%  $CO$ , 1.30%  $CO$  and 63.82%  $H_2$  by scrubbing at  $10^\circ$  and 20 atm. will be 0.05787 cu. m.  $H_2O$  per cu. m. gas. The  $CO$  dissolved will be 2.4% and the  $H_2$  1.64% of the vol. of each of the respective gases treated. The min. energy consumption will be 27,640 m. kg. R. L. DODGE

**The true concentration of solutions.** M. LEVAILLÉ-KZERSKII. *J. Russ. Phys.-Chem. Soc.* **60**, 1391-8 (1928); cf. *C. A.* **22**, 3333.—Raoult's equation is modified to read  $(p - p_1)/p = kn/(N + in)$ , where  $k = 1.03$  for water. The "true concn."  $C = N(p - p_1)/[p_1 + (k - 1)p] = in$ . Or,  $C$  can be calcd. from a vapor-pressure measurement at some temp.;  $C$  being known, the theoretical value of b. p. elevation can be found from  $\Delta t = EC$ , where  $E$  is the proportionality const. for  $\Delta t/C$ . A b.-p. detn. gives the observed value of  $\Delta t$ , from which  $\Delta t \text{ obs.} / \Delta t \text{ calcd.} = i$ ;  $i$  and  $C$  being known,  $n$  can be found for any salt. Values of  $n$  calcd. from the above equations are in good agreement with the exptl. data found in literature with  $NaCl$ ,  $KCl$ ,  $KBr$ ,  $KI$ ,  $KNO_3$ ,  $KClO_3$  and  $BaCl_2$ . BASIL C. SOYENKOFF

**Ionic radius and osmotic activity.** G. B. BONINO AND V. VAGLIO. *Gazz. chim. ital.* **50**, 49-56 (1929).—Modern theories of soln. attempt to foresee the chem.-phys. properties of solns. of strong electrolytes by utilizing data on the charge and the dimensions of the ions with a given solvent and concn. However, the ionic radii which must be introduced into the calcs. to obtain this information do not correspond (even with application of the Debye-Hückel theory) to the actual radii detd. in other ways, for they are diametrically opposite in character to the latter. In the present paper, an investigation already begun (cf. *Coefficiente di attività e deformabilità degli ioni. I. Atti soc. Lig. sci. lett.* **V**, no. 3 (1925)) in earlier work is continued, with the result that it is found that when the ionic deformability as well as the ionic radius and the charge are introduced into the calcs., there results a concordance between the ionic radii derived from the properties of the solns. and those detd. by other methods. Thus an exptl. relation is found which permits the calcn. in an inverse way of the ionic deformability from cryoscopic and ebullioscopic data in different solns. The agreement between these relations and exptl. data is satisfactory. C. C. DAVIS

**The exceptional mobility of the hydrogen and hydroxyl ions.** M. S. SKANAVI-GRIGORIEVA. *J. Russ. Phys.-Chem. Soc.* **60**, 1459-75 (1928).—If the views of Grotthuss and Danneel regarding the mechanism of elec. conduction are correct, the viscosity of the medium should have less influence on the conductance of electrolytes which have one or several ions in common with the solvent. Conductance of  $HCl$ ,  $KOH$  and  $KCl$  in glycerol- $H_2O$  mixts. were measured. The equiv. conductances plotted against  $\log V$  were nearly straight lines in the case of  $KCl$ .  $KOH$  and  $KCl$  exhibited a max. between 10 and 100 l. The lower equiv. cond. of more dil. solns. is attributed to solvation while in the case of more concd. solns. it is due to a rise in viscosity and a change in the degree of dissocn. When equiv. conductance was multiplied by the viscosity, the resulting curves were nearly straight lines in the case of  $KCl$ ; the curves representing mixts. of glycerol and water lay above the viscosity-by-conductance—diln. curve for  $KCl$  in pure water. In the case of  $KOH$ , the water curve approached a straight line; the 10% glycerol curve exhibited a max. while in 20, 40 and 50% glycerol the viscosity-conductance product declined continuously with increasing voltage. The glycerol-water curves in general lay below that for pure water. The viscosity-conductance product for a given concn. of  $HCl$  in concd. solns. of the electrolyte increased with the amt. of glycerol present; in dil. solns. it decreased on the addn. of glycerol. The cond. of  $KCl$ ,  $KOH$  and  $HCl$  decreases in a similar manner when viscosity is increased by the addn. of glycerol. The deviations are caused by changes in the degree of solvation and are not connected with the Grotthuss effect. B. SOYENKOFF

A modification of the moving-boundary method for the determination of transference numbers. H. P. CADY AND L. G. LONGSWORTH. *J. Am. Chem. Soc.* 51, 1656-64(1929).—The novel features of this method are a rising boundary and the automatic formation of an indicator electrolyte and adjustment of its concn. by soln. of the metal electrode. No new transference no. data are given. MALCOLM DOLE

Decomposition of mercurous chloride in concentrated solutions of other chlorides. T. W. RICHARDS AND MARCEL FRANÇON. *J. Phys. Chem.* 33, 936-50(1929).— $\text{Hg}_2\text{Cl}_2$  was treated with solns. of alkali chlorides of various concns. for 6 hr. in a thermostat. The extent of the reaction was obtained by detg. the amt. of Hg dissolved. The same details of procedure as those described by Richards and Archibald (*Proc. Am. Acad.* 37, 13, 347) were used. The data obtained were as follows: (1)  $\text{HgCl}_2$  found in solns. of KCl: 0.75 N, 0.035 g. per l.; 1.62 N, 0.166; 2.73 N, 0.590; 3.70 N, 1.256; 4.05 N, 1.570, 4.17 N, 1.666. (2)  $\text{HgCl}_2$  found in solns. of LiCl: 1.27 N, 0.049; 2.87 N, 0.160; 4.64 N, 0.294; 5.56 N, 0.325; 7.34 N, 0.386. (3)  $\text{HgCl}_2$  found in solns. of CsCl: 2.45 N, 1.35, 1.51 N, 0.324; 0.476 N, 0.0344. (4)  $\text{HgCl}_2$  found in solns. of  $\text{SrCl}_2$ : 3.59 N, 0.283 g per l. The wts. of  $\text{HgCl}_2$  (g. per l. of soln.) for various 2 N solns. were: LiCl, 0.09;  $\text{CaCl}_2$ , 0.08;  $\text{BaCl}_2$ , 0.11; NaCl, 0.14; HCl, 0.15; KCl, 0.28; CsCl, 0.70. The greater the mol. vol. of the elements of the same valence, the more important is the action of the chlorides. It seems hardly possible to explain the differences in the actions of the alkali chlorides on  $\text{Hg}_2\text{Cl}_2$  by the concn. of the Cl ion since the chlorides are practically completely dissocd. The results obtained are analyzed from the viewpoint of thermodynamics and from that of the mechanism of the reactions involved. The data show that the decompn. of  $\text{Hg}_2\text{Cl}_2$  is greatly lessened if the 0.1 N calomel electrode is used in the detn. of H-ion concns. A. J. MONACK

Uniform distribution of catalysts throughout porous solids. HARRY N. HOLMES AND ROBERT C. WILLIAMS. *Colloid Symposium Monograph* 6, 283-5(1928).—Porous  $\text{SiO}_2$  gel was soaked in a salt soln., and dried. A water-sol. gas was then admitted to the gel, which was later immersed in  $\text{H}_2\text{O}$  to allow the salt and the gas to react within the capillary pores. Pairs used were:  $\text{AgNO}_3$  and  $\text{H}_2\text{S}$ ;  $\text{FeCl}_3$  and  $\text{NH}_3$ . Pt and Pd were deposited similarly. JEROME ALEXANDER

The nature of the carbon produced by the catalytic decomposition of carbon monoxide with iron. TOKUNOSUKE WATANABE. *Bull. Inst. Phys. Chem. Research (Tokyo)* 8, 288-92(1929); *Abstract sect. 2*, 37-8(1929); cf. *C. A.* 23, 1560.—The density, particle size, crystallinity and adsorptive power of the C prepd. by the catalytic decompn. of CO at 400-800° were investigated. The graphitic nature of this C was verified by the x ray powder method; the higher the temp. of its formation the more graphitic it becomes. The adsorptive power of the C for  $\text{C}_6\text{H}_5\text{COOH}$  decreases as the temp. of its formation increases. The d. as detd. by the usual liquid immersion method by using toluene increases from 2.078 to 2.206 when the temp. of its formation rises from 400° to 700°. The size of particles is estd. by the method of Svedberg to be of the order of one micron. The reason that the C prepd. by the decompn. of CO shows the adsorptive property in spite of its graphitic nature is the fact that it consists of elementary C in a rather deformed structure. With graphite, because of its perfect crystalline structure, there appears no remarkable effect of adsorption. The d. and cryst. behavior of the C in question as well as its adsorptive power have a marked parallelism with the temp. of its formation, as if in character it stands between graphite and sugar C in every respect. That the view of Debye, Scherrer and Asahara on the allotropic nature of graphite and amorphous C still holds good in the case of the adsorptive C, was found in the present expt. G. CALINGAERT

The catalytic reduction of carbon monoxide under atmospheric pressure. I. Studies by the heating-curve method of the catalytic activity of a few metals. SHINIRO KODAMA. *Bull. Inst. Phys. Chem. Research (Tokyo)* 8, 277-83; *Abstracts sect. 2*, 35-6(1929). (In German).—Ni, Co and Fe are reduced at various temps., and their catalytic activity in the reduction of CO by  $\text{H}_2$  under atm. pressure is measured. The mixt. of 1 mol.  $\text{H}_2$  + 1 mol. CO is passed through 2 tubes, one with, and one without catalyst and heated progressively to 400°. A differential thermocouple records the exothermic reaction. After the reaction, the Ni dissolved in HCl without leaving any residue, while Co left a residue of C. The activity of Ni is thus independent of the temp. of reduction, while the opposite is true with Co. In the absence of  $\text{H}_2$ , both Ni and Co catalyze the decompn. of CO. Fe reduced at 350° and 450° shows an exothermic reaction around 300° which is caused principally by the oxidation of Fe. The Fe catalyst is then no longer active, and is found to be a mixt. of FeO and C. Furthermore, the heating curve with CO alone is practically identical with that of CO +  $\text{H}_2$ . II. Study by the heating-curve method of the influence of a few substances on the catalytic activity of cobalt.

*Ibid* 284-7; *Abstract sect.* 36-7.—The influence of  $K_2CO_3$ , Cu,  $ThO_2$ ,  $Al_2O_3$  and MnO on the activity of a Co catalyst was studied by the method described above. The decompn. of CO with sepn. of C is not evident when  $ThO_2$  or Cu is added to the Co catalyst, while the addition of  $K_2CO_3$  decreases it.  $ThO_2$  and Cu to a less degree increase the activity of Co toward the reduction of CO and the formation of hydrocarbons.  $Al_2O_3$  and MnO are detrimental to the activity of Co.

G. CALINGAERT

Catalytic solution of copper in sulfuric acid. I. B. EVTUSHENKO. *J. Chem. Ind.* (Moscow) 6, 429-30 (1929).—In presence of air  $H_2SO_4$  dissolves Cu but slowly, particularly if the metal has not been finely divided. A catalyst is reported which accelerates this reaction considerably. Cu turnings are placed in a flask,  $H_2SO_4$  ( $17^\circ$  Bé.) is added, an air current is passed through a tube reaching to the bottom of the flask, and the flask is heated on a water bath. Without the catalyst only 5.74% of  $H_2SO_4$  combines with Cu after 3 hr.; with the catalyst, 30%. The catalyst consists of a mixt. of 1 part  $Cr_2(SO_4)_3$  and  $1/2$  part  $HNO_3$  per 100 parts  $H_2SO_4$  taken. The product obtained contains but a trace of Cr alum, and the catalyst remains in the mother liquors and can be recovered.

BERNARD NELSON

Mutual decomposition in the absence of a solvent. VII. Equilibria in systems composed of thallium sulfate and mercury halides. N. K. VOSKRESENSKA. *J. Russ. Phys.-Chem. Soc.* 61, 79-87 (1929).—The appearance of solid phase on cooling could be directly observed except in the case of opaque  $HgI_2$  mixts. Eutectics and polymorphic transformation points were detd. from heating and cooling curves. The liquidus curve of  $Tl_2SO_4$ - $HgCl_2$  alloys is practically rectilinear up to 60% (molar)  $HgCl_2$ . At 64.5%  $HgCl_2$  and  $269^\circ$  the line becomes more nearly horizontal, and at 81.5%  $HgCl_2$  and  $232^\circ$  (the eutectic) the slope changes from pos. to neg. A single complex compd. is formed (probably  $3Tl_2SO_4 \cdot HgCl_2$ ), m.  $269^\circ$ . A double salt,  $5HgCl_2 \cdot 2Tl_2SO_4$ , crystallizes from dil aq solns. on cooling. The liquidus curve of  $Tl_2SO_4$ - $HgBr_2$  shows a eutectic at  $212^\circ$  and 79%  $HgBr_2$ . The cooling and heating curves show a horizontal portion  $10$ - $12^\circ$  above the eutectic corresponding to the decompn. of a complex compd. Mixts. contg. less than 65%  $HgBr_2$  boil below the m. p. at atm. pressure. No indication of a polymorphic transformation was found. No complexes are formed in mixts. of  $HgI_2$  and  $Tl_2SO_4$ . The eutectic lies at 83%  $HgI_2$  and  $249$ - $50^\circ$ . The temp. of polymorphic transformation of  $HgI_2$  is not affected by the addn. of  $Tl_2SO_4$ , showing that no solid solns. are formed.  $Tl_2SO_4$  does not increase the soly. of  $HgI_2$  in water. A comparison of the above systems shows that the miscibility of liquid  $Tl_2SO_4$  and Hg halide decreases with the increasing (negative) heat of soln. Mutual decompn. does not occur. VIII. The singular irreversible system  $TiNO_3 + KBr \rightarrow TiBr + KNO_3$ .—A. P. ROSTKOVSKI. *Ibid* 89-107.—The crit. soly. point lies at  $535^\circ$ . The binary system  $TiNO_3$ - $TiBr$  exhibits a eutectic at 88.5%  $TiNO_3$ , 11.5%  $TiBr$  and  $193^\circ$ . In  $TiBr$ - $KBr$  the liquidus curves intersect at  $KBr$  8.5% and  $457^\circ$ ; the  $TiBr$  branch is practically horizontal. The liquidus curve of the system  $KNO_3$ - $KBr$  consists of 3 portions, the middle one corresponding to the compd.  $KNO_3 \cdot KBr$ , which melts with decompn. at  $342^\circ$ ; the eutectic lies close to the m. p. of  $KNO_3$ . The diagonal section  $KNO_3$ - $TiBr$  of the space model is a binary system of limited mutual soly. Stratification is observed between 14 and 92.5%  $TiBr$ , and the primary crystn. (crystn. from single liquid phase) of  $TiBr$  begins at  $435^\circ$ . The eutectic line is at  $330^\circ$ , and eutectic point corresponds to about 2%  $TiBr$ . In the diagonal section  $TiNO_3$ - $KBr$ , the liquidus curve descends from the m. p. of  $TiNO_3$  to  $190^\circ$  at 92%  $TiNO_3$  and 8%  $KBr$ . Stratification occurs at  $395^\circ$  and 34%  $KBr$ ; here the outer branch of primary crystn. curve of  $TiBr$  intersects the inner branch and the stratification curve. The stratification curve passes through a max. at 50% and  $535^\circ$ . A similar intersection point lies at  $468^\circ$  and 61%  $KBr$ . The diagonal section contains a singular plane (locus of intersection for all curves) which characterizes chem. irreversible systems. The ternary system  $KNO_3$ - $TiNO_3$ - $TiBr$  contains a stratification region and a triple eutectic at  $181^\circ$ , 25.5%  $KNO_3$ , 4.5%  $TiBr$  and 70%  $TiNO_3$ . System  $KNO_3$ - $TiBr$ - $KBr$  contains a transition point at  $336$ - $8^\circ$ , 4.5%  $KBr$ , 1%  $TiBr$  and 93.5%  $KNO_3$ , and the triple eutectic  $327$ - $8^\circ$ , 1%  $KBr$ , 1%  $TiBr$  and 98%  $KNO_3$ , besides the stratification regions. The stratification field occupies 32% of the total surface of the space projection of the ternary system.

B. SOVENKOFF

The heterogeneous equilibrium of tungsten and its oxides with carbon monoxide and carbon dioxide. ZEN-ICHI SHIBATA. *Tech. Repts. Tôhoku Imp. Univ.* 8, 255-70 (1929).—The following reversible reactions exist:  $1/2[W_2O_5] + CO = 1/2[W] + CO_2$ ;  $[W_2O_5] + CO = 2[W_2O_3] + CO_2$ ;  $2WO_3 + CO = [W_2O_5] + CO_2$ . The brackets indicate satd. solid solns. of mutual components. The soly. of  $WO_3$  in  $W_2O_5$  is comparatively large at high temp.; at about  $1000^\circ$  a series of solid solns. is formed until 2% O of  $WO_3$  is reduced. The following exptl. equations were obtained for the relations between the

equil. const. and temp.:  $\log K_{p1} = (321.6/T) - 0.0647$ ;  $\log K_{p2} = (1029.8/T) - 0.7884$ ;  $\log K_{p3} = (1555.5/T) - 1.1427$ . H. C. PARISH

The heterogeneous equilibrium of tungsten and its oxides with hydrogen and water vapor; and the dissociation pressure of the oxides. ZEN-ICHI SHIBATA. *Tech. Repts Tôhoku Imp. Univ.* **8**, 271-7 (1929). H. C. PARISH

The melting point of potassium chromate. DAVID F. SMITH AND F. A. HARTGEN. *Fuel in Science & Practice* **8**, 302 (1929). See *C. A.* **23**, 2640. D. A. REYNOLDS

Dehydration mechanism. D. BALAREFF. *Kolloid-Z.* **48**, 63-70 (1929).—Study of the mechanism of the dehydration of gypsum shows it to be semihydrated in character. Application of the specific character of this dehydration to the results of van't Hoff, Le Chatelier, Linck and Jung, and Balareff concerning the dehydration of gypsum and the semihydrate makes possible an explanation of many contradictions. L. F. MAREK

Use of a recording manometer for studying the decomposition of hydrates (particularly of alumina hydrates). L. HACKSPILL AND E. STEMPEL. *Chimie & Industrie Special No.*, 151-9 (Feb., 1929).—*Gibbsite*, or orthoalumina acid,  $Al(OH)_3$ , is reversibly dehydrated at a perfectly definite temp. ( $220^\circ$ ). A water vapor pressure, even of several atm., can retard, but not prevent, the decomposition. This is not a dissociation phenomenon, but a sharp decomposition. Dehydration is complete and does not take place by progressive loss of  $H_2O$  with formation of lower hydrates. After it has taken place  $H_2O$  is adsorbed by the anhyd.  $Al_2O_3$  crystals, which offer a very large surface. Part of the  $H_2O$  combined as  $Al_2O_3 \cdot 3H_2O$  is converted into adsorbed  $H_2O$  without having left the crystal. The adsorption is reversible as long as the adsorbing substance has not been heated sufficiently to agglomerate the small crystals and decrease the total surface. *Diaspor*, or metaalumina acid,  $HAIO_2$ , behaves like gibbsite; i. e., it is dehydrated in one stage and quite sharply, but at a temp. of  $500^\circ$ . The presence of the intermediate hydrate  $Al_2O_3 \cdot 2H_2O$  was never observed in natural products. Pure *kaolin* has a very different dehydration curve from those of the other elements of bauxite. The curve of *goethite*,  $HFeO_2$ , is similar to that of aluminic acids, but decomposition takes place at about  $320^\circ$ . These data permit determination in a single operation of the approximate composition of a natural bauxite and confirmation of the results of the mineralogical examination. A. P. C.

Thermal decomposition of ozone at low pressures. E. H. RIESENFELD AND H. J. SCHUMACHER. *Z. physik. Chem.* **138**, 268-85 (1928); cf. *C. A.* **22**, 714.—The thermal decomposition of  $O_3$  mixed with  $O$  has been studied at  $85^\circ$  and  $95^\circ$  for partial pressures of  $O_3$  varying from about 60 to 6 mm. At these pressures, the unimolecular reaction predominates, the bimolecular reaction which occurs simultaneously at higher pressures (*C. A.* **22**, 714) being of little account, and the velocity coefficients of both reactions are not appreciably influenced by variations in the partial pressure of  $O$  or by the presence of  $N_2$ , however, and still more  $CO_2$  accelerate the bimolecular reaction. Alteration in the ratio of the surface to the volume of the reaction vessel affects the reaction velocity much less than it would if the unimolecular reaction were purely a wall reaction, so that it seems that the main reaction is homogeneous, although under ordinary conditions there appears to be some slight wall effect in addition. From the facts that in the experiments of Perman and Greaves (*C. A.* **2**, 2325) and of Griffith and McKeown (*C. A.* **20**, 323) variation of the surface of the vessel affected the velocity considerably, and also that the observed velocities were exceptionally high, it appears probable that these authors' results were vitiated by the presence of catalysts in the gas or in the apparatus. The results of the present experiments for the unimolecular reaction may be considered to supersede those of Riesenfeld and Bohnholzer (*C. A.* **22**, 714) on account of their greater accuracy. B. C. A.

The thermal formation of hydrogen chloride. J. A. CHRISTIANSEN. *Z. physik. Chem.*, Aft. B, **2**, 405-27; **3**, 481 (1929).—The rate of formation of  $HCl$  from  $H_2$  and  $Cl_2$  at  $200^\circ$  is almost independent of the concentration of  $H_2$  for definite values of the  $O_2$  concentration. It is approximately proportional to the concentration of  $Cl_2$ , and inversely proportional to the concentration of  $O_2$ .  $Br_2$  does not stop the reaction while  $HCl$  apparently retards it somewhat. A *microburet* is described. In an electric thermoregulator with an Fe-Hg contact, the Fe should be negative. F. D. ROSSINI

Specific heats of acetone, and methyl, ethyl and propyl alcohols at low temperatures. SHINROKU MITSUKURI AND KENJI HARA. *Bull. Chem. Soc. Japan* **4**, 77-81 (1929).—The calorimeter proper containing a heating element and a stirrer is surrounded by a brass cylinder and the whole immersed in a petroleum ether bath cooled by liquid air. In use the bath is cooled and the source of cold removed. The temperature of the liquid is then plotted against time, before, during and after the flow of current. From these data can be plotted a corrected curve of temperature rise due to electric energy. The usual calorimeter corrections are then made. From the energy supplied the specific heats are easily calculated. Results were given in *C. A.* **23**, 2095. V. F. HARRINGTON

**Studies on the heat of fusion and the specific heat of calcium and magnesium.** EDWARD ZALESIŃSKI AND ROMAN ZULIŃSKI. *Bull. intern. acad. polonaise*. 1928A, 479-505 (In German).—In a specially constructed  $H_2O$  calorimeter the sp. heats and the heats of fusion of solid and the av. sp. heats of fused Mg and Ca were detd. Differences in the sp. heat values of Ca lead to an assumption of a new allotropic modification in the neighborhood of the m. p. with a smaller sp. heat. Its existence was proved by measurements of the duration of crystn. of fused Ca, which recalcd. according to Tammann's formula for heat of fusion gave the transition point of this modification at  $800^\circ$ . The sp. heats (in cal./g.) of Ca for different temp. intervals are as follows:  $20-304^\circ$ , 0.1610;  $20-504^\circ$ , 0.1764;  $22-520^\circ$ , 0.1768;  $20-697^\circ$ , 0.1887;  $21-755^\circ$ , 0.1927;  $22-785^\circ$ , 0.1901 (this value obtained when coming from lower to higher temp.);  $22-785^\circ$ , 0.1724 (as obtained when coming from higher to lower temp.);  $22-802^\circ$ , 0.1724;  $810^\circ$  (m. p.)– $930^\circ$ , 0.2670. The corresponding values for Mg are:  $22-625^\circ$ , 8.2823;  $650^\circ$  (m. p.)– $775^\circ$ , 0.2880 or 0.2800. The heat of fusion in cal./g. for Ca is 78.5 (calorimeter), 74.0 (duration of crystn.); the heat of transition of the Ca allotropic modification 5.75. The values for Mg are 55.5 (calorimeter) and 46.0 (duration crystn.). J. WIERTELAK

The internal resistance of spontaneous processes and the entropy changes by which they are accompanied. N. V. TANTROV. *J. Russ. Phys.-Chem. Soc.* 61, 41-52(1929); cf. *C. A.* 19, 2437.—The heat generated by an exothermic reaction is the more quickly dispersed the higher the temp. and the smaller the amt. liberated. Or, the reaction will proceed most readily when  $dS(=dQ/T)$  is at a min. When the mols. react adiabatically this min. entropy change corresponds to min. internal resistance, the latter being detd. by the velocity with which the reacting mols. transmit kinetic energy to their neighbors. The initial stages of a reaction between individual mols. can be regarded as adiabatic, heat (acceleration) being produced by the forces of chem. attraction much more rapidly than dissipated. The formation of cryst. nuclei in supercooled liquids is discussed, starting with the above premises. It is concluded that of several possible solid phases the one of higher m. p. and lower d. and heat of fusion should sep. regardless of whether it is the stable one at the given temp. In crystn. from supersatd. solns. the phase of greatest soly. will sep. Assuming that gas laws hold for supersatd. vapors, condensation at a temp. below the m. p. yields a liquid phase (cf. *C. A.* 22, 2704). Among chem. reactions in systems of one phase, those of least heat effect will most readily take place.

**The gold content of sea water.** A. GLAZUNOV. *Chimie & industrie Special No.*, 426-7 (Feb., 1929).—For the detection of Au in sea water, the latter was passed over a pyrites filter, the Au forming a solid soln. with the pyrites, and the pyrites were analyzed for their Au content. Up to 200 tons of sea water was used in the individual tests. The Au content of sea water in the neighborhood of the French coast was found to be of the order of 1 mg. per ton. By making use of the tide, it is considered that Au could be commercially extd. from sea water contg. 4 mg. per ton. A. PAPINEAU-COUTURE

**Modern views of friction.** JEAN J. TRILLAT. *Metallwirtschaft* 7, 101-8(1928).—If a fatty acid is pressed out on a glass plate, cryst. lamellae are found parallel to the glass surface, which give a characteristic spectrum. Active mols. such as the fatty acids show layers 2 mols. deep, whereas inactive mols. such as the satd. hydrocarbons are monomol. On a metal plate, in addn. to the spectrum of the fatty acid, there is observed the spectrum of the combination of the fatty acid with the metal, occurring in an ex-

traordinarily thin layer, which has a completely lamellar structure, with the carboxyl radicals directed toward the metal. This process also occurs with mineral oil which contains some free acid. There are thus formed a certain no. of superimposed laminae of equal thickness so that the metal is covered with  $\text{CH}_3$  groups in the first layer which slip over the hydrocarbon mols. of the second layer very easily. The active ends of the mols. of the second layer attract an equal no. of mols., which are also oriented, thus giving rise to a series of layers, 100–200 in no., 2 mols. thick. Glycerides, such as tristearin, tripalmitin and trimyristin, orient themselves on metals the same as the free fatty acids, the hydrocarbon being directed away from the metal. It is then between the hydrocarbon residues that the phenomenon of "oiliness" originates. A substance may be defined as possessing *oiliness* which can readily take up an oriented lamellar structure. If one melts amorphous fats, like chicken fat, on a plate, little or no orientation can be recognized but if a small quantity is placed between 2 plates which are moved back and forth under pressure the oriented structure can usually be seen. It is therefore the movement which brings about the laminar structure. It is possible by calcn. of the spacing of the slip-planes and by a study of the lines of the spectra to reach conclusions in regard to the compn. of the lubricant. The oiliness is therefore a latent property which depends upon shear and pressure. This is similar to the phenomenon noticed in the prepn. of films of metal, rubber, etc. Spectrograms of fatty acids on glass, tin, lead, etc., are given. Conclusion: As the mols. orient themselves, they oppose the pressure, placing themselves at right angles to the pressure, they neutralize in part the mol. field of force in order to reduce the total energy to a min. Questions are raised as to the measurement of *adhesion*, as to the degree of satn., etc.

### 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

S. C. LIND

The structure of an electron. II. USAKU KAKINUMA. *Proc. Phys.-Math. Soc. Japan* [3], 11, 1–11(1929); cf. *C. A.* 23, 2357.

Two-dimensional orbits in the field of a non-neutral. M. A. HIGAB. *Phil Mag.* [7], 7, 783–92(1929).—A mathematical paper in which the motion of a charged particle in the field of an elec. doublet is discussed. Conditions for periodic orbits are obtained and typical examples are discussed and illustrated.

The collision of a slow electron with an atom. KIICHIRO OCHIAI. *Proc. Phys. Math. Soc. Japan* [3], 10, 120–6(1928).—By means of a wave-mech. treatment of an elastic and a non-elastic collision between a charged particle and a H atom, the probability function is calcd. The angular distribution of intensity of a scattered particle is complicated but in the 1st approximation remains a smooth curve without max. or min. A higher (2nd) approximation is carried out to explain the max. and min. which some expts. show. The wave equation for the disturbed system is  $[H - W, \psi] = 0$ ,  $H = H^0 + U$ , where  $H^0$  is the Hamilton function for the undisturbed system and is equal to  $H^0 +$

$II^p$  in which the indices refer to the atom and the particle, resp.  $U$  is the potential of interaction. The probability for elastic collision  $\phi_{00}$  for very slow electrons is

$$\phi_{00} = 2\pi a^2 \int_0^\pi \psi_{00} \sin \delta \, d\delta \rightarrow \frac{\pi a^2}{4}.$$

Born's first approximation was  $4\pi a^2$  instead of  $\pi a^2/4$ . This form ( $\pi a^2/4$ ) explains the Ramsauer effect more favorably than the 1st approximation for the probability of collision becomes very small for very slow electrons. The 2nd approximation causes a large change of  $\phi$  and cannot be used when the colliding electron is very slow. F. M.

The distribution of charge and current in an atom consisting of many electrons obeying Dirac's equations. D. R. HARTREE. *Proc. Cambridge Phil. Soc.* 25, 225-36 (1929).—Mathematical. The work is based on the assumptions that in a many-electron atom, each electron is in a stationary state in the field of the nucleus and remaining electrons and that the field is central. The distribution of current and the resultant magnetic moment according to a solution of Dirac's equation in a central field of force are obtained. It seems possible to specify the direction of the spin axis for states where the magnetic quantum no. has extreme values  $\pm j$ . WILLIAM E. VAUGHAN

Share of "reflection" in the total effect of the action of slow electrons on gas molecules. R. KOLLATH. *Physik. Z.* 29, 834-6 (1928).—The effective cross-sectional area arises from 3 factors: (a) reflection without loss of velocity, (b) absorption, temporary or permanent, (c) velocity loss, with or without deflection. In an attempt to ascertain the relative importance of these factors it is shown that the first rising portion of the cross-section curves (starting from low velocities) in the A group and the first maxima in the N and CO<sub>2</sub> groups arise from factor (a). With higher velocities factor (b) appears. In some cases the curve connecting cross-sectional area with electron velocity in volt<sup>1/2</sup> shows 2 maxima; the first is always due to "vertical" reflection without velocity loss, but no clear evidence is available as to the origin of the second, or as to the role of factor (c). B. C. A.

Secondary electron emission from solid metal surfaces. C. F. SHARMAN. *Proc. Cambridge Phil. Soc.* 25, 237-54 (1929).—S. describes in detail the app. used in this work. The secondary electron emission was measured by the rate of charge of a sensitive Dolezalck electrometer. The plot of no. of secondaries against retarding potentials shows a max at 3 v. and a dropping off with increased potential. This expt. was performed for several primary energies with consistent results. An inverse-square distribution fits the "falling-off" of the curve quite well. The rapid rise of the curve at the origin to reach a max at 3 v. is probably without phys. significance. Both app. gave concurrent data. The complex distribution found experimentally by other authors may be thought of as a superposition of 2 simple distributions: (1) the true secondary electron (delta ray) emission and (2) the energy distribution of the reflected primary electrons, which is practically const. and level, save for a sudden max. WILLIAM E. VAUGHAN

Thermionic emission through double layers. W. GEORGESON. *Proc. Cambridge Phil. Soc.* 25, 175-85 (1929).—Thermionic emission from surfaces has been treated with the consideration that the atoms in the surface contamination create an elec. double layer. If the layer is pos. with respect to the metal, the work function,  $\psi$ , of extn. is reduced. The subject is treated mathematically. The surface variation of the potential energy has a more gradual gradient than the abrupt discontinuities assumed by other authors. WILLIAM E. VAUGHAN

Liberation of electrons by means of x-rays. H. BEHNKEN. *Physik. Z.* 29, 836-7 (1928).—The no. of electrons liberated from an element under the action of homogeneous x-rays increases in general with increasing at. no. B. C. A.

Waves associated with  $\beta$ -rays, and the relation between free electrons and their waves. G. P. THOMSON. *Phil. Mag.* [7], 7, 405-17 (1929).—T. considers the variation of the speed of electrons in the continuous  $\beta$ -ray spectrum to be due to the dispersion of a short-wave group associated with each ray. The mean velocity is about that to be expected if the group had the form of an error function of sufficient spread to give the observed range of velocity. T. suggests the possibility of a group in the form of a heavily damped wave and an expt. is described concerning the propagation of waves along a thin lath. An expression is also considered for the velocity of an electron associated with a given wave, and it is shown to give consistent results in this problem. It leads to the consequence that the velocity of an electron may vary even in force-free space, which explains Ellis and Wooster's expt. (*C. A.* 22, 537) on the heat generated in the disintegration of Ra E. This variation of velocity is essentially associated with a short-wave train. L. H. REYERSON

Some difficulties in the spontaneous emission of radiation. I. GOLDSTEIN. *Compt. rend.* 187, 1285-6(1928).—The incompatibility which appears to exist between the 2 fundamental notions of the stationary state (Bohr-Sommerfeld) and the continuous change of configuration of the atom is discussed in the light of the Broglie-Schrödinger and Dirac analyses of undulatory mechanics. Conclusion: Existing at. structures provide no real phys. reason for the possibility of the spontaneous emission of radiation. B. C. A.

The production of the H rays of disintegration by the action of the  $\alpha$ -rays of polonium. C. PAWLOWSKI. *Compt. rend.* 188, 1248-50(1929).—A study of the disintegration of Al by  $\alpha$ -rays was effected by the method of scintillations. The H-rays were produced not only by the  $\alpha$ -rays of 3.9-cm. range but also by those of 2.4-cm. range. The ratio of the no. of H particles produced to the no. of  $\alpha$  particles agrees better with the results of Rutherford obtained with longer exciting rays than with those of Schmidt and of Bothe and Franz, who used the rays of Po. The max. range of the H particles emitted from Al under the action of the rays from Po was 48.2 cm. Rutherford obtained rays of 33-cm. range with  $\alpha$ -rays of 4.9-cm. range. H. F. JOHNSTONE

Determination of cathode-particles from Lenard high-power tubes. R. THALLER. *Physik. Z.* 29, 841-6(1928).—A convenient condenser method is described for measuring the output from high-power tubes. B. C. A.

Note on the number of high-velocity  $\beta$ -rays. H. M. CAVE. *Proc. Cambridge Phil. Soc.* 25, 222-4(1929).—C. uses an electroscope placed above a thin-walled glass tube contg. Rn which is located between the flat circular pole-pieces of an electromagnet. The electroscope is shielded from  $\gamma$  radiation by a block of lead. The field may be varied, thus causing a change in the rate of discharge of the electroscope. The field was so adjusted that none of the  $\beta$  rays of the Ra B-C spectrum of high-frequency limit 12,000 Hp could reach the electroscope. Under the exptl. conditions there was present no discharge of the electroscope other than the natural leak. Conclusion: There are very few (1 per 500 or more probably 1 per 1000 disintegrations) if any very fast  $\beta$  rays, contrary to the observations of Yovanovitch and d'Espine (*C. A.* 21, 3821). W. E. V.

The ionization potentials of the rare earth elements in relation to their position in the periodic system. L. ROLLA AND G. PICCARDI. *Phil. Mag.* [7], 7, 286-301(1929).—Assuming that the validity of the mass-action law has been demonstrated for the case of a neutral atom ionizing into an electron and a positive ion, R. and P. develop an exptl. method for detg. the equil. const. ( $K$ ) for the reaction neutral atom  $\rightleftharpoons$  positive ion + electron. From values of  $K$  it is possible to det. ionization potentials. The method employs a flame which may be regarded as a stationary phenomenon. This flame passes through a fine metallic gauze and impinges on a metal plate connected electrically to the gauze. A temp. difference between the plate and the gauze maintains a const. flow of electricity. Atoms capable of ionization are then introduced below the gauze from a bead contg. a known quantity of salt and the change in current is measured. The diff. gives the current due to the positive ions and electrons. From the loss in wt. in the bead and the current due to the positive ions and electrons the authors calc. the equil. const. and from this the ionization potentials. The method was first used to check known ionization potentials for such elements as the alkalis and alkaline earths and then applied to the rare earth oxides. Absolute potentials of the rare earths were found to vary from 5.49 to 7.06 v. Tables of results are given and a figure shows the known ionization potentials of the elements in the periodic system and the periodic changes which occur in these potentials. A discussion is given of these results in the light of the atomic theory of Bohr and Hund. L. H. REYERSON

The mobility distribution and rate of formation of negative ions in air. J. L. HAMSHERE. *Proc. Cambridge Phil. Soc.* 25, 205-18(1929).—A modification of Rutherford's (*Phil. Mag.* 44, 429(1897)) alternating-field method of measuring ionic mobility in a gas was used. The variable field  $X$  is synchronized with an auxiliary field  $X'$ , so that ions enter through the gauze only for a portion of the advancing phase of  $X'$ . Po was used as a source and  $\alpha$  particles were screened out. At atm. pressure in dry air the method gives results showing the upper and lower limits of  $K$ , the ionic mobility. From this is derived a distribution curve which with limits 2.15 and 1.45 has a peak at about 1.8.  $K = 2d/X_0T_0$ , where  $d$  is the distance between plates,  $X_0$  initial field and  $T_0$  initial period for one cycle. At lower pressures (below 100 mm.) the current is resolved into ions and free electrons. From the nos. reaching the electrometer it has been calcd. that the electron makes, on the av.,  $9.4 \times 10^4$  collisions before capture, independent of electron speed in a range of from  $2 \times 10^6$  to  $7 \times 10^6$ . A lengthy bibliography is appended. WILLIAM E. VAUGHAN

Measurements on the ionization of air by means of electron streams. W. SCHMITZ. *Physik. Z.* 29, 847-8(1928).—A new app. is described. B. C. A.

**Efficiency of ionization in hydrogen by positive-ion impact at 7000 volts.** R. W. GURNEY. *Phys. Rev.* [2], 32, 795-8 (1928).—If ionization is not accompanied by transfer of kinetic energy, the method used, in which H at low pressure is bombarded with pos. K ions, permits a comparison of the ionizing efficiency with that of electron impact. Conclusion.—Either the efficiency is less than  $1/160$  of that of 50-v. electrons or ionization is accompanied by transfer of kinetic energy. B. C. A.

**The dielectric constant of ionized gases.** HENRI GUTTON. *Compt. rend.* 188, 1235-7 (1929).—Expts. on the properties of ionized gases in a field of high frequency show the existence of a period of resonance in the gas. On the basis of these results an equation is calcd. that gives the dielec. const. of the ionized gas as a function of the no. of ions per cc. and from which the no. of ions for which the gas is in resonance for a given frequency may be found. The equation is valid outside of the absorption band corresponding to the resonance. H. F. JOHNSTONE

**An examination of reactions in ionized gases from the standpoint of Faraday's law.** SHRIDHAR S. JOSHI. *Trans. Faraday Soc.* 25, 143-7 (1929).—The values of  $M/F$  are considered from the standpoint of a theory of the kinetics of a chem. change in the silent discharge. It is assumed that the photochem. effect may be neglected. Consideration is also given to the conditions under which the photochem. effect must be taken into account. L. B. MILLER

**Scattering of quanta with diminution of frequency.** KARL K. DARROW. *Science* 68, 488-90 (1928); *Bell System Tech. J.* 8, 64-93 (1929).—There are 4, possibly 5, cases in which quanta appear to surrender part, but not all, of their energy in excitation of mols (Raman), in excitation of vibrations in crystal lattices (Raman, Landsberg and Mandelstam), in collisions with free electrons (Compton) and in ionization of atoms by removal of inner electrons (Duane and Clark). In these cases the original quantum does not disappear with the production of a new quantum of smaller energy, but simply loses part of its energy. Electrons also possess the properties of wave motion, the wave length changing with velocity. It could not be claimed that when an electron changes velocity that it is destroyed and a new one formed with a different wave length. In other cases an atom absorbs a quantum of energy and after an interval gives out another with different frequency, the 2 quanta being entirely distinct from one another. G. L. CLARK

**Relationship between effective cross section and quantum jumps.** E. BRÜCHE. *Z. Physik* 47, 114-30 (1928).—A close relationship exists between effective cross section and quantum jumps. B. shows the agreement between the Lenard and Franck-Hertz definitions for the influences which result from impact between electron and mols. and discusses the conceptions of cross section in their significance for no. and products of impacts. The sep. quantum jumps must be manifest on the effective cross section curve, probably as small jumps, and cross section investigations principally permit the detn. of products. The max. of effective cross section curves may be conditioned by the influence of quantum jumps. G. L. CLARK

**Striations in high-frequency discharges [in argon, etc.].** S. P. MCCALLUM AND W. T. PERRY. *Nature* 123, 48-9 (1929); cf. *C. A.* 22, 1724. H. L. D.

**The distribution of range of the  $\alpha$ -particles from radium C' and thorium C'. N. FEATHER AND R. R. NIMMO.** *Proc. Cambridge Phil. Soc.* 25, 198-204 (1929).—From measurements of tracks formed in an expansion chamber, there are obtained distribution curves relative to 2134  $\alpha$  particles from thorium C' and 729  $\alpha$  particles from radium C'. There are fewer short-range particles from the latter than from the former. In either case the most probable range is from 0.2 to 0.3 mm. greater than the mean range. Variations from the distribution curve are explained on the basis of slight inhomogeneity of the beam. Linear straggling coeffs. are estd.; 1.30 mm. (standard air) for Th C'; 1.20 for Ra C' (corrected values). This disagrees with 0.76 for Ra C' obtained by Curie and Mercier. Cf. *C. A.* 21, 698. WILLIAM E. VAUGHAN

**Energy relations in artificial disintegration.** E. RUTHERFORD AND J. CHADWICK. *Proc. Cambridge Phil. Soc.* 25, 186-92 (1929).—Expts. on disintegration of the N nucleus by  $\alpha$  particles and photographs thereof have been studied analytically. In a collision of an  $\alpha$  particle with a nucleus, a proton may be ejected and a residual nucleus formed; in this process there is involved a certain energy of formation,  $W$ , of the new nucleus. From equations involving conservation of momentum and of energy and from the exptl. photographs (from which may be measured the angles of approach and rebound), there has been calcd.  $W$  for 6 disintegration collisions as a fraction of the energy of the  $\alpha$  particle of radium C' ( $7.66 \times 10^6$  electron-volts), thus;  $-0.16$ ,  $-0.02$ ,  $-0.30$ ,  $-0.33$ ,  $-0.11$ ,  $-0.06$ . The value for  $W$  is not definite. The measurements are not in error by so large an amt. However, the velocity of the  $\alpha$  particle at impact may be uncertain.

Consideration of this point does not radically rectify the set of values obtained. Detns. of the magnitude of the energy change in Al disintegration expts. from the ranges of the expelled protons are also in variance. (The ejected bodies were proved by expt. to be protons.) The variance in  $W$  is explained as being due to variations in the internal energy of the original Al nucleus or of the final nucleus (presumably Si). Also there is the possibility that the  $\alpha$  particle is not captured; this results in a three-body problem. The explanation on the basis of variance in internal energy is favored and the evidence

that in the radioactive transformation of Th C  $\xrightarrow{-\beta}$  Th C'  $\xrightarrow{-\alpha}$  thorium Pb involves a different energy change than Th  $\xrightarrow{-\alpha}$  Th C''  $\xrightarrow{-\beta, \gamma}$  thorium Pb, is presented as supporting evidence.

WILLIAM E. VAUGHAN

**Osteogenic sarcoma in dial painters using luminous paint.** H. S. MARTLAND AND R. E. HUMPHRIES. *Arch. Path.* 7, 406-17(1929).—Of some 15 girls whose deaths were attributed to radium-mesothorium poisoning incurred while they were employed at painting watch dials with luminous paint, 2 had osteogenic sarcoma. The paint used consisted of cryst. phosphorescent ZnS rendered luminous by the addition of extremely small quantities of Ra, mesothorium and radiothorium in the form of insoluble sulfates. The mode of poisoning in these cases was by ingestion, from the general habit of pointing their brushes in their mouths. Absorption through the skin and inhalation were not considered significant portals of entry. The deposits in the bones were generalized over the entire skeleton. The outer layers of the cortex seemed to be the final position of storage. Here it was frequently stored in large amounts and probably replaced Ca in these areas. From the fixed deposits of Ra and mesothorium in the bones there was a never-ceasing radiation. Ninety-five percent of the radiation was  $\alpha$ , which biologically and chemophysically is much more destructive to body tissues than either  $\beta$  or  $\gamma$  radiation, the relation being 10,000 to 100 to 1, resp. In addition, the preponderance of mesothorium in this paint is of great toxicologic importance for the reason that mesothorium in equilibrium with its radiothorium emits 5  $\alpha$  particles, whereas Ra emits only 4; also the  $\alpha$  particles of mesothorium and the products of its decay have a greater velocity and penetration than those of Ra and therefore, are chemophysically and physiologically more active.

HARRIET F. HOLMES

**Scattering of x-rays in mercury vapor.** P. SCHERRER AND A. STÄGER. *Annales soc. espagn. fis. quim.* 26, 348-64(1928).—A study of the scattering of x-rays by atoms is one of the few ways of obtaining information about electrons and their distribution, and the study of such scattering by gases is of special interest because of the possibility of interference due to the rigidity and impenetrability of the atoms themselves. Little experimental work of this sort has been done. A study was made of the "coherent" scattered radiation from Hg vapor. A fine vertical jet of Hg vapor at 1 atm. pressure was produced by means of an injector-like device of glass or quartz at the axis of a cylindrical Debye-Scherrer camera. A perpendicular, narrow beam of x-rays was focused on this vapor as it would be on a powder specimen, and the scattered radiation registered on a photographic film. For successful work, both the vapor stream and the beam of x-rays must be very fine; in this work each was about 1 mm. in diam., and the camera 5.5 cm. in diam. The x-ray radiation must be intense and sensitive film used. A Hadding tube with Cu cathode was operated at 30 kv. effective voltage and 15 ma. Agfa double-coated films were used. Great care in the regulation of the boiling of the Hg and good thermal insulation were required to insure that the vapor was free from drops. Precautions had to be taken that no drops of Hg formed on the diaphragms. Secondary and tertiary radiation was eliminated by a brass screen. Since the Hg jet was formed in air and not *in vacuo* the diffusion due to the air was reduced by a suitably placed diaphragm. It was necessary to protect the film from the heat of the Hg vapor. The parts of the app. in contact with the Hg were made of iron. The rest was brass. Finally there was a system of horizontal and vertical wires surrounding the focus. The shadow of this on the film gave an idea of the size and shape of the focus and photometry of these shadows permitted eliminating air radiation. When the app. was complete and tested, 2 runs were made: one with Hg vapor and one with air only. The films showed much more blackening with the Hg and the shadows of the wires were sharp, indicating that the focus was nearly a point. With air, the vertical wires gave indistinct shadows. No max. of intensity could be observed by visual examn. The films were photometered and interpreted (1) by subtracting the blackening resulting from air alone, (2) by using only the Hg film and subtracting the blackening due to the shadows of the wires. The 2 methods gave comparable results. No max. were found. The intensity decreased up to about 120° and then increased slightly up

to  $160^\circ$ . The amplitudes after correcting for polarization showed a gradual decrease. The analysis of the amplitude curve is not yet complete, but the results show that the curve is not undulatory and the electrons must therefore be distributed uniformly. Static distributions such as in the Bohr atom would lead to curves having max. The diffusion called for by wave mechanics is not inconsistent with these results. A. W. K.

The absorption of x-rays from 0.63 to 2 A.U. IVOR BACKHURST. *Phil. Mag.* [7], 7, 353-73(1929).—A description is given of a form of x-ray tube convenient for absorption measurements with homogeneous radiation in the neighborhood of 1 A. U. and the results are given of measurements with Ag, Pt, Al, Au and Cu for wave lengths between 0.62 and 2 A. U. The relation between absorption and wave length was nowhere found to conform exactly to the cube law, the departure from this law often being very considerable. B. considers the possible existence of discontinuities due to multiple ionization. No general law was found that would fit accurately the data obtained for all the elements examined, although that found recently by Edvin Jonsson (Absorptionsmessungen im langwelligen Röntgenbiet und Gesetz der Absorption, Uppsala Universitets Årsskrift 1928, Matematik och naturvetenskap 1) appears to furnish a good approximation. The K-absorption jump of Cu and the L-absorption jumps of Pt and Au were measured and the results compared with theory. L. H. REYERSON

The interpretation of x-ray crystal photographs. I. Use of photographic grids. WM. H. GEORGE. *Phil. Mag.* [7], 7, 373-84(1929).—G. describes a photographic grid method, applicable to any x-ray spectrometer, of measuring x-ray photographs. The photographic plate or film is supported in the x-ray camera entirely by geometric constraints. A flash of light, together with a printing frame, also fitted with geometric constraints, is used to impress upon the x-ray photograph an image of some network suitable for interpretation of the particular type of x-ray photograph. A single calibration photograph is taken, and used to fix accurately the geometric constraints of the printing frame. Any subsequent photograph then shows on development both the x-ray photograph and a correctly aligned interpretative grid. Various modified applications of the method in x-ray crystallography are discussed as well as applications of grid methods to research in other fields. L. H. REYERSON

Soft x-rays from crystal faces. O. W. RICHARDSON AND U. ANDREWES. *Nature* 123, 344(1929).—By a method previously employed 17 discontinuities between 70 and 320 v are observed with graphite, each agreeing with a value previously found with C. Fifteen discontinuities observed with a C target are absent with a graphite target. Thus the no. of discontinuities from a single crystal surface are smaller than those from a polycryst. surface. G. L. CLARK

Soft x-rays from a single nickel crystal. S. RAMACHANDRA RAO. *Nature* 123, 344-5(1929).—From the results of the preceding abstr. an ideal crystal surface should give inflections at 63.8, 72.2, 106.2 and 116.0 v. The former 2 can be assocd. with transitions from the  $M_{II,III}$   $M_I$  level. Surface alteration of the non-cryst. target on electronic bombardment may account for the large no. of inflections which have been reported. G. L. CLARK

X-ray applications in everyday life. GEO. L. CLARK. *Sci. Monthly* 28, 172-8(1929).—A popular account of the achievements and possibilities of radiography and fine structure detn. by x-ray diffraction for materials of practical utility. G. L. CLARK

The K x-ray absorption edge of iron. H. R. VOORHEES AND GEO. A. LINDSAY. *Phys. Rev.* 31, 306(1928).—The K x-ray absorption edge of Fe was photographed by using as reflecting crystals pyrite, hematite, arsenopyrite, epidote and lepidomelane. A complicated fine structure of the edge was observed, extending over 200 v. The spectral range of fine structure due to the stopping of the ejected electron in different virtual orbits would be much smaller than that obtained here; it is, therefore, supposed that at least part of the fine structure is due to the simultaneous ejection of two or more electrons from the atom. W. F. MEGGERS

Fine structure in the K series of molybdenum. BERGEN DAVIS AND HARRIS PERKINS. *Phys. Rev.* 31, 306(1928).—It was shown before (C. A. 22, 1541; 23, 766) that by proper arrangement of crystals the resolving power of the double x-ray spectrometer may be much increased. Now it is found that by placing crystals for higher orders of reflection the resolving power is still further increased. By using both crystals at second order fine structures were observed as follows, all on the long-wave side of the parent line:  $\beta'_1$ , 0.17 X. U. from  $\beta_1$ ;  $\alpha'_1$ , 0.085 X. U. from  $\alpha_1$ ;  $\alpha'_2$ , 0.096 X. U. from  $\alpha_2$ . W. F. M.

A classical derivation of the Compton effect. C. V. RAMAN. *Indian J. Physics* 3, 357-69(1929).—With the aid of an at. model in which the electrons are regarded as a gas distributed in a spherical enclosure surrounding the nucleus, it is shown mathemati-

cally that the classical wave-principles lead directly to a quant. theory of the Compton effect and to an explanation of the known exptl. facts in connection with it.

**Doublet separation of Balmer lines and the molecule of hydrogen in relation to the electromagnetic quantum theory.** CORNELIO L. SAGUI. *Phys. Rev.* **31**, 715(1928). H. W. W.

**A spectroscopic determination of the pressure in the calcium chromosphere.** ALBRECHT UNSÖLD. *Astrophys. J.* **69**, 209-26(1929).—From emission and absorption photographs and photometric traces of the H and K resonance lines of the Ca chromosphere calcs. are made of the partial pressure of the Ca ion. For 3 exptly. chosen layers above the chromosphere it is: 0-2500 km.,  $19 \times 10^{-16}$  atm.; 2500-5600 km.,  $2 \times 10^{-16}$  atm.; 5600-14000 (?) km.,  $0.3 \times 10^{-16}$  atm.; with an av. of  $4 \times 10^{-16}$  atm. The av. velocity of the ions from Doppler measurements is 15 km./sec. Milne's theory that the radiation absorbed by these lines must be just sufficient to support the mass of Ca ion in the chromosphere is substantiated. W. F. MEGGERS

**Is there argon in the corona?** H. N. RUSSELL AND I. S. BOWEN. *Astrophys. J.* **69**, 196-208(1929).—The authors contend that Freeman (*C. A.* **23**, 1057) was in error in attributing most of the lines in the spectrum of the solar corona to Ar. The contention is that measurements were insufficiently accurate and that the no. of coincidences noted by F. were not beyond the limits of probability. GREGG M. EVANS

**Self-reversed lines in the spectrum of mercury.** L. H. DAWSON AND W. H. CREW. *Phys. Rev.* **31**, 308-9(1928).—Spectrograms in the region 6000 A. U. to 1860 A. U. were made of a Hg arc in quartz operating at atm. pressure and excited by a condensed discharge. Eleven arc lines and 2 spark lines were observed to be self-reversed. All of these arc lines except 2536 A. U. represent transitions originating on the  $2^3P$  levels, which are the lowest energy levels of the excited Hg atom. Furthermore, 6 of these lines start on the  $2^3P_1$  level, 2 on the  $2^3P_0$  level, and 2 on the  $2^3P_2$  level, indicating a predominant accumulation of electrons on the supposedly least stable orbit; the frequent collisions due to pressure possibly prevent the usual accumulation on the more stable orbits. W. F. MEGGERS

**Certain characteristics of the spectra of mercury at the higher radiating potentials.** L. R. MAXWELL. *Phys. Rev.* **31**, 711(1928).—Electrons in Hg vapor with velocities greater than 150 v. were confined in a beam by a magnetic field. Perpendicular to the beam an elec. field withdrew positive ions before they recombined. The arc lines emitted showed no increase in density on removing the elec. field. This indicates that recombination contributes very little to the production of these lines, which is contrary to the explanation given for the complete arc spectrum appearing above the ionization potential. Consequently the arc spectrum is explained in the following two ways: (1) as being due to inward transitions of one or both of the valence electrons after being removed to outer orbits, (2) due to the return to the  $1^1S$  state by an electron which has been displaced from a soft x-ray level to a virtual orbit, while simultaneously a valence electron falls in to fill the vacancy of the inner level. W. F. MEGGERS

**Unclassified lines of the indium arc spectrum.** JOHN G. FRAYNE. *Phys. Rev.* **31**, 152(1928).—The arc spectrum of In excited by 6.9-v. electrons showed 5 unclassified lines. Four of them, 3051.19, 2858.30, 2957.01 and 2775.35 A. U. are now identified as the following combinations,  $2p_1 - x_1$ ,  $2p_2 - x_1$  and  $2p_1 - x_2$ ,  $2p_2 - x_2$ , the two new levels  $x_1$  and  $x_2$  having values of 11680 and 10645, resp. The fifth line, 2858.30 A. U., remains unclassified. W. F. MEGGERS

**Characteristics of the neutral and of the singly and doubly ionized spectra of praseodymium, neodymium and samarium.** ARTHUR S. KING. *Phys. Rev.* **31**, 309(1928).—A study of these spectra from 2500 to 7000 A. U. at various temps. of the elec. furnace and in the arc and spark has furnished material for a sepn. of the spectra of neutral and ionized atoms, the identification of a large number of neutral lines previously unrecognized, the temp. classification of the neutral spectrum, the selection of ionized lines of lower atomic level, and the identification of new lines, probably doubly ionized, in the ultra-violet. A notable complexity of line structure was observed in the spectrum of singly ionized Pr. (Cf. *C. A.* **23**, 1056.) W. F. MEGGERS

**The spectrum of beryllium.** W. H. SANDERS AND V. M. ALBERS. *Phys. Rev.* **31**, 151(1928). W. F. MEGGERS

**The vacuum spark spectrum of aluminum.** R. F. PATON AND G. M. RASSWEILER. *Phys. Rev.* **31**, 151(1928). W. F. MEGGERS

**The influence of a hydrogen atmosphere upon the arc spectra of certain metals.** HENRY CREW. *Phil. Mag.* [7], **7**, 312-6(1929).—C. describes a method of introducing  $H_2$  gas between the poles of arcs of Mg, Zn, Al, Cd and C so that pole effects are eliminated

in the spectra.  $H_2$  appears to produce a more marked change in many lines than would be expected by the mere introduction of such a gas.

L. H. REYERSON

**An afterglow spectrum of argon.** CARL KENTY AND LOUIS A. TURNER. *Phys. Rev.* 31, 710(1928).—By using a rapidly rotating disk and commutator the arc spectrum of A is found to persist approx. 0.001 sec. after an arc of 0.5 amp. in pure A at 0.5 mm. pressure is cut off. This spectrum is not caused by direct excitation by electrons since the D lines of Na, which are strong in the arc itself, are absent in the afterglow. Na vapor from a properly impregnated oxide cathode is always present. Dropping the potential to 4–11 v. instead of to zero in the off period brings out the D lines in the afterglow and shortens its duration. Reverse potentials up to 45 v. have no effect. Comparison of photographs of the spectra of the afterglow and of the arc shows that, in the afterglow, lines involving jumps from high  $s$  and  $d$  states to the  $2p$  states are much stronger with respect to  $1s-3p$  lines than in the arc. The absence of the D lines, the relative enhancement of lines involving high energy levels and the shortening of the duration of the afterglow by electrons suggest the hypothesis that the afterglow spectrum results from recombination.

W. F. MEGGERS

**Interpretation of the Raman spectrum for the structure of organic compounds.** A. PETRIKALN. *Z. physik Chem., Abt. B*, 3, 360–6(1929).—Twenty-four compds. were investigated to det. the Raman lines assoc. with single, double and triple C bonds. A wave length between  $3.25$  and  $3.27\mu$  was found for a double-bonded carbon with one H attached, in both aromatic and aliphatic compds.;  $3.32-3.49\mu$  for a carbon with one H and 3 other single bonds;  $4.41-4.48\mu$  for a triple bond of N to C. Expressions are deduced for the amplitude, the energy and the strength of the bonds. The difference in wave length to be expected from isotopes of Cl is calcd. and preliminary investigation of  $CCl_4$  has indicated exptl. verification.

HELEN GILLETTE WEIR

**Infra-red absorption by the N-H bond.** JOSEPH W. ELLIS. *Phys. Rev.* 31, 314 (1928). The infra-red absorption spectra of several primary, secondary and tertiary aryl-, alkyl- and arylalkylamines have been examd. below  $3\mu$  with a recording spectrograph. Bands varying in wave length between  $1.04$  and  $1.07\mu$  and  $1.49-1.55\mu$  are found to be present in all of the primary amines and with less intensity in the secondary amines. Since they disappear in the spectra of the tertiary amines they are assumed to originate in oscillations of the N-H atom pair (cf. *C. A.* 21, 1224; 22, 1542).

W. F. MEGGERS

**The ultra-violet absorption spectra of benzene and toluene in alcoholic solution.** C. V. SHAPIRO AND R. C. GIBBS. *Phys. Rev.* 31, 310–11(1928).—The absorption spectrum of benzene consists of 23 bands and that of toluene of 21. With the possible exception of one band belonging to the absorption spectrum of benzene, all of the bands for each substance can be arranged in a series in accordance with a simple mathematical expression derived from the theory of band spectra.

W. F. MEGGERS

**A new determination by a photographic method of the water absorption band at  $9727\text{ A. U.}$**  J. E. LAMBLY. *Phys. Rev.* 31, 706(1928).

E. J. C.

**Proportion of energy radiated by incandescent solids in various spectral regions.** I. L. HOLLADAY. *J. Optical Soc. Am.* 17, 329–42(1928).—Theoretical. It is shown that from a table of the proportion of spectral energy emitted from a black-body radiator at a given temp. between wave lengths zero and  $\lambda$ , the proportion of energy  $\phi_1$  emitted in a given spectral region may be computed for a black-body radiator of any other temp. Similarly, the energy emitted from the same spectral region by a non-black-body radiator having color temp.  $T_c$  may be computed by multiplying the value of  $\phi_1$  for a black-body radiator at temp.  $T_c$  by a simple factor  $G$ .

B. C. A.

**Extinction law for various atoms.** H. SEYFARTH. *Z. Krist* 67, 422–9(1928).—Mathematical.

H. L. D.

**Luminescence associated with electrolysis.** R. T. DUFFORD. *J. Optical Soc. Am.* 18, 17–28(1929).—Luminescence during electrolysis is fairly widespread. Thus with Al as anode the effect was found in some 25 different substances, mostly neutral salts or bases. Zn, Ag, Ta, W, Mg, Ce, Sb and Hg gave some light with certain solns., but none of the solns. gave the effect with Fe, Cu, Pb, Sn, Ni, Mo or Pt, showing the effect to be a fairly regular accompaniment of mechanical passivity. It is believed that the light is given out by a film of high resistance which covers the electrode. More than 98% of the applied e. m. f. is used in driving current through the film. The brightness ranges from visibility to above  $10^{-6}$  lamberts, increasing with the applied voltage until heating of the film causes it to fall. Differences in concn. produce relatively small changes in brightness.

E. G. VANDEN BOSCH

**Kinetics and temperature coefficients of some photochemical reactions in radiations of different wave lengths.** B. K. MUKERJI AND N. R. DHAR. *J. Phys. Chem.* 33,

850-63(1929).—Reaction rate measurements were made on several photochem. reactions at different temps., to obtain temp. coeffs. The bleaching of diamine mesant, temp. coeffs. citrate and

dark. From results on these and 12 other reactions, M. and D. conclude that the greater the acceleration due to light, the smaller is the temp. coeff. of the photochem. change; and they calc. from the temp. coeff. of the reaction in the dark the "threshold frequency" of radiation which will promote the reaction. Wave lengths of 7304 Å. U. accelerated all the reactions studied. In some cases the "true acceleration" caused by the light was greatest in the region of 5650 Å. U., and the absorption was greatest in this region.

T. H. CHILTON

**Photochemical temperature coefficients.** WILDER D. BANCROFT AND RAYMOND P. ALLEN. *Proc. Nat. Acad. Sci.* 15, 445-8(1929).—The theory of photochem. temp. coeffs. is discussed. The curve of velocity vs. temp. seems to consist of 3 parts, rapid rise at low temp., horizontal over wide range, then rapid rise in region of thermal instability. Expts. on the decompn. of  $\text{CH}_3\text{CHO}$  by oscillatory discharge show a rise of coeff. from 1.003 to 1.10 between 80° and 340°.

G. B. TAYLOR

**The photochemical equilibrium between hydrogen, bromine and hydrogen bromide.** R. W. ARMOUR AND E. B. LUDLAM. *Proc. Roy. Soc. Edinburgh* 49, 91-101(1929).— $\text{H}_2$  and  $\text{Br}_2$  vapor (partial pressure  $\text{Br}_2$  110-140 mm.) were streamed through a silica coil within which was located an Al spark operated by a 0.5-kw. transformer at 9000 v. The strong lines at 185  $m\mu$  were sought. The issuing gases were bubbled through water and the Br was detd. by addn. of KI and titration with thiosulfate; total Br was estd. by reduction of the free  $\text{Br}_2$  by  $\text{H}_2\text{SO}_3$  or hydrazine sulfate and measurement with  $\text{AgNO}_3$  and  $\text{NH}_4\text{SCN}$ . Somewhat less than 1% ( $0.80 \pm 0.10$ ) by weight of the  $\text{Br}_2$  enters into combination under the exptl. conditions. To test whether or not equil. is established, the intensity of the spark was varied ten-fold. The result of  $0.80 \pm 0.17\%$  for the weaker intensity checks the other expts.

WILLIAM E. VAUGHAN

**The part played by the vessel wall in the photochemical reaction  $\text{H}_2 + \text{Cl}_2$ .** A. TRIFONOV. *Z. physik. Chem., Abt. B*, 3, 195-203(1929).—The reaction vessels used in these first expts. were tubes 1065 mm. long and 14 mm. and 27 mm., resp., in diam. A beam of sunlight was passed lengthwise of the cylinder through a mixt. of  $\text{H}_2$  and  $\text{Cl}_2$  and the partial pressures of both gases were measured at different times and for different initial pressures. In a second series, tubes 240 mm. long and 40 mm. and 120 mm. in diam. illuminated with an arc light were used. The ratio of the drop in pressure of the  $\text{H}_2$  in the 2 tubes at different times was then calcd. In the first series this ran from 0.93 to 1.00 and in the second from 3.5 to 0.75, the reaction being more rapid in the narrower tube. A plot of the relative amts. of  $\text{HCl}$  formed in the 2 tubes as a function of  $(P_{\text{H}_2} + P_{\text{Cl}_2})$  shows this ratio to be 1 below 10 mm. and approx. const. at 3.5 above 30 mm. Above 30 mm., then, the chain reactions are practically complete in the free space, whereas below 10 mm. practically all the chains break down at the surfaces of the walls. The results are entirely in accord with the theory of a reaction mechanism  $\text{Cl} + \text{H} = \text{HCl} + \text{H}$  and  $\text{H} + \text{Cl}_2 = \text{HCl} + \text{Cl}$ , but leave open the question whether any energy of activation is necessary.

A. W. KENNEY

**Monatomic iodine and molecular hydrogen.** WILDER D. BANCROFT AND DAVID S. MORTON. *Proc. Nat. Acad. Sci.* 15, 438-41(1929).—An argument is presented that photochemically activated halogens are monatomic. Light and dark reaction of  $\text{Cl}$ ,  $\text{Br}$  and  $\text{I}$  with  $\text{H}$  are discussed. At.  $\text{I}$  does not react with mol.  $\text{H}$ , but  $\text{Cl}$  and  $\text{Br}$  do.

G. B. TAYLOR

**The oxidation of hydrogen iodide in the dark and in the light. III. The constitution of iodine solutions.** CHR. WINTHER. *Z. physik. Chem., Abt. B*, 3, 299-315(1929); cf. C. A. 19, 936.—Five equil. consts. were detd. and their values found at -20° and 30° by measuring the distribution of  $\text{I}$  between  $\text{CCl}_4$  and water,  $\text{HCl}$  and solns. of  $\text{KI}$ , as well as the soly. of  $\text{I}$  in  $\text{HCl}$  and the extinction of light coeffs. of  $\text{I}$  in water and  $\text{KI}$  solns. with the wave length 436  $m\mu$ . E. g.,

$$K_5 = m_{\text{I}_2} \cdot m_{\text{I}^-} / m_{\text{I}_3^-} \quad (m \text{ is the no. of mols. per 1000 g. water.})$$

The substances considered in the soln. were  $\text{I}_2$ , the iodide cation and anion, the triiodide and tetraiodide,  $\text{ICl}$ , and the  $\text{I}_2\text{Cl}$  cation and the  $\text{Cl}$  ion. The consts. found were used to calc. the distribution between  $\text{CCl}_4$  and mixed solns. of  $\text{KI}$  and  $\text{HCl}$ . The extinction coeffs. being compared with the corresponding equil. consts.; the idea arises that the former run counter to the stability of the substance concerned. Tables of data and curves are given. IV. Preliminary discussion of the light sensitivity. *Ibid* 315-36—In connection with the question whether the so-called equivalence law established by

Einstein can be applied to photochem. processes, W. works out a prediction concerning the sensitivity for light in the process of the oxidation of HI. By making certain simple assumptions, it is possible to calc. the velocity of the light reaction from the one in the dark if combined with quant. absorption measurements. These conclusions are based upon extended observations of the effect of varying the no. of moles per 1000 g. water, the time, temp., wave length, energy and density.

Recent developments in electric furnaces. DONALD F. CAMPBELL. *Mining J.* (London), 165, 310-1, 331-2, 358 (1929).—See *C. A.* 23, 2369. ALDEN H. EMERY

Advances in the construction of high-frequency furnaces. M. TAMA. *Stahl u. Eisen* 49, 499-50 (1929).—Recent developments are reviewed. J. A. SZILARD

The design and operation of vacuum furnaces with carbon resistor tubes. ARTHUR S KING. *Trans. Am. Electrochem. Soc.* 56 (preprint), 13 pp. (1929).—The 2 types of elec vacuum furnaces described are the result of years of study on rendering metallic vapors luminous by "temp. radiation." High temps. alone appear to be necessary to produce the large variety of spectroscopic phenomena observed. No definite type of chem action seems to be necessary. The cylindrical and the hooded types of graphite resistor-tube furnace have a temp. range up to 3500°. Steady conditions of temp. and pressure are quickly reached, after which the light is permitted to pass to the spectrograph. An image of the interior of the tube is projected on the slit, light from the incandescent wall of the tube being excluded. The charge in the tube is vaporized, and the characteristic radiations of the vapor excited under close control of conditions. A long column of uniformly heated vapor is obtained. Various spectroscopic studies are briefly described. C. G. F.

Dimensions, operation and efficiency of German electric steel furnaces. ST. KRIZ. *Stahl u. Eisen* 49, 417-27 (1929).—Data regarding the operation of elec. steel furnaces submitted by a great number of steel works in Germany, covering 56 arc and 13 induction furnaces, are evaluated. J. A. SZILARD

Progress made in the use of electric furnaces for heat treating. A. N. OTIS. *Trans. Am. Soc. Steel Treating* 15, 767-94 (1929); cf. *C. A.* 22, 3586.—A discussion of the present status of elec. furnaces in industry. W. A. MUDGE

A new automatic thermoregulator for an electric (resistor type) furnace. TAKEO WATASE. *J. Study Metals* 5, 455-60 (1928).—There are many devices for the automatic regulation of small elec. resistor furnaces, but none of these is as simple as may be de-

sired when only rough regulation is required. Asahara and Shibata (cf. Shibata C. A. 23, 3845-6) have each devised an app. which can be easily built in a lab. The former attains an accuracy of  $\pm 3^\circ$  at  $300^\circ$  and the latter  $\pm 5^\circ$  at  $600^\circ$ . W. tested both of the app. finding them to be unsatisfactory, the former with respect to the sensitivity, the latter as to construction; he finally devised an app. in which the merits of the two are retained while the defects are eliminated. Since a tolerable constancy of the temp. can be obtained when there is no sudden heat evolution or absorption in the resistor wire itself, by maintaining the elec. current passing through the wire const., W. devised an app. in which an auxiliary resistance is connected in series with the furnace resistor and is regulated automatically with regard to fluctuations in watt input. An all-glass thermoregulator is connected in parallel with the elec. furnace, and when the furnace current fluctuates, there is a corresponding fluctuation of a very weak current passing through a Pt coil in the thermoregulator, which affects the vol. change of PhMe that in turn raises or lowers the Hg column in the head of the app., and thereby closes or opens a relay circuit. By actual test it was found that with this regulator a constancy of  $\pm 2^\circ$  within a temp. range of  $300$ – $1000^\circ$  was obtainable. K. SOMEYA

**Improvements in carbon electrodes.** M. OSWALD. *Chimie & industrie* Special No., 428-43 (Feb., 1929).—A review of progress made in the production of C electrodes for elec. arcs and batteries. A. PAPINEAU-COUTURE

**Commercial fused salt electrolysis.** P. DROSSBACH. *Metall. u. Erz* 26, 88-92 (1929); cf. C. A. 23, 566.—Equations developed previously are enlarged upon and examples of their application given. J. BALAZIAN

**Electrolysis of alkali chlorides.** A. LEVASSEUR. *Bull. soc. franç. élec.* 8, 798-801 (1928); *Science Abstracts* 31B, 636.—Many difficulties are encountered in the process, such as diffusion within the bath, which tend to lower the efficiency. Various methods of overcoming these difficulties are examd.: the use of diaphragms, of circulation, of circulation and diaphragms, the use of a Hg cathode. The theory is given of the formation of chlorates and perchlorates. The use of a Hg cathode, while involving a heavy capital outlay, has notable advantages in that it enables a concd. soln. of NaOH to be obtained directly, which soln., contg. no chlorides, is of special value for the prepn of artificial silk. H. L. D.

**Roasting flotation concentrates of zinc ores.** TORAICHI MIYAZAKI *Japan J. Mining* 45, 1-12 (1929).—M. first describes the history of electrolytic refining of Zn ores. The field of applicability of the refining method is widened by developments in flotation. Results of his studies on the roasting of flotation concentrates are presented. The roasting of sulfide ores is the more rapid the finer the grains of the ore. In M.'s expt. 60% ore was powdered to 200 mesh. It was allowed to fall from a funnel and blown with compressed  $O_2$  into a horizontal tube heated to  $800^\circ$ . The powd. ore burns energetically like powd. coal. Analysis of the flue gas gave S content less than 0.1%. When the powd. ore was allowed to fall from a tube 2 m. high and brought in contact with a mixt. of  $O_2$  and air counter-currentwise, the desulfurization was again found to be complete. In a third expt. the 100- or 200-mesh ore was placed in a rotating elec. furnace and air or air +  $O_2$  passed into the furnace. Roasting also took place in a short time. When the mixt. was ignited by compressed  $O_2$  the desulfurization was completed within 20-30 min., the combustion continuing due to the consequent rapid rise in the furnace temp., even after the elec. current was cut off. The extent of the temp. rise appears to be proportional to the amt. of  $O_2$  added to the air. M. concludes that rotating cylindrical furnaces are preferable to the modern mech. furnaces. K. SOMEYA

**Diaphragm electrolyzers.** DELTON. *Bull. soc. franç. élec.* 8, 816-21 (1928); *Science Abstracts* 31B, 637.—When a soln. of NaCl is electrolyzed in a bath provided with diaphragms, a soln. of gradually increasing concn. of NaOH is obtained as catholyte but the efficiency decreases as the concn. increases on account of secondary reactions. The limit of concn. depends on economical considerations, which are discussed. Various types of anodes and diaphragms are considered. H. L. D.

**Electrolytic production of alkaline chlorates.** BUNET. *Bull. soc. franç. élec.* 8, 805-15 (1928); *Science Abstracts* 31B, 636.—A description of the electrolytic production of  $NaClO_3$  and discussion of the advantages of magnetite and graphite anodes. The latter are more generally employed. The chlorates are removed from soln. by a refrigeration process. H. L. D.

**The electrical potentials of some metals.** L. BOUCHET. *Compt. rend.* 188, 1237-9 (1929).—The normal electrode potentials of several pure metals were measured,  $N$  solns. of the sulfates and a  $N$  calomel or  $H_2$  half-cell being used. With the calomel cell, the voltages, which have been corrected for the liquid junction potential by the

Henderson formula, are:  $Mg$ ,  $-1.766$  v.;  $Zn$ ,  $-1.052$  v.;  $H$ ,  $-0.81$  v.;  $Cu$ ,  $+0.041$  v.; and  $Ag$ ,  $+0.502$  v. The potentials of  $Zn$  toward normal solns. of the chloride and acetate and of  $Mg$  toward the normal chloride soln. differ by a few millivolts from the resp. potentials for the sulfates. The potential of  $Zn$  toward a normal nitrate soln. is only  $-0.99$  v., the low value being due evidently to the rapid oxidation of the metal.

H. F. JOHNSTONE

**Cathode potentials and electrode efficiencies of copper in copper cyanide-sodium cyanide solutions.** GEORGE M. SMITH AND J. M. BRÉCKENRIDGE. *Trans. Am. Electrochem. Soc.* 56 (preprint), 8 pp. (1929).—A record of the kinetic potentials of a  $Cu$  cathode, various current densities and different concns. of  $Cu$  cyanide in  $NaCN$  being used. Electrode efficiencies are given in various concns. of the electrolyte, and at different current densities. The potentials of the cathode become more neg. as the current density and diln. of the electrolyte are increased and as the molal ratio of  $Cu$  to  $NaCN$  is decreased. The change of potential with an increase of current density is most pronounced in the solns. with the highest molal ratio of  $Cu$  cyanide to  $NaCN$ . The efficiency of the cathode decreases with an increase of current density, with a diln. of the electrolyte and with a decrease of the molal ratio of  $Cu$  to  $NaCN$ . If the molal ratio of  $Cu$  to  $NaCN$  is less than 1 to 4, the efficiency is practically zero or even neg. The anode efficiency increases as the molal ratio of  $Cu$  to  $NaCN$  decreases, and decreases as the current density increases.

C. G. F.

**Maxima on current-voltage curves. III. The electrolysis of mercury salt solutions with dropping and steady mercury cathodes.** P. HERASYMENKO, J. HEYROVSKÝ AND K. TANČAKIVSKÝ. *Trans. Faraday Soc.* 25, 152-9 (1929); cf. *C. A.* 22, 1287, 2515.—The maxima on current-voltage curves and the corresponding changes of interfacial tension were investigated in the electrodeposition of  $Hg$  at a dropping cathode as the simplest case of a general phenomenon. Though less reproducible, the same current-voltage phenomena are observable. The current before the discontinuous fall is supported chiefly by absorption. The discontinuous decrease of the current accompanied by concentration polarization is due to the formation of an interfacial layer of solution exhausted of  $Hg$  salts. The thickness of this layer prevents further absorption of  $Hg$  salts to the cathode interface. The absorption velocity is very great, however, as evidenced by the fact that under certain conditions stirring does not affect the max. current. The max. is suppressed by a large excess of an indifferent electrolyte or of absorptive matter. This effect is explained by preferential absorption of the added material.

L. B. MILLER

**Recovery of tin from tin plate scrap.** WM. MASON. *Chem. Eng.-Mining Rev.* 21, 270-1 (1929).— $Sn$  scrap is placed in perforated bottom of a tank contg.  $NaOH$  soln. at  $40^\circ$ . 305 kg. of cans or boxes, contg. 2.5%  $Sn$  and 1%  $Pb$ , were detained in 5 hrs. 70 kg. of  $NaOH$  were used together with 50 kg. of sodium nitrate, which acts as oxidizing material. The scrap is then drained, washed and the stannic liquor electrolyzed in diaphragm cells. Graphite anodes are arranged against the inner sides of the cell on other side of the cathodes. The cathodes of pure  $Sn$  are contained in porous vessels placed in the center of the cells. Spongy deposits of  $Sn$  are obtained at 2-3 v. and 1-2 amp. per sq. dm. of active cathode surface. The deposited  $Sn$  is then washed and melted and cast into ingots. The residual electrolyte is concd. in a tank with a steam coil and, when at the desired concn., is conveyed back to the electrolytic cells. A sketch showing the arrangement of app. is given.

**Chromium plating.** J. COURNOT. *Mém. compt. rend. soc. ing. civils France* 1928, 303-11; *J. Inst. Metals* 40, 628.—Methods of overcoming difficulties are suggested.

H. L. D.

**Cathode efficiencies in nickel plating baths operated at high current densities. Effect of oxidizing agents and hydrogen-ion concentration.** BALLAY. *Compt. rend.* 188, 556-9 (1929).—The bath, contg. 450 g.  $NiSO_4 \cdot 7H_2O$ , 22 g.  $NiCl_2 \cdot 6H_2O$  and 22 g.  $H_2BO_3$  per l., was heated to  $50 \pm 1^\circ$ , stirred with air and electrolyzed with a 5 sq. cm. steel cathode at 0.1 amp. per sq. cm. for 15 min. By adding  $Ni(NO_3)_2$  the yield of  $Ni$  is lowered and the deposit is yellowish and cracked. By adding 0.175 g./l. of  $KMnO_4$  the current efficiency is 97% without perceptible evolution of  $H_2$ . With greater amts. of  $KMnO_4$  the efficiency drops to 93.8% and the deposit is brittle. At  $pH$  6.8 the deposit is brittle and the efficiency is 96.2%; at  $pH$  6.1 it is 97.8%; at  $pH$  5.5 to 4.4, it is 95.4 to 94.9% and the deposit is good.

**Chemicals in electrodeposition.** HEINZ LANGE. *Metallwaren-Ind. u. Galvano Tech.* 26, 249, 267-9, 289-90 (1928); *J. Inst. Metals* 40, 639.—A general discussion of the properties of various chem. substances which are used in electrodeposition.

H. L. D.

Chemical reactions in a lead storage battery. A. P. ROLLET. *Chimie & industrie Special No.*, 444-52 (Feb., 1929).—The method used to prove the existence of  $\text{Ag}_2\text{O}_3$  (C. A. 22, 2334) was applied to a study of the oxidation of the electrodes of a Pb storage battery. The results (given in detail) confirm Féry's theory (C. A. 19, 1099; 20, 1181; 21, 22). R. considers that the older theory of double sulfation represents an accidental and abnormal operation of the battery, e. g., when it is discharged to excess or when the electrodes are attacked directly by the  $\text{H}_2\text{SO}_4$ . Under these conditions the  $\text{PbSO}_4$  formed can be acted upon by the recharging current and readily transformed back to the normal products Pb and  $\text{PbO}_2$ . When  $\text{PbSO}_4$  is present in too large a quantity, its loss cond. prevents it from being reduced and oxidized. A. PAPINEAU-COUTURE

The effect of copper as an impurity in the lead accumulator. J. T. CRENNELL AND A. G. MILLIGAN. *Trans. Faraday Soc.* 25, 165-8 (1929).—The available published information about the effects of Cu is reviewed. H overvoltage at a pure Cu surface has been measured, and is compared with the e. m. f. of the Pb- $\text{PbSO}_4$  reaction. Results obtained indicate that local action, if any, will be slow. The effect of Cu on the rate of sulfation of a negative plate has been measured by collecting the evolved H. The effect of Cu was found to be negligibly small. A table is given showing the rates of loss of capacity of cells due to Cu. In general, Cu has no deleterious effect on the cell. L. B. MILLER

The behavior and effects of chlorine as an impurity in the lead accumulator. J. T. CRENNELL AND A. G. MILLIGAN. *Trans. Faraday Soc.* 25, 159-65 (1929).—The effect of Cl, added to a Pb accumulator as periodical doses of HCl, has been studied. HCl is oxidized to  $\text{Cl}_2$  at the positive plate, reducing the  $\text{PbO}_2$  to  $\text{PbSO}_4$ . Free  $\text{Cl}_2$  in soln. is in turn reduced to chloride ion at the negative plate, oxidizing sponge Pb to  $\text{PbSO}_4$ . A "self-discharge" of both plates is thus caused.  $\text{Cl}_2$  is removed gradually from the cell by evapn. and rapidly by charging; after two or three cycles the cell is freed of  $\text{Cl}_2$ . Wood sheet separators are bleached and ultimately disintegrated by  $\text{Cl}_2$ . L. B. MILLER

Practical mercury arc rectifier installation for charging storage batteries. G. W. MÜLLER AND A. SCHELLENBERGER. *AEG Mitt.* 1929, 360-3.—Wiring diagrams are shown and the installation is described of a Hg arc rectifier for charging storage batteries at an automatically diminishing current rate. H. STOERTZ

The electrochemical preparation of phenylhydrazine. ROBERT E. McCLEURE WITH ALEXANDER LOWY. *Trans. Am. Electrochem. Soc.* 56 (preprint) 11 pp. (1929).—The purpose of this investigation was to prep. phenylhydrazine by the electrochem. reduction of certain benzenediazonium compds., and to study the influence of the usual variable factors common to electrochem. reactions. A current efficiency of 36.5% was obtained by the reduction of benzenediazonium chloride, with a c. d. of 5.12 amp. per sq. dm., a temp. of 0-8°, and a Hg cathode. A current efficiency of 47.6% was obtained by the reduction of K isodiazobenzene sulfonate, with a c. d. of 1.9 amp. per sq. dm., a temp. of 90° to 95° and a Hg cathode. C. G. F

Improvements in the electrolytic preparation of hydrogen. V. PODROUZEK. *Chimie & industrie Special No.*, 463-5 (Feb., 1929).—In the Bayerle-Tamele process (C. A. 19, 2314) the high degree of dissocn. of the Zn salt formed results in a relatively rapid decrease in the current, and consequently in the evolution of H. By using KOH instead of HCl, there is but little decrease in intensity because the  $\text{K}_2\text{ZnO}_2$  is but little dissocd., and moreover the Zn can be easily and economically regenerated by electrolyzing the soln. Although Pt makes the most satisfactory electrodes for the process, it cannot be used commercially. Accordingly, Fe electrodes were electroplated with bright Cu on which was deposited a very thin film of Pt. These electrodes behaved like solid Pt cathodes. In order to lower the overvoltage of the H on Pt, the cathodes were covered with Pt black. The Zn anodes were made by electroplating a platinized wire gauze with c. p. Zn. The two electrodes were wound into parallel spirals and spaced as close as possible. A 30% KOH soln. was used as electrolyte. On connecting the electrodes, pure H was evolved, which contained only a trace (not over 0.05%) of foreign gases from the electrodes or electrolyte. Generation of H continued till all of the KOH had been used up; but care should be taken not to use up all of the Zn, as a thin layer of Zn on the electrodes facilitates restoring the anodes, which can be done efficiently by passing a current through the cell, making the Pt electrode the anode. Addn. of a little  $\text{H}_2\text{O}$  is necessary in the regeneration of the cell because the reaction may be considered as  $2\text{K}_2\text{ZnO}_2 + 2\text{H}_2\text{O} = 2\text{Zn} + 4\text{KOH} + \text{O}_2$ . In order to obtain a bright deposit of Zn, replating should be done at less than 4 v. and at a max. of 0.8 amp. per dm.<sup>2</sup> The  $\text{O}_2$  obtained is as pure as the  $\text{H}_2$ . The improved process was tried out for several weeks with a battery of 4 cells and gave the same amts. of H and O (contg. not over 0.05% impurities) as the ordinary electrolysis of alk. solns. A. P.-C.

**Electrochemistry of oxygen.** V. SIHVONEN. *Ann. acad. sci. Fennicae* A28, No. 1, 1-39 (1928).—N<sub>2</sub> was bubbled over a Pt anode in 2 N H<sub>2</sub>SO<sub>4</sub> and 2 N NaOH solns. and over an oxidized Pt anode in 2 N H<sub>2</sub>SO<sub>4</sub> soln. The potentials were unaffected. Substitution of O<sub>2</sub> for the N<sub>2</sub> results in a distinct depolarizing action. Using O<sub>2</sub> in place of O<sub>2</sub> increases the depolarizing values with the acid soln. but does not affect the values with the alk. soln. The depolarization is accompanied by the formation of H<sub>2</sub>S<sub>2</sub>O<sub>8</sub>. H<sub>2</sub>O<sub>2</sub> forms during the electrolytic production of H<sub>2</sub> from dil. H<sub>2</sub>SO<sub>4</sub> at an oxidized Pt cathode. This is probably due to the presence of PtO<sub>2</sub>. No H<sub>2</sub>O<sub>2</sub> is formed in NaOH soln in which PtO<sub>2</sub> does not exist. Bubbling N<sub>2</sub> over a Pt cathode in H<sub>2</sub>SO<sub>4</sub> or NaOH solns does not appreciably affect the potentials, but with an amalgamated Pt electrode distinct depolarization occurs during electrolytic H<sub>2</sub> evolution. Substitution of O<sub>2</sub> for the N<sub>2</sub> results in depolarization. Ozonized O<sub>2</sub> has a greater depolarizing effect in NaOH soln. but less in H<sub>2</sub>SO<sub>4</sub> soln. Analogous results were obtained with 50% H<sub>2</sub>SO<sub>4</sub> at 15° and 60°. The cathodic depolarization is accompanied by H<sub>2</sub>O<sub>2</sub> formation. Based on electrolytic equil. between PtO<sub>2</sub>, PtO and H<sub>2</sub>O<sub>2</sub>, the values of the O<sub>2</sub> and H<sub>2</sub>O<sub>2</sub> potentials in H<sub>2</sub>SO<sub>4</sub> are simple numerical ratios of the abs. potential of the N H<sub>2</sub> electrode.

J. E. SNYDER

**Influence of electrical discharge on gas containing hydrocarbons at diminished pressure.** FRANZ FISCHER AND KURT PETERS. *Z. physik. Chem., Abt. A*, 141, 180-94 (1929).—A discharge tube with steel electrodes, both cooled by incoming gas, was used. CH<sub>4</sub>, both pure and dild. with H<sub>2</sub>, was drawn through the tube. C<sub>2</sub>H<sub>2</sub> was condensed with liquid air. Most of the CH<sub>4</sub> was converted to C<sub>2</sub>H<sub>2</sub> and H<sub>2</sub>. The influence of gas velocity, tube loading and pressure are shown in tables. A pressure of 50 mm.; gas velocity of 370 l./hr.; and 1.3 k. v. a. power input gave 8.5% C<sub>2</sub>H<sub>2</sub> in the exit gas, at an elec. energy consumption of 31 k. v. a. per cu. m. C<sub>2</sub>H<sub>2</sub>. G. M. E.

Reduction and oxidation (Fr. pat. 655,846) 13.

**Electric batteries with elements formed in layers.** K. SCHENKEL (to Siemens & Halske A.-G.). Brit. 300,640, Nov. 17, 1927. Structural features.

**Battery of electrolytic cells.** R. KAPP. Brit. 301,290, Aug. 29, 1927. Structural features of an assembly of cells suitable for use as a grid bias for thermionic valves.

**Storage and other batteries.** MME. HOLBROOK (NÉE MARGUERITE NOCENZO). Fr. 656,185, June 21, 1928. Constructional details.

**Storage batteries.** SOC. DES ACCUMULATEURS FIXES ET DE TRACTION. Fr. 656,079, June 18, 1928. The construction of plates is described.

**Storage batteries.** PAUL E. CAILLEUX. Fr. 655,628, June 11, 1928. Constructional details.

**Storage batteries.** LOUIS KRIEGER. Fr. 655,994, June 16, 1928. In a battery having a NiO cathode and an alk. soln. as electrolyte, an anode of finely divided Zn contained in an envelope having porous walls is used.

**Storage batteries.** CONCORDIA ELEKTRIZITATS-A.-G. and W. GOSMANN. Brit. 300,451, March 19, 1928. Structural features are described of cells which may be formed of celluloid secured in position by an adhesive such as AmOAc.

**Storage batteries.** I. G. FARBENIND. A.-G. Fr. 655,340, May 16, 1928. Spongy Pb electrodes are obtained by removing by electrolysis the alloying metal from a Pb alloy.

**Storage battery.** HENRY B. TEFFT (to Harry C. McNamer). U. S. 1,719,204, July 2. A high voltage elec. current is passed through ore such as a Au, Ag or Pb ore submerged in water; the water thus treated is mixed with H<sub>2</sub>SO<sub>4</sub> and some of this soln. is mixed with Pb<sub>2</sub>O<sub>3</sub> and PbO to form a paste; the paste is applied to grids to form plates,

the plates are dried, pos. and neg. plates are assembled, immersed in some of the prepd. acid soln., charged at a low rate and discharged at a high rate; the acid soln. is replaced with fresh soln. and the plates are then recharged.

**Storage battery.** THEODORE A. WILLARD (to Willard Storage Battery Co.). U. S. 1,717,863, June 18. Structural features.

**Storage battery.** E. S. ELLIOTT. Brit. 301,173, Oct. 26, 1927. Structural features.

**Storage battery.** JAMES M. SKINNER (to Philadelphia Storage Battery Co.). U. S. 1,718,086, June 18. Structural features.

**Storage battery plates.** WM. H. GRIMDITCH (to Philadelphia Storage Battery Co.). U. S. 1,718,139, June 18. Neg. battery plates carrying wet charged active material are treated with an aq. soln. of an org. substance such as sucrose or other sugar capable of restricting the oxidation in air of the active material; the plates are then rapidly dried. Cf. C. A. 23, 3634.

**Storage battery plates with separators of glass wool.** D. P. BATTERY CO., LTD, and J. WADDELL. Brit. 300,536, Aug. 13, 1927. Structural features.

**Antimony.** NORDDEUTSCHE AFFINERIE. Fr. 656,221, June 22, 1928. In the electrolytic refining of Sb to avoid increases of anodic pressure, the electrolyte is composed of  $\text{SbF}_3$  contg. at least 6% of free  $\text{H}_2\text{SO}_4$  and a little free HF. The  $\text{H}_2\text{SO}_4$  may be replaced by an alkali bisulfate, and the HF by a mixt. of alkali fluoride and  $\text{H}_2\text{SO}_4$ .

**Lead compounds.** MARCEL L. J. HIRIART. Fr. 656,423, June 25, 1928. Pb metal is reduced to a colloidal galvanic deposit electrolytically; an aq. soln. of  $(\text{AcO})_2\text{Pb}$  to which is added  $\text{Na}_2\text{SO}_4$  until the pptd.  $\text{PbSO}_4$  does not redissolve is used as electrolyte. The deposit is mixed in water acidulated with  $\text{AcOH}$  to obtain a paste which swells and gives a porous, spongy product. The deposit may be converted to white lead by treatment in thin layers with  $\text{CO}_2$ , and this may be converted to minimum by roasting in an elec. furnace.

**Mercury from cinnabar.** WM. C. BAXTER. U. S. 1,718,103, June 18. The ore is dissolved in a soln. of alkali metal sulfide and alkali metal hydroxide and the soln. is electrolyzed to sep. the Hg.

**Alloys of aluminum and silicon.** VEREINIGTE ALUMINIUM-WERKE A-G and H. SCHORN. Brit. 300,429, Jan. 23, 1928. Alloys of Al and Si in desired proportions are obtained by adding uncombined Si to a fused bath of alumina and a fluoride during electrolysis at a rate corresponding to the rate of liberation of Al.

**Electrodeposition of chromium.** LANGBEIN-FRANHAUSER WERKE A-G. Brit. 301,478, Dec. 1, 1927. An electrolyte is used comprising a soln. of a trivalent Cr compd., which is maintained as neutral as possible; Cr oxide or basic salts are retained in soln. by the addn. of substances such as Rochelle salt, Na citrate or salts of oxalic acid or phenolsulfonic acid or alc., glycerol or sugar; the  $p_{\text{H}}$  is kept between 4 and 6. Numerous details are given.

**Chromium plating.** TERNSTEDT MANUFACTURING CO. Fr. 655,698, June 13, 1928. See Brit. 292,094 (C. A. 23, 1356).

**Electroplating with cobalt chromium alloys.** LOUIS SCHULTE (to Allegheny Steel Co.). U. S. 1,717,468, June 18. In forming the plating bath a portion of a soln. formed from Co sulfate 50-75,  $\text{Na}_2\text{SO}_4$  30-40, HF 5-15 and water about 250 parts is mixed with a larger proportion of a soln. formed from chromic acid 75, KOH 3,  $\text{H}_2\text{SiF}_6$  10 and water about 250 parts.

**Apparatus for electroplating metal bands.** JOSEPH J. MASCUCH. U. S. 1,717,460, June 18. Structural features.

**Purifying zinc sulfate solutions electrolytically.** METALLGES. A-G. Brit. 301,512, Dec. 1, 1927. Halogen ions are removed from  $\text{ZnSO}_4$  and other metal salt solns., which may be intended for use in electrodeposition of the metal, by quant. anodic introduction of Hg and sepn. of the pptd. mercurous salt.

**Electrolysis of brine in amalgam cells.** I. G. FARBERIND. A-G. Brit. 300,603, Aug. 16, 1927. Brine for electrolysis particularly in amalgam cells is preliminarily purified from Mg and Ca salts by pptn. with  $\text{NaF}$ .

**Prevention of overvoltage in electrolysis.** BAMAG-MEQUIN A-G. Ger. 655,834, June 14, 1928. Overvoltage in electrolytic elements is decreased by deposition on the cathode of metal or metallic compds. in a finely divided or colloidal state.

**Treating gases with electric discharges.** I. G. FARBERIND. A-G. and A. CARPMAEL. Brit. 300,282, Nov. 11, 1927. In the manuf. of liquid or solid products by gaseous reaction under the influence of elec. discharge, as in the synthesis of  $\text{H}_2\text{O}_2$ , deposition of the product on the wall of the chamber corresponding to one of the electrodes is prevented by permitting the temp. at this part of the app. to rise above the point at which deposition would occur.

**Electric furnaces.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMAS-HOUSTON. Fr. 655,944, June 15, 1928. The construction of heating resistances is described.

**Electric furnaces.** I. G. FARBENIND. A.-G. Fr. 656,282, May 11, 1928. The charged material is directed by plates inside the furnace toward the electrodes.

**Induction furnace.** SIEMENS & HALSKÉ A.-G. (Walther Mareth, inventor). Ger. 477,187, Nov. 13, 1925.

**Electrically heated annular furnace for effecting heat treatments.** METROPOLITAN-VICKERS ELECTRICAL CO., LTD. Brit. 300,862, March 22, 1928. Structural features.

**Electrically heated continuous furnace with rotatable charge-supporting platforms.** ALLGEMEINE ELEKTRICITÄTS-GES. (to International General Electric Co.). Brit. 300,905, Nov. 19, 1927. Structural features.

**Electric arc furnace suitable for making tungsten carbides.** OSCAR L. MILLS (to Mills Alloys, Inc.). U. S. 1,719,558, July 2. Structural features.

**Electric arc furnace suitable for melting and refining steel.** WM. E. MOORE. U. S. 1,718,172, June 18.

**Material for electromagnetic cores.** J. H. GROSS (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 300,911, Nov. 19, 1927. Core plates for dynamo-elec. app. and transformers or similar magnetic plates with an adherent insulating film are coated with an aq. soln. of Na silicate and one or more carbohydrate compds., e. g., sugar, with or without addn. of a filling material such as talc, clay, magnesia or oxides of Fe or Al. When the plates are annealed after the coating is applied, the carbohydrate breaks down and prevents the adhesion of the plates which otherwise might occur.

**Rectifier for alternating currents.** CLARENCE E. OGDEN (to Kodel Radio Corp.). U. S. 1,718,663, June 25. A metallic rectifying plate has a layer of oxide formed on it and a film of reduced Cu on the oxide. Air channels are provided for cooling by use of an adjacent corrugated plate which may be formed of Sn.

**Electrical precipitation apparatus, etc., for preparing "smoked salt" for treating foods.** JAMES N. ALSOP (to Smoked Products Co.). U. S. 1,719,353, July 2. U. S. 1,719,354 also relates to the production of similar products and describes app.

**Electric dust separating apparatus.** SOC. INDUSTRIELLE D'APPLICATIONS ÉLECTRIQUES (S. A. R. L.). Fr. 656,394, June 23, 1928.

**Precipitating electrode (with transverse collecting slits) for electric gas cleaners.** METALLGES. A.-G. Ger. 477,177, Apr. 8, 1928.

**Furnace electrodes.** SIEMENS-PLANIAWERKE A.-G. FÜR KOHLEFABRIKATE. Ger. 477,331, June 12, 1925. Large furnace electrodes, which are consumed in use, are prepd. with non-tarry binders, e. g., gelatin or PhOH-CH<sub>2</sub>O condensation products, such that the electrodes can be hardened at a low temp.

**Battery-condition indicator for automobiles.** WILLIAM C. ZAGARINO and MARSHALL T. McDONALD. U. S. 1,719,160, July 2. Falling of the electrolyte level serves to admit a heating medium such as exhaust gas to a thermometer in position to be observed.

**Electric cables sheathed with aluminum or aluminum alloys.** FELTEN & GUILLEAUME CARLSWERK A.-G. Brit. 300,920, Nov. 19, 1927. Structural features.

**Internal-combustion engine pistons formed of aluminum, magnesium, etc., electroplated with iron.** CHILDS H. WILLS. U. S. 1,717,750, June 18.

**Discharging electricity from films.** SPICERS, LTD., and H. J. HANDS. Brit. 301,439, Aug. 30, 1927. The elec. charge carried by films of cellulose acetate or other cellulose derivs. after evapn. of the solvent in the process of their manuf. is removed by passing them through an elec. cond. aq. bath connected to earth. Solns. of NaOH, Na H phosphate, NaCl, (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> or Na<sub>2</sub>SO<sub>4</sub> may be used. A softening agent such as alc may be added to the electrolyte bath. An app. is described.

**Alternating current rectifier.** HARRY N. MILLER and EDGAR W. ENGLE (to Fansteel Products Co.). U. S. 1,717,517, June 18. A partially reduced metallic chloride such as a specially prepd. Ag chloride compn. is used in contact with a metal of the group comprising W, Ta, Mo and Cb.

**Electric contact material.** O. S. JENNINGS (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 301,461, Nov. 30, 1927. Contacts for circuit interrupters comprise finely divided Ag and graphite molded into block form with which Cu and Ni may be assocd.

**Electrical condenser.** EDWARD F. ANDREWS (to Andrews-Hammond Corp.). U. S. 1,717,488, June 18. A condenser adapted for use with a. c. has one electrode with an effective surface of metallic Ni and another with an effective surface of metallic Fe, which may be used with an electrolyte formed from KOH. Cf. C. A. 22, 2720.

**Electric resistance element.** SIEGMUND LOEWÉ (to Radio Corp. of America), U. S. 1,717,712, June 18. A resistor suitable for use as a grid leak is formed by depositing a uniform film from a fine mist of a noble metal soln. such as Pt on the surface of a heated non-cond. carrier such as glass.

**Photoelectric cell.** TELEFUNKEN GES. FÜR DRAHTLOSE TELEGRAPHIE M. B. H. (Fritz Schroeter, inventor). Ger. 477,158, July 9, 1925. The cell has a filling of inert gas and the sensitive electrode is made from K or Na alloyed with not more than 4% of Rb or Cs or a mixt. thereof.

**Photoelectric cells containing active material such as potassium, sodium or rubidium.** FIRM OF O. PRESSLER. Brit. 300,917, Nov. 17, 1927. Various structural features are described.

**Filaments of incandescent electric lamps.** NEUE GLUHLAMPEN GES. (to Falk, Stadelmann & Co., Ltd.). Brit. 301,014, Nov. 23, 1927. Structural features are specified. When long- or single-crystal wire is used, its crystal structure is destroyed at several points by bending it to prevent distortion of the filament in use. Brit. 301,015 also relates to structural features of W filaments.

**Electric incandescent lamps.** GENERAL ELECTRIC CO., LTD., and F. J. G. VAN DEN BOSCH. Brit. 301,143, Sept. 17, 1927. Vapor from white P heated to above 50° is introduced into an evacuated bulb, which is simultaneously or subsequently filled with inert gas such as A or an A-N mixt. which may contain a little H.

**High vacua in lamps, etc.** G. I. FINCH. Brit. 300,516, May 13, 1927. Hg vapor is absorbed in or prevented from access to evacuated lamps or the like by an alloy of 2 or more alkali metals, such as Na and K, liquid at ordinary temps. and with which it forms an amalgam.

## 5—PHOTOGRAPHY

C. E. K. MEES

**Theory of the photographic process.** W. MEIDINGER. *Phot. Korrr.* 65, 100-6 (1929).—A review of the present position of the theory of exposure and development under the headings: (1) structure and properties of AgBr-in-gelatin films; (2) exposure of the sensitive film; (3) development; and (4) density curves.

**Recent application of reflection printing methods in practice.** G. KÖGEL. *Phot. Korrr.* 65, 110-4 (1929).—A Ag and a Cr process of reflection photography are in use in Germany today. The former is Playertype, for which Typon paper and printing equipment are supplied by the Baltische Co., and the latter is the Manul process for photo-engraving.

**New method of obtaining direct positives in photography.** R. SESMA. *Bull. soc. franç. phot.* 16, 108-10 (1929).—Direct positives are obtained on com. sheet film by a process, "reversal by penetration," which consists of the following steps: (1) normal development in elon-hydroquinone; (2) treatment in a citric acid or AcOH stop bath; (3) bleaching in a hardening bleach whose formula is given below; (4) washing and drying; (5) redevelopment in a high carbonate elon-hydroquinone developer; (6) rinsing, fixing, washing and drying. Successful operation of the process depends on the action of the preferential hardening bleach combined with the complete drying before redevelopment. Bleach formula is  $\text{CuSO}_4$  10 g., KBr 8 g.,  $\text{CrO}_3$  1 g. and  $\text{H}_2\text{O}$  1 l.

**Has the temperature of radiation any effect on its photographic action?** R. A. HOUSROUN. *Phil. Mag.* [7], 7, 1139-43 (1929).—To test if the ability of a radiation to ionize a mol. or atom is dependent on its temp., it was desired to deliver 2 quantities of light of the same energy content but different temp. in the same time on equal adjacent areas of the same photographic plate, photographic action being assumed to be essentially a case of ionization. The actual exptl. method used, and assumed to give these conditions, was to have, in the first case, a wide-angle beam of light focused on the photographic plate; and in the second, a narrow-angle beam delivering the same quantity of energy in the same time on the plate. With the series of com. plates used, however, any variation observed in the photographic effect could be accounted for by exptl. error.

**Chemicals of the fixing bath.** STRAUSS. *Das Atelier* 36, 31-3 (1929).—A brief account of the use of bisulfites, AcOH, citric, or tartaric acid to acidify, of common alum to harden, and of  $\text{NH}_4\text{Cl}$  to accelerate, the action of the ordinary photographic fixing bath. Greater hardening is given by formaldehyde or chrome alum used in a sep. bath before fixing.

E. R. BULLOCK

**Methods of sulfide toning.** P. WIGLEB. *Brit. J. Phot.* 76, 344-6(1929).—Direct sulfide toning by the hypo-alum, cold hypo-dextrin, and acidified hypo processes is described, the colloidal S present being the active agent in each case. Other methods depend on the use of alkali polysulfide baths, or liver of S, the latter being especially suitable for rapid work on a large scale. The more recently introduced indirect methods of S toning have the advantage of offering a wider variety of tones. The compn. of bleaching baths is considered. A. BALLARD

**Gaslight prints and transparencies in pleasing tones.** K. JACOBSON. *Das Atelier* 36, 26-8(1929).—An account is given of the method of the Lumières and Seyewetz in which the developed Ag image is bleached to one of AgCuCNS and this used as a mordant for thioflavine T, methylene blue or rhodamine S, or for a mixt. of these basic dyes. A considerable range of tones is thus available. The clearing of the high-lights by means of  $\text{KMnO}_4$  is, however, a very delicate operation. E. R. BULLOCK

**Silver grain size and development.** K. WENSK. *Das Atelier* 36, 51-3(1929).—W. describes the results of his microscopical studies of the development, with an ordinary metol-hydroquinone developer and with alkali-less metol, resp., of a high-speed, coarse-grained emulsion coated in a single-grain layer. About 10 times the exposure was given for the latter developer in order that the densities in each case should be comparable. While the metol-hydroquinone gave deep black grains of irregular shape by the side of completely unchanged ones, the alkali-less metol caused only the appearance of dark tubercles on the edges of individual grains. Alkali-less metol thus causes no graininess, and it is, further, an excellent leveling developer. E. R. BULLOCK

**Further contribution on the graininess of negatives.** A. v. BARSY. *Kinotechnik* 11, 40-1(1929).—B. considers the graininess problem from various angles and summarizes his experiences. Special fine-grained emulsions have too much contrast, and a new combination of fine-grained emulsion and suitable developer is needed. Among developers, a pyro formula is fairly satisfactory. Neol, diluted 1:60, is effective temporarily, and the borax developer is very strongly recommended. B. suggests that occasional abnormal graininess may be caused by atm. conditions affecting the quality of the exposure light. M. L. DUNDON

**Herschel effect.** A. P. H. TRIVELLI. *J. Franklin Inst.* 207, 765-97(1929).—To correct some historical statements concerning its origin and theory the discovery of the Herschel effect is republished. The results of the investigations of A. L. Schoen and R. M. Briggs, who showed that Wratten filter No. 87 is the most suitable for the Herschel effect, are given. The significance of the Herschel effect for the study of desensitizers of the latent image is discussed. It is shown that the Herschel effect shows max. effects detd. by the amt. of the first blue-light exposure and the time of development. A quant. expression for the Herschel effect is discussed. A. P. H. T.

**Intensification of photographic latent image.** III. E. P. WIGHTMAN AND R. F. QUIRK. *Proc. 7th Intern. Congress Phot.* 1929, 235-43; cf. C. A. 22, 547.—The results of previous work are reviewed and the hypothesis which was offered to explain them. Addnl. facts have been obtained, and are presented, which lend further support to this hypothesis. These are: (a) The latent image intensification is largely independent of the developer used. (b) No latent image intensification is obtainable with x-ray exposures. (c) Acetone-semicarbazone, a Br absorber, apparently lessens or prevents intensification of latent image by  $\text{H}_2\text{O}_2$ , but at the same time itself causes a latent image intensification. Org. peroxides as well as  $\text{H}_2\text{O}_2$  are capable of producing intensification of latent image. It is considered that only those substances which act on the latent image specks can produce latent image intensification. It is further considered that those which act in general on the Ag halide to form new specks do not produce latent image intensification but only fog. E. P. WIGHTMAN

**Notes on sensitizing agents in gelatin.** E. CALZAVARA. *Sci. ind. phot.* 9M, 9-10(1929).—A criticism of the theory that sensitizers such as thiosinamine or cystine preexist in naturally active gelatin from the standpoint of the low sensitivity of the chem. reactions characterizing these substances and the reactions involved in the maturing of photographic emulsions. C. E. CLIFTON

**Anti-fogging and anti-sensitizing effects.** S. E. SHEPPARD. *Phot. J.* 69, 37-40(1929).—In previous work with H. Hudson it was shown that the thioanilides could act as anti-sensitizing and anti-fogging agents. It was concluded that in this case they react with Ag halides in the tautomeric form,  $\text{RC}(:\text{NAr})\text{SH}$ . This action is now attributed to a tendency to form first a complex Ag compd. with Ag halide at the interface of sensitizing specks of  $\text{Ag}_2\text{S}$  with  $\text{AgBr}$  or of Ag with  $\text{AgBr}$ . This provides a sp. chem. mechanism in explanation of Lüppo-Cramer's "nucleus isolation" hypothesis of desensitizing by dyes. It is shown that the same mechanism is applicable, completely

to 4,5-disubstituted imidazoles and partially to the phenazine dye desensitizers. In both cases the primary event is an electro-adsorption of the org. substances to Ag halide at the interface of Ag halide-Ag<sub>2</sub>S or Ag halide-Ag, by development of a semipolar double bond. This is followed, in the case of thioanilides and imidazoles, by firmer attachment of the Ag ion to N, whereby these Ag ions become resistant to reduction or sulfiding, so that growth of the isolated speck is inhibited. In the case of phenazine dyes, the electro-adsorption is not followed by firmer union, but oxidative attack of the speck by the dye is facilitated.

**Anti-fogging and anti-sensitizing effects.** S. E. SHEPPARD. *Phot. J.* **69**, 206-9 (1929); cf. preceding abstract.—S. replies to criticisms of the hypothesis that the azine groups of many desensitizing dyes are the seat of their nucleus isolating power, and that their action is similar in principle to that of the imidazoles and thioanilides, and to criticisms of the formulation suggested for the complexes of thiocarbamides and thioanilides with the Ag halides.

**Apparent desensitization by silver nuclei.** LÜPPO-CRAMER. *Camera (Lucern)* **7**, 237-8 (1929).—Colloidal Ag, prepd. by Carey Lea's dextrin method, was added to a motion picture positive emulsion in an amt. equal to 0.2% of its AgBr content. Plates coated with this emulsion, developed in org. developers, particularly *p*-phenylenediamme showed an apparent loss of speed compared with the unsilvered plates and an orange to red fog was produced. No loss was found with ferrous oxalate. The results are explained by the theory that in developers having a slight solvent action on AgBr, some of the introduced Ag nuclei grow in preference to the latent image. Ferrous oxalate shows no loss because it contains no sulfite or other Ag solvent.

**Ammonium persulfate reducer.** H. SPÖRL. *Das Atelier* **36**, 41-4 (1929). As the outcome of his expts. S. recommends a soln. of 5 g. (NH<sub>4</sub>)<sub>2</sub>S<sub>2</sub>O<sub>8</sub> with 5 drops of H<sub>2</sub>SO<sub>4</sub> in 200 cc. of H<sub>2</sub>O for normal use as a reducer for photographic negatives. NaCl up to 0.01 the weight of the (NH<sub>4</sub>)<sub>2</sub>S<sub>2</sub>O<sub>8</sub> may be added if it is desired to reduce considerably while conserving as far as possible the highest lights.

**Little-known point in intensification.** K. JACOBSON. *Das Atelier* **36**, 38-9 (1929).—J. points out that in the majority of cases for the intensification of negatives what is needed is not a proportional effect but an effect greater than this in the shadows and somewhat less in the highlights. The single-soln. HgI<sub>2</sub> method and the two-soln. Welborne Piper method with acidified K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> and development are among those which tend to give this kind of intensification.

**Hypersensitizing for extreme speed of exposure.** K. JACOBSON. *Brit. J. Phot.* **76**, 315-7 (1929).—Hypersensitization results in an increase in the sensitivity of the material to light of the longer wave lengths. The effect is, therefore, much more pronounced in artificial light exposures than in daylight. Various panchromatic plates and films respond to hypersensitization in different degrees. Full directions are given for the treatment of panchromatic material, ammoniacal AgCl being used. The method of sensitization by pre-exposure is described, and is stated to be of value only when the negative is to be used finally with very dim lighting. The negatives should be developed in darkness, or after desensitization, in a green light. A method of development to avoid irradiation is given.

See and its use in the arts [in photographic toning baths] (KUFFERATH) **18**. Manufacture of sensitized papers for photography (ANON.) **23**. Composition of the commoner grades of paper [photographic papers] (RETTORI) **23**. Grain growth in Ag halide precipitates (SHEPPARD, LAMBERT) **2**.

**Photographic developers.** I. G. FARBERIND. A.-G. *Brit.* **300**, 970, Nov. 21, 1927. See Ger. 467,818 (*C. A.* **23**, 572).

**Developing photographic films.** ÉTABLISSEMENTS ÉDOUARD BELIN. *Fr.* 655,925, Oct. 31, 1927. A machine is described for the ultra-rapid development of endless photographic films by projection of the baths on to the band with visual control of the development.

**Color photography.** JOHN H. POWRIE. U. S. 1,717,404-5, June 18. Optical and mech. features.

**Color photography.** HEINRICH FREDERKING. Ger. 477,350, Jan. 5, 1928. A modified 3-color process is described whereby the effects of a 4-color process are obtained. The principal feature of novelty is the intentional addn. of a black color to the pigments used in prepg. the gelatin-pigment layers.

**Film for color photography and cinematography.** SOCIÉTÉ FRANÇAISE DE CINÉMATOGRAPHIE ET DE PHOTOGRAPHIE FILMS EN COULEURS KELLER-DORIAN. Ger. 477,474, Oct. 18, 1928. See Brit. 298,951 (C. A. 23, 2895).

**Photographic plates.** R. S. VILASECA. Brit. 300,809, Dec. 9, 1927. The rear surfaces of glass plates are sand-blasted or treated with HF to remove their polish and provide a surface suitable for direct use for retouching.

**Hydroxyethylaminobenzene derivatives.** I. G. FARBENIND. A.-G. Brit. 300,503, Nov. 12, 1927. A nuclear substitution product of a 4-amino-1-hydroxybenzene is treated with glycol halohydrin or with ethylene oxide at ordinary or at raised temp. and pressure, and if necessary in the presence of an acid-binding agent, a diluent, solvent or catalyst, to obtain N-mono- and di-hydroxyethyl derivs., which are suitable for use as *photographic developers*. Several examples are given.

**Composite films for motion-picture and sound records.** ALBERT F. SULZER (to Eastman Kodak Co.). U. S. 1,717,815, June 18.

**Colored particles for making photographic multicolor screens.** SOC. LUMIÈRE. Brit. 301,516, Dec. 2, 1927. Dyed threads of natural or artificial silk are embedded in a substance such as paraffin, the material is cut as with a microtome and the embedding material is then dissolved to free the particles of thread; mixed colors of the thread particles are then applied to a plate or the like by use of adhesive varnish such as rubber soln. Charcoal may be used for filling interstices between the thread particles.

**Photographic silver halide emulsions.** OTTO MATTHIES, WALTER DIETERLE and JOSEF REITSCHÖTTER (to Agfa Ansco Corp.). U. S. 1,719,711, July 2. The emulsions are treated with a sensitivity-increasing material prepd. by alk. hydrolysis and simultaneous partial oxidation of proteins such as horn shavings or gelatin.

**Coloring or coating portions of cinematograph film to facilitate identification by inspection of the margins without unrolling.** I. G. FARBENIND. A.-G. Brit. 300,991, Nov. 22, 1927. Various methods of coloring are described.

## 6—INORGANIC CHEMISTRY

A. R. MIDDLETON

A suggestion as to the nomenclature and method of writing inorganic compounds. ANGEL SABATINI. *Rev. centro estud. farm. bioquim.* 16, 449-52(1927); *Chem. Zentr.* 1928, I, 1489.—S. proposes that the Spanish practice of writing the electronegative radical first, *i. e.*, ClH, be followed. FRANCIS P. GRIFFITHS

The chemical characterization of the sulfur-nitric oxide compounds of univalent iron, cobalt and nickel. W. MANCHOT AND G. LEHMANN. *Ann.* 470, 255-61(1929).—The authors present exptl. evidence in support of their contention that the NO groups in compds. of this type do not behave as hyponitrite radicals. L. F. AUDRIETH

The constitution of the sulfur-nitric oxide compounds of univalent iron, cobalt and nickel. W. MANCHOT. *Ann.* 470, 261-70(1929).—The properties of compds. of the type, Fe(NO)<sub>2</sub>SR, Co(NO)<sub>2</sub>SR and Ni(NO)SR (where R = alkyl, H or S.SO<sub>3</sub>K) may best be expressed by a consideration of their electronic structures. The NO groups act as neutral constituents linked to the metal by coordinative covalence, whereas the SR groups may involve either electrovalent or covalent linkage, the nonpolar character being most strongly accentuated in the mercaptides (where R = alkyl), less so in the hydrosulfides (R = H), and least in the thiosulfates (R = S.SO<sub>3</sub>K). L. F. A.

**Germanium. XXXI. Alloys of germanium: silver-germanium.** T. R. BRIGGS, R. O. McDUFFIE AND L. H. WILLISFORD. *J. Phys. Chem.* 33, 1080-96(1929); cf. Jordan, Grenell and Hirschman, *C. A.* 22, 54.—Thermal analysis indicates that Ag-Ge forms simple eutectiferous series with no stable intermetallic compds. Conductance of these alloys is remarkably low, indicating that Ge predominates as continuous phase in fine structure. The eutectic contains 74 atomic % Ag and eutectic temp. is 650°. A. P. SACHS

The stability of complex metallic salts. FREDERICK G. MANN. *J. Chem. Soc.* 1929, 651-8; cf. *C. A.* 22, 2335.—Further evidence is presented for M.'s theory that the case with which coordinated mols. can arrange themselves about a square, octahedron or cube has a greater effect on the stability of the salt than whether in coordination the central atom acquires an excess or deficiency of electrons as compared with the next inert gas. Zn is shown to give extremely stable compds. with triaminopropane, like those of Ni, Pt<sup>II</sup> and Pd<sup>II</sup> previously described, in which the coordination no. is 6 although the central atom has an excess of 4 electrons over the number in Kr.

Cd is found to act differently. Like Cu (C. A. 21, 388) it shows a coordination no. of 4 in all its compds. with triaminopropane. Bivalent Pd also unites with this base to form a compd. in which the Pd has its normal coordination no. of 4, which is identical in type with the platinous salt previously described. The following new salts were prepd. (ptn. = 1 mol. of  $\alpha\beta\gamma$ -triaminopropane):  $[Znptm_2]I_2$ ;  $[Pdptm_2]I_2$ ;  $[Pd(ptn-HSCN)_2](SCN)_2$ ;  $[Cd_2ptm_4]I_6$  converted by boiling water to  $[IptnCd]I$ ;  $[Cd_2ptm_4]Br_6 \cdot 3H_2O$  converted by boiling water to  $[BrptnCd]Br$ ;  $[SCNptnCd]SCN$ ;  $[(SCN)_2Cd-ptnHCl]$  slowly loses HCl when exposed to air. F. W. LAIRD

Action of cyanogen bromide and hydrogen cyanide on titanium tetrabromide. F. OBERHAUSER AND J. SCHORMÜLLER. *Ber.* 62B, 1436-41(1929).—An addn. compd.,  $TiBr_4 \cdot 2BrCN$ , is prepd. by mixing 5 g.  $TiBr_4$  in 50 cc.  $CS_2$  and 6 g.  $BrCN$  in 50 cc. of  $CS_2$  with the careful exclusion of moisture. The compd. m. 151-152°, is decomposed by  $H_2O$  to give  $BrCN$  and by alkali to give  $TiO_2$ . A similar compd. is formed with  $CNCl$ . An addn. compd.,  $TiBr_2 \cdot 2HCN$ , is formed by adding dry HCN to  $TiBr_4$ . This decomposes in steps into  $2TiBr_4 \cdot 3HCN$  and  $TiBr_4 \cdot HCN$ .  $NH_3$  and  $BrCN$  interact quantitatively according to  $2NH_3 + BrCN \rightarrow NH_4Br + NH_2CN$ . This may be used for analysis of  $BrCN$  by submitting the sample to the action of 100 cc. dil  $NH_3$  for 20-30 min. in the cold, followed by a short heating on the water bath and diln. with 300 cc.  $H_2O$ . After driving off most of the  $NH_3$  the soln. is made slightly acid with  $HNO_3$  and the soln. is titrated with 0.1 N  $AgNO_3$ . HANS C. DREUS

The behavior of cyanogen bromide and hydrogen cyanide towards iron salts. (A contribution to the theory of oxidation processes.) F. OBERHAUSER AND J. SCHORMÜLLER. *Ber.* 62B, 1482-8(1929).—The unsymmetrical structure of  $BrCN$  makes it especially adapted to follow oxidation processes. The oxidation of  $FeBr_2$  to  $FeBr_3$  shows an intermediate stage in the compd.  $Fe_3Br_8 \cdot 3BrCN \cdot (CN)_2$ , formed by heating  $FeBr_2$  with excess  $BrCN$ . By reduction of pressure this goes over into  $Fe_3Br_8$ .  $Fe_3Br_8$  reacts at room temp. with  $BrCN$  to give  $Fe_3Br_8 \cdot 4BrCN$ , which may be converted into  $FeBr_3$ . A compd.  $Fe_3Br_8 \cdot 5HCN$  has also been prepared.  $3FeBr_3 \cdot 4BrCN$  is in the highest state of oxidation as shown by its tendency to split off  $Br$ .  $Fe_3Br_8 \cdot 4BrCN$ , however, shows the most stable satn. of the residual valences.  $Fe_3Br_8 \cdot 4BrCN$  shows a greater satn. tendency of  $BrCN$  than does HCN in the addn. product  $Fe_3Br_8 \cdot 5HCN$ . The color of the compds. becomes darker with increasing addns. to the nucleus, being bright yellow for  $2FeBr_2 \cdot BrCN$ , light brown for  $Fe_3Br_8 \cdot 3BrCN \cdot (CN)_2$ , dark brown for  $FeBr_3 \cdot BrCN$  and black for  $3FeBr_3 \cdot 4BrCN$ . HANS C. DREUS

The action of oxalic acid and malonic acid upon tetramminocobaltic complexes and their analogs. WALTER SCHRAMM. *Z. anorg. allgem. Chem.* 180, 161-83(1929). On the basis of similarity of behavior of  $H_2C_2O_4$  and  $H_4C_2O_4$  toward compds. contg. complex anions (cf. C. A. 16, 4153; 21, 539, 2230) S. has made a systematic examn. of calcd. quantities of these 2 substances upon numerous  $[CoA_4]$ -complexes ( $A = NH_3, \frac{1}{2}$  ethylenediamine or  $\frac{1}{3}$  propylenediamine).  $H_2C_2O_4$  displaces with more or less facility the  $H_2O, OH, Cl, Br, NO_3, CO_3$  and  $C_2H_3O_4$  groups to give the corresponding oxalatotetramminocobaltic salts  $[CoA_4C_2O_4]X$ . The stability of the resulting compds. toward the mineral acid which is split off permits their formation. The malonato group in  $[Co(NH_3)_4C_2H_3O_4]Br$  is not attacked. The nitro groups in  $[Co(NH_3)_4(NO_2)_2]NO_3$  are displaced only with utmost difficulty. Malonic acid reacts with diaquo-, hydroxoquo-, acidoquo- and diacidoquo-complexes to split off the free mineral acid, which may then partly or entirely react with the cation, or even add on to the latter, to give acidoquo-, diacido- or acid diacido-salts. Dinitrotetramminocobaltic nitrate,  $[Co(NH_3)_4(NO_2)_2]NO_3$ , and the oxalato complexes are not attacked. Malonato complexes,  $[CoA_4C_2H_3O_4]^-$ , are obtained only when the mineral acid, primarily formed, is removed from soln. by hydrolytic cleavage, as in the case of the carbonato complexes where the action of malonic acid causes evolution of  $CO_2$ . Carbonatotetramminocobaltic malonate,  $[Co(NH_3)_4CO_3]C_2H_3O_4$ , reacts with malonic acid to give the diaquo-salt,  $[Co(NH_3)_4(H_2O)_2]_2(C_2H_3O_4)_2$ . The action of  $H_2C_2O_4$  and  $H_4C_2O_4$  upon the sulfato complexes causes primary liberation of free  $H_2SO_4$ , which subsequently reduces the trivalent Co. Attempts to prep. the corresponding succinato and glutarato compds. by the action of the free acids upon the  $CoA_4$ -complexes were unsuccessful. The exptl. results are conveniently tabulated. The following new oxalato and malonato complexes were prepd.: oxalatodiethylenediaminocobaltic nitrate monohydrate,  $[Coen_2C_2O_4]NO_3 \cdot H_2O$ ; oxalatodipropylenediaminocobaltic chloride trihydrate,  $[Coen_2C_2O_4]Cl \cdot 3H_2O$ ; oxalatodiethylenediaminocobaltic chloride monohydrate,  $[Coen_2C_2O_4]Cl \cdot H_2O$ ; oxalatotetramminocobaltic dithionate,  $[Co(NH_3)_4C_2O_4]S_2O_6$ ; malonatotetramminocobaltic chloride,  $[Co(NH_3)_4C_2H_3O_4]Cl$ ; malonatodiethylenediaminocobaltic chloride tetrahydrate,  $[Coen_2C_2H_3O_4]Cl \cdot 4H_2O$ ; malonatotetramminocobaltic bromide,  $[Co(NH_3)_4$

$C_3H_2O_4$ )Br; *malonatotetramminocobaltic selenate trihydrate*,  $[Co(NH_3)_4C_3H_2O_4]_2SeO_4 \cdot 3H_2O$ ; *malonatotetramminocobaltic nitrate monohydrate*,  $[Co(NH_3)_4C_3H_2O_4][NO_3] \cdot H_2O$ . L. F. AUDRIETH

The oxidation of alkali sulfites to dithionates. R. HAC. *Collection Czechoslov. Chem. Comm.* 1, 259-62(1929); cf. *J. prakt. chem.* 80, 229; *Ber.* 34, 3606.—The alkali dithionates were prepd. in 75% yield by heating 1 part each of  $Na_2SO_3 \cdot 7H_2O$  and  $PbO_2$  and 2 parts of water until all the sulfite is in soln., passing in  $CO_2$ , filtering, neutralizing with lactic acid, concg. and crystg. This reaction is not effected by  $MnO_2$  as previously reported. V. F. HARRINGTON

Contributions to the study of phosphorus trioxide. II. The reciprocal action between phosphorus trichloride and phosphorous acid. LUDWIG WOLF, ERICH KALAEHNE AND HERMANN SCHMAGER. *Ber.* 62B, 1441-9(1929).—The authors were unable to verify previous results that  $PCl_3$  and cryst.  $H_3PO_3$  react to give  $P_2O_3$ , but always found the product to be of a sirupy consistency and orange color.  $HCl$  and  $P_2O_3$  gave  $PCl_3$  and  $H_3PO_3$ , which, on standing, passed over into the same sirupy product at  $60^\circ$ . When heated to  $150^\circ$  this product decomposes partially into red P. HANS C. DUUS

Bromamine. WILHELM MOLDENHAUER AND M. BURGER. *Ber.* 62B, 1615-8(1929).—When Br and  $NH_3$  react in ether soln.  $NH_2Br$  is formed. It was not isolated but its compn. was deduced from the distribution of the  $NH_3$  and Br between ether and water. The ether soln. has oxidizing properties. The reaction velocity const. for the decompn. of the amine in water as a monomol. reaction is 0.0056 at  $0^\circ$ ; 0.035 at  $15.1^\circ$ ; and 0.10 at  $24.0^\circ$ . J. B. AUSTIN

New fluorides, especially chlorine fluoride. OTTO RUFF, JOSEPH FISCHER, FRITZ LUFT, ERNST ASCHER, FRIEDRICH LAASS AND HERBERT VOLKMER. *Z. anorg. Chem.* 41, 1289-92(1929); cf. *C. A.* 22, 4398; 23, 785. T. H. CHILTON

Iridium fluorides. OTTO RUFF AND JOSEPH FISCHER. *Z. anorg. allgem. Chem.* 179, 161-85(1929); cf. *C. A.* 22, 4398.— $IrF_6$  was prepd. by passing  $F_2$  over powd. Ir heated in a  $CaF_2$  tube to  $260^\circ$ . Cooled with liquid air,  $IrF_6$  is pale yellow; at about  $-15^\circ$ , it becomes intensely yellow and glassy; it melts to an intensely yellow liquid at about  $44^\circ$ . After standing some weeks, the glassy solid showed distinct crystn., indicating that there might be 2 cryst. modifications. X-ray examn. at  $-150^\circ$  indicates tetragonal structure. By a special pycnometric procedure using liquid  $O_2$ , d. was detd. as 6.0, agreeing with that calcd. from x-ray data (5.56). B. p., estd. from vapor pressure curve, is  $53^\circ$ ; latent heat, 8500 cal. Heat of formation, estd. from temp. rise during prepn., is 130,000 cal.  $IrF_6$  is hydrolyzed by  $H_2O$ , giving  $HF$ ,  $Ir(OH)_3$  and  $O_2$  contg.  $O_3$ . In all reactions, it easily gives up 2 atoms of F. With  $H_2$  or  $CO$ , it is reduced to Ir. It does not form complex salts. An oxyfluoride was formed by the action of moisture or of glass at ordinary temps. or of quartz when heated; its formula is believed to be  $IrOF_4$ . It forms microscopic, gray-white needles.  $IrF_4$  was prepd. by reducing  $IrF_6$  with Ir. It is a viscous, yellow-brown oil, very volatile and hygroscopic, decomposing instantly with  $H_2O$ . T. H. CHILTON

Fluorides of manganese and cadmium. P. NUKA. *Z. anorg. allgem. Chem.* 180, 235-40(1929).—By pptn. of  $MnCl_2$  with  $NH_4F$  in large excess  $NH_4MnF_6$  is obtained. A satd. soln. heated to  $60^\circ$  ppts.  $MnF_2$ .  $NH_4MnF_6$  heated to  $290-300^\circ$  in  $CO_2$  gives  $MnF_2$ . Solubilities of the latter per 100 g. of soln. are  $40^\circ$  0.66 g.,  $60^\circ$  0.44 g.,  $100^\circ$  0.48 g..  $MnF_2$  hydrolyzes and oxidizes in air at room temp. Evapn. *in vacuo* or pptn. of  $MnCl_2$  with  $CdF_2$  gives  $MnF_2 \cdot 4H_2O$ , which loses  $H_2O$  at room temp. This hydrate is sol., 1.05 g. per 100 g. of soln.  $KF$  and  $NaF$  ppt.  $KMnF_6$  and  $NaMnF_6$  from  $MnCl_2$ . Addn. of  $NH_4F$  to  $Cd(NO_3)_2$  soln. gives  $CdF_2 \cdot 2H_2O$ , losing  $H_2O$  slowly in the air. More than 1 crystal form exists. About 1.8 g. of  $CdF_2$  is sol. in 100 g. of soln. The soly. of  $ZnF_2$  and  $NiF_2$  decreases with temp. FOSTER DEE SNELL

Iron tetranitrosyl. W. MANCHOT AND E. ENK. *Ann.* 470, 275-83(1929).—Iron tetranitrosyl,  $Fe(NO)_4$ , may be obtained as a black, cryst. substance by heating carefully Fe carbonyl with NO under pressure in an autoclave at a temp. of  $44-45^\circ$ . The freshly prepd. product fumes in air, possibly because of the presence of volatile higher iron nitrosyls. The non-volatile tetranitrosyl undergoes surficial oxidation in air. It reacts vigorously with liquid  $NH_3$  with probable formation of  $Fe(NO)_3NH_3$ . It dissolves in concd.  $H_2SO_4$  to give a red soln. due to the presence of  $Fe(NO)SO_4$ . With  $NaCN$ , Na nitroprusside is obtained.  $K_2S_2O_8$  gives dinitroso-iron(II)-thiosulfate,  $Fe(NO)_2S_2O_4K$ . It reacts with  $EtSH$  to form dinitroso-iron(II)-mercaptide,  $Fe(NO)_2SC_2H_5$ . KSH yields Pavel's salt,  $Fe_4(NO)_7S_3K$ , and with K xanthogenate, dinitroso-iron(II)-xanthogenate,  $Fe(NO)_2(SCSOC_2H_5)_2$ , is obtained. Fe acts as the NO carrier in these reactions and is itself oxidized to the univalent or bivalent state at the expense of the NO. L. F. AUDRIETH

A methanol compound of iron nitrosyl. W. MANCHOT AND H. GALL. *Ann.* **470**, 271-4(1929).—The interaction of NO with  $\text{Fe}(\text{CO})_5$  at room temp. in the presence of MeOH results in the formation of  $\text{FeNO} \cdot n\text{CH}_3\text{OH}$ , a black, unstable, microcryst. substance. It decomposes on contact with air and loses part of the combined MeOH at  $80^\circ$  and the remainder above  $200^\circ$ . When heated in an atm. of A, it leaves a residue of  $\text{Fe}_2\text{O}_3$ . L. F. AUDRIETH

Note on the recovery of platinum. G. J. HOUGH. *Ind. Eng. Chem., Anal. Ed.* **1**, 162(1929).—The residues and alc. solns. contg. Pt from the detn. of K are treated with  $\text{NH}_4\text{Cl}$ . The ppt. is dissolved in hot water, treated with HCl and magnesium powder. The platinum black is treated with aqua regia and then HCl. A. I. E.

The supposed sesquisulfide of molybdenum. V. MONTORO. *Atti accad. Lincei* [6], **9**, 331-7(1929).—By means of x-ray examn. of Mo sulfide (pure as well as at various stages of desulfurization) and alloy of Mo-C, M. has found that supposed lower sulfides of Mo are  $\text{MoS}_2$  and solid solns. of C in Mo. In this way it has been proved that a sulfide lower than  $\text{MoS}_2$  does not exist. A. W. CONTIERI

Some ammino-pyridino complexes of tervalent iridium. MARCEL DELÉPINE AND JEAN PINRAU. *Bull. soc. chim.* [4], **45**, 228-35(1929); cf. C. A. **22**, 738. The prolonged action of aq.  $\text{NH}_3$  in sealed tubes at  $100^\circ$  was studied. (I =  $[\text{IrCl}(\text{NH}_3)_4\text{Py}]^{++}$ ; II =  $[\text{IrPy}_2\text{Cl}_2]^-$ ; III =  $[\text{Ir}(\text{NH}_3)_3\text{H}_2\text{OPy}_2]^{+++}$ .)  $\text{K}_2[\text{IrPyCl}_5]$  heated 15 hrs gave  $\text{IrCl}_3$  isolated as its compd. with  $2\text{HgCl}_2$ ; after removal of Hg by  $\text{H}_2\text{S}$  and of HCl by evapn. to dryness,  $\text{IrCl}_3$  was obtained anhydrous by crystn. from hot soln., as a dihydrate from cold soln. It is very sol. in water and forms ppts. with  $\text{HgCl}_2$ ,  $\text{K}_2\text{HgI}_4$ , picric acid,  $\text{K}_2\text{Cr}_2\text{O}_7$ ,  $\text{KI}_3$ ,  $[\text{IrPy}_2\text{Cl}_5]^-$  and  $[\text{IrPy}_2\text{Cl}_4]^-$ . NaBr and NaI formed ppts from very concd. solns.  $\text{K}_2\text{CrO}_4$ ,  $\text{K}_4\text{Fe}(\text{CN})_6$ ,  $\text{K}_3\text{Fe}(\text{CN})_6$  and  $\text{K}_2\text{PtCl}_6$  formed no ppts. A sulfate was prepd. by treating  $\text{IrCl}_3$  with  $\text{Ag}_2\text{SO}_4$ . Attempts to replace the Cl of I by  $\text{NH}_3$  were fruitless.  $\text{Na}[\text{IrPy}_2\text{Cl}_4]$  (red trans-isomer) heated 30 hrs. gave [III]-[II]<sub>3</sub>·6H<sub>2</sub>O, which treated with  $\text{PyHCl}$  gave  $\text{Py}[\text{II}]$  and [III]Cl<sub>3</sub>·3H<sub>2</sub>O. On dehydrating at  $115^\circ$  for 3 hrs. the latter loses 4 mols. of water and forms  $[\text{IrCl}(\text{NH}_3)_3\text{Py}_2]\text{Cl}_2$ , which does not ppt.  $\text{K}_4\text{Fe}(\text{CN})_6$  and  $\text{Na}_4\text{P}_2\text{O}_7$ . The aquo-chloride ppts.  $\text{HgCl}_2$ ,  $\text{HgBr}_2$ ,  $\text{K}_2\text{HgI}_4$ ,  $\text{K}_2\text{Cr}_2\text{O}_7$ , picric acid, tannin and concd. solns. of KBr and KI. Heating of [III]-[II]<sub>3</sub>·6H<sub>2</sub>O for 36 hrs. with 12 times its wt. of  $\text{NH}_3$ , d. = 0.92, gave  $[\text{IrCl}(\text{NH}_3)_3\text{Py}_2]\text{Cl}_3 \cdot 2\text{H}_2\text{O}$ , which D. had previously obtained (+4H<sub>2</sub>O) by the action of cold  $\text{NH}_3$  on  $[\text{Ir}^{\text{IV}}\text{Py}_2]\text{Cl}_2$ . These results demonstrate the extraordinary tenacity of the Ir-Py union. I. M. LEVINE

RUDZIK, WALTHER: *Repetitorium der anorganischen Chemie*. Marburg-Lahn Selbstverlag. 136 pp. M. 5.

## 7—ANALYTICAL CHEMISTRY

W. T. HALL

The accuracy of titrations, the critical concentrations of buret solutions and the sensitiveness of indicators. HERMANN RUOSS. *Z. anal. Chem.* **77**, 175-85(1929).—A mathematical discussion of the limits of the accuracy of titrations in acidimetry and alkalimetry. W. T. H.

Simple arrangement for electrometric titrations. ALFRED UHL. *Z. anal. Chem.* **77**, 280-3(1929).—The app. is very simple but is best understood by reference to the cut in the original article. It consists of a tube which is closed at the end with filter paper that has been wet with satd. KCl soln. On top of this is agar-agar jelly and then the comparative soln., which can be a previously titrated soln. At the bottom of the tube; on the outside is fused a strip of Pt; electrical connection is made so that this strip forms one electrode and Pt resting in the comparative soln. is the other. The app. is relatively inexpensive and can be used for acidimetric or oxidimetric titrations. W. T. H.

Iodo-oxidimetric determinations. ALFRED SCHWICKER. *Z. anal. Chem.* **77**, 161-9(1929).— $\text{H}_2\text{SO}_5$  can be titrated directly with  $\text{KIO}_3$  soln. and vice versa. When 3  $\text{H}_2\text{SO}_5$  are present to 1  $\text{KIO}_3$ , the reduction is to colorless  $\text{I}^-$ , but when more  $\text{KIO}_3$  is present,  $\text{I}_2$  is formed. In all cases the oxidation is to  $\text{SO}_4^{--}$ . The reaction can be used for the analysis of substances such as hydrazine, ferrocyanides, thiocyanates, arsenites and antimonous compds.; in every case an excess of  $\text{KH}(\text{IO}_3)_2$  soln. is added to the acid soln. of the reducer and the excess titrated with 0.1 N  $\text{KHSO}_5$  soln. contg. 5-10% of alc. to stabilize it. Toward the end starch is added. The oxidation of

the hydrazine is to  $N_2$ , of the  $Fe(CN)_6^{4-}$  to  $Fe(CN)_6^{3-}$ , of  $CNS^-$  to  $HCN$  and  $H_2SO_4$  of  $As^{+++}$  to  $AsO_4^{3-}$  and of  $Sb^{+++}$  to  $SbO_4^{3-}$ . W. T. H.

Two new reversible oxidimetric indicators and the manganometric determination of hydroferrocyanic acid. J. KNOP. *Z. anal. Chem.* 77, 111–25(1929).—Because of the deep brown color of ferricyanide anions it is difficult to detect the end point in the titration of  $Fe(CN)_6^{4-}$  with  $KMnO_4$ . Diphenylamine, useful in  $K_2Cr_2O_7$  titrations, shows a color change only after the end point has been considerably passed. Indigo-sulfonic acid, which is oxidized to yellow isatinsulfonic acid, also shows a color change somewhat too late. In the series of triphenylmethane dyes, however, *Erioglaurin A* and *Eriogrün*, prepd. by Geigy of Basel, are 2 reversible indicators, which are very sensitive to traces of permanganate but cannot be used in dichromate titrations. The former dyestuff dissolves easily in water, forming a blue soln. The addn. of mineral acid causes the formation of some yellow salt and the soln. becomes green. A trace of  $KMnO_4$  changes the green soln. to a bluish red. At the exact end point the color is pale gray. The second indicator gives a bluish green soln. in water, which becomes a deep yellow upon the addn. of acid; a trace of  $MnO_4^-$  changes the color to orange-yellow. The first indicator is more sensitive than the second. With the help of either, the end point in the titration of ferrocyanide with  $KMnO_4$  can be detd. within 1 drop of 0.05 N soln. The following procedure is recommended: To not over 1 g. of ferrocyanide, add 20 cc. of 8 N  $H_2SO_4$  or HCl and 400 cc. of water. Add 1 cc. of 0.1% aq. soln. of *Erioglaurin A* or 2 cc. of *Eriogrün* soln. of the same concn. and titrate with 0.05 N  $KMnO_4$ . In HCl solns. the less sensitive indicator works better. There is, contrary to the statement of Kessler, a slight induced oxidation of the HCl just as in the titration of HCl solns. of  $Fe^{++}$ , so that the end point does not last long. Other dyestuffs of the triphenylmethane series can also be used, 10 of these being mentioned. W. T. H.

Permanganate titrations of iron with *Erioglaurin A* (G) and with *Eriogrün B* (G) as indicators. J. KNOP AND O. KUBELKOVA. *Z. anal. Chem.* 77, 125–30(1929).—By use of the indicators explained in the preceding abstr., excellent results were obtained in the  $KMnO_4$  titration of  $Fe^{++}$  in Mohr's salt. With samples contg. only 1 mg. of Fe and by use of 0.005 N  $KMnO_4$ , results were obtained accurate to 0.5% of the truth. W. T. H.

Titration of potassium ferrocyanide with diphenylamine as internal indicator. I. M. KOLTHOFF. *Chem. Weekblad* 26, 298–301(1929); cf. C. A. 21, 2238 and 23, 1839.—To 50 cc.  $\frac{1}{40}$  mol.  $K_4FeCy_6$  are added 1 to 4 drops 1% diphenylamine (in concd.  $H_2SO_4$ ), 1 to 5 drops 1%  $K_3FeCy_6$  soln., 10 to 20 cc. 4 N  $H_2SO_4$ . The titration is done with 0.05 mol.  $ZnSO_4$  soln. The color changes from yellow, over grayish, to blue-violet. Excess can be back-titrated with ferrocyanide. The Zn soln. is standardized with pure  $K_4FeCy_6$ . The soln. of  $K_4FeCy_6$  is stabilized by the addn. of 1 g.  $Na_2CO_3$  per l. When substances with reducing action are present 2 to 4 cc. 4 N NaOH and 10 cc. 0.1 N  $Br_2$  soln. are added to 25 to 50 cc. cyanide soln. After the oxidation is finished 10 cc. 0.1 N  $As_2O_3$  is added. In 15 to 30 min. the soln. becomes colorless and is acidified with 10–15 cc. 4 N  $H_2SO_4$  and titrated as above. E. SCHORRE.

Spot analysis. W. P. MALITZKY. *Mikrochem.* 6, 157–60(1928).—A reply to Feigl (C. A. 22, 3599). B. C. A.

Microanalysis and technical methods of investigation. R. LUCAS AND F. GRASSNER. *Mikrochem.* 6, 116–32(1928).—A description of the application of microanalytical methods to technical problems with special reference to the detn. of S, halogens, C, H, N and P in org. materials, to electroanalysis and colorimetric methods. B. C. A.

Sensitive spot reaction for fluoride. F. PAVELKA. *Mikrochem.* 6, 149–51(1928).—The method depends on the fact that the color of a Zr alizarin lake is destroyed by HF. The test-papers are prepd. by moistening filter paper with a soln. of basic Zr chloride to which an excess of an alc. soln. of alizarin has been added. The dried papers are moistened with a drop of 50% AcOH and a drop of the suspected soln. is added. In presence of 0.01 mg. of F a yellow stain appears on the originally red paper. Sulfates, oxalates and phosphates interfere. With insol. fluorides the powd. material is shaken with 5 cc. of dilute HCl contg. 0.5–1.0 g. of borax and a drop of the resulting mixt. taken for the test. About 0.06 mg. of  $CaF_2$  may be detected thus. Alternatively, the fluoride may be treated with silica and  $H_2SO_4$  and the moistened test-paper held in the vapors. B. C. A.

A microchemical color test for sulfur. E. GRÜNSTEIDL. *Z. anal. Chem.* 77, 283–4(1929).—The method depends upon the conversion of the S to  $CNS^-$  and the color developed with very dil.  $FeCl_3$ . Details are given for carrying out the test upon a slide under the microscope. W. T. H.

Determination of sulfur in unalloyed steel, alloyed steel, cast iron and ferrous

alloys by combustion in a stream of oxygen. KARL SWOBODA. *Z. anal. Chem.* 77, 269-77(1929).—The app. is the same as that used for the direct combustion of steel, but the O before entering the furnace should pass through  $\text{KMnO}_4$  soln. (40 g. per l.) or 2.5%  $\text{AgNO}_3$  soln., then through concd.  $\text{H}_2\text{SO}_4$ , through a tube contg. solid NaOH and finally through a  $\text{CaCl}_2$  tube. A temp. of 1150–1200° suffices except for high-speed steel, which requires 1300° for complete combustion. Use 1.0 g. of material and pass the gas from the furnace into 2.5%  $\text{AgNO}_3$  soln. or through 3%  $\text{H}_2\text{O}_2$  soln. The formation of  $\text{Ag}_2\text{SO}_4$  in the absorption tube indicates the approx. quantity of S present. After the combustion is complete, continue passing O through the app. for 3–6 min. to expel all  $\text{CO}_2$  from the absorbent. Then rinse the soln. into a flask with  $\text{CO}_2$ -free water and titrate with 0.005 N NaOH using methyl red as indicator. A pale yellow color is obtained at the end point. The  $\text{AgNO}_3$  soln. must be neutral to methyl red. W. T. H.

Determination of sulfur in galena and in metallic lead. H. LEVSAHT. *Z. anal. Chem.* 77, 209–13(1929).—By heating 0.15–0.21-g. samples of PbS and 2 g. of pure Zn with HBr, d. 1.49, the S was all obtained as  $\text{H}_2\text{S}$ , which could be caught in  $\text{Cd}(\text{OAc})_2$  soln.; the S was detd. iodometrically. W. T. H.

Nephelometric determination of barium sulfate. J. KĀPELKA AND A. KALINA. *Chem. Listy* 22, 545–50(1928).—At concns. of 0.3–1.0 mg. Ba per l. the mean error of nephelometric detns. of sulfate is 0.5%. The suspension should not be kept longer than 30 min. after prepn.; the addn. of glycerol to 10% by vol. greatly augments the stability of these suspensions. The limiting percentage concns. of other salts which may be present without affecting the accuracy of this method are: Na 0.15, H 0.30, Mg 0.003, Zn or Cd 0.006, Hg 0.04 and  $\text{AlCl}_3$  0.002. All these ions, with the exception of Mg, provoke coagulation of the suspension at higher concns. than the above, leading to excessively high results, while Mg has a protective influence, so that the results are low. B. C. A.

The determination of calcium by the methods of Clark and deWaard with proposed modifications and a comparison of results obtained by both methods. G. F. M. J. BĀR. *Endokrinologie* 1, 90–9(1928). S. MORCULIS

The errors in the dry assay for gold and silver, as seen from the scientific standpoint and their remedy. MIKIO KUBARA. *Japan. J. Mining* 45, 13–7(1929).—The fact that the actual yields of Ag and Au in the dry smelting of sulfide ores are usually higher than indicated by fire assay is attributed to the decompn. of Au silicate during smelting by strong base. To overcome this error, K. recommends adding to the assay charge an equimolecular mixt. of  $\text{FeCO}_3$  and  $\text{CaCO}_3$ . According to K. the ordinary roasting of the sulfide ores causes the loss of 4–96% Au and 13–26% Ag, and should be avoided. From the above results K. insists that in smelters where acidic ores are used in a large quantity, the basicity of the slag should be carefully regulated. K. SOMEYA

Rapid determination of silicon in iron-silicon alloys by density measurements. W. DENECKE. *Giesserei-Ztg.* 25, 304–6(1928).—Schlumberger's method is applied to Fe-Si alloys contg. smaller percentages of Si,  $\text{C}_2\text{H}_6$  being used as volumeter liquid. Alloys contg. less than 21% Si gave a remarkable distribution of results. B. C. A.

The use of tantalum as cathode for the electrodeposition of copper. LESTER W. STROCK AND HIRAM S. LUKENS. *Trans. Am. Electrochem. Soc.* 56 (preprint) 9 pp. (1929).—Details of procedure are given. C. G. F.

Method for the rapid detection of tungsten in ores. A. PETROVSKII. *Z. anal. Chem.* 77, 268–9(1929).—Treat 0.1–0.2 g. of the powder with a small piece of Pb and heat 1–2 min. with concd. HCl. If W is present a blue color will develop. On adding 10–15 cc. of water a volatile blue ppt. is formed. If very little W is present or the reduction is carried further, the ppt. is green or brown. If the water is not added after the boiling with HCl, a bluish red soln. is obtained; when the HCl is evapd. off, a blue  $\text{W}_2\text{O}_8$  ppt. is formed and the soln. is yellow with  $\text{WO}_3$ . This test will serve to detect 0.5% of W in an ore. Ti, V, Nb and Mo interfere by giving similar colors upon reduction, but Nb is the only one that gives first a blue and then a brown color. The Nb blue, however, is not as deep and disappears upon addn. of water. W. T. H.

Determination of vanadium in steel. J. KASSLER. *Z. anal. Chem.* 77, 290–8 (1929).—Heat 3.75 g. of steel in a 300-cc. Erlenmeyer flask with 40 cc. of 6 N  $\text{H}_2\text{SO}_4$ . As soon as the evolution of H slackens, stopper the flask with a Contat or Gockel valve contg.  $\text{NaHCO}_3$  soln. Continue heating until all the metal has been attacked and the Fe is practically all in soln. as  $\text{FeSO}_4$ . Remove the valve, dil. with 100 cc. of water and add an aq. suspension of ZnO in small portions until an excess is present as shown by the appearance of turbidity. This serves to ppt. the small quantity of V

that went into soln. while the  $\text{Fe}^{++}$  remains in soln. Stopper the flask and shake vigorously for 1 min. Cool quickly, filter promptly and wash 2–3 times with cold water. There is a slight oxidation of the  $\text{Fe}^{++}$ , but if the manipulation has been correct, not more than 0.25 g. of  $\text{Fe}^{+++}$  at the very most will be found in the ppt. which will contain all of the V. By means of  $\text{ZnO}$ , therefore, a fairly good sepn. of V and Fe can be accomplished. Place the filter in a beaker, add 100 cc. of hot, 6 N HCl and after about 10 min. action at  $90^\circ$  boil gently and oxidize with 10 cc. of concd.  $\text{HNO}_3$ . Allow the hot soln. to stand for about 10 min. to permit the complete oxidation of the W. Filter and wash with hot, dil. HCl. The V in this  $\text{WO}_3$  ppt. is best detd. colorimetrically. To accomplish this, rinse off the  $\text{WO}_3$  from the filter, dissolve it in NaOH soln., add  $\text{H}_2\text{O}_2$  and considerable  $\text{H}_2\text{SO}_4$ . Compare the color with that of a known V soln. treated similarly. If the  $\text{WO}_3$  contained enough Fe to cause a little difference in shade, this difficulty can be overcome in the colorimetric comparison by adding a few cc. of 2%  $\text{FeCl}_3$  to the standard V soln. Take the filtrate from the  $\text{WO}_3$  ppt., which contains almost all of the V, and nearly neutralize with NaOH soln. Add 10 cc. of 3%  $\text{H}_2\text{O}_2$  to oxidize any quadrivalent V and boil 5 min. to remove the excess peroxide. In the case of unalloyed and lightly alloyed steels, add 1 g. of  $\text{FeCl}_3$  to make sure that the Cr is completely pptd. by the next treatment. Pour the clear, hot soln. in a thin stream into 130 cc. of hot, 30% NaOH contained in a porcelain dish. Boil, transfer to a 500 cc. measuring flask, cool, make up to the mark, mix and filter through a hardened filter. Take 400 cc. of the filtrate (3 g. of the steel) in a liter flask, make slightly acid with concd. HCl, boil off the  $\text{CO}_2$  and add 20 g. of  $\text{NH}_4\text{Cl}$ . Neutralize with concd.  $\text{NH}_4\text{OH}$ , add 25 cc. in excess and ppt. the V by adding a soln. of 10 g.  $\text{MnCl}_2$  and 5 g. of  $\text{NH}_4\text{Cl}$  in 50 cc. of water. Boil half a min., cool and filter. Wash the flask and filter with 3 portions of cold water. Place the same flask under the filter and dissolve the  $\text{MnNH}_4\text{VO}_4$  ppt. in 50 cc. of hot, 6 N  $\text{H}_2\text{SO}_4$  contg. 5 cc. of 3%  $\text{H}_2\text{O}_2$ . Boil the soln. to remove excess peroxide, oxidize the last traces with a little  $\text{KMnO}_4$ , reduce the V with  $\text{SO}_2$  in the usual way and finally titrate at  $60^\circ$  with  $\text{KMnO}_4$  after removing the excess  $\text{SO}_2$  with  $\text{CO}_2$ . Test analyses were made by adding  $\text{V}_2\text{O}_5$  to solns. of steel; the results were very good.

W. T. H.

Dilatometric analysis of some non-metallic substances: minerals, rocks and industrial products. A. PORTEVIN AND P. CHEVENARD. *Chimie & industrie* Special No., 343–53 (Feb., 1929).—Expansion curves obtained by means of the Chevenard differential recording dilatometer (C. A. 11, 2743) at various temps. up to about  $1100^\circ$ , with quartz, topaz, orthite, feldspar from Saint-Yrieix, magnetite, siderite, wolframite, pyrolusite, chromite, pyrites, fused  $\text{MgO}$ , hornblende granite, mica shale from Mount Blanc, black mica granite from Calvados, basalt, fine-grained limestone (used as flux in steel making), enamel for crockery ware, refractory clay brick and fused basalt are given and discussed.

A. PAPINEAU-COUTURE

Determination of chromic anhydride in chromites. B. LOGINOV. *J. Chem. Ind. (Moscow)* 6, 430–1 (1929).—Fuse 0.2 g. of chromite for 4 min. with excess  $\text{Na}_2\text{O}_2$  in a glass test tube. Otherwise the procedure is conventional. BERNARD NELSON

Note on the detection of phosphoric acid by means of ammonium molybdate and benzidine. F. FEIGL. *Z. anal. Chem.* 77, 299–300 (1929).—To avoid interference by sol silicates or borates it is now recommended to carry out the test as follows: Place a drop of the soln. to be tested on a filter paper and add 1 drop of  $(\text{NH}_4)_2\text{MoO}_4$  soln. contg. 15% of tartaric acid. Add 1 drop of benzidine and hold the paper over an open ammonia bottle. When the molybdate soln. contains tartaric acid, it is possible to detect 0.0015 mg. of  $\text{P}_2\text{O}_5$  in the drop by the blue color even when considerable arsenite, borate or sol. silicate is present.

W. T. H.

Detection of phosphoric acid in minerals and rocks. H. LEITMEIER. *Mikrochem.* 6, 144–8 (1928).—The sensitive phosphomolybdic acid-benzidine reaction may be applied to the detection of phosphates in minerals, etc. A little of the powd. material on a filter-paper or a scratch on a porcelain plate is treated in the manner described (Feigl, C. A. 22, 4082). The localization of phosphates in minerals may be detd. by pressing a filter paper moistened with nitric acid-molybdate soln. against a section. This paper is then brought into contact with a second paper moistened with benzidine soln. and finally held in  $\text{NH}_3$  vapor. The blue regions correspond with the positions of the phosphatic constituents.

B. C. A.

Iodometric determination of thiocyanate. ALFRED SCHWICKER. *Z. anal. Chem.* 77, 278–80 (1929).—By using a soln. of  $(\text{NH}_4)_2\text{BO}_3$  as neutralizer, the reaction  $\text{CNS}^- + 3\text{I}_2 + 4\text{H}_2\text{O} \rightarrow \text{SO}_4^{--} + 6\text{I}^- + \text{HCN} + 7\text{H}^+$  will proceed to completion within a few min. and the excess I can be titrated with thiosulfate. To 50 cc. of 0.1 N I soln. add 10–30 cc. of thiocyanate soln. (corresponding to 0.5–3 milli-equiv. of I). After

2 min., add 20 cc. of  $(\text{NH}_4)_2\text{BO}_3$  soln. (prepd. by dissolving 20 g. of  $\text{H}_3\text{BO}_3$  in 170 cc. of 6 N  $\text{NH}_4\text{OH}$  and dilg. to 1 l.) and titrate with  $\text{Na}_2\text{S}_2\text{O}_3$  soln. W. T. H.

Some convenient methods for the analysis of galvanizing and tin-plating materials. C. HOPKINS. *Sheet Metal Ind.* 2, 137-8, 179-80(1928); *J. Inst. Metals* 40, 587—Details are given for the detn. of Pb (by the molybdate method), Fe, Cu, Cd and Sn in spelter used for galvanizing, of moisture,  $\text{NH}_4\text{Cl}$  and Fe in galvanizing flux, and of Zn and Cl in flux skimmings, for the analysis of Zn ashes, Sn dross, flue-dust, tinning flux ( $\text{ZnCl}_2$  soln.) and palm-oil, and for the detn. of the amt. of Zn or Sn in galvanized or tinned plates. H. L. D.

Analysis of a lead-barium-calcium alloy with lead as chief constituent. KUMAO TANIYAMA. Tokyo Imp. Univ. *Japan J. Mining* 44, 1004-17(1928).—The method recommended involves the soln. of the alloy in  $\text{HNO}_3$ , electrolytic sepn. of Pb as  $\text{PbO}_2$ , pptn. of the Ba as  $\text{BaCrO}_4$  and of Ca as  $\text{CaC}_2\text{O}_4$ . K. SOMEYA

Decomposition of silicates by strontium salts for the determination of alkali metals. J. KAVINA. *Chem. Listy* 22, 289-94(1928); cf. *C. A.* 23, 1592.— $\text{SrCO}_3$  can be substituted for  $\text{CaCO}_3$  in the J. Lawrence Smith method. W. T. H.

Electrometric determination of small quantities of lead ion. HORACE MILLER. *Trans. Faraday Soc.* 25, 147-52(1929).—A study was made of the electrochem. behavior of Pb in neutral and acid solns. of Pb salts at  $25^\circ$ . A Pb electrode prepd. by electro-depositon of Pb upon Pt in the presence of gelatin functions well in neutral solns. of low Pb ion concns., but less satisfactorily in acid solns. With a Pb amalgam as electrode, very small concns. of Pb may be detd. in acid soln. provided  $\text{O}$  and  $\text{CO}_2$  be excluded. The Pb electrode functions best in solns. of high ionic strength. The observed activity coeffs. of Pb ion may be expressed by a modified Debye-Hückel equation. L. B. MILLER

New analytical determination of the sulfate ion. D. KÖSZEGI. *Z. anal. Chem.* 77, 203-9(1929).—The following modification of the well-known chromate method is proposed: To the hot slightly acid soln. of not over 0.1 g. of sulfate, add an excess of 0.1 N  $\text{BaCl}_2$  corresponding to about 0.25 milli-mol. of Ba. Boil 5 min., add 5-6 g. of  $\text{NaOAc}$  and 20-25 cc. of 0.1 N  $\text{K}_2\text{Cr}_2\text{O}_7$ . Then cool the contents of the flask, make up to exactly 200 cc., mix and filter. In 100 cc. of the filtrate det. the excess  $\text{Cr}_2\text{O}_7^{--}$  by adding 1 g. of KI, 10 cc. of concd.  $\text{HCl}$  and 0.1 N  $\text{Na}_2\text{S}_2\text{O}_3$  to the starch end point. W. T. H.

Methone as aldehyde reagent. D. VORLÄNDER. *Z. anal. Chem.* 77, 241-68(1929).—Methone (5,5-dimethylresorcinol) as a test for the carbonyl group has the advantage that it does not react at all with ketones in aq.-alc. solns. In this paper, the results obtained with methone and some 50 aldehydes are described and the ultimate analysis of the methone-aldehyde compds. agreed closely with the theoretical values. W. T. H.

Some reactions of the primary arsines. S. S. NAMETKIN AND VASEVOLOD NEKRASOV. *Z. anal. Chem.* 77, 285-9(1929).—Expts. with methylchloroarsine, ethylchloroarsine,  $\beta$ -chlorovinylchloroarsine and phenylchloroarsine showed that when 1 cc. of 0.1% aq. soln. was treated with 2-3 drops of satd.  $\text{H}_2\text{S}$  water a distinct turbidity was formed by the reaction  $\text{RASCl}_2 + \text{H}_2\text{S} = 2\text{HCl} + \text{RAS}$ . The test was less satisfactory in alc. solns. Tests with some 8 different salt solns. failed to give any means of characterizing the above substituted arsines but with  $\text{HgNO}_3$  soln it was found that the first of the above-mentioned compds. gave a dark gray ppt. contg. metallic Hg, the second gave a white ppt. which turned gray within a few secs., the third gave a white ppt. which turned gray in 12 hr. and the fourth was not oxidized by the  $\text{HgNO}_3$  even after long standing, giving a white ppt. only. If the soln. is heated, however, even the last ppt. is oxidized by the  $\text{HgNO}_3$  soln. and free Hg is formed. This test with  $\text{HgNO}_3$  is less sensitive than the  $\text{H}_2\text{S}$  test but can be used for the differentiation of these substances. W. T. H.

Quantitative examination of mixtures of benzene, benzene and alcohol. AUG. NOLL. *Chem. tech. Fabrik.* 26, 65-7, 69-70(1929).—An exptl. series of known mixts. of benzene, benzene and alc. was analyzed by treating with varying amts. of sulfonating acids, which led to a quant. method. The presence of alc. is first detected by treating a few cc. of the sample with a small quantity of benzoic acid and a few drops of concd.  $\text{H}_2\text{SO}_4$ ; on heating, the presence of alc. is shown by the characteristic odor of benzoic ethyl ester. Benzene is detected by gently warming the sample with a 1:2  $\text{HNO}_3$ - $\text{H}_2\text{SO}_4$  mixt. and noting the oil of bitter almond odor of nitrobenzene. Quantitative — To 10 cc. of the sample in a flask with a graduated neck add  $\text{CaCl}_2$  soln., d. 1.3, and shake frequently during 15 min.; fill to the mark with  $\text{CaCl}_2$  soln. and read off the resulting contraction in vol. due to alc. and its accompanying  $\text{H}_2\text{O}$ . To det. the % abs. alc.

add to 100 cc. of the sample in a separatory funnel 100 cc. of the  $\text{CaCl}_2$  soln. and shake well. When sepn. is clear, draw off  $\text{CaCl}_2$  soln. and repeat the treatment; unite the 2  $\text{CaCl}_2$  solns., distil 100 cc. and det. the sp. gr. of the distillate to find % of abs. alc. To find % benzene, dry the hydrocarbons left in the separatory funnel with ignited  $\text{Na}_2\text{SO}_4$ , filter, and shake 10 cc. of the filtrate with 50 cc. of " $\text{H}_2\text{SO}_4$ -oleum" mixt. (80 vol.  $\text{H}_2\text{SO}_4$  plus 20 vols. oleum of 20%), fill to mark with concd.  $\text{H}_2\text{SO}_4$ , allow to settle 1 hr. and note reading; the % compn. of the original mixt. can be calcd. from the data found. P. ESCHER

**The determination of aldoses.** F. PIRRONI AND L. IRRERA. *L'industria chimica* 4, 105-6(1929).—The basis of the method is the reaction  $\text{R}\cdot\text{CHO} + \text{I}_2 + \text{H}_2\text{O} = \text{R}\cdot\text{COOH} + 2\text{HI}$ , which takes place in alk. soln. Into a 150-cc. stoppered bottle place 20 cc. of 0.1  $N$   $\text{I}_2$  soln. and 30 cc. of 10%  $\text{Na}_2\text{CO}_3$  soln. Cool to  $0-1^\circ$  and then add 10 cc. of 1% aldose soln. Keep  $2\frac{1}{2}$  hr. at  $0-1^\circ$ . Then add 5 cc. of 2  $N$   $\text{HCl}$  and titrate the excess  $\text{I}_2$  with 0.1  $N$   $\text{Na}_2\text{S}_2\text{O}_3$ . This method has been found satisfactory with erythrose, rhamnose, apiose, glucose and mannose. A. W. CONTIERI

**Determination and characterization of allantoin.** R. FOSSE AND MILLE. V. BOSTYK. *Compt. rend.* 188, 106-9(1929).—Allantoin is hydrolyzed in acid media to give glyoxylic acid (1 mol.) and carbamide (2 mols.). Allantoin may be detected by heating the sample, slightly acidified with  $\text{HCl}$ , for 1 min. at  $100^\circ$  and adding 1% phenylhydrazine- $\text{HCl}$  (4 drops), followed, after cooling, by 5%  $\text{K}_3\text{Fe}(\text{CN})_6$  (2 drops) and concd.  $\text{HCl}$  (1.5 cc.). An immediate red coloration indicates allantoin. B. C. A.

**Sources of error in organic microelementary analysis. II. Determination of carbon and hydrogen.** F. BÖCK AND K. BRAUCOURT. *Mikrochem.* 6, 133-43(1928); cf. Friedrich, *C. A.* 23, 1840; 18, 29.—A critical discussion. Errors due to the presence of C and H compds. in the O, etc., used and impurities given off by rubber connections may be avoided by the insertion of a platinized asbestos catalyst followed by a bubbler and absorption vessel in front of the combustion tube. B. C. A.

**Bromometric determination of phenol and of the cresols.** HUGO DITZ. *Z. anal. Chem.* 77, 202(1929).—Järvinen has recently claimed that all the older methods for the examn. of substances like lysol are unsatisfactory but it is pointed out in this paper at considerable length that J. has merely utilized principles involved in methods previously published by D. and his collaborators and, moreover, the procedure advocated is subject to some criticism. W. T. H.

**Separation and determination of ortho- and pyrophosphoric acids.** W. STOLLENWERK AND A. BAURLE. *Z. anal. Chem.* 77, 81-111(1929).—Pyrophosphates apparently exist in isomeric forms. The soly. in water changes with the duration of heating and by contact with a liquid which does not dissolve the salt. The d. of the sample changes also. Thus, a sample of  $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7$  showed a d. of 2.33 when freshly prepd. and of 2.59 after standing 6 months in contact with xylene. Methods described in the literature for sepg.  $\text{H}_4\text{P}_2\text{O}_7$  from  $\text{H}_3\text{PO}_4$  based on the different solubilities of Ag, Cu, alk. earth, Mg, Be, Al and Pb salts were tested and it was found that the use of alk. earth ions alone permitted a satisfactory sepn. To carry out an analysis it is necessary to make sure that the precipitant ( $\text{Ba}(\text{OH})_2$ ) is protected from the  $\text{CO}_2$  in the air. This is accomplished by the usual soda-lime tube. The reagent should flow into a buret, which is likewise protected, and the buret should lead directly into a stoppered flask through a Y-tube, the open end of which can also be connected to a soda-lime tube. For the detn. of  $\text{NaH}_2\text{PO}_4$ ,  $\text{Na}_2\text{HPO}_4$ ,  $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7$  or  $\text{Na}_4\text{P}_2\text{O}_7$  alone, dissolve 1 g. of the salt in 200 cc. of water and mix well. Take 10-25 cc. of the soln. and dil. to 50 cc. Heat to boiling and add a measured vol. of 0.25  $N$   $\text{Ba}(\text{OH})_2$  soln. (50-200 cc.). Cool out of contact with  $\text{CO}_2$ , make up to exactly 200 cc., mix and allow to stand overnight. Take 100 cc. of the supernatant, clear soln. and det. the excess Ba as  $\text{BaSO}_4$ . The ppt. formed will be  $\text{Ba}_3(\text{PO}_4)_2$  with an orthophosphate and  $\text{Ba}_2\text{P}_2\text{O}_7$  with a pyrophosphate. Or, the excess Ba can be detd. by titration. For the detn. of phosphate and pyrophosphate in the presence of one another, first det. the quantity of Ba required to react with both, by adding a measured vol. of  $\text{Ba}(\text{OH})_2$  soln. and detg. the excess as  $\text{BaSO}_4$ . Then, in another sample, det. the total  $\text{P}_2\text{O}_5$  by v. Knorre's method, which consists in adding  $\text{CaCl}_2$  to the neutral soln. and then titrating with  $\text{Ba}(\text{OH})_2$ , phenolphthalein being used as indicator. Best results are obtained when the  $\text{CaCl}_2$  treatment is made at  $80^\circ$ . From these data the quantities of the 2 phosphates can be computed in the usual way. W. T. H.

Action of  $\text{BrCN}$  and  $\text{HCN}$  on  $\text{TiBr}_4$  (OBERHAUSER, SCHORMÜLLER) 6. The determination of N by the Kjeldahl method as applied to dyestuffs and intermediate products (SISLEY, DAVID) 25. Recovery of Pt (HOUGHT) 6.

WATTERSON, N. F.: **Elementary Qualitative and Volumetric Analysis.** London: Cambridge Univ. 69 pp. 2s. 6d.

## 8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHAIKER

**Optical properties of some artificial minerals.** P. GAUBERT. *Bull. soc. franç. minéral.* 50, 504-15(1927).—Values of  $n_D$  for various artificial minerals are:  $MgAl_2O_4$  (colored red by Cr or blue by Co) 1.721; *gahnite*,  $ZnAl_2O_4$  (colored red by Cr), 1.80; corundum,  $Al_2O_3$ ,  $\omega$  1.7689,  $\epsilon$  1.7609,  $d$  3.988;  $3Ca_3(PO_4)_2$ ,  $CaCl_2$ ,  $\omega$  1.642,  $\epsilon$  1.637;  $3Sr_3(PO_4)_2$ ,  $SrCl_2$ ,  $\omega$  1.658,  $\epsilon$  1.664;  $3Ba_3(AsO_4)_2$ ,  $BaCl_2$ ,  $\omega$  2.14,  $\epsilon$  2.13; *monetite*,  $CaHPO_4$ ,  $n_\alpha$  1.623,  $n_\gamma$  1.604,  $d$  2.928 (trigonal); rhombic  $SrHPO_4$ ,  $n_\alpha$  1.625,  $n_\gamma$  1.608,  $BaHPO_4$ ,  $n_\alpha$  1.635,  $n_\gamma$  1.617; *iron-leucite* 1.619,  $d$  2.59; *K silicoberyllate* 1.523,  $d$  2.531; *Na silicoberyllate*,  $Na_2B_6Si_4O_{37}$ , 1.545-1.532,  $d$  2.552; *Na silicotitanate*,  $Na_4Si_4Ti_2O_{20}$ ,  $n_\alpha$  1.655,  $n_\gamma$  1.623,  $d$  2.88.

**The crystal structure of covellite.** H. S. ROBERTS AND C. J. KSANDA. *Am. J. Sci.* [5], 17, 489-503(1929).—The structure of natural and synthetic covellite as revealed by the spectrometer using the oscillation method and by the x-ray powder method is hexagonal with  $a_0 = 3.802$  A. U.,  $c_0 = 16.43$  A. U., and  $c_0/a_0 = 4.321$ . The unit cell contains 6 Cu atoms and 6 S atoms in Wyckoff's special positions (d) and (f), and (a) and (e) resp. of space group  $D_{6h}^4$ , where  $u_{Cu} = 0.093$  and  $u_S = 0.126$ . No other combinations of special cases in  $D_{6h}^4$  satisfied the test of comparing calculated with observed intensities. The perfect basal cleavage and possible gliding parallel to the base are explained by the assigned structure. H. W. WALKER

**Löllingite from the Hazaribagh district, Bihar and Orissa.** A. L. COULSON. *Records Geol. Survey India* 61, 325(1928).—Three specimens on analysis all showed abundant Fe and As and a little S. The pure löllingite (sp. gr. 7.4) contained a little Sb but no Co or Bi. Of the 2 impure specimens one (sp. gr. 7.05) contained a little Sb and Bi but no Co and the other (sp. gr. 6.55) contained a little Bi but no Sb or Co.

**Leucopyrite from Kodarma.** A. L. COULSON. *Records Geol. Survey India* 61, 206(1928).—Qual. tests showed abundant As, Fe, little S, traces of Sb and no Bi, Co or Ni; sp. gr. = 7.02. The mineral occurs in a mine on the schist foot-wall at a contact with pegmatite. ALDEN H. EMERY

**A zinc spinel from southern India.** W. A. K. CHRISTIE AND A. L. COULSON. *Records Geol. Survey India* 61, 315-7(1928).—A mineral found at Tummalatalapur had the following properties: cleavage indistinct, fracture conchoidal, brittle, hardness 8, sp. gr. 4.55, luster vitreous, color greenish black,  $n_D = 1.802 \pm 0.002$ . It showed on analysis:  $SiO_2$  0.12,  $ZnO$  38.9,  $MnO$  0.52,  $FeO$  4.67,  $Al_2O_3$  54.66,  $Fe_2O_3$  0.81,  $H_2O$  (below  $108^\circ$ ) 0.02,  $H_2O$  (above  $108^\circ$ ) 0.11%. This is a normal *gahnite* with both  $ZnO$  and  $Al_2O_3$  replaced to a small extent by Fe oxides. ALDEN H. EMERY

**Further note on the nomenclature of hollandite.** L. LEIGH FERMOR. *Records Geol. Survey India* 61, 146(1928).—Cf. C. A. 13, 105. ALDEN H. EMERY

**Fine structure of feldspars.** E. SCHIEBOLD. *Trans. Faraday Soc.* 25, 316-20(1929).—See C. A. 23, 1368. E. C. M.

**Mode of occurrence and chemical composition of beryl from Nellore with a note on its industrial and chemical applications.** V. S. SWAMINATHAN. *Trans. Mining Geol. Inst. India* 22, 258-67(1928).—Two new analyses of beryl from the Lakshminarayana and Kubera quarries gave, resp.:  $SiO_2$  67.28, 64.78;  $Al_2O_3$  16.10, 16.56;  $Fe_2O_3$  0.43, 1.99;  $B_2O_3$  13.51, 13.53;  $CaO$  0.48, 0.52;  $Na_2O$  0.64, 0.56;  $Li_2O$  both gave a trace;  $H_2O$  1.60, 2.10; totals 100.04, 100.04%. No new industrial applications are given. J. F. SCHAIKER

**Structural relation between beryl and cordierite.** B. GOSSNER. *Centr. Mineral. Geol.* 1928A, 204-7.—Cordierite has  $a$  9.78,  $b$  17.1,  $c$  9.33 A. U. with 4 mols. of  $Mg_3Si_2O_{12} \cdot 2Al_2O_3$  in the unit cell. The structure is compared with that of beryl. B. C. A.

**Crystal structure of zircon.** L. VEGARD. *Z. Krist.* 67, 482-4(1928).—Polemic (cf. Wyckoff and Hendricks, C. A. 22, 2125). B. C. A.

**Betafite from Sludianka, E. Siberia.** G. CHERNIK. *Bull. soc. franç. minéral.* 50, 485-9(1927).—Betafite, black octahedra, often combined with dodecahedra,  $d$  4.82-4.93, contained:  $MgO$  0.13,  $CaO$  3.93,  $PbO$  0.10,  $MnO$  0.15,  $FeO$  1.20,  $Fe_2O_3$  2.25,  $Al_2O_3$  0.24, Ce earths 1.61, Y earths 13.11,  $UO_3$  26.37,  $ThO_2$  1.30,  $SnO_2$  0.37,  $TiO_2$  16.51,  $SiO_2$  0.59,  $Cb_2O_5$  37.36,  $Ta_2O_5$  1.46,  $H_2O$  2.47%. B. C. A.

The composition and nomenclature of chlorophaeite and palagonite, and the chlorophaeite series. L. LEIGH FERMOR. *Records Geol. Survey India* 60, 411-30 (1928); cf. C. A. 20, 1197, 3414.—Chlorophaeite is a gel-mineral of compn. varying within the limits of the general formula  $2\frac{1}{2} \text{H}_2\text{O} \cdot 5\text{R}_2\text{O}_3 \cdot 20\text{SiO}_2 + n(\text{RO} \cdot \text{H}_2\text{O}) + (80 - 4n)\text{H}_2\text{O}$ . Four analyses from Nagpur, Edinburgh, Scur Mohr and Giant's Causeway give  $n = 7, 8, 11$  and  $14$ , resp. Sp. gr. and refractive indices (1.47-1.54) increase with  $n$ . Analyses showed:  $\text{SiO}_2$  32.95-36.0,  $\text{Al}_2\text{O}_3$  1.0-10.49,  $\text{Fe}_2\text{O}_3$  11.89-22.8,  $\text{FeO}$  1.63-9.18,  $\text{MnO}$  0.08-0.5,  $\text{CaO}$  2.51-5.15,  $\text{MgO}$  4.75-10.52,  $\text{Na}_2\text{O}$  trace -1.68,  $\text{K}_2\text{O}$  trace -0.36,  $\text{H}_2\text{O}^+$  4.98-9.04 and  $\text{H}_2\text{O}^-$  14.16-27.44%. Palagonite is a chlorophaeite-bearing rock. It can be formed by modification and hydration of sideromelane (basalt-glass). Neotocite has  $n = 16$  and may be regarded as a manganese-chlorophaeite. F. advocates the abolition of the term sideromelane in favor of inclusion of this rock under tachylite.

ALDEN H. EMERY

Helium content and the age of meteorites. FRITZ PANETH, H. GEHLEN and P. J. GÜNTHER. *Z. Elektrochem.* 34, 645-52(1928).—App. for detg. the He content of rocks has been modified to det. that of stony and Fe meteorites. They are dissolved or decompd. by fusion in the absence of air. The relation of Th and U content to He is discussed. Portions of meteorites can be identified by detg. the He content, which varies in meteorites from  $2 \times 10^{-10}$  to  $2 \times 10^{-8}$  cc./g., being greater in the stony ones.

J. F. SCHAIER

A new Indian meteorite: The Lua fall. A. L. COULSON. *Records Geol. Survey India* 61, 318-24(1928).—Four stones with a total recovered wt. of 9240.75 g. are known to have fallen in the region of Lua, Dongia and Dabra about 4 p. m., Sept. 14, 1926. All are fractured fragments except the Lua fall (8632 g.). All exhibit chondritic structure (olivine) with nickel-iron and troilite between the chondri. Fibrous enstatite also occurs.

ALDEN H. EMERY

Operative causes in ore deposition. H. C. BOYDELL. *Bull. Inst. Mining Met.* No. 296, 15-24(1929); cf. C. A. 23, 2395.—A further discussion of the silicification of limestones by the reaction of silica-bearing solns. on  $\text{CaCO}_3$ . J. F. SCHAIER

Deposition of ore in pre-existing limestone caves. R. T. WALKER. *Am. Inst. Mining Met. Eng., Tech. Publ.* No. 154, 43 pp.(1928).—The criteria which serve to characterize and distinguish ore bodies occupying pre-mineral caves in limestone are: (1) the presence of pre-mineral cave-earth, breccia and soln. faces; (2) a pipe-like shape; (3) casual and capricious relationship to pre-mineral fissures; (4) erratic and inconst. course; (5) unusual persistency and continuity of mineralization; and (6) uniformity of cross section.

J. F. SCHAIER

Mineralized volcanic explosion pipes. R. T. WALKER. *Eng. Mining J.* 126, 895-8, 939-42(1926).—A description of the field relations of volcanic explosion pipes and their relation to ore deposition.

J. F. SCHAIER

The influence of old glacial levels on the weathering of the ore deposits of Levico-Vetriolo. RICHARD CANAVAL. *Montan. Rundschau* 19, 643-7(1927).—A geological discussion. Analyses of waters are given, that at Levico-well being the most acid and Fe-rich of the group of As-bearing Fe sulfate waters.

J. F. SCHAIER

An example of the periodic precipitation in contact ore deposits. MANJIRO WATANABE Tôhoku Imp. Univ. *J. Petrology, Mineralogy and Ore Deposits* 1, 76-7(1929).—The occurrence of a structure resembling the periodic pptn. in high temp. ore deposits as in contact ore deposits is very rare and has as yet not been described. W. observed recently that in the Kamioka mine, Gifu Prefecture (Japan), galena and sphalerite are arranged in a manner closely resembling that of the pptn. of  $\text{Ag}_2\text{Cr}_2\text{O}_7$  in a gelatin soln., the intervening space being filled with gray ferruginous pyroxene.

K. SOMEYA

The iron ore deposits of the northern Shan States. J. COGIN BROWN. *Records Geol. Survey India* 61, 180-95(1928).—Descriptive.

ALDEN H. EMERY

Manganese-ore mining by underground methods in the Central Provinces. B. V. MELLON. *Trans. Mining Geol. Inst. India* 23, 80-5(1928).—An av. analysis of the ore from the Balaghat deposit shows Mn 50, P 0.07,  $\text{SiO}_2$  5 and Fe 5%.

J. F. S.

The chromium deposit at Pteri in northern Greece. P. LEPEZ. *Métall. u. Erz* 26, 85-7(1929); cf. C. A. 23, 581.—The geography and geology of the district are briefly described. The ore contains 47-52%  $\text{Cr}_2\text{O}_3$ .

J. BALOZIAN

Gold mining in Outer Mongolia. EDWIN W. MILLS. *Mining J.* (London) 165, 399-402(1929).—At least 19 places have a definitely recorded production from 1901 to 1919 of about \$6,000,000 worth of Au. Probably  $\frac{1}{2}$  more is not reported. Au-quartz veins were opened in 1915 and until 1919 had produced about \$350,000 worth of Au. Accessibility of deposits, raw materials and individual operations are discussed.

ALDEN H. EMERY

Some notes on the tin fields of South-west Africa. O. G. HELDRING. *Mining J.* (London) 161, 371-2, 386-7, 410, 432-3, 460(1928).—The Sn deposits of S. W. Africa lie in a wide belt around the Erongo Mts. A detailed description of their geology is given. The metalliferous deposits are zonally arranged in pegmatite-aplite-quartz veins—oxides and oxy-salts of metalloids such as Sn, W, Fe, Ti, Ta, Ni, etc., in the lowest zone, sulfides and arsenides in the middle, and carbonates in the highest. ALDEN H. EMERY

The genesis of the crystalline magnesite deposits of the Alps. MIHÁLY RÓZSA. *Földtani Közlöny* 55, 385-6(1926); cf. C. A. 20, 1046.—Magnesite, which forms large deposits in Austria, is formed by ascending magnesium hydrocarbonate-bearing solns. The dolomite deposits have a similar origin and are formed by the action of these solns. on limestone ( $\text{CaCO}_3$ ). J. F. SCHAIERER

Barite from the Anantapur district, Madras. A. L. COULSON AND A. K. DEY. *Records Geol. Survey India* 60, 431(1928).—Barite veins (3-11 ft. wide) occur in slates and limestones. The color is white to light green and faint pink; sp. gr. = 4.4.

Barite in Orchha State. A. L. COULSON. *Records Geol. Survey India* 60, 431-2 (1928).—Barite assoc. with equal amts. of quartz and a little chalcocopyrite occurs, as a vein in gneiss. ALDEN H. EMERY

General report for 1927. EDWIN PASCOE. *Records Geol. Survey India* 61, 1-140 (1928).—Among other items, P. describes various occurrences of chalcantite, clay, corundum, garnet, gems, Au, Fe ore, kyanite, limestone, malachite, Mn ore, marble, mica, monazite, petroleum, pyrite, pyrrhotite, ruby, salt, sandstone, sapphire, sillimanite, spinel, tin, etc., in India. ALDEN H. EMERY

The mineral production of India during 1927. L. L. FERMOR. *Records Geol. Survey India* 61, 207-93(1928).—The value of mineral production in India in 1927 (about \$115,000,000) decreased 11.2% from 1926. These minerals in order of importance are coal (about \$35,000,000), petroleum (about \$22,000,000), Mn, Pb, Au, bldg. materials, salt, Ag, mica, Zn, Sn, Fe, Cu, saltpetr, chromite, W ore, ilmenite, jadeite, ruby-sapphire-spinel, clay, magnesite, Ni, Sb-Pb, zircon, steatite, gypsum, monazite, diamonds, bauxite, ocher, amber, refractories, alum, fuller's earth, asbestos, Sb, apatite, barite, corundum, soda, Bi, borax and Cu. The production and economic condition of these minerals are individually discussed in some detail. A. H. E.

The mineral wealth of the Black Hills. JOSEPH P. CONNOLLY AND CLEOPHAS C. O'HARRA. South Dakota School of Mines, *Bull.* No. 16, 13-418(1929). This comprehensive bulletin reviews the mineral productivity of the region to date. The manner in which mineral deposition has taken place is discussed and some of the possibilities of future development are pointed out. E. J. C.

Geological aspects of the formation of coal. CYRIL S. FOX. *Mining J.* (London) 164, 203-4, 237, 246-7; *Colliery Guardian* 138, 2204-6, 2309-11(1929).—Coal is found in India in rocks from the Lower Cambrian to the Upper Pliocene. The richest workable seams are of the Lower Gondwana period and occur in the Damuda Valley where the coal-bearing series (Damuda) is 7000 ft. thick. In the Jharia field, the lowest stage of this series (Barakar) has 18 workable seams totaling 200 ft. of coal. In the upper stage (Raniganj) there are 6 seams of 50 ft. total thickness. In both stages shales usually underlie and sandstones overlie the coal. In Assam and Burma (Pegu) the coal measures occur locally faulted and folded in Tertiary rocks closely associated with petroleum. The 2 are usually present in inverse proportion. In N. W. India, Baluchistan, the Punjab Salt Range and Jammu (Kashmir) workable coal occurs in the Laki stage (Eocene) associated with oil. Indian coals range from the brown lignite of Bikanir to the anthracite of Jammu. A table of 34 analyses of Gondwana coals shows a range in composition of (moisture-free basis): volatile matter 14.1-34.8%, fixed C 48.9-68%, ash 9.0-21.13% and moisture 0.65-11.0%. F. concludes that the variety of coal is indicative of the stage of its maturity. The vitrain of Gondwana coals is strongly coking. Petrographic examn. of thin sections of Indian coals shows them to be completely permeated by a substance of remarkable uniformity. In sections parallel to the bedding this behaves as an isotropic mineral; at right angles it behaves as an uniaxial mineral, giving straight extinction parallel to the lamination. It is probably colloidal matter in a state of strain caused by pressure. F. holds that the fundamental coal substance is a colloid, which when freshly formed has been identical in all coals. It is the product of chemical breakdown of cellulose, lignin and suberin to a common jelly, which by hardening and devolatilization forms vitrain. The quality of the vitrain is a measure of the degree of maturity of the coal. Coalification is due to chem. changes and not to bacterial activity, which must have ceased soon after submergence of the debris. ALDEN H. EMERY

**The chemistry of coal.** RICHARD BRUNNER. *Z. oesterr. Ver. Gas- u. Wasserfach.* 68, 211-21 (1928).—The theories on the formation of coal from plant and animal residues and the chem. changes probably involved are outlined. Several diagrams illustrate possible successive changes: of cellulose and lignin to form humic acids and humus coal; of waxes and resins to form polymerized furane and benzol compds.; and of lignins to produce methoxy and phenolic substances. The work of many investigators on the chemistry of coal is reviewed, especially extn. expts. on coals, action of chem. reagents and of heat on coals. The essential differences in compn. and in extn. products obtained from peat, brown coals, lump coal and anthracite are given and their significance is discussed. W. W. HODGE

**Pyritic oxidation—Ravine seam.** H. MACPHERSON, N. SIMPKIN AND S. V. WILD. *Safety in Mines Research Board* (London) *Paper No. 47*, 23 pp. (1928).—The behavior on oxidation in the lab. of the pyrite contained in coal taken from the Ravine seam, Lancashire, and representing the complete seam from top to bottom is compared with the behavior of the corresponding coal *in situ*. Conclusion: While the oxidizable pyrite contained in this coal may assist in a minor degree in the self-heating of the coal, the most important effect of the pyrite is the disintegration caused in the coal by its oxidation to bulkier products. Detailed chem. analyses and descriptions of samples are given. J. F. SCHAIRER

**Note on a contact of basalt with a coal-seam in the Isle of Skye, Scotland: Comparison with Indian examples.** L. LEIGH FERMOR. *Records Geol. Survey India* 60, 358-62 (1928).—Examn. and analysis of coal underlying basalt in Scotland shows change only in the upper 0.5 mm. of the seam, although alteration extends 1-4 ft. from Indian dikes intruded into coal. This is probably due to protection afforded by a steam layer formed between coal and basalt, and quick cooling of basalt by the H<sub>2</sub>O. ALDEN H. EMERY

**Role of resorption in the petrogenesis of Tokajese Nagyhegy.** E. LENGVEL. *Földtani Közlöny* 54, 181-5 (1926).—The interior of the earth with its more or less separately lying fluid magmatic bodies affords ample opportunities for the development of mixts. by processes of soln. and assimilation, especially during the upward journey of such a magmatic body through the solid igneous or sedimentary rocks nearer the surface. Phenocrysts may develop and resorption may alter the character of some of the intruded rocks. At a later stage such processes may result in magmatic differentiation and may develop various highly interesting hybrid rocks, which build up a series chemically and mineralogically between the unaltered magma and the intruded rocks prior to the intrusion. The factors which influenced the development of such hybrid rocks are indicated by the abnormal chem. and mineralogical compn. of these rocks. J. F. SCHAIRER

**The petrology of Iceland.** Preface. G. W. TYRRELL AND MARTIN A. PEACOCK. *Trans. Roy. Soc. Edinburgh* 55, 51-3 (1927). I. **The Basic Tuffs.** MARTIN A. PEACOCK. *Ibid* 53-76.—The finer-grained beds of Icelandic tuffs of early glacial and later age are either sideromelane-tuffs or palagonite-tuffs. *Sideromelane* is a black, lustrous, mostly anhyd. basalt glass, pale colored and translucent in thin section, known only in fragmental volcanic rocks. In Iceland, it is a product of drastically chilled, subglacially extruded basalt magma. *Palagonite* is the hydrogel of sideromelane. It is a yellow, colloidal material contg. up to 28% H<sub>2</sub>O. When hydration has taken place at low temps. by submersion, isotropic gel-palagonite tends to form; when hydration results from hot-spring action, faintly birefracting fibro-palagonite is the main product. The change from sideromelane to palagonite is accompanied by a partial loss of lime and soda, by an almost complete oxidation of Fe and by a progressive lowering of *n*. Palagonite is unstable, tending to crystallize, with partial loss of H<sub>2</sub>O, into chlorites and zeolites. ALDEN H. EMERY

**Hungarian diorite.** FERENC PAPP. *Földtani Közlöny* 55, 341-4 (1926).—Analyses of diorite are included. J. F. SCHAIRER

**Petrochemical studies of the basaltic rocks from Salgótarján, Co. Nógrád, Hungary.** R. REICHERT. *Földtani Közlöny* 55, 344-9 (1926).—Petrographic descriptions of basaltic rocks with 6 new chem. analyses are given. J. F. SCHAIRER

**Igneous intrusions between St. Andrews and Loch Leven.** FREDERICK WALKER AND JOHN IRVING. *Trans. Roy. Soc. Edinburgh* 56, 1-17 (1929).—The igneous intrusives between St. Andrews and Loch Leven are mainly sills and include olivine-dolerites, teschenites, nephelite-basanites, monchiquites and quartz-dolerites. The possible modes of chem. origin of the zeolite minerals are considered. Analyses of analcite-bearing quartz-dolerite and quartz-dolerite are given. J. F. SCHAIRER

The geology of the region of Nagyszal. A. KUBACSKA. *Földtani Közlöny* 55, 327-32(1926).—Mainly geological. An analysis of a dolomitic limestone is given.

Geology of the Buda-Kovácsier Mts. ISTVÁN FERENCZI. *Földtani Közlöny* 55, 349-67(1926).—Analyses of fresh chalk, porous chalk and fresh and altered dolomite are given.

The soil of the Tokajer Mts. (Kopasz) and the surrounding region. GYULA SIMKO. *Földtani Közlöny* 55, 298-309(1926).—Analyses of dust falling on snow at Nyiregyháza and Tokaj are given.

The origin of chernozem and of the South Russian steppe. G. I. TANFIL'EV. *Pochvovedenie* (Pédologie) 23, No. 1-2, 5-23(1928).—T. shows that the ice movements of the various glacial periods were responsible for the accumulation of sol. salts in the loess, which in turn inhibited the growth of forests. The result was the accumulation of org. matter and the formation of chernozem, the Ca being responsible for the resistance of the org. complexes. The forestless areas were, as a result of the climatological and geological conditions, converted into the steppe.

Hydrochemistry of the upper Kama and its tributaries (TRIFONOV) 14. Use of a recording manometer for studying the decomposition of hydrates (HACKSPILL, STEMPFEL) 2.

## 9—METALLURGY AND METALLOGRAPHY

D. J. DEMOREST, R. H. ABORN

Modern selective flotation. FERD. P. EGEBERG. *Tids. Kemi og Bergvesen* 8, 53-6, 75-81(1928).—A survey. The Callow process is especially mentioned. A D

Some remarks concerning modern flotation practice in the United States. O DALEN. *Tids. Kemi og Bergvesen* 8, 138-9(1928).—The paper deals with flotation of porphyritic Cu ores in the west. The most important new acquisitions and reagents are mentioned.

A study of the effect of certain cations on the flotation of galena. NELSON W. TAYLOR AND HENRY B. BULL. *J. Phys. Chem.* 33, 641-55(1929).—A study was made of the decrease in the flotation of galena suspended in H<sub>2</sub>O in the presence of eucalyptus oil, caused by the addn. of certain cations to the soln. The curve of decrease of flotation plotted against the concn. of electrolyte suggests that the cation is adsorbed on the galena surface. The increase in electrostatic charge on the galena particle caused by the adsorption would produce a repulsion to the adherence of air bubbles necessary for flotation. The order of increasing "toxicity" of cations, viz., Co, Ni, Cd, Pb, Ag, is the same as that of decreasing soly. of the sulfides. The highly toxic effect of solns. of Cr and Th nitrates on the flotation, however, cannot be explained by the adsorption theory.

The electrostatics of flotation. H. B. BULL. *J. Phys. Chem.* 33, 656-8(1929), cf. preceding abstr.—The electrostatic charge carried by finely ground galena particles in H<sub>2</sub>O and in solns. of different concns. of salts was measured by detg. the elec. potential established between the top and bottom of a column of the liquid through which the galena was falling. The difference of potential is similar to the  $\xi$  potential suggested by Freundlich for cellulose suspensions, and is due to the potential existing across the immovable adsorbed layer of ions and the boundary layer of movable mols. It amounts to as much as 240 milliv. for a soln. of AgNO<sub>3</sub>. The results probably do not measure the actual  $\xi$  potential but are only proportional to it. There is a connection, however, between the toxicity of Ag, Pb and Co ions on the flotation of galena and the electrostatic charge. This relation does not exist for solns. of Th and Cr nitrates.

Testing reagents for the flotation of carbonate lead-silver ores. L. J. CHRISTMANN AND S. A. FALCONER. *Eng. Mining J.* 127, 951-3(1929).—Tests were run on synthetic mixts. and ores contg. PbCO<sub>3</sub>. Data are given showing the recoveries obtained when oleic acid, K amylxanthate or one of several unnamed reagents was used with pine oil. Phosphoric acid and NH<sub>4</sub>H<sub>2</sub>PO<sub>4</sub> were used effectively as conditioning agents.

Furnaces for foundries and waste metal utilization (exhibited) at the Leipzig spring fair of 1929. H. REININGER. *Giesserei Ztg.* 26, 237-46, 316-22, 346-9(1929).—Foundry melting furnaces, annealing furnaces for steel and temper castings and furnaces for smelting metallic wastes are described and illustrated in detail.

**Investigations in ore dressing and metallurgy.** Canada Dept. Mines, Mines Branch, *Report No. 695* (1929). **Experimental tests of gold ore from the Sylvanite Gold Mine, Kirkland Lake, Ontario.** J. S. GODARD. 4-21.—This material is high-grade Au ore, analyzing 2.0 oz. Au and 0.14 oz. Ag per ton. The Au is free and associated with small quantities of a no. of sulfides and some tellurides. It is refractory and recoveries by cyanidation are low. Tests showed that recoveries were considerably increased by floating in conjunction with cyanidation. Local conditions will det. whether to float before or after cyanidation; recovery is about the same by both systems. If floated first, a high-grade conc. is obtained, which may be roasted and cyanided with a good recovery and low cyanide consumption or sold directly to a smelter. If cyanided first, the flotation feed should be freed from cyanide and sol. lime by washing, as both are depressing on the pyrite with which the Au in the cyanide tailing is mainly assocd. **Experimental tests on ore from the Blue Quartz Gold Mine, Paikiller Lake, Ontario.** J. S. GODARD. 22-8.—This ore consists of free Au associated with sulfides, chiefly arsenopyrite and chalcopyrite. It analyzes Au 0.38 oz. per ton, Fe 15.29, insol. 56.54, Cu 0.08, As 0.97 and lime 7.43%. Recovery of this Au by all methods of test increases with finer grinding. By flotation or tabling and flotation, 30% is the max. recovery. Amalgamation is unsatisfactory. Cyanidation with 2 lb. KCN and 6 lb. lime per ton of ore gives 85-90% recovery of Au. **Experimental work on a gold-silver-lead ore from the Planet Mines, Nicola, British Columbia.** C. S. PARSONS. 29.—This ore, analyzing Cu 0.28%, Pb 1.89%, Zn 1.16%, Au 0.22 oz. and Ag 6.5 oz. per ton, is very clean, free from interfering gang or sol. salts. It gave a recovery of Au 92.4, Ag 95.2, Pb 95.7 and Zn 78.6% by flotation with acid coal-tar creosote (1.25 lb.), xanthate (0.15 lb.) and pine oil. **Experimental work on the lead-zinc ore from the Yankee Girl Mine, Ymir, British Columbia.** C. S. PARSONS AND J. S. GODARD. 30-7.—This ore analyzed Pb 3.12%, Zn 4.6%, Au 0.35 oz. and Ag 2.48 oz. per ton. The ore cyanided readily but with only fair recoveries. Cyanidation followed by flotation gave erratic results. Flotation was successful, and when followed by cyanidation of the tailings added further recoveries. **Flotation of cyanide tailings from Wright-Hargreaves ore.** C. S. PARSONS AND J. S. GODARD. 37-42.—These tailings assay about 0.075 oz. per ton of Au associated with fine pyrite and small amts. of other base-metal sulfides, 80% through 200 mesh. Exptl. flotation recovered 60-65% of the Au in a sulfide conc. Fine grinding, proper pulp conditioning (violent mech. agitation for 10 min. or more) and proper design of conditioning tank are important.  $\text{Na}_2\text{CO}_3$  and  $\text{CuSO}_4$  are the conditioning reagents; xanthate, acid coal-tar creosote and pine oil are used for flotation. **Concentration of a copper-zinc ore from the Amulet Mine, Rouyn, Quebec.** C. S. PARSONS AND A. K. ANDERSON. 42-64.—The ore analyzed Cu 3.85%, Zn 8.75, Au 0.2 oz., Ag 3.78 oz. and free acid (as  $\text{H}_2\text{SO}_4$ ) 9.0 lb. per ton. It was a heavy sulfide type contg. an intimate mixt. of sulfides of Fe, Cu and Zn, mostly pyrite, chalcopyrite and sphalerite, resp. The Cu floated easily and with good recoveries under widely varying conditions. Zn was difficult to float in any but very fresh ore. Au recovery was better with Acrofloat than with xanthate. Recoveries in 2 successful tests were Cu 90, 88; Zn 75, 77; Au 57, 77; Ag 47, 72%. **Experimental tests on gold ore from the Francoeur property, Boischatel Township, Quebec.** A. K. ANDERSON. 64-6.—A fine-grained, pink feldspar porphyry contg. finely divided sulfides of Fe and As carrying 0.37 oz. Au and 0.10 oz. Ag per ton. Flotation of Fe sulfides followed by concn. of the tailing on Wilfley tables to recover values present as free Au and associated with arsenopyrite yielded a 90% or better recovery of Au in a conc. acceptable for smelting. **Experimental tests on gold ore from the Cooper Gold Mine, Michipicoten area, Ontario.** J. S. GODARD. 67-73.—Au in this ore is free and assocd. with small quantities of pyrite, pyrrhotite and chalcopyrite in a quartz gang. Analyses showed Cu trace -0.12%, Fe 1.42-2.75% and Au 0.4-1.33 oz. per ton. Amalgamation gave about 80% recovery. Flotation showed erratic results. When succeeded by tabling, a satisfactory recovery was obtained. Flotation preceded by amalgamation and followed by tabling gave a good recovery but with a low-grade conc. Cyanidation was unsatisfactory especially on the +200-mesh material. **The concentration and recovery of values contained in a lead-zinc-gold ore from the Premier Gold Mining Company, Ltd., Premier, British Columbia.** A. K. ANDERSON. 73-82.—The ore minerals are heavy sulfides of Pb, Zn and Fe intimately associated, carrying values in Au and Ag. The ore analyzed Cu 0.18%, Zn 3.69%, Pb 1.33%, Fe 9.68%, Au 0.34 oz. and Ag 8.08 oz. per ton. Bulk flotation was unsatisfactory. Cyanidation, after fine grinding, easily gave recoveries of 94-96% of the Au and 50% of the Ag. Flotation of residues (carefully washed) gave 25-30% further Ag recovery and commercial concs. of Pb and Zn. **The selective flotation of a copper-zinc ore from the Sherritt-Gordon Mines, Ltd., Manitoba.**

A. K. ANDERSON. 93-8.—This ore, contg. high percentages of sulfides of Cu, Zn and Fe, analyzed Cu 0.53-11.61%, Zn 4.63-21.39%, Au trace —0.08 oz. and Ag 0.72-3.92 oz. per ton. Best results were secured by grinding with cyanide and  $\text{ZnSO}_4$  in a circuit alk. with  $\text{Na}_2\text{CO}_3$ . Cu can then be floated either by adding thiocarbamilide to the grinding mill or Aerofloat or phosphoresylic acid to the classifier overflow or to the head of the Cu flotation cells. Lime and  $\text{CuSO}_4$  should then be added to the tails for conditioning. Aerofloat will now yield a Zn cone. Middlings are reground and retreated. The Au and Ag are associated chiefly with the Cu. **Experimental tests on ore from the Kirkland Premier Mine, Kirkland Lake, Ontario.** J. S. GODARD. 98-102.—The ore contained Au partly free but mostly associated with small quantities of sulfides of Fe and Cu. The analysis showed Cu 0.19%, Fe 5.38%, insol. 75.81%, Au 0.39 oz. and Ag 0.33 oz. per ton. The best flotation recovery was 92% of the Au in a conc. assaying 2 oz. per ton or 4 oz. by cleaning a rougher conc. Tailing the tailings increases Au recovery 2 or 3%. **Experimental tests on cyanide tailings from the Kirkland Lake Gold Mining Company, Ltd.** J. S. GODARD. 102-8.—These tailings are those discharged from the countercurrent decantation mill of the Co.; they contain 40% moisture and an av. of about 0.05 oz. of Au per ton. Best av. recovery was 42.5% at a grade of 0.26 oz. Au per ton. Cleaning to free from cyanides is necessary prior to flotation. **Concentration of copper-gold ore from Archean Mines, Clercy Township, Quebec.** C. S. PARSONS. 109-11.—The ore consisted of disseminated chalcopyrite and pyrite with a little Zn blende and analyzed Cu 0.66%, Zn 0.46%, Au 0.32 oz. and Ag 0.26 oz. per ton. It can be coned. by flotation in a neutral pulp to produce \$75 of Au per ton or by using 20 cents worth of  $\text{Na}_2\text{CO}_3$ , KCN and  $\text{CuSO}_4$  to give \$110 of Au. Free Au is present, which should be removed by amalgamation. **Concentration of the lead-zinc ore of the Stirling Mine, Cape Breton, Nova Scotia.** C. S. PARSONS. 111-4.—This ore is a complex mixt. of chalcopyrite, galena, sphalerite and pyrite, with small values in Au and Ag finely disseminated and associated with an altered talcose gang. The analyses of high- and low-grade ore, resp., are Cu 0.49-0.5%, Pb 4.02-1.16%, Zn 16.11-7.99%, Fe 6.54-5.43%, Au 0.06-0.08 oz. and Ag 2.67-2.14 oz. per ton. The talc floats in all ordinary processes and spoils the grade of product. After adding 5 lb. of  $\text{Na}_2\text{CO}_3$  and 0.4 lb. of cyanide to the ball mill, talc was floated with 0.1 lb. of pine oil. Pb was then floated with Aerofloat (0.1 lb.) and Zn with 2 lb. of  $\text{CuSO}_4$ , 0.1 lb. xanthate and 0.1 lb. of pine oil. This gave recoveries of 76% Pb, 57% Au and 54% Ag in the Pb conc., 55% Zn in the Zn conc. and 30% more in the middling, together contg. additional recoveries of 12% Au and 27% Ag. **Experimental tests on gold ore from Reno Mine, Sheep Creek District, British Columbia.** J. S. GODARD. 115-8.—This high-grade ore contains free Au 2.51 oz. and Ag 1.28 oz. per ton, Cu 0.12, Fe 5.38, As trace, Zn trace, Pb 0.35 and insol. 88.16%. Over 90% of the Au was recovered by amalgamation. Cyanidation was unsatisfactory. **The concentration of the silver ore of the Toric Mine, Alice Arm, British Columbia.** C. S. PARSONS. 119-22.—The chief value of this ore is Ag, occurring native, as argentite and ruby silver (small amt.). Pyrite and galena are present. More than 85% of the Ag left after amalgamation can be recovered by flotation in a conc. exceeding 225 oz. per ton. The tailing should be tabled to recover native Ag. **Concentration of a lead-silver ore from the Confederation Group, Cambourne, British Columbia.** C. S. PARSONS. 122.—This ore analyzed Pb 24.75%, Zn 0.06%, Au trace and Ag 8.93 oz. per ton. Flotation with xanthate and pine oil after  $\text{Na}_2\text{CO}_3$  conditioning gave a conc. contg. 92.6% of the Pb and 89.9% of the Ag.

ALDEN H. EMERY

**Chemical-analysis records on punched cards.** H. STEINHAUS. *Techn. Wirtschaft* 22, No. 2, 47-9(1929).—A discussion of the use of cards for recording chem. combustion of metallurgical products.

J. I. S.

**A hydrometallurgical process for the treatment of stibnite ore and the recovery of metallic antimony.** H. C. MABEE. Canada Dept. of Mines, Mines Branch, *Rept.* No. 695, 158-62(1929).—Stibnite is leached with hot NaOH and electrolyzed cold. High concn. of Sb and low concn. of free NaOH give most adherent deposits. Current efficiencies are high. Pb anodes are better than Fe. **Custom concentrators.** C. S. PARSONS AND A. K. ANDERSON. Canada Dept. of Mines, Mines Branch, *Rept.* No. 695, 173-8(1929).—A discussion of ore-handling methods, sampling, purchasing schemes, etc., for existing custom concentrators.

ALDEN H. EMERY

**A proposed nickel refining process.** FRANK E. LATHE. *Can. Chem. Met.* 13, 174-6(1929).—A short account of the Oxford process and the Mond process is followed by L.'s modification of the oil of vitriol process. When 3% of Fe is left in the converter mat and the latter granulated in water to produce a fine crystal structure, it is possible on grinding to 80 mesh to dissolve 99 to 99.9% of the Ni in "30 percent"

$\text{H}_2\text{SO}_4$  at  $80-100^\circ$  and still leave all the Cu in the insol. residue. S can be recovered from the liberated  $\text{H}_2\text{S}$ . The Fe is removed from the  $\text{NiSO}_4$  soln. by oxidation of part of the latter in a cyclic process and pptn. by  $\text{Ni}(\text{OH})_2$ . From the Ni soln.  $\text{NiSO}_4 \cdot 7\text{H}_2\text{O}$  is crystd. out, dehydrated at  $300^\circ$ , decompd. at  $800^\circ$  and reduced by petroleum coke in a reverberatory furnace. The CuS is melted, blown in a converter and electrolyzed. The precious metals are recovered in a very concd. slime. In dissolving the Ni from the mat, a countercurrent flow is recommended, in which the fresh mat comes in contact with a soln. of low acidity and high  $\text{NiSO}_4$  content, while the nearly exhausted mat comes in contact with the strongest acid to remove the last trace of Ni. Traces of Cu dissolved by the strong acid are later pptd. when the soln. comes in contact with the fresh mat. The process in a single operation gives an almost quant. sepn. of the Ni from the Cu and the precious metals. It provides for the recovery of the Ni and Cu in a condition of high purity, for the recovery of the S as a by-product and for the recovery of the precious metals in a very concd. form. No chemicals need be purchased since the  $\text{H}_2\text{SO}_4$  is regenerated and the small quantity of  $\text{Ni}(\text{OH})_2$  required is made in the plant by electrolysis. E. G. R. ARDAGH

The sizing of minette ore and its influence upon the smelting process. EWALD BERTRAM. *Arch. Eisenhüttenw.* 2, 461-72(1929).—Minette ore, a siliceous oölitic Fe ore of great importance technically, sometimes occurs in a form that splits up or powders easily. No adequate explanation of the phenomenon could be found. Expts. upon smelting such ores in small furnaces were useless, but data obtained from com. blast furnaces using minette ore of various predetd. sizes show that a much more uniform Fe, with better phys. and chem. properties, can be made from the crushed material than from larger lumps. With one furnace a saving of 2-5% in coke was effected, which sufficed to pay for the crushing required. The geological nature of the ore itself is the important factor; one must distinguish carefully between the kind (usually contg. lime) that breaks up into pieces when heated to  $200-300^\circ$  and the others (usually siliceous) which retain their shape in the blast furnace. A drawback to the use of finely crushed minette ore is the increase in dust from the furnace. The sepn. of fines and agglomerating them before charging to the furnace is recommended. W. C. EBAUGH

Handling of fine ores and concentrates in Salt Lake Valley lead smelters. L. D. ANDERSON. *Am. Inst. Mining Met. Eng., Tech. Pub. No. 223*, 15 pp.(1929). E. H.

Concentrator practices at Morenci, Arizona. ARTHUR CROWFOOT. *The Mining J. (Arizona)* 13, 5-8(1929).—The history of concentrator operations and a detailed description of recent improvements are given. E. M. SYMMES

Magnetic roasting of iron ores. WALTER LUYKEN AND ERNST BIERBRAUER. *Mill Kaiser-Wilhelm Inst. Eisenforsch. Düsseldorf* 11, 95-107; *Arch. Eisenhüttenw.* 2, 531-43(1929).—By magnetic roasting is meant the conversion of weakly magnetic Fe mineral into one strongly magnetic, the object being to render it more suitable for an electromagnetic concn. process. Fe ores were heated in an exptl. revolving roasting furnace at  $500^\circ$  and  $700^\circ$  with (a) coal gas and (b) generator gas, for periods of 10-240 min., the total Fe and free Fe were detd. and concn. of the products was effected. Results are given in tables and graphs. To prevent over-roasting,  $\text{CO}_2$  (in place of steam) was used with the reducing gases in certain trials, with successful results. Heating with steam alone gave  $\text{Fe}_3\text{O}_4$  with certain ores, but it was discovered that the reduction was due to an anthracite-like C contained in veins throughout the ore itself; heating them without a reducing agent caused a marked improvement in their magnetic properties. The influence of particle size upon the roasting process was relatively small—at least with particles under 2-4.5 mm. diam. Temps. of  $500^\circ$  were preferable to  $700^\circ$  (approx.). Gaseous reducing agents are better than solid, and H and CO (easily obtained commercially as water gas) are best among the gases used. Fears that a roasted ore would reoxidize upon cooling in air were unfounded—so quenching the roast is not called for. Whether roasting in reducing gas followed by ordinary magnetic sepn. will be more economical than treatment of weakly magnetic ores with magnetic fields of great strength has not been detd. W. C. EBAUGH

How to obtain high-test cast iron. B. OSANN. *Maschinenbau* 8, 284-9(1929).—This study is based on the sepn. of graphite from pig iron. In order to control this and to obtain proper chem. compn., calcn. is necessary, for which 4 basic rules are given. E. I. S.

Developments in the steel industry. ANON. *World Power* 12, 35-40(1929).—Nine illustrations. A review covering in particular the products and works of Hadfields, Ltd. C. G. F.

Blast-furnace gas management in German iron and steel plants. H. BANSSEN.

*Arch. Eisenhüttenw.* 2, 309-20(1928).—A review dealing with the generation and economical utilization of blast-furnace and coke-oven gases. R. D. BUMBACHER

Comparative studies on working results of blast furnaces. G. EICHENBERG AND R. HAHN. *Arch. Eisenhüttenw.* 2, 207-16(1928).—A critical review of work done by Evans and Bailey (*C. A.* 22, 2909). R. D. BUMBACHER

Gas-solid contact in the shaft of a 700-ton blast furnace. S. P. KINNEY AND C. C. FURNAS. *Bur. Mines, Repts. of Investigations*, Serial 2939, 10 pp.(1929).—The gas velocity is fairly high along the wall, drops off to a min. about 2 ft. from the wall and then rises to a high velocity at the center, probably caused by the batter. At the 3-ft. plane, above the batter line, there is no high wall velocity, the max. velocity being almost 6 times the min. In general, the temp curves follow the gas-velocity curves. Where the gas velocity is high, the CO<sub>2</sub> content is low, especially in the center of the furnace. In general, the greater static pressure is in the center of the furnace. Also in *Iron Steel Ind. & British Foundrymen* 2, 335-8; *Blast Furnace & Steel Plant* 17, 1039-43(1929). H. C. PARISH

Beryllium. ALFRED STOCK. *Z. angew. Chem.* 42, 637-9(1929).—A review of the production of Be and its use, particularly in alloys. E. H.

Beryllium. J. SCHLENZIG. *Metallbörse* 19, 1323-4(1929).—Since Be has a sp. gr. only  $\frac{1}{2}$ , as great as that of Al and has properties making it very desirable for air-craft motor construction, demands for it from America have brought about very active prospecting for beryl in South Africa (Leydsdorp district), in the Urals and Siberia (Altai Mountains). Instead of mining beryl simply as a gem, *e. g.*, aquamarine, it is used as an ore. From a price of 1800 M./kg. for metallic Be in 1926 there has been a decrease to about 440 M., and on account of the low Be content of its ores and difficulty encountered in extg. it as metal it is doubtful if its price will fall below 400 M./kg. Soviet Siberia will probably be the detg. factor in fixing the price. Methods for extn and purification are outlined. W. C. EBAUGH

Molybdenum. H. H. SMIDT. *Tids. Kemi og Bergvesen* 8, 66-9(1928).—A statistical, metallurgical, chemical survey. ARNE DROGSETH

The course of the silver market. HANS HIRSCHSTEIN. *Metallbörse* 19, 1321-2(1929).—The changes in the position of Ag during the last 20 years are discussed from economic, geographic and industrial viewpoints. W. C. EBAUGH

Production of tungsten and molybdenum. G. A. MEERSON. *Zhur. Prikladn. Khim.* (Moscow) 2, 133-48(1929).—Several thousand tons of Russian deposits of wolframite, scheelite and molybdenite are sufficient to meet the demands of the native elec. incandescent lamp industry as it requires only a few tons of Mo and W a year. Production and mfg. methods are essentially the same as those used in America. V. KALICHEVSKY

The temperature determination of fused metals. C. SPADON. *Met. ital* 21, 56-73(1929).—A description of the various types of pyrometers, thermocouples as well as optical, for the detn. of temps. of molten metal. A. W. CONTIERI

Cloudburst process for hardness testing and hardening. EDWARD G. HERBERT. *Trans. Am. Soc. Steel Treating* 16, 77-92(1929).—Artificial bombardment at high velocity by hard steel balls will roughen a soft steel surface but will not affect a hard surface. The method permits testing in quantity over whole surfaces. Steel surfaces may be super-hardened by the method. W. A. MUDGE

The cathodic pulverization of metals applied to the photomicrographic study of alloys. L. BELLADEN AND M. DE MARTINO. *Met. ital.* 21, 18-26(1929).—When a current is passed through an evacuated tube the cathode metal evaporates under the influence of the rays striking it. When an alloy is used as cathode the result is an "etched" electrode, which shows up the constituents, pure metal crystals, eutectic crystals, etc., much more clearly than etching with acid, and becomes, therefore, a valuable method for the study of alloy structure. A. W. CONTIERI

Heat-treating automobile parts. F. L. PRENTISS. *Iron Age* 123, 1625-9(1929).—Descriptive. The Oakland Co. uses *elec. furnaces* to heat-treat gears, pinions and axles. E. J. C.

Notch impact tests. Development and criticism. F. FETTWIS. *Arch. Eisenhüttenw.* 2, 625-74(1929).—A thorough survey of the subject, with 700 references to the literature from 1885 to 1928. J. BALOZIAN

Comparison of different hardness numbers. KATSUJIRO ENDO. *J. Study of Steel Manuf.* 8, (7) 1-25(1928).—In ball hardness tests on C steels it was found that the depth of indentation with 15 min. and 30-55 min. loading was almost the same. In impact hardness tests (using a steel cylinder 4 cm. diam., 3 cm. high as the hammer)

on two C steels it was found that the vol. of the indentation cavity and the absorbed energy was not const.

**Surface hardening caused by friction.** KASEJI BITO. *Bull. Army Ordnance* 7, 73-8(1928).—A Norton emery or alundum wheel, coated with Pb to increase the resistance and turned 1000 to 15,000 times per minute, was employed. *Results.*—In C steels the results were negative while in special armor plate a martensitic structure was obtained to a depth of 0.4-0.6 mm. from the surface, the Shore hardness increasing from 30 to 65-72 due to the low heat cond. of the special steel used. By applying the process to the common infantry steel, the Shore hardness could be raised from 41 to 74.

K. SOMEYA

**Change in microstructure of iron at  $A_3$  transformation point.** B. A. ROGERS. *Am. Inst. Mining Met. Eng., Tech. Pub. No. 218*, 13 pp.(1929).—The app. and method are described for observing the change in microstructure of Fe as it goes from the alpha to the gamma state. The results of the investigation confirm the work of previous investigators, in that there is no appreciable change in the microstructure of Fe until the  $A_3$  point is reached, and further, in the case of pure Fe, that the change comes simultaneously with the changes in heat content and space lattice.

DOWNES SCHAAF

**The nature of martensite crystals.** KOTARO HONDA. *Trans. Am. Soc. Steel Treating* 16, 97-112(1929).—A discussion of the nature and properties of  $\alpha$ - and  $\beta$ -martensite as evidenced by x-ray investigations. Values for lattice const., specific vols., magnetizability, elec. resistance and hardness are given.

W. A. MUDGE

**Report of committee A-3 on cast iron.** ANON. *Proc. Am. Soc. Testing Materials* (preprint) No. 11, 28 pp.(1929).—New proposed tentative specifications are submitted for chilled-tread cast-Fe car wheels, and also for grey Fe castings for valves, flanges and pipe fittings. The paper includes reports on the correlation of test bar and casting and on the heat treatment of cast Fe.

DOWNES SCHAAF

**Study of cast iron. IV. Influence of melting temperature upon low-carbon cast iron.** K. TANIMURA. *Bull. Tech. Coll., Kyushu Imp. Univ.* 3, 266-76(1928).—Cast iron contg. 3% C and 1.19-2.5% Si was melted and slowly solidified from different temps. and the ratio of the total to graphitic C as well as the hardness of the resulting specimens were detd. It was found that when the temp. of the melt is high, the degree of graphitization is comparatively small. The hardness is higher the higher the temp. of the melt, the result being opposite to the case of high C, high Si cast iron previously studied by T. The matrix of the specimens melted at a high temp. was relatively heterogeneous, and had many ferrite regions mixed with pearlitic portions.

K. S.

**Sulfur in cast iron.** KUMAHIKO HASEGAWA. *Iron and Steel* (Japan) 14, 1072-83 (1928).—H. has already shown that in the gravimetric oxidation method for detg. S in iron the total quantity of S can be detd., but in the volumetric reduction method only part can be estd. This is due to the difference in the solubilities of S compds. in acids (dependent upon the quantity of Mn present in the iron). When the specimen is tempered, the soly. is increased; this does not take place with steels. The state in which S exists in the cast iron was studied by means of chem. analysis, microscopic examn., heat treatment, etc., various kinds of white and gray cast irons of different Mn, Si and S contents being used. In white cast iron S exists chiefly as FeS and MnS. The coincidence of the results obtained by microscopic examn., volumetric and gravimetric analyses and S print prove this. In gray cast iron most of the S exists as MnS and the remainder as FeS when the Mn content exceeds 0.5%. When the Mn content is below 0.5%, there are acid-sol. and acid-insol. sulfides besides. The insol. sulfides cannot be recognized by S print and microscopic examn.; they are produced when the Si content of the iron is large and the Mn content small. From the fact that the pearlite present is easily spheroidized and that the FeS which is considered to be its decompn. product appears close to the spheroidized cementite, the insol. compd. is concluded to be an unstable compd. formed by the interaction between Fe, S, Fe<sub>3</sub>C and Fe<sub>3</sub>Si, and moreover that this unstable compd. is one of the constituents of the pearlite. The decompn. of this unstable compd. by tempering begins to occur at 600°; it is more marked the higher the temp., the longer the time and the finer the grain of the specimen. When the specimen is in the form of a drilling, the decompn. is completed in 1 hr. at 900°.

K. SOMEYA

**The practical utilization of pearlitic cast iron.** SHIDZUO SETO. *Iron and Steel* (Japan), 14, 1107-33(1928).—S. recommends a product of low C and high Si and Mn content. Practical details are given of the melting and casting processes. The best compn. is: total C 2.8%, Si 1.9%, Mn 1.3%.

K. SOMEYA

**Some notes on Perlite iron.** R. T. ROLFE. *Iron & Steel Ind. and Brit. Foundryman* 2, 283-6(1929).—Perlit Fe made by the Perlit process differs from cold-mold gray Fe

in that it has greater homogeneity, less porosity, greater regularity in obtaining an "all-pearlite" structure with low Si, greater ductility, superior shock resistance, less growth on heating and greater freedom from casting stresses.

**Oxygen dissolved in steel, and its influence on the structure.** MARCUS A. GROSSMAN. *Trans. Am. Soc. Steel Treating* 16, 1-18(1929).—Steel absorbs  $O_2$  as well as C in box carburizing. A high  $O_2$  content favors soly. of cementite with a resultant opportunity for diffusion, and accounts for the phenomenon of "split cementite" in McQuaid-Ehn test and of "boundary cementite" in low-C steels. Different Fe-C diagrams can be drawn from different steels by varying the diagram to accord with the soly. of cementite and diffusion power.

**Cementation of steels by special alloys having a manganese base.** J. COURNOT. *Chimie & Industrie Special No.*, 423-4(Feb., 1929); *Rev. métal.* 25, 669-70(1929).—See C. A. 23, 81.

**The hardening of ingot steel in cyanide salt bath.** F. RAPATZ. *Stahl u. Eisen* 49, 427-9(1929).—Hardening expts. with Duferrit-cyanide hardening compd. (essentially of NaCN dild. with other salts) are described. Hardening a 0.12% C steel 2 hrs at 850° gave C contents from 0.66 to 0.33% at a distance from 0.05 to 0.6 mm. The corresponding figures for N are 0.8 to 0.05%. Thin diffusion layers up to 0.6 mm. are easily obtained; it is difficult, however, to obtain heavier layers. The best bath temp. is 850°. The results for a 4-hr. hardening period at 850°, then of 2- and 4-hr. periods at 950° are also given. The method seems to be well adapted for the hardening of small pieces.

**Some characteristics of pearlite in eutectoid rail steels.** O. V. GREENE. *Trans. Am. Soc. Steel Treating* 16, 57-74(1929).—Pearlite may be fine or coarse, independent of the C content, depending upon velocity of cooling through  $Ar_1$ . No relation exists between Brinell hardness and av. grain diam. A decrease in distance between lamellae results in an increase in hardness and tensile strength.

**X-ray study of steel: use of the high voltage Laue method.** FUSAO OTA. *Study of Steel Manuf.* 105, 322-4(1928).—Laue photographs of an Al plate, electrolytic Fe plate, Si steel plate, Armco iron plate and a mild steel wire were taken by the method of St. John, with the application of 185,000 volts and current at 2.5 milliamperes. Two hrs. exposure is sufficient for a steel plate of 1 mm. thickness. The defect of the method is that the Laue spots always appear near the central spot, and the photograph is not very clear.

**X-ray studies of cold-worked steel.** F. C. ELDER. *Iron Age* 123, 1488, 90(1929).—Several x-ray photographs are shown of prepared specimens 0.006 in. thick of C steel wire. While a single heating through the crit. range tends to reconstitute the preexisting cryst. structure, and tends to remove internal strain, and a 2nd treating brings these effects nearer completion, a multiple heat-treatment is necessary for complete recrystallization.

**The properties of Thomas rail steel.** E. H. SCHULZ AND A. WIMMER. *Stahl u. Eisen* 49, 385-8(1929).—Comparative tests on 2 Siemens-Martin and 2 Thomas-rail steel samples are part of a series of expts., which at present are not yet complete. The analysis of the samples, tensile characteristics and impact strength are given. With practically the same composition the 2 steel types do not show any difference.

**Die steels for aluminum alloy die castings.** A. R. PAGE. *Metal Ind.* (London) 34, 485-6(1929).—W steels behave better than Cr-V steels. All good steels examined contained a smaller no. of foreign inclusions than the poor ones. Such inclusions as existed were of globular form in the good steels and elongated in the bad ones. It appears that elongated MnS inclusions may cause erosion in use. Heat treatment does not seem to be a factor.

**Fatigue of steel (by impact).** TOKUJIRO MATSUSHITA, KIVOSHI NAGASAWA AND JEINOSUKE KOMATSU. *Iron and Steel (Japan)* 14, 985-96(1928).—The max. impact value was obtained with 0.45% C steel quenched and tempered at 250°; the tempering temp. which gives the max. impact value increases with increased C content. In the study of the mechanism of fatigue, since it was found that in quenched samples, or in those annealed at a temp. below 200° the elastic limit is hardly recognizable, it is concluded that fatigue occurs when slipping within the crystal grain has taken place below the so-called elastic limit. Similar expts. were made by means of repeated impact test; the authors conclude that when an alternate stress is applied to a single crystal grain, if slip takes place repeatedly on the same plane, the degree of disturbance between different slip planes is increased, with the consequent increase in the no. of grains of indefinite shape and poor contact, so that the crystal grains slip even

when acted by a very slight external force, and thus the elastic limit is gradually lowered until final failure occurs.

K. SOMEYA

**The system iron-silicon, iron-chromium and iron-phosphorus.** P. OBERHOFFER AND C. KREUTZER. *Arch. Eisenhüttenw.* 2, 449-56 (1929).—Chem., microscopical and x-ray studies were carried out to explain certain details in the systems Fe-Si, Fe-Cr and Fe-P. Special investigations were made to study the influence of Si and Cr on the  $A_1$ - and  $A_4$ -transformation of Fe. No chem. combination of Fe and Cr was found; a series of solid solns. might exist. The x-ray studies proved the existence of a saturated solid soln. at 1.7% P,  $Fe_3P$  at 15.58% P,  $Fe_2P$  at 21.5% P and an unknown compound above 21.3% P. A number of photographs, diagrams and tables are given and a high-vacuum-camera is described.

A. E. BEITLICH

**Heat-treated low-manganese steels.** E. E. THUM. *Iron Age* 123, 1691-5 (1929).—Phys. and metallographic properties are given for heat-treated parts made for Si-Mn steel (0.95% Mn), high Mn carburizing steel (1.00% Mn), forgings (1.60-1.90% Mn), high strength castings (1.10-1.40% Mn), and welds made from high-strength welding rod contg. 0.80% Mn.

DOWNES SCHAAF

**Alloys of chromium and iron.** T. HOLLAND NELSON. *Iron Age* 123, 1478-82 (1929).—Stainless steel is defined as a material contg. under 16% Cr, which will harden by quenching and which is capable of attaining a Brinell hardness of 250 or more by heat-treatment. Stainless Fe is defined as a material containing over 16% Cr with less than 0.12% C which, on quenching, does not harden appreciably, and which will not attain a Brinell hardness of over 200 by heat-treatment. The higher the Cr content the greater the corrosion resistance. The most mobile Fe-Cr alloy to obtain substantial corrosion resistance with sufficient malleability to obtain all structural shapes contains less than 0.12% C and 16-20% Cr. Where high phys. properties are required, Fe-Cr alloys contg. under 16% Cr will be found applicable.

H. C. PARISH

**Study of a 20% chromium steel.** ANDRÉ MICHEL AND PIERRE BÉNAZET. *Rev. métal.* 25, 668 (1928); *Chimie & industrie Special No.*, 391-403 (Feb., 1929).—The Chevenard differential dilatometer, hardness test and microscopical examn. were used to study the behavior of a steel contg. C 0.54, Cr 19.0, Ni 0.80%, after quenching in oil from various temps. up to 1250°. The structure becomes more and more austenitic as the quenching temp. increases, and is completely so at 1250°. The expansion curves showed neg. anomalies at about 150°, 260° and 600°, the first two occurring in the  $\alpha$ -phase and the last in the  $\gamma$ -phase. The 600° anomaly followed by marked expansion on cooling is interpreted as a pptn. of carbide from the supersatd. austenite phase, which permits the austenite  $\rightarrow$  martensite transformation to take place on cooling, owing to a decrease in the passive resistances brought about by the dissolved carbide. In steel which has been quenched from 1250° and tempered to 600° or over, there is an accentuation of the martensitic transformation, which increases with the tempering temp. and the time of cooling; but if the tempering period is extended beyond a certain limit, there is a gradual softening of the metal, and the magnetism, which is practically nil, gradually reappears even at the tempering temp. This behavior is compared with that of a steel contg.: C 0.95, Cr 5.80, W 5.60, Co 25.5%, which, at 700°, shows high expansion and strong recalcence, and assumes a pearlitic structure on cooling. A steel contg.: C 1, Cr 12, W 6, Co 20, exhibited both types of change. Moreover, when the 20%-Cr steel was tempered for a sufficient length of time, it exhibited the 2nd type of change. It is concluded that the 2 types of phenomena (pptn. of carbides at the tempering temp. and martensitic transformation on cooling, on the one hand, and transformation at the tempering temp. itself with formation of pearlite, on the other) are not essentially different, the differences observed depending on the magnitude of the passive resistance to transformation caused chiefly by Cr, and on the time at the tempering temp.

A. PAPINEAU-COUTURE

**Ternary chromium steels.** J. POMEY AND P. VOULET. *Chimie & industrie Special No.*, 401-21 (Feb., 1929).—Cr steels contg. Ni or Co show a pt. of inflection on the expansion curve above the  $A_3$  pt. With a steel contg. Ni 10, Cr 23, W 4%, the  $A_3$  pt. is between 700° and 800° and the  $A_4$  pt. between 975° and 1000°. This pt. is marked by a falling-off in magnetic properties as well as by vol. changes, and occurs at a slightly lower temp. during cooling. The investigation may be considered as an attempt at thermodynamic classification of steels, based on the sepn. surfaces of the  $\alpha$  and  $\gamma$  phases, which leads to attributing a considerable importance to the  $A_4$  pt. It follows from the results given that the  $A_4$  transformation can be rendered visible by fairly simple means, either by magnetic analysis of austenitic steels after quenching or by taking advantage of the fact that in certain alloy steels this pt. is sufficiently low to be studied by means of the Chevenard differential dilatometer.

A. PAPINEAU-COUTURE

Recent developments in nickel-alloyed iron, steel and cast iron. J. S. VANICK. *Iron & Steel Can.* 12, 127-9, 149-51, 157-9(1929).

Effect of heat-treatment on the quality of tungsten steel. F. PÖLZGUTER AND W. ZIEGLER. *Stahl u. Eisen* 49, 521-7(1929).—For each type of W-steel, there is a crit. temp. range in which a sufficiently long annealing causes the sepn. of WC, with corresponding decrease in quality. The compn. of the 2 steels investigated was: (A) 0.75% C, 0.35% Mn, 0.36% Si, 5.46% W and 0.35% Cr, (B) 0.75% C, 0.37% Mn, 0.32% Si, 5.77% W; the heat treatment was for 4 hr. at temp. between 600° and 1250°. Brinell hardness decreased from 675 at 750° for both samples to 550 for the Cu-W-steel and to 450 for the W-steel at 975-1000°, and rose again to 675 for both steels at 1250°. The same types of curves were obtained, plotting the coercive force as a function of the annealing temp. A small amt. of Cr renders the steel less sensitive toward incorrect heat-treatment.

Study of surface-hardening of steel by nitridation. SHIGEYUKI KOYABU. *Iron and Steel (Japan)* 14, 1138-57(1928).—Normalized pieces of Cr-Mn steel, Cr-Ti steel, Si-Mn steel and Cr steel were heated at 560-670° for 5, 15 and 30 hr. in  $\text{NH}_3$ , the change in the hardness and length being subsequently measured. In mild steels the increase of scratch hardness is not marked, but it is very marked in Cr steels. The suitable temp., for obtaining a hard surface is 560-80°, above which temp. range a brittle compd., which is near to  $\text{Fe}_3\text{N}$  in compn., forms. The hardness reaches a max. in 15 hr. By nitridation the length of the specimen increases a little, while the impact value decreases by about 60%. From these results K. concludes that for nitridation low-C-Cr steel is the most suitable.

Mechanism of the decarburization of carburized irons by alkali and alkaline earth chlorides. L. HACKSPILL AND E. SCHWARZ. *Chimie & industrie Special No.*, 386-90 (Feb., 1929).—A study of the decarburization of Fe and steel by  $\text{NaCl}$ ,  $\text{CaCl}_2$  and  $\text{LiCl}$  showed that it is due to the intermediate production of a metal carbide, which subsequently disappears. The mechanism of decarburization by Na, Ca and Li is the same. Na and Ni carbides were produced by direct combination of the elements at relatively low temp. (950° for  $\text{Na}_2\text{C}_2$ , 1050-1100° for  $\text{NiC}_2$ ) under pressure.

Study of the vanadium-carbon system. SHOKICHI OYA AND ATOMI OSAWA. *J. Study of Metals* 5, 434-41(1928).—The authors detd. röntgenographically the phases appearing, inferred the order of solidification of the alloys from their microscopic examn and proposed a qual. constitutional diagram. According to x-ray analysis, V has a body-centered cubic lattice having the lattice const.  $a = 3.024$  A. U. In the alloys of the V-C system there appear 2 phases besides the one ( $\alpha$ ) consisting mainly of V. One of these is the  $\beta$ -phase, having a close-packed hexagonal lattice with the avul ratio 1.59, and the other is the  $\epsilon$ -phase, which has a face-centered cubic lattice. In 1-4% C alloys there are 2 patterns due to the body-centered cubic and the close-packed hexagonal lattices; in 4-6% C alloys only the pattern due to the close-packed hexagonal lattice appears; in 6-14% C alloys the interference patterns due to the close packed hexagonal and the face-centered cubic lattices appear, while at 14-15% C only the face-centered pattern appears. The no. of atoms per unit cube was calcd. from the d. actually detd., from which the chem. formulas of the 2 carbides were shown to be  $\text{V}_3\text{C}$  (the  $\beta$ -phase) and  $\text{V}_4\text{C}_3$  (the  $\epsilon$ -phase). The alloys of the range of compn. for which only the patterns belonging to one of the above compds. appear consist of the homogeneous phases of  $\beta$  or  $\epsilon$ , while those for which the 2 kinds of patterns appear consist of the eutectic of  $\alpha + \beta$  or of  $\beta + \epsilon$ .

Physical properties and methods of test for some sheet non-ferrous metals. J. R. TOWNSEND, W. A. STRAW AND C. H. DAVIS. *Proc. Am. Soc. Testing Materials* (preprint) No. 46, 36 pp. (1929).—Com. hardness limits for 4 brass alloys, and for 2 alloys each of nickel silver and phosphor bronze, have been developed based on a Rockwell hardness-tensile strength relationship. Refinements in the application of the Rockwell hardness test as an inspection instrument have been worked out, and it is shown that agreements of  $1\frac{1}{2}$  Rockwell numbers or better can be obtained between producer and consumer on com. shipments of material.

Crystalline changes in copper due to annealing. F. C. HOWARD AND E. T. DUNN. *Ind. Eng. Chem.* 21, 550-3(1929).—A cold drawn Cu rod was annealed at 700° for a definite time, then allowed to cool in the air and examd. photomicrographically. After examn. the specimen was replaced in the furnace and held there for a further definite time. Conc'd.  $\text{HNO}_3$  disclosed the grain boundaries, twinning, etching pits and fine grain structure.  $\text{NH}_4\text{OH}$  and  $\text{H}_2\text{O}_2$  showed twinning and etching pits, sometimes the fine grain structure but not to the same extent as  $\text{HNO}_3$ . The photomicrograph shows clearly the grain growth accompanying repeated heating.

**Bearing bronzes with and without zinc.** H. J. FRENCH AND E. M. STAPLES. *Proc. Am. Soc. Testing Materials* (preprint) No. 49, 33 pp. (1929).—Bronzes in the Cu corner of the Cu-Sn-Pb system are classified according to the character of service for which they seem to be best adapted, the results being based on lab. tests comprising hardness tests, Izod impact tests, repeated impact tests and wear tests, both with and without lubrication, at temps. within the range 20° to 315°. Bronzes with less than 4% Sn are unsuited for general bearing service. Bronzes with less than about 5% Pb are suited only for service where lubrication can be maintained. Bronzes contg. more than about 5% Pb are best able, of any of the groups studied, to operate for short periods in the absence of lubrication. The addn. of 4% Zn to the bronzes had, in general, small influence upon the properties of the bronzes studied. DOWNS SCHAAP

**Notes on high-resistance bronzes.** DURANTON. *Arts et métiers* 93, 224-5 (1928); *J. Inst. Metals* 40, 511.—The detg. mech. properties of bronzes contg. Cu 90-73%, Sn 5-16%, with or without Zn, Pb and traces of P, and of 62:20:18 Cu-N-Zn and 67:33 Cu-Zn alloys are described. The uses of Delta metal are given and typical compns. suitable for each. High-resistance "Al-bronzes" are of the type 90:10 Cu-Al, and their properties and price here given show them to be suitable for a great variety of industrial purposes. H. L. D.

**X-ray study of castings. I. Perkin's metal.** GUNJI SHINODA. Kyoto Imp. Univ., *Suiyokaishi* 5, 687-94 (1928).—A part of the much disputed Cu-Sn diagram was investigated by x-ray and thermal analysis, elec. resistance measurement and microscopic examn. (1) The soly. of Sn in the  $\alpha$ -solid soln. is 14%. (2) The small thermal effect at 577° is observable in the 14-26% Sn alloys, appears even after annealing for a long time above 700°, and since the quantity of the  $\beta$ -phase increases with increase in Sn content, this thermal effect is caused by the transformation which the said  $\beta$ -phase undergoes. (3) The transformation occurring at 578° for the alloy of the range of 30-38.4% Sn is a peritectoid reaction  $\beta + \text{Cu}_3\text{Sn} \rightarrow \delta$ . (4) There is another eutectoid reaction  $\gamma \rightarrow \beta + \text{Cu}_3\text{Sn}$  occurring at 637°. (5) The range of temp. for which the  $\beta$  and  $\gamma$  phases can coexist lies above 640°. (7) The compd.  $\text{Cu}_3\text{Sn}$  has no soly. on the Cu side. (8) The elec. resistance begins to increase at 120-140°, reaches a max. at 200°, gradually decreases at about 300°, reaches a min. at 330-50°, finally increasing rapidly. (9) The resistance increase occurring at 120-40° is due to some type of decompn. of the  $\beta$ -phase, the min. near 340° is due to the change of the  $\beta$ -phase into  $\alpha$  (which has a small sp. resistance) and some phase which is unstable and richer than  $\delta$  in Sn content, while the rapid increase observed at 420° is due to the formation of  $\delta$  or  $\text{Cu}_3\text{Sn}$ . K. SOMEYA

**Characteristics of very pure and commercial lead.** GEORGE O. HIERS. *Trans. Am. Inst. Chem. Eng.* 20, 131-48 (1928).—Test results are shown on the characteristics of very pure Pb. Similarities of certain varieties of com. Pb, of special use in chem. equipment, are noted. Probably Cu in chem. Pb is present in the most desirable amt. and distribution to account for the marked improvement it imparts to the Pb; Cu may inhibit grain growth. E. M. SYMMES

**Influence of bismuth on the mechanical behavior of lead.** O. BAUER. *Giesserei-Ztg* 25, 298-9 (1928); *J. Inst. Metals* 40, 463.—Bi increases the hardness of Pb and reduces its bending strength very considerably. The rate of corrosion of Pb pipes is seriously increased by the presence of Bi, failure taking place by intercryst. attack. H. L. D.

**Use of lead in mechanical engineering practice.** OWEN W. ELLIS. *Trans. Am. Inst. Chem. Eng.* 20, 167-86 (1928).—The characteristics of Pb and Pb alloys, together with compn. of the latter, are shown. E. M. SYMMES

**Surface charring and scaling of carbon steel in various gases.** W. HÜLSBRUCH. *Mitt. Versuchsanst. Deut.-Luxemburg. Bergwerks-u. Hütten-A.-G. Dortmunder Union* 2, 83-120 (1927); *Chem. Zentr.* 1928, I, 249.—Three steels of different C content (0.50, 0.90, 1.30%) were heated to 750-1050° and the influence of gases upon surface charring and scaling was studied. In blast furnace gas, in the atm. of a red furnace, in tech.  $\text{H}_2$ , in impure  $\text{N}_2$ , charring but no scaling occurred. In steam,  $\text{CO}_2$ , air and oxidizing oven gas there was bad scaling and charring. In  $\text{O}_2$ , dry air, and salt bath there was scaling but less charring. In pure  $\text{H}_2$ , pure  $\text{N}_2$  and imbedded in cast Fe filings there was charring but no scale. In CO and illuminating gas carbonization occurred. A mixt. of  $\text{H}_2$  and  $\text{CH}_4$  was used as an inert medium. FRANCIS P. GRIFFITHS

**Corrosion embrittlement of duralumin. Practical aspects of problems.** H. S. RAWDON. U. S. Natl. Advisory Comm. Aeronautics, *Tech. Notes* 1928, No. 282, 1-11.—An investigation to develop methods of improvement and protection which would assure the reliability and performance of duralumin as a material for aircraft construction is

discussed. Tensile strength and ductility of duralumin sheet are very greatly affected by intercryst. corrosion. The danger from embrittlement decreases as the cross section of duralumin increases. Embrittlement is below the surface. The failure of ordinary coatings is dealt with. Accelerated corrosion tests and the behavior of high-strength aluminum alloys of different compositions. *Ibid* 1928, No. 283, 1-38.—Cu is most closely related to the susceptibility of duralumin to intercryst. corrosion. The microstructural aspects of corroded duralumin are discussed. X-rays are useful for demonstrating the existence of internal stress. R. discusses the method of heat-treatment, which is important in detg. the behavior of the material with respect to corrosion. Effect of previous treatment of sheet material on the susceptibility to this type of corrosion. *Ibid* 1928, No. 284, 1-24.—The effect of variables of heat-treatment of sheet duralumin upon its susceptibility to intercryst. corrosion is discussed. Control of the rate of quenching and avoidance of accelerated aging are the only means of modifying materials so as to minimize intercryst. corrosive attack. The use of protective coatings. *Ibid* 1928, No. 285, 1-31.—Although the corrosion resistance of duralumin sheet is improved by suitable heat-treatment, protection of the surface is still necessary for long life. R. discusses varnish and oxide types of protective coating, metallic coatings, of which Al appears most promising, and test methods. The character of the surface has a noticeable effect upon the rate of corrosive attack. Oxide coatings produced by the anodic method and Al coatings applied by metal spraying are dealt with. From *J. Inst. Metals* 40, 538-9. H. I. D.

Fissuring corrosion (season cracking) of an iron-nickel-chromium alloy. M. SAUVAGEOT. Laboratoire du Creusot des Etablissements Schneider. *Chimie & industrie Special No.*, 421-2 (Feb., 1929).—Ferro-Ni, even when it contains a small proportion of Cr, is subject to the phenomenon of fissuring corrosion (similar to season cracking of brasses) in steam. Although Chevenard has indicated that this can be completely avoided by addn. of massive doses of Cr (at least 10%), a steel contg. C. 0.34, Si 0.33, Mn 1.98, Ni 36.5, Cr 11.4 and Fe 49.8%, when subjected to strains simulating those of the vanes of a turbine in the low-pressure stage, failed by fissuring corrosion.

A. PAPINEAU-COUTURE

The effect of nitrates upon corrosion in tin cans. C. W. CULPEPPER AND H. H. MOON. *Canning Age* 9, 619-20 (1928); *J. Inst. Metals* 41, 545.—Expts. have shown that when solns. of nitrates in tin cans are heated, as in ordinary canning operations, the effect upon the corrosion of the can is often very great. The effect of nitrates is not very great when the acidity is very low, except when very high temps. are used. As the acidity is increased the effect of the nitrate rapidly increases; the effect also increases as the temp. and time of processing are increased. H. L. D.

Critical study of corrosion tests. E. HERZOG AND G. CHAUDRON. *Chimie & industrie Special No.*, 335-42 (Feb., 1929).—Results are given showing that the loss in wt. of metal on corrosion is not a sufficient indication of the change in mech. properties: when there is even and uniform corrosion over the whole surface, the mech. properties are not greatly affected, even with losses in wt. of up to 20%; in the case of corrosion by local action (pitting), fairly small losses in wt. do not greatly affect the breaking load, but the elongation is considerably reduced, and frequently also the resilience. H. and C. consider that the decrease in elongation is the most significant data for indicating local corrosion, though the stamping test may be used for convenience. In the tensile strength test, locally corroded test pieces behave similarly to notched test pieces.

A. PAPINEAU-COUTURE

Action of sea water on ferrous metals. R. GIRARD. *Chimie & industrie Special No.*, 354-65 (Feb., 1929); cf. *C. A.* 20, 573, 3151; 21, 2114.—Previous results are given, together with considerable new data. The technic adopted for the tests is described. Solns. contg. 3 g.  $MgCl_2$  or 1.75 g.  $MgSO_4$  per l. are quite corrosive toward both cast Fe and steel, the latter being attacked to a great extent; O has a decidedly accelerating effect on corrosion. The results with NaCl were previously given (*C. A.* 20, 573). A soln. contg. 1.8 g.  $CaSO_4$  per l. is more corrosive toward steel than cast Fe, in both aerated and deaerated soln., and the Fe<sup>++</sup> corrosion products ppt. better than the Fe<sup>+++</sup>, the adhesion coeff. (ratio of oxides adhering to the metal to oxides theoretically formed, calcd. from the loss of Fe) is considerably higher in deaerated than in aerated soln., the coating of rust formed in deaerated soln. is much more protective (for both Fe and steel) than that formed in aerated soln. With a soln. contg.: NaCl 20,  $MgCl_2$  3,  $MgSO_4$  1.75,  $CaSO_4$  1.8 g. per l., the  $CaSO_4$  seems to exert a fairly strong action by producing a protective coating, which prevents to a considerable extent the corrosive action of the Mn salts, particularly in deaerated soln.; with the same soln. minus  $CaSO_4$ , the corrosive action of the Mg salts preponderates. With a synthetic sea water contg.:

NaCl 27.21,  $MgCl_2$  3.81,  $MgSO_4$  1.66,  $CaSO_4$  1.26,  $K_2SO_4$  0.86,  $MgBr_2$  0.08 g.,  $H_2O$  q. s. for 1000 g., in deaerated soln. the loss in wt. is fairly low and very similar to that obtained with the above-mentioned NaCl- $MgCl_2$ - $CaSO_4$  soln., but the adhesion coeffs. are lower; in aerated soln. the loss in wt. is very great, particularly with steel, and the adhesion coeffs. are decidedly lower than with NaCl- $MgCl_2$ - $MgSO_4$ - $CaSO_4$ . The theoretical and practical conclusions to be drawn from these results are discussed at some length.

Lincoln "Stable-Arc" Welder Instruction Manual. Cleveland: The Lincoln Elec. Co. 94 pp.

SMITHHELLS, COLIN J.: Tungsten: A Treatise on Its Metallurgy, Properties and Applications. London: Chapman & Hall, Ltd. 168 pp. 21s., net. Reviewed in *J. Roy. Soc. Arts* 77, 798 (1929).

Parting composition for foundry use. BENJAMIN F. WALLACE. U. S. 1,717,820, June 18. A finely divided pptd. alk. earth metal carbonate such as  $CaCO_3$  is impregnated with a small proportion of an org. waterproofing substance such as tallow, stearic acid or degrass to form a very light product capable of floating on water for over 14 days.

Apparatus for sintering ores. REED W. HYDE (to Dwight and Lloyd Sintering Co.) U. S. 1,719,114, July 2. Structural features.

Rubber-covered woven metal wire screen suitable for screening minerals. CHAS. F. SHERWOOD (to Oliver-Sherwood Co.). U. S. 1,718,386, June 25.

Apparatus for concentrating ores by washing. ANTOINE FRANCE. Fr. 655,500, June 8, 1928.

Treating sulfur-bearing minerals. MELVILLE F. COOLBAUGH and JOHN B. READ. U. S. 1,719,534, July 2. In order to effect sulfation of minerals such as ores of Cu, Pb, Zn, Au and Ag they are roasted in the presence of a chloride such as NaCl; gases comprising  $SO_3$ ,  $SO_2$  and O are caused to come into contact with the chloride; the S gases present exceed the amt. necessary to expel all chloride and the mineral and gases are moved in the same direction.

Treating ores. SOC. MINIERE ET METALLURGIQUE DE PENARROYA. Fr. 655,615, June 11, 1928. Zn and other ores are calcined or desulfurized by roasting them in a fine state of division with org. material such as saw dust, chaff or waste paper pulp contg. some moisture.

Ores. ALEXANDRE FOLLIET and NICOLAS SAINDERICHIN. Fr. 655,375, May 30, 1928. Zn and mixed ores are enriched by volatilization of the metallic elements by blowing air at a temp. of 650-800° on to a layer composed of the ore in small pieces and mixed with a fuel (coal, lignite, etc.) also in small pieces and a small amt. of an alkali chloride.

Treating antimonial ores. HENRYK GOLDMANN. U. S. 1,719,657, July 2. Sb is leached from ores by use of a non-oxidizing inorg. acid such as HCl contg. a metallic "protoxide salt" such as  $FeSO_4$  having the property of reducing Sb oxide.

Chromium ores. I. G. FARBERIND. A.-G. Fr. 655,793, April 16, 1928. Cr ores are enriched and freed from  $SiO_2$ ,  $Al_2O_3$  and  $MgO$  by treating them above 100° with alkali metal hydroxides or carbonates in the absence of O, preferably under pressure. Cf. C. A. 23, 366.

Tin ores. GUGGENHEIM BROTHERS. Fr. 655,965, June 15, 1928. Crude Sn-contg. material is treated to remove objectionable impurities and reduced in the presence

of a carbonaceous reducing agent and a mixt. of alkali and alk. earth fluxes, preferably lime and soda with excess lime. The charge may be briquetted with molasses, sulfite liquor, etc. The preliminary treatment may consist in heating with a mineral acid and leaching with NaCl and NaOH solns., from which Ag, Bi and Pb may be pptd. by diln. W may be recovered as Ca or Fe tungstate from the NaOH soln. If "hard-head" is treated it is first roasted to oxidize the Sn.

**Treating copper ores.** T. J. TAPLIN, B. TAPLIN and METALS PRODUCTION, LTD. Brit. 300,701, Aug. 19, 1927. In a process as described in Brit. 250,991 (C. A. 21, 1247) in which oxidized Cu ores are heated with a carbonaceous reducing agent in the presence of available halogen, an oxidizing step is interposed after the reduction-halogenation has been carried on for some time and the latter is subsequently resumed. If native Cu or Cu sulfide is present in the initial material, the treatment may commence with an oxidation.

**Treating low-grade iron ore.** A. HOLMBERG. Brit. 300,438, Feb. 11, 1928. In order to render low-grade Fe ore suitable for magnetic concn., it is mixed with powd. fuel and the mixt. is ignited in pans to which air is supplied together with part of the escaping combustion gases in such proportion that the charge is maintained below the sintering temp. A gaseous reducing agent such as producer gas also may be supplied. An app. is described in which the supply of air is varied according to the porosity of the charge by a damper actuated by a relay responsive to the pressure beneath the grate.

**Reducing iron, etc.** M. LAMBOT. Brit. 301,011, Nov. 23, 1927. See Fr. 644,478 (C. A. 23, 1610).

**Magnesium.** WM. KOEHLER. Fr. 655,364, July 29, 1927. See Brit. 300,149 (C. A. 23, 3413).

**Mercury from cinnabar ore.** FRANK M. SCHAD. U. S. 1,718,491, June 25. The finely divided ore is treated with a soln. of a sulfide and sulphydrate such as BaS and NaSH to form a water-sol. Hg compd.

**Removing arsenic from ores, mats, speiss and copper-arsenic compounds.** ERICH KIRMSE and WALTER SCHOPPER (to American Metal Co., Ltd.). U. S. 1,718,825, June 25. The As-contg. material is mixed with materials contg. S and C such as iron pyrites and lignite or coal to form a "self-combustible" mixt.; this mixt. is ignited and its combustion maintained with a limited supply of air to produce an atm. of C oxysulfide in contact with the mixt.

**Treatment of lead-zinc ores.** FRIED. KRUPP GRUSONWERK A.-G. Ger. 477,458, Aug. 9, 1925. Addn. to 473,016. In applying the method of Ger. 473,016 (C. A. 23, 2689) to oxide ores, etc., contg. Pb and Zn, the Pb and Zn are volatilized separately by heating the ore under oxidizing conditions, without addn. of a reducing agent, to volatilize the Pb, and then applying this method to the residue. Cf. C. A. 22, 4451.

**Zinc recovery.** WM. G. HORSCH (to Vulcan Detinning Co.). U. S. 1,719,056, July 2. Material such as galvanized iron scrap is subjected to the action of a solvent such as Na zincate soln. contg. NaOH, which dissolves the Zn but not the Fe to form a metastable soln. as the Zn concn. increases; a Zn-bearing product is recovered from the soln., e. g., by heating with or without addn. of water.

**Zinc.** AUGUSTIN L. J. QUENEAU. U. S. 1,718,378, June 25. ZnO is subjected to the action of a fluid reducing agent such as H or hydrocarbons while held in a molten bath such as chlorides of Na, K and Ca. An app. is described.

**Zinc.** ALEXANDER ROITZHEIM and WILHELM REMY. Ger. 477,457, Nov. 14, 1925. In the manuf. of Zn in continuously operated vertical retorts, the plant is kept in operation for long periods by filling defective retorts with inert material such as sand, and continuing to operate the plant until the no. of defective retorts is uneconomically large. A suitable retort furnace is described. Cf. C. A. 23, 3655.

**Distilling zinc.** NEW JERSEY ZINC CO. Brit. 300,519, Aug. 8, 1927. A porous charge of Zn-bearing material and reducing agent is passed progressively through a horizontal, externally heated reducing chamber without substantial breaking down or relative movement of the agglomerates. Various details of app. are described. Cf. C. A. 23, 2924.

**Metals such as nickel and iron by the carbonyl process.** GENERAL ELECTRIC CO., LTD., L. D. GOLDSMITH and J. F. JACKSON. Brit. 300,691, Aug. 18, 1927. In order to obtain metal powder, the metal carbonyl is decompd. by heat in an enclosure, which is at a temp. below that of decompn. (suitably by mixing the gas stream contg. the relatively cool carbonyl vapor with hot N or CO<sub>2</sub>).

**Shaped copper bodies.** GEBR. SIEMENS & CO. Ger. 473,376, Nov. 10, 1921. Addn. to 454,804. Ger. 454,804 describes the manuf. of shaped Cu bodies by pptg. Cu from a soln. of its salts by means of Fe or Zn, washing the ppt., reducing it with

H at a dark red heat, and shaping the resulting mass by pressure. This method is now modified by using Cu deposited by electrolysis at a high c. d.

**Air and gas supply means for Siemens-Martin and like regenerative furnaces.** MICHEL J. LACKNER. Ger. 477,228, Mar. 8, 1927. Addn. to 436,786.

**Shaft furnace.** CARL LUBER & SOHN. Austrian 111,624, July 15, 1928. A downwardly projecting wall in the shaft prevents the fuel from covering a horizontal grate at the base of the shaft. Air is supplied above the projecting wall through channels, which lead from the space enclosed by a double top cover, the upper member of which has adjustable air inlet holes.

**Supplementary heating means for hearth furnaces.** EISEN- UND STAHLWERK HOESCH A.-G. Ger. 477,063, Mar. 19, 1927.

**Cupola furnace construction.** J. W. JACKMAN & Co., LTD., and F. W. NEVILLE. Brit. 300,405, Dec. 8, 1927. A damper is provided for regulating the effective tuyère area.

**Cupola furnace construction.** P. MARK. Brit. 300,559, Nov. 14, 1927. The lower part of the shaft is surrounded by an annular chamber which communicates with the main shaft through upper and lower openings and serves as a refining chamber for the molten metal. Various structural details are described.

**Cupola furnace construction suitable for melting metals.** WILHELM STEFFE (to Freier Grunder Eisen-und Metallwerke G. m. b. H.). U. S. 1,717,813, June 18.

**Burner construction, etc., for utilizing liquid and gaseous fuels together in open-hearth furnaces or similar apparatus.** GEORGE L. DANFORTH, JR. (to Open Hearth Combustion Co.). U. S. 1,718,732, June 25.

**Blast-furnace top construction.** DAVID BAKER. U. S. 1,717,828, June 18.

**Spray-jet apparatus for washing blast-furnace gas.** SAMUEL STEWART. U. S. 1,718,988, July 2. Structural features.

**Iron oxide.** MAXINE A. MINOT. Fr. 655,258, Sept. 28, 1927.  $\text{Fe}_2\text{O}_3$  extd. magnetically from blast-furnace gas dust is used for purifying coke-oven gas. Residues from roasting pyrites are agglomerated with  $\text{H}_2\text{SO}_4$  and calcined, the gases being led to a Glover tower and crude oxide being obtained.

**Molybdenum-bearing pig iron.** A. KISSOCK (to Climax Molybdenum Co.). Brit. 300,570, Nov. 15, 1927. A Mo-bearing pig iron (which may be made by the process described in Brit. 299,800; C. A. 23, 3432) may be used as an alloying agent in a solid or molten state for admixt. with iron or steel or as part of the charge in a steel-making furnace for the production of gray, white, malleable or semi-steel castings.

**Magnetic elements of iron.** CHARLES H. SEYMOUR. U. S. 1,719,564, July 2. Soft iron elements of electromagnetic devices such as magnet, armature or transformer cores have their susceptibility to heating reduced by heating to redness and quenching in turpentine.

**Cast iron.** MEEHANITE METAL CORP. Fr. 655,602, June 11, 1928. See Brit. 292,164 (C. A. 23, 1382).

**Centrifugally cast-iron pipe.** WM. H. MILLSAUGH (to Paper & Textile Machinery Co.) U. S. 1,717,615, June 18. Pipe is formed with a large proportion of the impurities distributed mainly on the inner portion and forming an irregular surface with interstices filled with a cement lining, thereby being interlocked with the irregularities.

**High-temperature casting investment composition.** CHARLES A. OVERMIRE (to Western Gold & Platinum Works). U. S. 1,719,276, July 2. An investment for casting metals of high m. p. such as Pt or Pd or their alloys comprises at least 50% of  $\text{MgO}$  together with  $\text{CaSO}_4$ .

**Centrifugal metal casting apparatus.** GEORGE W. DAVIS. U. S. 1,719,596, July 2. Structural features.

**Rendering iron surfaces resistant to oxidation.** FLOYD C. KELLEY (to General Elec Co.). U. S. 1,718,563, June 25. In order to render iron resistant to oxidation at high temps., it is heated in H in contact with powd. Cr and Si at a temp. of about  $1350^\circ$ .

**Steel.** FRIED. KRUPP A.-G. Fr. 655,855, June 5, 1928. The limit of drawing in hollow steel bodies, particularly austenitic steel, is increased by forming the alloy by forging, etc., while hot, to a hollow body and expanding this, e. g., by a mandrel, to a degree such that the effort this produced exceeds and increases the original drawing limit.

**Steel.** VEREINIGTE STAHLWERKE A.-G. Brit. 300,553, Nov. 14, 1927. In order to increase the elongation limit and tensile strength of low-C unalloyed or alloy steel, the steel is quenched from a temp. below the range of decompn. of austenite and then stored or heated up to a temp. not exceeding  $250^\circ$ . The steel may contain small proportions of Cr, Ni, Si, Mo or similar elements.

**Hollow drill steel with a lining free from rust.** FAGERSTA BRUKS AKTIEBOLAG. Brit. 301,484, Dec. 1, 1927. Various mech. details of prep. and working hollow drill steel are described.

**Rustproofing iron and steel.** WM. H. COLE. U. S. 1,719,463, July 2. A satd soln. for rustproofing iron or steel is formed by dissolving Al, Zn, Fe and Cr in  $H_3PO_4$  and water. U. S. 1,719,464 relates to the prep. of similar solns. from the metals or oxide. Cf. C. A. 23, 2691.

**Determining foreign substances in iron and steel.** BROR D. ENLUND (to Henning Enlund). U. S. 1,718,687, June 25. The specific elec. resistance of hardened and annealed or normalized test pieces of the material to be tested is compared with known factors to det. the C content.

**Case-hardening.** P. F. M. AUBERT, A. J. P. DUVAL and H. A. M. DUVAL (trading as Aubert et Duval frères). Brit. 300,633, Nov. 17, 1927. Parts of metal articles to be protected from N during nitrogenization are coated with a salt or mixt. of salts or with a glazing or enamel-like material. Chlorides of K, Ba, Ca and Na, Pb oxide, sand and borax, etc., may be used in various mixts.

**Dense sintered metals or metal carbides.** R. WALTER. Brit. 300,972, Nov. 21, 1927. In order to increase the density of a sintered mass of metal or metal carbides such as W, Mo or Ta or their carbides or nitrides, the material is caused to absorb one or more molten metals of lower m. p. such as metals of the Fe or Cr group, or an alloy of Co with a metal of the Cr group, with or without addn. of up to 0.5% of B or Ti or both. An example is given.

**Metallic surfaces.** KOLLOIDCHEMIE STUDIENGESSELLSCHAFT M. B. H., JOHANNES B. CARPZOW, ROBERT LENZMANN, MARTIN MARCH and HERMANN SANDERS. Fr. 656,306, June 20, 1928. Metal surfaces are protected or oxidized metallic surfaces are deoxidized by bringing them in intimate contact with crude mud contg. unsatd  $S_2$  compds. or with active colloidal substances extd. from the mud. The mud may first be allowed to stand for some time in aq. suspension in the absence of air and with the addn. of cultures of bacteria and nutrient therefor.

**Photographic reproductions on metal.** ROBERT W. CARTER. U. S. 1,718,945, July 2. A light-sensitive coating is applied to a metal such as a white heat-resisting alloy and the surface is exposed to light through a half-tone negative; a powder substance such as silicate enamel is then applied for fusing to the metal surface, the light-affected portions are developed and portions are removed together with the powdered material deposited on them; the metal is heated to dissipate the sensitive coating from beneath the deposited material and to fuse the powdered substance to the surface of the metal.

**Superheating metals.** ACIÉRIES DE GENNEVILLIERS. Fr. 656,167, June 21, 1928. Molten metals are superheated by bringing them in contact with a gas carrying a large no. of calories and which is inert to the metal. At. H obtained by circulating mol. H through an elec. arc may be used. Fr. 656,168 describes a method of superheating by means of gases which act exothermally with the metal of the bath, e. g., O or Cl. Addns. such as Mn, C, Si or Al, which combine readily with the gas used, may be added.

**Coating metals.** DR. OTTO SPRENGER PATENTVERWERTUNG JIROTKA M. B. H. Fr. 655,786, Mar. 3, 1928. Al, Mg, Zn, Fe or their alloys are treated in baths contg. sol. permanganates to which substances are added which will ppt. Mn or oxides of Mn. HF, AcOH,  $H_2O_2$  or dichromates are suitable for addn.

**Forming multi-ply metal strips.** H. W. BUNDY. Brit. 300,272, Nov. 11, 1927. Sepd. plies are drawn through a bath of solder and then joined. An app. is described.

**Apparatus for comminuted metal granules to obtain powdered metal.** E. KRAMER and HARTSTOFF-METALL A.-G. HAMETAG. Brit. 300,879, April 27, 1928. The material is subjected to the action of rapidly rotating arms in a hardened steel casing which may contain an inert atm.

**Coating sheet metal containers with paraffin, shellac or similar materials.** CHARLES T. DRAPER (to Draper Mfg. Co.). U. S. 1,718,039, June 18. A meltable substance such as paraffin or shellac is applied to the inner surface of a blank from which a sheet metal container is to be made and, after the container has been formed, it is heated to melt the coating material and rotated to distribute it uniformly and then cooled to effect solidification of the coating.

**Pickling and cleaning metals.** GEORGE D. CHAMBERLAIN (to R. T. Vanderbilt Co.). U. S. 1,719,167, July 2. A small quantity of a condensation product of a nitrogenous base and a ketone, e. g.,  $NH_3$  and acetone, is used with baths such as those formed from  $H_2SO_4$ ; it serves to inhibit attack of the metal. U. S. 1,719,168 specifies the use of  $(CH_3)_2H_4$  as an inhibitor in baths for cleaning or pickling metals. Cf. C. A. 22, 2546 and following abstr.

**Pickling and cleaning metals.** GEORGE D. CHAMBERLAIN (to R. T. Vanderbilt Co.). U. S. 1,719,649, July 2. Metals such as iron or steel are subjected to a non-oxidizing inorg. acid-pickling or cleaning bath such as  $\text{H}_2\text{SO}_4$ ; the chem. action of the acid on the metal is inhibited without interfering with removal of scale or oxide by incorporating in the acid bath a condensation product of an aldehyde such as aldol with an amine such as  $\alpha$ -naphthylamine. U. S. 1,719,650 specifies the use of an inhibiting amine such as dibenzylaniline with thiocarbonyl. Cf. C. A. 22, 2546 and preceding abstr.

**Apparatus for continuous pickling of steel strips.** HARRY M. NAUGLE and ARTHUR J. TOWNSEND (to American Rolling Mill Co.). U. S. 1,718,063, June 18. Structural features.

**Apparatus for pickling strip iron, etc.** HEINRICH BAECKER. Ger. 477,132, Aug. 10, 1927.

**"Oil drawing furnace" for treating steel gears, etc.** ERNEST F. DAVIS (to Warner Gear Co.). U. S. 1,718,779, June 25.

**Tunnel furnace suitable for brazing and annealing in an inert atmosphere.** C. L. IPSEN and J. L. MCFARLAND (to British Thomson-Houston Co., Ltd.). Brit. 301,431, Nov. 29, 1927. Structural features.

**Means for charging annealing furnaces for iron and steel.** FRIED. KRUPP GRUSON-WERK A.-G. Ger. 477,441, Mar. 10, 1926.

**Annealing furnace for sheet iron, etc.** HEINRICH GRÜNEWALD. Ger. 477,178, Feb. 17, 1926.

**Purification of metals.** BRITISH MAXIUM, LTD. Fr. 656,354, Nov. 7, 1927. See Brit. 300,164 (C. A. 23, 3432).

**Coating aluminum.** SPRENGER CORP. M. B. II. Fr. 655,788, Mar. 10, 1928. Coatings are obtained on Al by adding an alkali borate to baths contg. Zn compds., e. g.,  $\text{ZnCO}_3$  and NaCN or  $\text{Na}_2\text{CO}_3$ .

**Refining aluminum.** ALUMINIUM-INDUSTRIE A.-G. Ger. 477,425, Jan. 28, 1926. See Brit. 265,170 (C. A. 22, 195).

**Refining aluminum.** ALUMINIUM-INDUSTRIE A.-G. Ger. 477,500, June 8, 1926. See Brit. 272,246 (C. A. 22, 1737).

**Amalgamating zinc.** BATTERIEN- UND ELEMENTE-FABRIK SYSTEM ZEILER A.-G. Ger. 477,115, Nov. 5, 1927. The Zn containers for small elec. batteries are amalgamated by brushing or swabbing them with a soln. having amalgamating and cleaning properties, e. g., with a soln. of a Hg salt in a solvent promoting the removal of fat, etc.

**Amalgamating zinc.** BATTERIEN- UND ELEMENTE-FABRIK SYSTEM ZEILER A.-G. Ger. 477,684, Mar. 25, 1928. Addn to 477,115. The method of Ger. 477,115 (preceding abstr.) is modified (1) by amalgamating the Zn in sheet form or the like on one side before the containers are formed from it, and (2) by effecting the amalgamation under acid conditions, the excess of acid being removed after the amalgamation with  $\text{CaCO}_3$  or other neutralizing agent.

**Melting and refining bronze, copper, nickel, tin or other non-ferrous metals.** DANIEL CUSHING (to Barrett Co.). U. S. reissue 17,347, July 2. See original pat. No. 1,556,591 (C. A. 20, 36).

**Alloys.** SIEGMUND DEICHES. Fr. 655,487, June 7, 1928. See Brit. 292,936 (C. A. 23, 1383).

**Alloys.** AMERICAN MACHINE & FOUNDRY CO. Fr. 655,510, June 8, 1928. An alloy which may be beaten out to very thin sheets consists of Pb satd. with Mg, i. e., contg. about 0.5% of Mg.

**Alloys.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PROCÉDÉS THOMSON-HOUSTON. Fr. 656,128, June 20, 1928. A brazing alloy contains approx. Cu 84, Sn 8 and Ag 8%.

**Alloys.** FREDY W. RAUTH. Fr. 655,208, June 5, 1928. In making alloys for tools, etc., from carbides of W or Mo and metals of lower f. p., sepn. of C is prevented by cooling the alloys rapidly to temps. at which the C is entirely dissolved. The alloy may be submitted to a thermal treatment after the cooling. Fr. 655,216, June 4, 1928, describes the prepn. of alloys from carbides of W or Mo with electrolytic Fe or Cr, or with these metals obtained by ordinary means but in the presence of about 5% of Cu or Mn.

**Alloys.** THE BARBER ASPHALT CO. Fr. 655,708, June 13, 1928. See Brit. 294,233 (C. A. 23, 1864).

**Light alloys.** GAËTAN PY. Fr. 656,364, Nov. 8, 1927. Light alloys of high resistance are made by adding Cu 4-5, Si 0.55 and Mg 0.95% to Al.

**Lead-tin alloys.** HÜTTENWERKE TEMPELHOF A. MEYER. Ger. 477,379, Oct. 12,

1924. Pb-Sn alloys contg. Sb and (or) Cu are converted into other alloys by fusion followed by slow cooling; the constituents which crystallize are sepd. from those which remain liquid. *E. g.*, by fusing and cooling a mixt. of metal scrap compounded so that Pb and Sn are present in the mixt. in the eutectic ratio, a sepn. of Pb and Sn in the eutectic ratio can be effected. Examples are given and a suitable furnace is described.

**Alloys containing magnesium, copper, aluminum and cadmium.** JOHN A. GANN (to Dow Chemical Co.). U. S. 1,718,642, June 25. Alloys which are suitable for casting comprise Mg as principal constituent together with Cu 3-12%, a smaller proportion of Al, and Cd (suitably about 2%). Cf. C. A. 23, 3203.

**Ferro-aluminum alloy.** RALPH P. DeVRIES and HENRY A. DEFRIES (to Ludlum Steel Co.). U. S. 1,718,685, June 25. Iron is melted and treated with a small proportion of Al to effect deoxidation, and then further treated with addnl. Al to bring the Al content of the mixt. to 60%.

**Bearing metal alloy.** ROBERT J. SHOEMAKER (to S. & T. Metal Co.). U. S. 1,717,469, June 18. An "anti-drossing" metal such as Ca and Al is introduced into molten Pb heated to a temp. sufficient to melt the "anti-drossing" metal, the melt is allowed to cool and Na is added to it at a temp. between the m. p. and vaporizing point of the Na.

**Copper aluminum alloys.** EUGEN VADERS. U. S. 1,718,502, June 25. Alloys which may be used for bearings comprise Cu together with Al 5-9.5, Mn 1-6 and Sn 0.01-2.0%.

**Hardening metals and alloys.** F. THIEMANN. Brit. 301,328, Nov. 24, 1927. Hardening is effected by exposure to gaseous HCN at about 800°. Inert gases such as N, NH<sub>3</sub>, or H may be present and compds. producing HCN such as NH<sub>4</sub>CN may be used.

**Chromium and iron-chromium alloys.** H. G. FLODIN. Brit. 300,637, Nov. 17, 1927. Metals such as these are obtained in spongy form by the reduction of briquets by carbonaceous, siliceous or other reducing agents, *e. g.*, finely crushed Fe ore and Cr ore may be briquetted with C, ferro-Si and a binder and the briquets heated progressively to 800-1300°.

**Laminations for cores of electric transformers, etc.** NAAMLÖÖZE VENNOOTSCHAP PHILIPS' GLOEILAMPENFABRIEKEN. Brit. 300,930, Aug. 13, 1927. C contg. Fe or an Fe alloy contg. at least 40% Ni is subjected to a single heating in air or O until not only a substantial decarbonization but a partial oxidation throughout has been effected and an effective permeability showing large and substantially const. values is attained. Sheets of an Fe alloy contg. 50% Ni may be heated at 900° in air for 20 min.

**Molding ingots.** EMIL GATHMANN. U. S. 1,719,542, July 2. An app. is described by which material such as lime or infusorial earth may be deposited from a reservoir on the upper face of the ingot metal and retrieved from the ingots for further use after the ingots have solidified. U. S. 1,719,543 relates to ingot-mold construction. U. S. 1,719,544 relates to the manuf. of ingot molds by treating the upper end only of the core of a forming mold with a metallic material, which is adapted to alloy with molten iron and which is highly heat-resistant to the cutting action of liquid steel, and then pouring the ingot mold metal into the forming mold and around the core so that the heat-resisting material on the core will be transferred to that portion of the ingot mold which forms the lower portion of the ingot-mold chamber.

**Ingot mold.** RADCLYFFE FURNESS. U. S. 1,717,504, June 18. A mold construction is described which provides for a chilling effect on the contained metal decreasing toward the top because of gradual change in the ratio of perimeter to cross section of the cavity by a gradual change in the contour of the cavity.

**Refractory composition for ingot-mold hot tops.** EUGENE L. MESSLER. U. S. 1,717,575, June 18. Flint clay 40-60 and grog 10-20% are used in a compn also contg. plastic clay.

**Hollow drill rods and similar articles.** PERCY A. E. ARMSTRONG (to Ludlum Steel Co.). U. S. 1,718,210, June 25. A hollow ingot is cast around a central core such as a low-C steel tube and the resulting ingot is then subjected to elongation and reduction of cross section.

**Soldering aluminum.** P. ODAM. Brit. 300,969, Nov. 21, 1927. Al-Si alloys contg. 5-12% Si are used as solders.

**Tempering, welding and brazing composition.** COLIN R. BOWERS (one-fourth to JAMES H. ANDERSON). U. S. 1,718,917, June 25. Borax 1 lb., NH<sub>4</sub>Cl 1 oz., Venetian red 1 oz., NaHCO<sub>3</sub> 1 oz., powd. coke 0.25 oz. and salt 1 oz.

**Arc-welding electrodes.** ALLOY WELDING PROCESSERS, LTD., and E. J. CLARKE. Brit. 301,221, Dec. 20, 1927. Metal electrodes for welding or soldering metals other

than Al or its alloys are made with a flux or slag priming coating contg. sawdust to create a reducing atm. around the arc. Various details and examples are given. Cf. *C. A.* 23, 2693.

**Electric-arc welding.** ELIHU THOMSON (to General Electric Co.). U. S. 1,717,530, June 18. Arc welding is effected in a protective gaseous mixt. formed by disassoc.  $\text{CO}_2$  in the presence of H. An arrangement of app. is described.

**Dip brazing.** OTTMAR M. KREMB. U. S. 1,719,512, July 2. A flux-free spelter bath is maintained in molten state beneath a stratum of comminuted micaceous material. An app. is described.

## 10—ORGANIC CHEMISTRY

CHAS. A. ROUILLER AND CLARENCE J. WEST

**The preparation of pure hydrocarbons.** J. KLEPPER. *Chimie & Industrie Special No.*, 261-4 (Feb., 1929).—With a Widmer distg. app. a no. of pure hydrocarbons were prepd. by fractionation, and were found to have the following properties: 2,3-octene,  $b_{760}$  123-123.5°,  $n_D^{20.5}$  1.4145,  $d_4^{30}$  0.7127, I no. 220.8 (calcd. 226.7); 1,2-duodecene,  $b_{15}$  93.5°,  $n_D^{21}$  1.4319,  $d_4^{30}$  0.7512; 1,2-tetradecene,  $b_{15}$  124.5-125°,  $n_D^{22}$  1.4392,  $d_4^{30}$  0.7683, I no. 123.1 (calcd. 129.6); octonaphthene (1,3-dimethylcyclohexane),  $b_{760}$  119-23°,  $n_D^{20.5}$  1.4288,  $d_4^{24}$  0.7671; nononaphthene (1,3,5-trimethylcyclohexane),  $b_{760}$  136-40°,  $n_D^{21}$  1.4304,  $d_4^{25.5}$  0.7521; *o*-xylene,  $b_{760}$  141-3°,  $n_D^{20.5}$  1.5102,  $d_4^{28}$  0.8839; *p*-xylene,  $b_{760}$  136-8°,  $n_D^{21}$  1.5004,  $d_4^{28}$  0.8541; *m*-xylene,  $b_{760}$  137-8°,  $n_D^{21}$  1.5018,  $d_4^{28}$  0.8786; nonane,  $b_{760}$  149-51°,  $n_D^{20.5}$  1.4165,  $d_4^{27.5}$  0.7348; decane,  $b_{757}$  165-7°,  $n_D^{24}$  1.4752,  $d_4^{28}$  0.8203; anthracene, m. 217°,  $b_{760}$  354-5°; *meso*-dihydroanthracene, m. 107-8°,  $b_{13}$  165-70°; tetrahydroanthracene, m. 103-4°,  $b_{14}$  170-3°.

**Contributions of x-ray studies of crystal structure to organic chemistry.** WHEELER P. DAVY. *Chem. Reviews* 6, 143-56 (1929); cf. *C. A.* 23, 10.—A brief review of the results of the x-ray analysis of the paraffin hydrocarbons, their alcs., acids and esters, the geometrically isomeric unsatd. acids, the tartaric acids,  $\text{C}_6\text{H}_6$ ,  $\text{C}_{10}\text{H}_8$ , and cellulose. Twenty-eight references are given.

**Oxidation of the gaseous paraffin hydrocarbons.** GUSTAV EGLOFF AND RAYMOND E. SCHAAD. *Chem. Reviews* 6, 91-141 (1929); cf. *C. A.* 23, 3337.—A review. 123 references are given. A program of research is suggested.

**Vapor-phase oxidation of isomeric octanes. II. Octanes with branched chains.** J. C. POPE, F. J. DYKSTRA AND GRAHAM EDGAR. *J. Am. Chem. Soc.* 51, 2203-13 (1929); cf. *C. A.* 23, 3436.—Data are presented on the vapor-phase oxidation of the 5 isomeric  $\text{C}_8\text{H}_{18}$ ,  $\text{BuEtMeCH}$ ,  $\text{Et}_2\text{PrCH}$ ,  $\text{Et}_2\text{CHCHMe}_2$ ,  $\text{Me}_2\text{CHCH}_2\text{CH}_2\text{CHMe}_2$ , and  $\text{Me}_3\text{CHCH}_2\text{CMe}_3$ . Distinct differences exist in the behavior of these hydrocarbons towards O. With the exception of the data for  $\text{Me}_3\text{CHCH}_2\text{CMe}_3$ , the various curves show a marked similarity in general nature to those for *n*- $\text{C}_8\text{H}_{18}$ , the O-consumption curves, e. g., rising rather abruptly at temps. below 300° and then showing little further rise over a considerable temp. range. The extent to which oxidation proceeds, however, before the reaction slows down, varies greatly among the different hydrocarbons. From the data, which are shown in tables and curves, it seems reasonable to assume for the 1st 4 hydrocarbons that, as in the case of *n*- $\text{C}_8\text{H}_{18}$ , the primary product of oxidation is an aldehyde; that this aldehyde is further oxidized by a chain reaction producing aldehyde, CO and  $\text{H}_2\text{O}$  and by a reaction producing aldehyde,  $\text{CO}_2$  and  $\text{H}_2\text{O}$ ; and that these reactions proceed until products are formed which resist further oxidation until temps. are reached which are high enough for general disintegration to occur, accompanied by complete oxidation to  $\text{CO}_2$  and  $\text{H}_2\text{O}$ . O attacks the Me group at the end of the longest open-end straight chain of the hydrocarbon, forming an aldehyde and  $\text{H}_2\text{O}$ ; the aldehyde is oxidized with the formation of an aldehyde of 1 less C atom,  $\text{H}_2\text{O}$  and either CO or  $\text{CO}_2$ . This reaction proceeds until a branch in the hydrocarbon chain occurs, making the oxidation product a ketone instead of an aldehyde; when this stage has been reached the low-temp. oxidation slows down markedly, as it would be expected that a ketone would resist further oxidation more than an aldehyde. In the case of  $\text{Me}_3\text{CHCH}_2\text{CMe}_3$ , the highly condensed structure evidently renders the hydrocarbon so resistant to oxidation that no reaction occurs at all until such high temps. are reached that the reaction, once started, goes rapidly to completion. There is little relation between the temp. of initial attack and the other oxidation characteristics. Certain points of interest bearing on the general problem of hydrocarbon

oxidation are briefly discussed, for which the original should be consulted. **III. The effect of tetraethyl lead and the relation of oxidation to engine detonation.** *Ibid* 2213-20.—Data are presented upon the oxidation of  $C_8H_{18}$  and of  $C_8H_{18}CHO$  in the presence of  $PhEt_4$ . The effect of the  $PhEt_4$  seems to be chiefly that of slowing down the oxidation of aldehydes to  $CO$ ,  $H_2O$  and other aldehydes. The tendency of the hydrocarbons studied to detonate follows the same order as that of the extent to which this reaction occurs at low temps. and the hydrocarbon showing no low-temp. oxidation has less tendency to detonate than any of the others. Apparently, therefore, both the temp. of initial oxidation and the extent to which such oxidation proceeds are factors involved in the detonation phenomena. The mechanism of engine detonation is also discussed.

C. J. WEST

**Thermochemical studies of the acetylene hydrocarbons.** PHILIPPE LANDRIET AND FRANÇOIS BAYLOCO. *Bull. soc. chim.* **45**, 217-25 (1929); cf. *C. A.* **23**, 2967.—For  $\alpha$ -heptene and  $\alpha$ -octene, resp., the following values were obtained: mol. heat of combustion (const. vol.), 1092, 1243.5 cal.; (const. pressure), 1093.5, 1245.5 cal.; mol. heat of formation, -19.5, -8 cal.

DAVID DAVIDSON

**Aliphatic diolefins. II. The preparation and some physical constants of 1,5-hexadiene.** FRANK CORTESE. *J. Am. Chem. Soc.* **51**, 2266-9 (1929); cf. *C. A.* **23**, 3436.—Detailed directions are given for the prepn. of 1,5-hexadiene from  $CH_2=CHCH_2Cl$  or  $CH_2=CHCH_2Br$  and  $Mg$  in  $Et_2O$ , 27 and 36% yields, resp., being obtained. The following consts. were detd.:  $b_{760}$  59.57  $\pm$  0.05°;  $dn/dp$  (750-70 mm) 0.027  $\pm$  0.001°; m. -140.9  $\pm$  0.1°;  $d_4^{20}$  0.7106,  $d_4^{25}$  0.6863;  $n_D^{20}$  1.4076, 1.4014, 1.4012 for 15°, 20°, 25°. The last 5 values are correct within  $\pm$  0.0002. The compd. has a very penetrating, highly "unsatd.," nauseating odor, inducing anesthesia easily. It has a sweet taste when highly dild. with  $H_2O$ . Ordinary samples develop a sharp odor and deposit a yellow oil on standing. It can be identified as the mono  $H_2SO_4$  ester of hexane-2,5-diol.

C. J. WEST

**The most recent processes for the catalytic production of methanol from carbon monoxide and hydrogen.** ARTHUR ULLRICH. *Metallborse* **19**, 1181-2, 1238 9, 1291-5 (1929).—A review.

W. C. EBBACH

**Polyglycerols.** MAURICE RANGIER. *Chimie & industrie Special No.*, 535 (Feb., 1929).—See *C. A.* **22**, 4468.

A. PAPINEAU-COUTURE

**Carbylamines.** M. PASSERINI. *Mem. accad. Lincei* [6], **2**, 377-98 (1927). A résumé of work previously published (*C. A.* **16**, 555; **21**, 1095). P. discusses the reactions of carbylamines with org. acids, aldehydes and ketones in presence of acids, hydrates of chloro aldehydes, phenol and naphthols and pernitroso derivs.

B. C. A.

**Silver cacodylates.** ENRIQUE V. ZAPPI AND ALICE MANINI. *Bull. soc. chim.* **45**, 154-5 (1929).—A double decompn. between  $Me_2AsO_2Na$  and  $AgNO_3$  yields exclusively  $Me_2AsO_2Ag \cdot AgNO_3$ . In order to obtain pure  $Me_2AsO_2Ag$ , freshly prepd wet  $Ag_2O$  is dissolved in a 88% aq.  $Me_2AsO_2H$ , after 12 hrs. 3 vols.  $HNO_3$  is added, and the 1st crop of crystals is filtered off after 24 hrs. The yield is 50% and the crystals are pure. By treatment of the mother liquid, the yield becomes nearly theoretical.

ALBERT L. HENSE

**Thermic decomposition of organo-magnesium alcoholates.** D. IVANOV. *Compt. rend.* **188**, 1259-60 (1929).—I. tried to arrive at ethers from  $Mg$  alcoholates according to the following scheme:  $2 ROMgX \rightarrow R_2O + MgX_2 + MgO$  ( $X = \text{halogen}$ ). Instead, thermic decompn. produced merely  $MgO$ ,  $MgX_2$ , the corresponding ethylene hydrocarbon, its polymers and the corresponding alc. Small quantities are also formed of halogen derivs. of the ethylene hydrocarbons and of the alc., the corresponding aldehyde, satd. hydrocarbons and  $H_2$ . The decompn. of the  $Mg$  alcoholates occurs at the following temps.: primary 330-50°, secondary and hydroaromatic 190-220°, tertiary 140-60°, arylaliphatic 380-400°, phenolates 500°. The reaction was carried out on  $EtOMgBr$ ,  $iso-PrOMgBr$ ,  $tert-BuOMgBr$ ,  $C_6H_{13}OMgBr$ ,  $PhCH_2OMgBr$  and  $PhOMgBr$ . For the prepn. of the  $Mg$  alcoholates by oxidation of org.  $Mg$  halides see Ivanov (*C. A.* **20**, 3893).

G. TOENNIES

**Reaction of a mixture of methyl chloride and methyl bromide with magnesium in ether.** HENRY GILMAN AND R. J. VANDER WAL. *Bull. soc. chim.* **45**, 135-7 (1929).—Criticism of Rudd and Turner (*C. A.* **22**, 1950). Contrary to their conclusions, a mixt. of  $MeCl$  and  $MeBr$  reacts easily with  $Mg$  in  $Et_2O$  and gives a mixt. of  $MeMgBr$  and  $MeMgCl$ , where the bromide is preponderant.

ALBERT L. HENSE

**Mercuric complexes of the olefins.** G. HUGEL AND J. HIBOU. *Chimie & industrie Special No.*, 296-301 (Feb., 1929).—According to Hoffmann and Sand, olefins react with aq.  $Hg(OAc)_2$  solns. to give compds. having the general formula:  $C_nH_{2n}Hg(OH)OAc$ .

The higher hydrocarbons react only very slowly with cold aq.  $\text{Hg}(\text{OAc})_2$  and the reaction takes place more readily in MeOH, giving compds. of the formula  $\text{C}_n\text{H}_{2n}\text{Hg}(\text{OMe})_2(\text{OAc})_2$ , which would indicate that the fixation of Hg salts by olefins is intimately related with a hydrolysis or an alcoholysis, and that it is therefore necessary (in the case of mineral acid salts of Hg) to neutralize the acid liberated in order to obtain a quant. reaction. Salts which are not hydrolyzed (*e. g.*,  $\text{Hg}(\text{CN})_2$  and  $\text{Hg}(\text{CNS})_2$ ) do not react, and if olefin-Hg complexes are treated with KCN or KCNS, they are decompd. with formation of  $\text{Hg}(\text{CN})_2$  or  $\text{Hg}(\text{CNS})_2$ . In order to det. if such hydrolysis is essential to the fixation of Hg salts, 1,2-hexadecene was treated with  $\text{Hg}(\text{OAc})_2$  in glacial AcOH. The hexadecene rapidly dissolves; on cautious addn. of  $\text{H}_2\text{O}$  there ppts. an oil which rapidly crystallizes and has a compn. corresponding to  $\text{C}_{16}\text{H}_{32}\cdot\text{Hg}(\text{OAc})_2$ . This reaction is quite general for all the olefins, and seems to be also general for the Hg'' salts of a large no. of org. acids. The following compds. were thus prepd.:  $\text{C}_2\text{H}_4\cdot\text{Hg}(\text{OAc})_2$ , 2,3-octene.  $\text{Hg}(\text{OAc})_2$ , 1,2-duodecene.  $\text{Hg}(\text{OAc})_2$ , 1,2-tetradecene.  $\text{Hg}(\text{OAc})_2$ , 1,2-hexadecene.  $\text{Hg}(\text{OAc})_2$ , 1,2-hexadecene.  $\text{Hg}(\text{C}_2\text{H}_2\text{ClO}_2)_2$ , 1,2-hexadecene.  $\text{Hg}(\text{C}_3\text{H}_5\text{O}_2)_2$ , 1,2-hexadecene.  $\text{Hg}''$  palmitate, 1,2-hexadecene.  $\text{Hg}''$  stearate. The reaction with  $\text{Hg}(\text{C}_2\text{H}_3\text{ClO}_2)_2$  was carried out in  $\text{CH}_2\text{ClCO}_2\text{H}$ , while the Hg'' palmitate and stearate were dissolved in excess of  $\text{C}_{16}\text{H}_{32}$ . The reaction is quite rapid in all cases, requiring only a few min. Though addn. compds. can be obtained without hydrolysis in the case of org. Hg'' salts, they cannot be thus obtained with inorg. Hg'' salts; *e. g.*,  $1\text{HgOAc}$  does not react directly with  $\text{C}_{16}\text{H}_{32}$  to give  $\text{C}_{16}\text{H}_{32}\cdot 1\text{HgOAc}$ ; but the latter, which is quite stable, is easily obtained by the action of KI on the addn. compd. obtained with  $\text{Hg}(\text{OAc})_2$ . There are also definite indications of the existence of the corresponding purely inorg. addn. compds. They can also be obtained indirectly, *e. g.*, by adding in excess of a concd. aq. soln. of KI to  $\text{C}_{16}\text{H}_{32}\cdot\text{Hg}(\text{OAc})_2$  in  $\text{Et}_2\text{O}$  or  $\text{CHCl}_3$ . Both Ac groups can be replaced by I; on evapn. the soln. gives an oil which spontaneously changes to highly unstable white crystals which, on touching with a glass rod, decomp. into  $\text{C}_{16}\text{H}_{32}$  and yellow  $\text{HgI}_2$ , ultimately changing to red  $\text{HgI}_2$ . Nearly all the addn. compds. of olefins with  $\text{Hg}(\text{OAc})_2$  are obtained as thick oils which ultimately change spontaneously (possibly by isomerization) into cryst. solids, frequently having high mps and of different solubilities; *e. g.*, the oily  $\text{C}_2\text{H}_4$  addn. compd. is sol. in  $\text{Et}_2\text{O}$ , while the cryst. form is insol. The soly. in  $\text{H}_2\text{O}$  decreases as the mol. wt. increases. In  $\text{H}_2\text{O}$  only slightly more than 1 Ac group of  $\text{C}_2\text{H}_4\cdot\text{Hg}(\text{OAc})_2$  can be titrated with NaOH, there being formed a strong base  $\text{HO}\left[\text{Hg}\begin{smallmatrix} \text{C}_2\text{H}_4 \\ \text{OH} \end{smallmatrix}\right]$ , which is sol. in  $\text{H}_2\text{O}$ . Similarly, in  $\text{CHCl}_3$  only slightly more than 1 Ac of  $\text{C}_{12}\text{H}_{24}\cdot\text{Hg}(\text{OAc})_2$  can be titrated. In  $\text{CHCl}_3$ , 1 Ac of  $\text{C}_{16}\text{H}_{32}\cdot\text{Hg}(\text{OAc})_2$  can be titrated, the end point being quite sharp with formation of  $\text{HO}\left[\text{Hg}\begin{smallmatrix} \text{C}_{16}\text{H}_{32} \\ \text{OAc} \end{smallmatrix}\right]$  (I), which decomp. above  $90^\circ$  without melting and by means of which 1 mol. of NaOH can be titrated according to the reversible equation:  $\text{HO}\left[\text{Hg}\begin{smallmatrix} \text{C}_{16}\text{H}_{32} \\ \text{OAc} \end{smallmatrix}\right] + \text{NaCl} \rightleftharpoons \text{Cl}\left[\text{Hg}\begin{smallmatrix} \text{C}_{16}\text{H}_{32} \\ \text{OAc} \end{smallmatrix}\right] + \text{NaOH}$ . In  $\text{Et}_2\text{O}$ , however, Ac of  $\text{C}_{16}\text{H}_{32}\cdot\text{Hg}(\text{OAc})_2$  can be titrated rapidly, and the 2nd Ac very slowly, the final reaction product pptg. out of the  $\text{Et}_2\text{O}$  and corresponding to  $\text{HO}\left[\text{Hg}\begin{smallmatrix} \text{C}_{16}\text{H}_{32} \\ \text{OH} \end{smallmatrix}\right]$ , which acts with NaCl as follows:  $\text{HO}\left[\text{Hg}\begin{smallmatrix} \text{C}_{16}\text{H}_{32} \\ \text{OH} \end{smallmatrix}\right] + \text{NaCl} \rightleftharpoons \text{Cl}\left[\text{Hg}\begin{smallmatrix} \text{C}_{16}\text{H}_{32} \\ \text{OH} \end{smallmatrix}\right] + \text{NaOH}$ , (II)

and with AcOH according to:  $\text{HO}\left[\text{Hg}\begin{smallmatrix} \text{C}_{16}\text{H}_{32} \\ \text{OH} \end{smallmatrix}\right] + \text{AcOH} = \text{AcO}\left[\text{Hg}\begin{smallmatrix} \text{C}_{16}\text{H}_{32} \\ \text{OH} \end{smallmatrix}\right] + \text{H}_2\text{O}$ . (III)

I, isomeric with I, m.  $55-60^\circ$ , and does not react with NaCl to give NaOH, the  $\text{Et}_2\text{O}$  soln. remaining neutral, so that it reacts according to the equation:  $\text{AcO}\left[\text{Hg}\begin{smallmatrix} \text{C}_{16}\text{H}_{32} \\ \text{OH} \end{smallmatrix}\right] + \text{HCl} = \text{Cl}\left[\text{Hg}\begin{smallmatrix} \text{C}_{16}\text{H}_{32} \\ \text{OH} \end{smallmatrix}\right] + \text{NaOAc}$ . This proves that in the addn. compds. of  $\text{Hg}(\text{OAc})_2$  to olefins, the 2 positions occupied by Ac are not equiv.: I is an unstable form of the addn. compd., and it is shown that the titration of the 2 Ac by NaOH in  $\text{Et}_2\text{O}$  is due to the instability of I, which decomp. according to the equation:

The isomerism of the position of the 2 Ac radicals has also been shown by reactions which may be indicated as follows:

I can react with  $\text{C}_n\text{H}_{2n}\text{-Hg}^{++}$  complexes according to either:  $\text{C}_n\text{H}_{2n}\text{-Hg}(\text{OOCR})_2 + 2\text{I} = \text{C}_n\text{H}_{2n}(\text{I})\text{OOCR} + \text{Hg}(\text{I})\text{OOCR}$ , or  $\text{C}_n\text{H}_{2n}\text{-Hg}(\text{OOCR})_2 + 3\text{I} = \text{C}_n\text{H}_{2n}(\text{I})\text{OOCR} + \text{HgI}_2 + \frac{1}{2}\text{RCOOR} + \frac{1}{2}\text{CO}_2$ . H. and H. have not yet succeeded in identifying the compds. of general formula  $\text{C}_n\text{H}_{2n}(\text{I})\text{COOR}$ , so that the equations were confirmed only as regards the compds.  $\text{Hg}(\text{I})\text{COOR}$  and  $\text{HgI}_2$  and the formation of  $\text{RCOOR}$  and  $\text{CO}_2$ . As regards the constitution of these complexes, they admit the existence of a complex univalent cation contg. the Hg, olefin and 1 acid radical, according to the formula  $\text{Ac}'\text{O} \left[ \text{Hg} \begin{smallmatrix} \text{C}_n\text{H}_{2n} \\ \text{OAc} \end{smallmatrix} \right]$  (' designates the anion, ' the cation), which accounts

sufficiently for the difference in reactivity and isomerism of the 2 acid radicals and which has the great advantage of permitting a simple and clear nomenclature. The preceding results were obtained with a view to finding a satisfactory method for the *detn. of unsatd. hydrocarbons* in mixts. This phase of the work is not yet completed, and the chief results obtained to date are briefly summarized as follows: *To det. unsatd. hydrocarbons* treat the mixt. with  $\text{Hg}(\text{OAc})_2$  in glacial  $\text{AcOH}$ ; the unsatd. hydrocarbons dissolve as  $\text{Hg}''$  complexes, and the vol. of unabsorbed hydrocarbons is measured. The satd. hydrocarbons are partly sol., but can be pptd. practically quant by cautious addn. of  $\text{H}_2\text{O}$ . The unsatd. hydrocarbons can be regenerated by addn. of  $\text{HCl}$  to the  $\text{AcOH}$  soln. and their mean mol. wt. detd. The closer the initial and final b. ps., the more accurate the results. *To det. the degree of unsatn.* treat the mixt. with  $\text{Hg}(\text{OAc})_2$  in glacial  $\text{AcOH}$ , sep. the satd. hydrocarbons, ppt. the  $\text{Hg}^{++}$  complexes by addn. of  $\text{H}_2\text{O}$  and ext. with  $\text{Et}_2\text{O}$ ; as each double bond fixes one Hg, the degree of unsatn. can be detd. by titrating with  $\text{NaOH}$  or by titrating Hg with  $\text{SnCl}_2$ . As it seems difficult to det. the conditions under which the  $\text{Hg}^{++}$  complexes behave uniformly as regards direct titration with  $\text{NaOH}$ , it is simpler to neutralize with  $\text{NaOH}$ , add  $\text{NaCl}$  and titrate the liberated  $\text{NaOH}$ . Chloroacetates of cadmium, manganese and cobalt. L. FOGEL, (MISS) T. RUBINSZTEIN AND (MISS) A. TAUMAN. *Roczniki Chem.* 9, 348-53 (353 German)(1929).—By neutralizing the free acids with Cd, Co or Mn carbonates and evapg. in a vacuum desiccator at room temp. the following cryst. salts were prepd.: Cd chloroacetate,  $(\text{CH}_3\text{ClCO}_2)_2\text{Cd} \cdot 6\text{H}_2\text{O}$ ,  $d_{25}$  1.942; dichloroacetate, needles with 1  $\text{H}_2\text{O}$ ,  $d_{25}$  2.131 at 25°; trichloroacetate, needles or rhombs with 1.5  $\text{H}_2\text{O}$ ,  $d_{25}$  2.093. Co chloroacetate  $(6\text{H}_2\text{O})$ , m. 68-9°,  $d_{25}$  2.290; dichloroacetate  $(3\text{H}_2\text{O})$ , m. 115-7°,  $d_{25}$  2.358; trichloroacetate  $(3.5 \text{ H}_2\text{O})$ , m. below 40° (decompn.),  $d_{25}$  1.130. Mn chloroacetate (1.5

H<sub>2</sub>O),  $d_{25}$  1.152; *acid dichloroacetate*,  $3(\text{CHCl}_2\text{CO}_2)_2\text{Mn} \cdot 2\text{CHCl}_2\text{CO}_2\text{H} \cdot 6\text{H}_2\text{O}$ ,  $d_{25}$  1.565; *trichloroacetate* (3.5 H<sub>2</sub>O),  $d_{25}$  1.967. J. KUČERA

**Bicyclic di-tertiary glycol pinacol rearrangements.** JOHN PALMÉN. *III Kemistismölet* (Finland) 1926, 195–208 (1928).—In Swedish. The pinacols may be classified into 4 types each of which has 2 possible rearrangements on dehydration.

1,2-Dimethyl-1,2-dihydroxycyclohexane may become either 1-methyl-1-acetylcyclopentane or 1,1-dimethyl-2-hexanone. The latter has been demonstrated (Nametkin, *C. A.* 18, 2885). To follow this pinacol rearrangement into the bicyclic types it became necessary to synthesize hitherto unknown compds. of santene and camphane origin. The details of this work not being pertinent to the title of this paper are temporarily withheld. Santene glycol on dehydration should give either 1-methyl-1-acetyl-2,5-bicyclomethylenecyclopentane or camphenilone. Dehydration was done with H<sub>2</sub>SO<sub>4</sub> in a freezing mixt. and a 5% yield of camphenilone was isolated. Resinous matter formed simultaneously but the alternative dehydration product was not found. "I have shown that a bicyclic pinacol loses water by simple Me migration without changing the bicyclic system. The chief reaction, however, must be otherwise with a destruction of the mol. since no characteristic products occur. If the glycol has Me substituents in the bicyclic bridge there will be no Me migration on dehydration but a fundamental change resulting in a monocyclic compd. with double bonds. If other substituents than Me are introduced into camphorquinone, the stereo interferences permit only one CO group to react and only keto alcs. result." "If attempt is made to form a carbonyl *o*- to that already present in satenone, colorless hydrates result instead of yellow santenequinone." A. R. ROSE

**Note on the use of aniline in the preparation of amino acids.** H. C. BENEDICT. *J. Am. Chem. Soc.* 51, 2277 (1929).—PhNH<sub>2</sub> can replace C<sub>6</sub>H<sub>5</sub>N in the prepn. of NH<sub>2</sub> acids; alanine is obtained in 50% yield by hydrolyzing a mixt. of AcH (1 mol.), aq. NH<sub>4</sub>Cl (2 mols.) and NaCN (1 mol.) with concd. HCl, evapg. to a thick paste, treating with 10 mols. MeOH, filtering and treating with 1.3 mols. PhNH<sub>2</sub>.  $\alpha$ -Aminoisobutyric and -valeric acids have been prepd. similarly. C. J. WEST

**Relations between rotatory power and structure in the sugar group. XIX. Improvements in the preparation of aldonic acids.** C. S. HUDSON AND H. S. ISBELL. *J. Am. Chem. Soc.* 51, 2225–9 (1929); cf. *C. A.* 22, 3140.—The use of a buffering salt of an org. acid, such as Ba or Ca benzoate, during the oxidation of aldoses by Br-H<sub>2</sub>O, greatly increases the speed of the reaction, because of the maintenance of a relatively low H-ion concn., and permits the oxidation of compound-reducing aldoses, such as lactose, without complications from hydrolysis. The reaction mixt. should be kept

in the dark for the best results. The yields of aldonic acid are nearly quant. With lactose, it is possible to oxidize it to nearly pure lactobionic acid, which can then be hydrolyzed to galactose and gluconic acid, both of which can be obtained in high yields. Examples of the oxidation of glucose, xylose and lactose are given. C. J. WEST

**New derivatives of glycolaldehyde and methylglyoxal.** HERMANN O. L. FISCHER and LEONHARD FELDMANN. *Ber.* 62B, 854-65(1929).—As has been briefly mentioned (*C. A.* 22, 223)  $\text{HOCH}_2\text{CHO}$  (I) and its derivs. can be obtained by ozonizing the appropriate compds. with double bonds and reducing the resulting ozonides with Zn dust and  $\text{AcOH}$ . The prepn. of I from allyl and cinnamic alcs. is now described in detail because others are working along the same line (cf. F. Gottwalt Fischer, *C. A.* 22, 3627). Glucosidic and acyl derivs. of I can be prepd. in the same way. The glucoside *tetraacetate* (II) has not yet been obtained in cryst. form, perhaps because it exists in both a cyclic,  $\text{ROCH}(\text{CH}_2\text{O})$ , and an open form,  $\text{ROCH}_2\text{CHO}$ , but the amorphous

product had the calcd. compn. and with  $\text{HCl}$  in  $\text{MeOH}$  gave a well-crystd. *dimethyl acetal* (III), also obtained from acetobromoglucose,  $\text{Ag}_2\text{CO}_3$  and  $\text{HOCH}_2\text{CH}(\text{OMe})_2$ . Since the ozonization of  $\text{CH}_2=\text{CHCH}_2\text{OH}$  for the prepn. of I gives but a poor yield, other starting materials were sought for. The now technically available monomeric  $\text{AcOCH}:\text{CH}_2$  was treated in  $\text{AcOH}$  with 1 mol.  $\text{Br}_2$  and, without isolating the dibromide, with  $\text{KOAc}$ , which gave a well-crystd. *triacetate* (IV) of I. The free I, however, has thus far been obtained only in poor yield by hydrolysis of IV, nor has it been possible to convert the IV into the cyclomonoacetate of I. IV is also obtained from cryst I and  $\text{Ac}_2\text{O}$ .  $\text{CO}(\text{CH}_2\text{OH})_2$ , refluxed with  $\text{Ac}_2\text{O}$  likewise yields the diacetate  $\text{CO}(\text{CH}_2\text{OAc})_2$  (V) and  $\text{MeCOCHO}$  gives the *dimethyl acetal* (VI) which with cold perhydrol yields a peroxide-like compd.,  $\text{C}_7\text{H}_{10}\text{O}_6$  (VII). The reactions of VII are so anomalous, however, that its structure has not yet been definitely established; it liberates 1 atom I from HI and in  $\text{Ac}$  detns. by the Freudenberg method gives 3 acid groups (probably because the  $\text{MeCOCHO}$  group is oxidized by the O under the conditions of the detn.), on the other hand, with excess of hot  $\text{PhNIINH}_2$ .  $\text{HOAc}$ , it gives the phenylsazone of  $\text{MeCOCHO}$ . The  $\text{MeCOCHO}$  was prepd. by distg.  $\text{CO}(\text{CH}_2\text{OH})_2$  *in vacuo* with  $\text{F}_2\text{O}_2$ , yield, 35-40%. This method of prepg. ketoaldehydes, which has been frequently used for biol. purposes, is now described in detail and a drawing of the app. is given. As the methods mentioned above do not afford a convenient means of prepg. I, the prepn. from dihydroxymaleic acid (VIII) has been improved. With coned  $\text{H}_2\text{O}_2$  the troublesome addn. of fuming  $\text{H}_2\text{SO}_4$  can be entirely avoided. From 200 g. tartaric acid is obtained 48 g. VIII, contaminated with a little Fe salt but admirably adapted to the prepn. of I. The yield of I, m.  $76^\circ$ , from allyl alc. through the ozonide is 20.5%, from cinnamic alc. 6%. *Me allyl carbonate* (63% from allyl alc. and  $\text{ClCO}_2\text{Me}$  in  $\text{C}_6\text{H}_5\text{N}$ ),  $b_{18}$   $38^\circ$ , and yields through the ozonide 39% of *O-carbomethoxyglycolaldehyde*,  $b_{17}$   $78-9^\circ$ , which strongly reduces hot Fehling soln. and with  $\text{HC}(\text{OEt})_3$  and a little  $\text{NH}_4\text{Cl}$  and abs. alc. at room temp. gives after 3 days 50% of the *diethyl acetal*,  $\text{MeO}:\text{COCH}_2\text{CH}(\text{OEt})_2$ ,  $b_{0.3-0.4}$   $72-5^\circ$ ,  $n_D^{20}$  1.4105. II (25-30% from allyl glucoside tetraacetate) is decompd. into I and glucose by hot 0.1 N  $\text{H}_2\text{SO}_4$ . III (40% from II or 12% from  $\text{HOCH}_2\text{CH}(\text{OMe})_2$  and acetobromoglucose), m.  $84^\circ$ ,  $[\alpha]_D^{18} -20.48^\circ$  ( $\text{MeOH}$ ) IV (with GERDA DANGSCHAT), obtained in 16% yield from  $\text{AcOCH}:\text{CH}_2$  or 20% yield from I, m.  $52^\circ$ . V (40% yield), m.  $46-7.5^\circ$ . VI (29%), faintly yellow,  $b_{13}$   $115-6^\circ$ . VII (80%), m.  $78-9^\circ$ , mol. wt. in  $\text{AcOH}$  193. C. A. RUTTLER

**Methyl ethers of diacetyl dioxime.** RICH THILO. *Ber.* 62B, 866-71(1929).—Only a mono- (I) and a di-Me ether (II) of diacetyl dioxime (III) are described in the literature and nothing definite is known as to their structure. I was prepd. by Charrier from  $\text{AcCMe:NOMe}$  with  $\text{NH}_2\text{OH} \cdot \text{HCl}$  in  $\text{Na}_2\text{CO}_3$ ; a repetition of his work gave a 73% yield. The work of Avogadro and Tavola, who obtained II from III with  $\text{Me}_2\text{SO}_4$  in  $\text{NaOH}$ , was also repeated. The yield of II is 65% at most, although no unchanged III remains in the soln. II with fuming  $\text{HCl}$  at about  $60^\circ$  gives, along with unchanged II, only  $\text{Ac}_2$  and  $\text{NH}_2\text{OMe}$ , identified as its  $\text{HCl}$  salt, and I behaves in the same way except that some III can also be extd. with  $\text{Et}_2\text{O}$  from the acid reaction mixt. The residue obtained by evapg. the aq.  $\text{HCl}$  layer reduces Fehling soln. As it is relatively little sol. in alc. and not hygroscopic, it probably consists only of  $\text{NH}_2\text{OH} \cdot \text{HCl}$  and  $\text{NH}_2\text{OMe} \cdot \text{HCl}$ , with no  $\text{MeNH}(\text{OH}) \cdot \text{HCl}$ . With 1%  $\text{HCl}$  at about  $60^\circ$  I gives a mixt. of substances in which were identified unchanged I,  $\text{AcCMe:NOMe}$  and some III;  $\text{Ac}_2$  was present only in traces, if at all. After removal of the  $\text{AcCMe:NOMe}$  and extn. with  $\text{Et}_2\text{O}$ , the soln. on evapg. gave a residue which reduced Fehling soln. If the reaction mixt. is cooled and allowed to stand overnight, all the  $\text{AcCMe:NOMe}$  disappears

and is replaced by **II**; on working up the soln. there are now obtained, together with much unchanged **I**, equiv. amts. of **II** and **III** and the  $\text{Et}_2\text{O}$ -extd. soln. no longer reduces Fehling. Evidently at  $60^\circ$  part of the **I** splits off the  $\text{NOH}$  group and another part the  $\text{NOMe}$  group and on cooling the fragments reunite, partly regenerating **I** and partly forming **II** and **III** in equiv. amts. The cleavage expts. indicate that in both **I** and **II** the ethereal  $\text{Me}$  groups are attached to  $\text{O}$  and the disproportionation of **I** shows that its  $\text{Me}$  group is attached in the same way as those in **II**, a conclusion confirmed by the fact that **I** with  $\text{Me}_2\text{SO}_4$  in weakly alk. soln. gives 91% of **II**. Furthermore,  $\text{AcCMe: NOH}$  with  $\text{NH}_2\text{OMe}$ .  $\text{HCl}$  in faintly alk. soln. gives 80% of **I** and extn. of the reaction mixt. with  $\text{Et}_2\text{O}$  leaves a yellow soln. from which unchanged **I** can be extd. after acidification. This seems to establish beyond doubt the structure of **I** and at the same time of  $\text{AcCMe: NOMe}$ , for this can give **I** with  $\text{NH}_2\text{OH}$  only if the  $\text{Me}$  group in it is on the  $\text{O}$ . Likewise,  $\text{AcCMe: NOMe}$  in alc. with  $\text{NH}_2\text{OMe}$  gives 97% of **II**. All attempts to obtain  $\text{N-Me}$  ethers of **III** have thus far failed. C. A. R.

**Polygalacturonic acid.** WANDA WLOSTOWSKA. *Roczniki Chem.* **9**, 371-89 (1929).—A method of prep. polygalacturonic acid and its  $\text{Na}$  salt as well as its chem. and phys., particularly colloidal, properties are described. J. KUČERA

**Action of phenyl isocyanate on urethans, ureas and thioureas.** HANS LAKRA AND F. B. DAINS. *J. Am. Chem. Soc.* **51**, 2220-5 (1929).—Direct addn. products were obtained with  $\text{PhNCO}$  and  $\text{EtO}_2\text{CNH}_2$ ,  $\text{CO}(\text{NH}_2)_2$ ,  $\text{PhNHCONH}_2$ ,  $\text{CO}(\text{NHPh})_2$ ,  $\text{CS}(\text{NH}_2)_2$  and all isothioureas ethers contg. a free  $\text{NH}$  grouping. In all other cases the results obtained were due either to addn. and subsequent breaking down of the addn. product or dissocn. at the elevated temp. of the urethan, urea, etc., and the reuniting of  $\text{PhNCO}$  and these fission products in various ways. This is illustrated especially by the formation of isocyanuric acid and its derivs. Thiourea ethers, isothioureas ethers and guanidine unite with 2 mols. of  $\text{PhNCO}$  but with only 1 mol. of  $\text{PhNCS}$ . The original should be consulted for the mass of exptl. detail. The following new compds. are reported. *1-Phenyl-4-thiobiuret*, m.  $186^\circ$  from  $\text{PhNCO}$  and  $\text{CS}(\text{NH}_2)_2$  at  $100^\circ$  for 5 hrs.; with  $\text{MeI}$  it gives the *4-Me deriv.*(**I**), m.  $147-8^\circ$ . The  $\text{MeI}$  addn. product of  $\text{CS}(\text{NH}_2)_2$  and  $\text{PhNCO}$  give *methylthiocarbonyldiphenyldiurea*, m.  $142^\circ$ , also obtained from **I** and  $\text{PhNCO}$ . *Thiocarbonyldiphenyldiurea Et ether*, m.  $145^\circ$ , from  $\gamma$ -ethylthiourea and  $\text{PhNCO}$ . C. J. WEST

**Preparation of semicarbazones in pyridine solution.** I. V. HOPPER. *J. Roy. Tech. Coll.* (Glasgow) **2**, No. 1, 52-6 (1929).—Pyridine as a solvent facilitates the prep. of semicarbazones generally and no other reagent need be added to remove  $\text{HCl}$  from the  $\text{H}_2\text{NCONHNH}_2 \cdot \text{HCl}$  as the pyridine is sufficiently basic for this purpose. The aldehyde or ketone is dissolved in pyridine and the theoretical quantity of  $\text{H}_2\text{NCONHNH}_2 \cdot \text{HCl}$  in approx. its own wt. of  $\text{H}_2\text{O}$  is added. The reaction is usually complete within 24 hrs. at ordinary temps. and in some cases the semicarbazone is pptd. immediately. If the semicarbazone is very sol. in  $\text{C}_6\text{H}_5\text{N}$ , it may be pptd. by the addn. of  $\text{H}_2\text{O}$ . The semicarbazones of the following compds. were prepd. by this method:  $\text{MeCOPh}$ , citral,  $\text{AcCH}_2\text{CO}_2\text{Et}$ ,  $\text{B}_2$  and  $\text{MeCOEt}$  (m.  $143^\circ$  after several recrystns.). Attempts to prep.  $[\text{PhC}(:\text{NNHCONH}_2)]_2$  gave no reaction or yielded only diphenyltriazone. Free semicarbazide in anhyd.  $\text{C}_6\text{H}_5\text{N}$  could not be employed on account of its insoly. but  $\text{PhCH}_2\text{NHCONHNH}_2$  is sufficiently sol. to be thus employed.  $\text{PhCH: NNHCONHCH}_2\text{Ph}$  was thus prepd. Acetophenone  $\delta$ -benzylsemicarbazone, m.  $128^\circ$ , sol. in hot  $\text{EtOH}$ ,  $\text{CHCl}_3$ ,  $\text{C}_6\text{H}_6$ ,  $\text{Et}_2\text{O}$ , insol. in  $\text{H}_2\text{O}$ , petroleum, was prepd. from 1.2 g.  $\text{PhCOMe}$  in 20 cc.  $\text{C}_6\text{H}_5\text{N}$  plus 2 g.  $\text{PhCH}_2\text{NHCONHNH}_2 \cdot \text{HCl}$  in 2 cc.  $\text{H}_2\text{O}$ . C. H. PEET

**Synthesis of some alkylxanthines.** D. W. MACCORQUODALE. *J. Am. Chem. Soc.* **51**, 2245-51 (1929).—The following compds. were prepd. because of their possible therapeutic importance. *3,7-Diethyl-8-chloroxanthine* (**I**) (1 g.), m.  $207^\circ$  (cor.), and 15 cc. of 10%  $\text{KOH}$  in abs.  $\text{EtOH}$  give 0.93 g. *3,7-diethyl-8-ethoxyxanthine*, m.  $212^\circ$  (cor.); heating with concd.  $\text{HCl}$  on the  $\text{H}_2\text{O}$  bath for 20 min. gives *3,7-diethyluric acid*, m.  $371-6^\circ$  (cor.) with decompn. **I** and  $\text{MeI}$  with 0.917  $\text{N}$   $\text{KOH}$  give *1-methyl-3,7-diethyl-8-chloroxanthine*, m.  $114.5^\circ$  (cor.); with  $\text{KOH-EtOH}$  this yields the *8-EtO deriv.*, m.  $112^\circ$  (cor.), which with concd.  $\text{HCl}$  gives *1-methyl-3,7-diethyluric acid*, m.  $266^\circ$  (cor.). *1,3,7-Triethyl-8-chloroxanthine*, m.  $79-80^\circ$ ; reduction with  $\text{HI}$  and  $\text{P}$  gives *1,3,7-triethylxanthine*, m.  $113^\circ$ . *3,7-Dibutyl-8-chloroxanthine*, m.  $145^\circ$  (cor.); reduction gives *3,7-dibutylxanthine*, m.  $127^\circ$  (cor.). *1,3,7-Tributyl-8-chloroxanthine*, b<sub>10</sub>  $232-40^\circ$ ; reduction gives *1,3,7-tributylxanthine*, m.  $41-2^\circ$  ( $\text{HCl}$  salt, m.  $131-4^\circ$ ). C. J. WEST

**Acetate of the free aldehyde form of glucose.** M. L. WOLFROM. *J. Am. Chem. Soc.* **51**, 2188-93 (1929).—Glucose ethylmercaptal pentaacetate (**I**) is obtained in 97%

yield by dissolving 5 g. glucose ethylmercaptal in 18 cc. dry  $C_4H_9N$ , cooling in ice and adding slowly 36 cc.  $Ac_2O$ ; after standing overnight the reaction product was poured into 1 l.  $H_2O$  and the ppt. finally recrystd. from  $MeOH$ ; it m.  $45-7^\circ$ ,  $[\alpha]_D^{25} 11.2^\circ$  (1.255 g. in 24.88 cc.  $CHCl_3$ ). I (25.2 g.) in 90 cc.  $Me_2CO$  and 45 cc.  $H_2O$ , treated with 45-50 g.  $CdCO_3$  and 49.5 g.  $HgCl_2$  in 72 cc.  $Me_2CO$ , stirred at room temp. for 24 hrs. with occasional addns. of small amts. of  $CdCO_3$ , then heated at  $50^\circ$  for 15 mins. and finally boiled for 15 mins., gives 10.1 g. of 2,3,4,5,6-pentaacetyl-d-glucose, m.  $116-8^\circ$ ,  $[\alpha]_D^{25} 2.7^\circ$  (0.5028 g. in 10.05 g.  $C_2H_5Cl_4$ ); in  $CHCl_3$ ,  $[\alpha]_D^{24} -4.6^\circ$  (c 4.997),  $-4.8^\circ$  (c 4.725); in  $MeOH$   $[\alpha]_D^{25} 10$  (c 4.980 or 2.013); in the last 2 solvents the rotation slowly changes in the *d*-direction, probably due to acetal formation. The crystals are monoclinic,  $\alpha$  1.460,  $\beta$  1.500-,  $\gamma$  1.515. It gives a positive fuchsin or Schiff aldehyde reaction. It dissolves in  $H_2O$  on slight heating and gives a *d*-glucose semicarbazone pentaacetate, m.  $150^\circ$ . This compd. possesses the open-chain, free aldehyde structure and the name  $\mu$ -*d*-glucose pentaacetate is proposed.

C. J. WEST

**Behavior of glucose on heating in alkaline solution.** F. FISCHLER, K. TAUFEL, AND S. W. SOUCL. *Biochem. Z.* 208, 191-211(1929).—The amt. of acid formed, when the concn. of alkali and glucose as well as the time are const., increases gradually with the temp., reaching a max. between  $140^\circ$  and  $150^\circ$ . The reaction time also causes an increase in the acid production, the relation between the 2 being a linear one, but the duration of the reaction necessary to reach the max. amt. of acid production diminishes with the alk. concn. Thus with 0.69 *N* glycerol-KOH soln. the end value is not yet attained at  $98.5^\circ$  after 6 hrs., whereas with 10 *N* soln. it is reached in less than 15 mins. Other factors being const. the acid production is affected very markedly by changes in alk. concn. The acid production is greatest with very small quantities of sugar and diminishes very rapidly with increasing concns. The end products with 1.2 *N* and 10 *N* KOH are:  $CO_2$ ,  $HCO_2H$ ,  $AcOH$ ,  $EtCO_2H$ ,  $PrCO_2H$ , lactic, succinic, oxalic,  $\beta$ -hydroxybutyric acids. With *N* KOH the following distribution of end products was found on the assumption that the total acid production = 100. Of this 7.2% was removed by ordinary distn.; 10.1% by steam distn., and 49.7% extd. by ether

S. MORGULIS

**Sulfuric acid compounds of the sugars. II. A reaction for distinguishing ring-isomeric acylated halogensugars.** HEINZ OHLE, WLADIMIR MARECEK AND WALTER BOURJAU. *Ber.* 62B, 833-54(1929); cf. *C. A.* 19, 2189.—It was shown in the 1st paper that acetobromo- or acetochloroglucose with  $C_4H_9N$  and  $Ag_2SO_4$  gives chiefly tetraacetyl-d-glucosido-1-pyridinium tetracetyl-d-glucosido-1-sulfate,  $AcOCH_2CH(CH(OAc))CH(OAc)CH(OAc)CHOSO_2N(C_4H_9)CH(CH(OAc))CH(OAc)$  (I) and that the reaction is highly characteristic and appar-

ently limited to acylated 1-halogenosugars. Simpler compds. ( $PhCH_2Cl$ ,  $CICH_2CO_2H$ ,  $PhCOCH_2Br$ ) give exclusively the corresponding pyridinium sulfates;  $MeCHClOEt$  almost instantly splits off all its  $Cl$  as  $HCl$  and gives  $MeCH(OEt)_2$ . To det. whether the specificity of the reaction might not be even more pronounced and whether perhaps only pyroid sugar derivs. would give it, a no. of other halogenosugars were studied. With the completely acylated halogenosugars, ester salts of type I are always formed when the sugar has a pyroid structure (acetobromoglucose, acetodibromoglucose, benzobromoglucose and 3-*p*-toluenesulfonyl-2,4,6-triacetyl- $\alpha$ -*d*-glucosyl 1-bromide (II)), also with the halogenosugars derived from acetylated disaccharides of glucose (acetobromocellobiose, acetobromolactose). The compds. so obtained crystallize well and have good soly. relations and the yields are therefore almost always satisfactory. With the derivs. of furoid glucose it is quite different. 3-*p*-Toluenesulfonyl-2,5,6-triacetyl- $\alpha$ - (III), 2-acetyl-3,5,6-tri-*p*-toluenesulfonyl- (IV) and 2-acetyl-3-*p*-toluenesulfonyl-5,6-dibenzoyl-*d*-glucosyl 1-bromide (V) gave sirupy products. The product from III was sol. in  $H_2O$  and it could readily be shown that it contains all its S in sulfate form and therefore must have the structure  $RN(C_4H_9)OSO_2N(C_4H_9)R$  ( $R$  = sugar residue) (VI). Acetochloro-*l*-arabinose and acetochloro-*l*-xylose gave cryst. esters of type I in good yield and acetobromo-*d*-galactose yielded in addn. a sulfate of type VI. The reaction with pyroid derivs. is therefore not limited to the formation of esters of type I (in other cases also, the formation of sulfates of type VI was observed); this is easily explained, for there are 2 competing reactions: (1) addn. of  $C_4H_9N$  to form a pyridinium bromide, and (2) exchange of the Br for the  $H_2SO_4$  residue. This last reaction apparently occurs the more readily the more difficult the addn. of the  $C_4H_9N$  is. The max. yield of I will therefore be obtained when the 2

reactions proceed with equal velocity. Catalytic influences also seem to play a role; thus,  $C_6H_5N$  adds extraordinarily slowly to acetochloroglucose, the greater part of which is recovered unchanged even after 48 hr. at incubator temp., but in the presence of  $Ag_2SO_4$  I is formed normally within 24 hr., just as with the Br deriv. The difference between the pyroid and furoid sugars, therefore, consists in that with the latter the addn. reaction is very much more rapid than the exchange of Br for the  $H_2SO_4$  residue. It is not surprising, therefore, that with certain pyroid derivs. the yield of sulfate is greatly increased at the expense of that of ester;  $\beta$ -acetochlorofructose and the acetochloro- and acetobromo derivs. of mannose and rhamnose gave sirups contg. relatively much sulfate which could be sepd. into their components only after treatment with  $AcOEt$ ; with the mannoses, neither of the 2 fractions so obtained could be made to cryst. and the rhamnoses even yielded 3 fractions: (1) sirup insol. in  $AcOEt$  and contg. only sulfate S; (2) sol. cryst. compd. of the ester type; and (3) sol. sirup contg. the cryst. ester and another substance, apparently chiefly an isomer, for its  $H_2O$  soln. gave only a very slight sulfate reaction. In general, the esters of type I obtained by the above reaction belong to the series epimeric with that of the original halogen-sugar, but with the rhamnoses the cryst. esters seem to belong to the same series, for their rotations are of about the same order as those of the corresponding acylated methyl-lactolides. The rotations of the sirupy fractions (3) are much smaller than those of the cryst. esters, and it is therefore concluded that these sirups consist chiefly of the ester of type I. The same is true of the mannose derivs.: although no cryst. ester could be isolated the rotations of the sirupy fractions pointed to the presence of a mixt. of the  $\alpha$ - and  $\beta$ -forms. The cryst. ester isolated from  $\beta$ -acetochlorofructose showed only a weak *l*-rotation and it is believed that in spite of its being cryst. it was not homogeneous but contaminated with the  $\beta$ -form. Acetobromorhamnose, to which, on the basis of the authors' findings, must be ascribed a pyroid structure, gives with  $MeOH$  and quinoline 40% of  $\gamma$ -triacetyl-*l*-methylrhamnoside, which contains no 1,5-O bridge. The question is: does acetobromorhamnose really contain a 1,5-bridge or is this only formed during the reaction with  $C_6H_5N$  and  $Ag_2SO_4$ ? Taking, for the sake of simplicity, acetobromoglucose, it can react with  $C_6H_5N$  alone only in 2 ways: (A) Simple addn. of the  $C_6H_5N$  between C atom 1 and the Br, with formation of the glucosidopyridinium bromide, or (B) formation of a mol. compd. (VII) followed by a rearrangement of the primary valences with rupture of the ring between C atom 1 and the O atom, attachment of the pyridine N atom to the resulting free valence of the C and migration of the Br to the N (VIII), and finally reformation of the ring through the new free valence on the C atom, a process which can take place only if the C atom with its substituents rotates  $120^\circ$  about the line of union between C atoms 1 and 2 as an axis, there being thus obtained, starting from  $\alpha$ -acetobromoglucose, the  $\beta$ -glucosidopyridinium bromide (IX). In general, the reaction proceeds according to (B). A mol. compd. (VII) between acetobromoglucose and  $C_6H_5N$  has never been isolated but the fact that the glucosidopyridinium salts do not show mutarotation in soln. would indicate that such a compd. is formed. There is no mutarotation, either, when the  $C_6H_5N$  soln. is treated with  $C_6H_5N \cdot HCl$ , *i. e.*, the salts, when once formed cannot rearrange into each other, and the  $\beta$ -salt can be formed from the  $\alpha$ -acetobromoglucose only at the moment of the reaction. An entirely analogous reasoning can be applied to the reaction in the presence of  $Ag_2SO_4$ . Therefore, if the ester resulting from the reaction is of the same series as the original material there has been no intermediate opening of the O ring, whereas if it belongs to the epimeric series, there has occurred a rupture. With acetobromorhamnose the relationships are in principle the same except that, as indicated by its behavior toward  $MeOH$ , there may be a shifting of Ac groups when the ring is ruptured; thus, the 4-Ac group may migrate to the O of the bridge and the bridge is not reestablished in its original form, the product of the reaction now having a 1,4-bridge and being of the  $\beta$ -series. In other words, if the resulting ester is of the same series as the original material, there has occurred no rupture of the bridge, no shifting of an acyl group, and the product must have the same ring structure as the original material. If the ester belongs to the epimeric series, however, there has occurred a rupture of the bridge and the ring structure of the product remains in doubt. In a study of the question whether other tertiary bases than  $C_6H_5N$  can be used for their reaction, the authors started with  $PhNMe_3$ . Conc'd. solns. of  $\alpha$ -acetobromoglucose in  $PhNMe_3$  deposit in 2-3 days crystals of  $PhNMe_3Br$ ; apparently there is first formed the glucosidodimethylphenylammonium salt which is unstable and decomps. into the glucosidomethylphenylamine and  $MeBr$  and the latter then reacts with the excess of  $PhNMe_3$ . In the presence of  $Ag_2SO_4$  was obtained trimethylphenylammonium tetraacetyl- $\beta$ -D-glucosido-1-sulfate (IX). Benzylpyridinium sulfate

from  $\text{PhCH}_2\text{Cl}$ ,  $\text{Ag}_2\text{SO}_4$  and  $\text{C}_6\text{H}_5\text{N}$ , m.  $117-8^\circ$ , quite hygroscopic. [*Carboxymethyl*]-pyridinium sulfate, from  $\text{HO}_3\text{CCH}_2\text{Cl}$ , m.  $177^\circ$  (decompn.). Phenacylpyridinium sulfate (approx. equimol. mixt. of neutral and acid salts obtained from  $\text{PhCOCH}_2\text{Br}$  and  $\text{Ag}_2\text{SO}_4$  in  $\text{C}_6\text{H}_5\text{N}$ ), m.  $210-25^\circ$ . 2,3,4-Triacetyl- $\alpha$ -l-arabinosido-1-pyridinium 2,3,4-triacetyl- $\alpha$ -l-arabinosido-1-sulfate, from  $\beta$ -acetochloroarabinose, m.  $153^\circ$ , gives a ppt. with  $\text{BaCl}_2$  only after boiling with dil. acids or alkalis, weakly reduces hot Fehling soln.,  $[\alpha]_D^{18}$   $27.97^\circ$  ( $\text{CHCl}_3$ ,  $c$  1.430). 2,3,4-Triacetyl- $\alpha$ -l-xylosido-1-pyridinium 2,3,4-triacetyl- $\alpha$ -l-xylosido-1-sulfate, from  $\beta$ -acetochloroxylose, m.  $143^\circ$ ,  $[\alpha]_D^{18}$   $-41.24^\circ$  ( $\text{CHCl}_3$ ,  $c$  1.68). 2,3,4-Triacetyl- $\alpha$ -l-rhamnosyl 1-chloride (acetochlororhamnose) has been obtained by the Pacsu method (with  $\text{TiCl}_4$ ) in cryst. form, m.  $72.5^\circ$ ,  $[\alpha]_D^{20}$   $-127.03^\circ$  ( $\text{CHCl}_3$ ,  $c$  0.858); 2 g. with  $\text{Ag}_2\text{SO}_4$  and  $\text{C}_6\text{H}_5\text{N}$  gave a sirup sepd. by  $\text{AcOEt}$  into 0.3 g. insol. sirup, 0.12 g. crystals, m.  $142^\circ$ ,  $[\alpha]_D^{18}$   $-51.38^\circ$  ( $\text{CHCl}_3$ ,  $c$  0.331) and 0.7 g. sirup with  $[\alpha]_D^{18}$   $-17.08^\circ$  ( $\text{CHCl}_3$ ,  $c$  1.054). 5-Bromo-2,3,4-triacetyl- $\beta$ -d-glucosido-1-pyridinium 6-bromo-2,3,4-triacetyl- $\beta$ -d-glucosido-1-sulfate (with HEINZ ERLBACH), from  $\alpha$ -acetodibromoglucose, crystals with 2 EtOH, m.  $62-9^\circ$ . 3-p-Toluenesulfonyl-2,4,6-triacetyl- $\beta$ -d-glucosido-1-pyridinium 2,4,6-triacetyl- $\beta$ -d-glucosido-1-sulfate, from II, m.  $145-6^\circ$ ,  $[\alpha]_D^{20}$   $-4.47^\circ$  ( $\text{CHCl}_3$ ,  $c$  1.118). The sirup obtained from III showed  $[\alpha]_D^{18}$   $-4.87^\circ$  ( $\text{CHCl}_3$ ). Tetra benzoyl- $\beta$ -d-glucosido-1-pyridinium tetra benzoyl- $\beta$ -d-glucosido-1-sulfate, from  $\alpha$ -benzobromoglucose, m.  $193-4^\circ$ ,  $[\alpha]_D^{18}$   $15.47^\circ$  ( $\text{CHCl}_3$ ,  $c$  0.646).  $\alpha$ -Acetobromogalactose (4.2 g.) gave 2 g. tetraacetyl- $\beta$ -d-galactosido-1-pyridinium tetraacetyl- $\beta$ -d-galactosido-1-sulfate, m.  $172-3^\circ$ , optically inactive in  $\text{CHCl}_3$ , and tetraacetyl- $\beta$ -d-galactosido-1-pyridinium sulfate, m. about  $170^\circ$  (decompn.) (not enough was available for a detn. of the rotation). The  $\text{AcOEt}$ -sol. part of the sirup obtained with acetochloromannose showed  $[\alpha]_D^{20}$   $18.7^\circ$  ( $\text{CHCl}_3$ ), the insol. part was almost inactive. From  $\beta$ -acetochlorofructose (2 g.) were obtained 2 g.  $\text{AcOEt}$ -sol. crystals, sinter  $97^\circ$ , m. completely  $109^\circ$ ,  $[\alpha]_D^{18}$   $-8.48^\circ$  ( $\text{CHCl}_3$ ,  $c$  1.144). Heptaacetyl-d-cellobiosido 1 pyridinium heptaacetyl-d-cellobiosido-1-sulfate, m.  $194-5^\circ$  (decompn.), seps. with 2.5  $\text{H}_2\text{O}$ ; because of its low soly. its rotation could not be detd.  $\beta$ -d-Lactosido analog, from  $\alpha$ -bromoacetolactose, m.  $185-6^\circ$ ,  $[\alpha]_D^{20}$   $-9.44^\circ$  ( $\text{CHCl}_3$ ,  $c$  0.1388). IX, m.  $163-4^\circ$ , reduces hot Fehling soln., is optically inactive in  $\text{H}_2\text{O}$  but on long standing at  $100^\circ$  shows an increasing positive rotation.

C. A. ROUVIER

The acrolein group as a most probable component of all plant lignins. PETER KLASON. *III Nord. Kemistmötet* (Finland) 1926, 213-16(1928).—In Swedish. A theoretical conclusion based on previously published exptl. data. A. R. ROSE

Coniferaldehyde (remarks on the communication of H. Pauly and K. Feuerstein: Hadromal, lignin and coniferaldehyde, its preparation and detection). ARNIM HILLMEYER and ERICH HELLRIEGEL. *Ber.* 62B, 725-7(1929).—In connection with expts on the ultra-violet absorption of lignin and compds. of known constitution such as coniferin, isoeugenol, vanillin, etc., attempts were made to prep. coniferaldehyde (I) by the method of Pauly and Wäscher but without success, and in several respects the intermediate methoxymethylconiferaldehyde (II) also differed widely from the description given by P. and W. On the other hand, the paper of P. and Feuerstein (*C. A.* 23, 2982) agrees satisfactorily with the results of A. and H., not only as to the consts. of I and II but also as to the method of prepn. of I. The color of solns. of I is different in different solvents: yellow in  $\text{H}_2\text{O}$ , the lower alcs., glycol, glycerol, very faintly yellow in iso-AmOH,  $\text{PhCH}_2\text{OH}$  and  $\text{C}_6\text{H}_5\text{N}$ , colorless in  $\text{Et}_2\text{O}$ ,  $\text{Me}_2\text{CO}$ ,  $\text{MeCOEt}$ , hexane,  $\text{CCl}_4$ ,  $\text{CS}_2$ ,  $\text{C}_6\text{H}_6$ , xylene; the yellow  $\text{MeOH}$  soln. is decolorized by  $\text{Et}_2\text{O}$  and the dil. aq. soln. on long standing. II, m.  $80.3-1.5^\circ$ , b.  $179-83^\circ$ . I, m.  $82.5^\circ$ . The II was prepd. by heating methoxymethylvanillin at  $65-8^\circ$  for 3 hrs. in  $\text{H}_2\text{O}$ - $\text{EtOH}$  (1:5) and 0.1 N alkali with 2-3 times the calcd. amt. of  $\text{AcH}$  passed through in gaseous form in  $\text{N}_2$ . I acts as an indicator; the change from the yellow alk. color to colorless on acidit-

cation is very sharp; by interpolation from the values for various common indicators, a  $pH$  of 7.6 is obtained for the turning point of I. The absorption spectrum in the ultra-violet of I (and II) is distinctly different from that of vanillin and permits of distinguishing the 2 aldehydes in 0.0001  $M$  solns. The absorption max. for I lie at 321 and 301 $m\mu$ , for II at 312 and 292 and for vanillin at 303 and 282, the characteristic min. at 262, 257 and 248, resp. The extinction coeff. for I and II in the middle ultra-violet is about 3 times that of vanillin.

C. A. ROULLER

**Molecular structure of inulin. Isolation of a new anhydrofructose.** JAMES C. IRVINE AND JOHN W. STEVENSON. *J. Am. Chem. Soc.* **51**, 2197-203 (1929).—When triacetylulinin(I) and  $HNO_3$  in  $CHCl_3$  react for 30 mins., the greater part of the material is converted into triacetylfructose dinitrate, the esterification being preceded by the opening of the anhydro-linkages. One component of I present to the extent of 20% is resistant to the hydrolytic action and is isolated as triacetyl $\alpha$ -anhydrofructose (II), crystg. with 0.5 mol.  $AcOH$ ,  $m.$  123°,  $[\alpha]_D$  1.5° ( $CHCl_3$ ,  $c$  2.272). The same compd. can be obtained in similar yield from other reactions in which I is used as the starting material. Shaking II in  $MeOH$  contg. 5% of  $Me_3NH$  for 20 min. in the cold gives anhydrofructose,  $m.$  143-5°,  $[\alpha]_D$  30.17° ( $H_2O$ ,  $c$  2.32), is highly hygroscopic and does not reduce Fehling soln. This is quant. convertible into fructose but is much more resistant to hydrolysis than the known derivs. of  $\gamma$ -fructose. Methylation gives a *tri-Me deriv.*, isolated in a dimeric form,  $b_{0.1}$  166°,  $n_D$  1.4730,  $[\alpha]_D$  23.8° ( $CHCl_3$ ,  $c$  2.5). These results indicate that inulin is not related exclusively to a single form of  $\gamma$ -fructose but contains 2 classes of components in the approx. ratio of 4:1. Of these, I is relatively much more stable toward hydrolysis. The additional complication introduced into the constitutional study of inulin through these results is discussed.

C. J. WEST

**Notes on a precipitant for aldehydes.** HENRY LEFFMANN AND CHARLES C. PINES. *Bull. Wagner Free Inst. Sci. Phila.* **4**, 15-6 (1929).—Dimethyldihydroresorcinol (dime-done) yields cryst. ppts. with  $HCHO$ ,  $AcH$ , vanillin, ethylvanillin and salicyl aldehyde. The reagent may be dissolved in  $H_2O$ , alc., or  $MeOH$ . The crystals yielded by  $HCHO$  are always fine and needle-like. Those yielded by  $AcH$  usually are large and prismatic and frequently cross like the letter X, occasionally they resemble those given by  $HCHO$ . Microphotographs of the ppts. yielded by  $HCHO$  and  $AcH$  are given.

JOSEPH S. HEPBURN

**Chlorination of *p*-cymene.** WALTER QVIST. *III Nord Kemistmötet* (Finland) 1926, 194 (1928).—Swedish abstract. Attempts were made to substitute  $Cl$  on the side chains of *p*-cymene using catalysts, light and increased temps., but no satisfactory yield was obtained in any given condition.

A. R. ROSE

**Structure of some phenylated olefins.** K. v. AUWERS. *Ber.* **62B**, 693-701 (1929).—Schlenk and Bergmann (*C. A.* **22**, 4493) are so convinced of the validity of their law that "an unsatd. C atom tends to add Na when it is combined with aryl groups" that because certain styrenes do not add Na they believe the structures generally assigned to them (*c. g.*,  $PhCH:CMc_2$ ,  $PhCMe:CMc_2$ ,  $Ph_2C:CHMe$ ,  $Ph_2C:CMc_2$ ) should be changed (to  $PhCH_2CMe:CH_2$ ,  $PhCHMeCMe:CH_2$ ,  $Ph_2CHCH:CH_2$ ,  $Ph_2CHCMe:CH_2$ ). They have no decisive structural proofs for their proposed formulas, which cannot be reconciled with the formation of the olefins from the carbinols with the  $HO$  group in the  $\alpha$ -position from the  $C_6H_5$  nucleus (*c. g.*,  $PhCH(OH)CHMe_2$  can give only  $PhCH:CMc_2$ , for a migration of the conjugated double bond from the  $\alpha$ - to the  $\beta$ -position would be contrary to all experience in this field). Furthermore, the spectroscopic behavior of these substances shows that they have the structures originally assigned to them; thus,  $PhCH:CH_2$ ,  $PhCH:CHMe$ ,  $PhCH:CMc_2$ ,  $PhCMe:CH_2$ ,  $PhCMe:CHMe$ ,  $PhCMe:CMc_2$ ,  $Ph_2C:CH_2$ ,  $Ph_2C:CHMe$ ,  $Ph_2C:CMc_2$ ,  $PhCH:CHPh$ ,  $PhCH:CMcPh$ ,  $Ph_2C:CHPh$  and  $Ph_2C:CMcPh$  all show more or less strong exaltations ( $E_{2D}$  0.5-3.55), indicating that without exception they contain a conjugated system. On the other hand, calcs. from Klages' data for 3  $\Delta^2$ -styrenes ( $PhCH_2CH:CHMe$ ,  $PhCH_2CH:CMc_2$ ,  $PhCHMeCH:CMc_2$ ) give values of 0.21-0.39.  $Ph_2C:CHCHMe_2$ , readily prepd. from  $Ph_2C(OH)CH_2CHMe_2$ , gave values indicating it belongs to the  $\Delta^1$ -styrenes ( $E_{2D}$  0.88), but when  $Ph_2CHCH_2C(OH)Me_2$  was converted into the chloride and boiled with  $C_2H_5N$  it gave a product contg.  $Cl$  and when the carbinol was distd. under atm. pressure the refraction of the product showed that at the high temp. (about 300°) the  $\Delta^2$ - had partly rearranged into the  $\Delta^1$ -isomer. Again, the data on 3 pairs of Eykman's allyl and propenyl derivs. of aromatic compds. show these isomers can be recognized and distinguished with certainty by the optical method. Some attempts to det. the structures of the styrenes by oxidative degradation were also made.  $Ph_2C:CHCHMe_2$ , boiled a short time in  $AcOH$  with  $CrO_3$ , gave no test for  $Me_2CO$  with va-

nillin- $\text{H}_2\text{SO}_4$ , while the  $\Delta^1$ -isomer gave a positive test on oxidation both with  $\text{CrO}_3$  and with  $\text{O}_3$ . S. and B.'s law, therefore, does not hold generally in its simple form. *4,4-Diphenyl-2-methyl-2-butanol*, from  $\text{Ph}_2\text{CHCH}_2\text{CO}_2\text{Et}$  and  $\text{MeMgI}$ , viscous oil,  $b_{12}$  180-2°,  $d_4^{20}$  1.036,  $n_D^{20}$  1.5636,  $E_D^{20}$  0.11, 0.13, 15%, 15% for  $\alpha$ ,  $D$ ,  $\beta$ - $\alpha$  and  $\gamma$ - $\alpha$ . The following values of  $d_4$  and  $n$  for  $\alpha$ ,  $\text{He}$ ,  $\beta$  and  $\gamma$  have been detd. anew.  $\text{Ph}_2\text{C} \cdot \text{CHMe}$ , 0.9710, 1.56534, 1.57329, 1.58958, — at 78.2°;  $\text{Ph}_2\text{C} \cdot \text{CMe}_2$ , 1.0021, 1.58167, 1.58855, 1.60512, 1.62055 at 17.6°;  $\text{Ph}_2\text{C} \cdot \text{CHPh}$ , 1.0373, 1.62918, 1.64012, 1.66798, — at 78.4°;  $\text{Ph}_2\text{C} \cdot \text{CMePh}$ , 0.9956, 1.58414, 1.59253, 1.61146, — at 100.2°;  $\text{Ph}_2\text{C} \cdot \text{CHCHMe}_2$ , 0.9813, 1.57015, 1.57667, 1.59269, 1.60724 at 17.0°;  $\text{Ph}_2\text{CHCH}_2\text{C}(\text{OH})\text{Me}_2$ , 1.0373, 1.55916, 1.56431, 1.57708, 1.58818 at 18.4°. C. A. R.

Some *p*-ethylenic derivatives of bromobenzene and their organomagnesium compounds. II. RAYMOND QUELET. *Bull. soc. chim.* 45, 255-74 (1929); cf. C. A. 22, 1341, 3150; 23, 2157.—Addn. of 40 g. of *p*-bromopropenylbenzene (I), 0.5 cc. of  $\text{Br}_2$  and several drops of  $\text{EtBr}$  in 75 cc. of anhyd.  $\text{Et}_2\text{O}$  to 4.5 g. of  $\text{Mg}$  in 25 cc. of  $\text{Et}_2\text{O}$ , gave a soln. which upon hydrolysis and fractionation contained 10-15% of I, 43% of propenylbenzene,  $b_{12}$  68° (*di-Br* deriv., m. 68°), and a residue of polymer,  $b_{10}$  180-210°, which contained some *p,p'*-dipropenyldiphenyl, m. 186°. In the same manner, *p*-bromostyrene gave practically no reaction; *p*-bromo- $\Delta^1$ -butenylbenzene (II) gave  $\Delta^1$ -butenylbenzene,  $b_{12}$  80° (*di-Br* deriv. 70°), unchanged II, polymers and *p,p'*-*di*- $\Delta^1$ -butenyldiphenyl; *p*-bromoallylbenzene (III) gave allylbenzene,  $b_{730}$  154°, 20% of III, polymers and *p,p'*-diallyldiphenyl; and *p*-bromo- $\Delta^2$ -butenylbenzene (IV) gave  $\Delta^2$ -butenylbenzene,  $b_{12}$  65°, IV and polymers. The  $\text{Mg}$  deriv. (V) obtained from 40 g. of III was oxidized with a stream of  $\text{O}_2$ , hydrolyzed, acidified with dil.  $\text{HCl}$  and the oil layer washed with 2%  $\text{Na}_2\text{CO}_3$ . Distn. after drying over  $\text{Na}_2\text{SO}_4$  gave 5 g. of *p*-allylphenol,  $b_{12}$  120°,  $b_{732}$  235°. Treatment of V with  $\text{CO}_2$  followed by hydrolysis, gave 25% of *p*-allylbenzoic acid (VI), m. 104-5°, after purification from  $\text{Na}_2\text{CO}_3$  and boiling  $\text{H}_2\text{O}$ . With  $\text{Br}_2$  in  $\text{CCl}_4$ , VI gave the *di-Br* deriv., m. 154°. With  $\text{CH}_2 \cdot \text{CHCH}_2\text{Br}$ , V gave, by the usual treatment, a mixt. of III and 10 g. of *p*-diallylbenzene (VII),  $b_{12}$  94°,  $d_4^{11}$  0.915,  $n_D^{11}$  1.526, which were sepd. by distn. after treating with  $\text{Na}$  to convert III to a compd. of high b. p. With  $\text{Br}_2$ , VII gave the *tetra-Br* deriv., m. 109°. With  $\text{HC}(\text{OEt})_3$ , V gave 12% of *p*-allylbenzaldehyde,  $b_{12}$  113°,  $d_4^{15}$  1.015,  $n_D^{15}$  1.555 (*di-Br* deriv.,  $b_{15}$  193-5°; *semicarbazone*, m. 197°). In the same manner, the  $\text{Mg}$  compd. from 40 g. of I gave 5.6 g. of *p*-propenylphenol,  $b_{12}$  136-7°, m. 93°; 30% of *p*-propenylbenzoic acid, m. 215°, sublimes at 190°; 10 g. of *p*-allylpropenylbenzene,  $b_{11}$  107-8°,  $d_4^{11}$  0.918,  $n_D^{11}$  1.559 (*tetra-Br* deriv., m. 73°); and 15% of *p*-propenylbenzaldehyde,  $b_{17}$  132°,  $d_4^{11}$  1.044,  $n_D^{11}$  1.607 (*semicarbazone*, m. 230°). The  $\text{Mg}$  deriv. from 50 g. of I was treated (cold) with 16 g. of  $\text{EtCHO}$ , hydrolyzed with ice and the  $\text{Mg}(\text{OH})_2$  dissolved with  $\text{NH}_4\text{Cl}$ . The oil soln. was dried and distd., giving 10 g. of *p*-propenylphenylethylcarbinol (VIII),  $b_{11}$  143-5°, m. 57° (*phenylurethan* deriv., m. 235-6°). VIII in  $\text{PhH}$  was slowly added to  $\text{P}_2\text{O}_5$ , decanted off, washed, dried and distd., giving *p*-dipropenylbenzene, m. 63-4°,  $b_{12}$  123-5°, *tetra-Br* deriv., m. 168-9°. A. S. CARTER

Reaction between trimethylethylene oxide and benzylamine. YU. O. GABEL. *Ukrainskii Khim. Zhur.* 2, Sci. Pt. 382-6 (1926); *Chem. Zentr.* 1928, I, 199.— $\text{PhCH}_2\text{NH}_2$  (I) and  $\text{Me}_2\text{C} \cdot \text{CHMe} \cdot \text{O}$  (II) form hydroxyamylbenzylamine,  $\text{Me}_2\text{C}(\text{OH})\text{CHMeNH}_2$

$\text{CH}_2\text{Ph}$  (III). The condensation of 1 mol. of I and 2 mols. of II does not take place. Four mols. of I and 1 mol. of II are heated together in a sealed tube at 160-80° for 6-8 hrs. The reaction product is distd. under 20 mm. and III is obtained between 152-4°. By addn. of 1 mol. of  $\text{H}_2\text{O}$  the reaction may be completed by 5 hrs. heating at 90°. III, liquid,  $d_4^{20}$  0.9514,  $d_4^{15}$  0.9437, insol. in cold  $\text{H}_2\text{O}$ , partially sol. in  $\text{EtOH}$ ,  $\text{Et}_2\text{O}$ ,  $\text{C}_6\text{H}_6$ . Gold salt,  $\text{C}_{12}\text{H}_{20}\text{O}(\text{HCl})_3\text{Au}$ , yellow, m. 140-2°, sol. in  $\text{EtOH}$ ,  $\text{Et}_2\text{O}$ . Picrate,  $\text{C}_{17}\text{H}_{22}\text{O}_6\text{N}_4$ , yellow, m. 163-4°.  $\text{HCl}$  salt, m. 155-7° partially sol. in  $\text{H}_2\text{O}$ ,  $\text{EtOH}$ . F. P. G.

Action of the Grignard reagent on azoxybenzene. W. M. CUMMING AND G. S. FERRIER. *J. Roy. Tech. Coll.* (Glasgow) 2, No. 1, 49-51 (1929).—From analogy with the reaction of  $\text{EtMgI}$  on  $\text{PhNO}_2$  and  $(\text{PhN})_2$ ,  $\text{PhN}_2\text{O}$  should react to give either ethylhydrazobenzene or  $\text{PhNHEt}$  and  $(\text{PhN})_2$ .  $(\text{PhN})_2$  was identified as one product together with a basic oil which was not definitely identified but which smelled strongly of  $\text{PhNHEt}$ . C. H. PEET

Tetraaryldiarsyls. I. F. F. BLICKE AND F. D. SMITH. *J. Am. Chem. Soc.* 51, 2272-6 (1929).—Tetraaryldiarsyls can be prepd. readily by the interaction of  $\text{R}_3\text{AsI}$  and  $\text{Hg}$  in  $\text{C}_6\text{H}_6$  in a N atm.  $\text{Ph}_4\text{As}_2$  in  $\text{PhBr}$  absorbs the theoretical quantity of  $\text{O}$ ; it decolorizes  $\text{KMnO}_4$  in  $\text{Me}_2\text{CO}$  and decolorizes I in  $\text{CCl}_4$ , giving  $\text{R}_3\text{AsI}$ . The soln.

of  $\text{Ph}_3\text{As}$ , is stable toward light. Because of their great reactivity, it seems that their behavior can best be explained by the assumption that the  $\text{R}_3\text{As}$ , dissociates spontaneously into  $\text{R}_2\text{As}$ , i. e., bivalent As radicals.

C. J. WEST

**Forced reaction of phenyl isocyanate, phenyl isothiocyanate and benzophenone anil with phenylmagnesium bromide.** An unusual type of 1,4-addition to a conjugated system that is part aliphatic and part aromatic. HENRY GILMAN, J. E. KIRBY AND C. R. KINNEY. *J. Am. Chem. Soc.* 51, 2252-61 (1929).—The forced reaction of  $\text{PhNCO}$ ,  $\text{PhNCS}$  and  $\text{Ph}_2\text{C:NPh}$  with an excess of  $\text{PhMgBr}$  gives *o*-phenylbenzohydrilamine (I), *o*- $\text{PhC}_6\text{H}_4\text{CHPhNHPH}$ , m. 143-4°, in 30-44, 45 and 42% yields, resp.; the  $\text{HCl}$  salt, m. 182.5°. This was also synthesized from  $\text{PhCH:NPh}$  and *o*- $\text{PhC}_6\text{H}_4\text{MgI}$ . *o*-Iodobiphenyl b. 158,  $d_{25}^{25}$  1.6038. I and concd.  $\text{HCl}$  or  $\text{EtOH-HCl}$  give  $\text{PhNH}_2$  and 9-phenylfluorene (II);  $\text{AcCl}$  and  $\text{Ac}_2\text{O}$  also give II. In the reaction of  $\text{Ph}_2\text{C:NPh}$  and  $\text{PhMgBr}$ , 80% of the amine was recovered after heating at 100° for 10 hrs. The formation of I is unique in the sense that it undoubtedly takes place as a result of a 1,4-addn. to the  $\text{—C:N}$  group in the side chain and 1 of the so-called ethylenic linkages in a  $\text{C}_6\text{H}_4$  ring.

C. J. WEST

**Arylamides of aromatic carboxylic and sulfonic acids.** KURT HELLER. *J. prakt. Chem.* [2], 121, 193-203 (1929).—The arylsulfonamides were made from the sulfonyl chlorides and amines by heating with  $\text{Na}_2\text{CO}_3$  and excess  $\text{PhMe}$  or  $\text{C}_6\text{H}_5\text{Me}_2$  (stirring). The  $\text{NO}_2$  groups were then reduced with Fe powder in hot dil.  $\text{AcOH}$ . In many cases the  $\text{NH}_2$  compds. were diazotized and reduced with  $\text{Na}_2\text{SO}_3$  to hydrazines, which were then condensed with  $\text{AcCH}_2\text{CO}_2\text{Et}$  or  $\text{BzCH}_2\text{CO}_2\text{Et}$  to the corresponding pyrazolones. Many of the amides and pyrazolones gave promising *azo dyes* insol. in alkali (not described). The following new compds. are described: 1,5- $\text{H}_2\text{NC}_{10}\text{H}_6\text{SO}_2\text{NHPH}$ , yellow, m. 171°; 1,8-, yellow, m. 139-40°; 1,4-, m. 190°; 1,7-, m. 146-7°; 1,6-, m. 127-8°; 1,5- $\text{Ar}(\text{OC}_6\text{H}_4)_2\text{SO}_2\text{Cl}$ , m. 129°; 2,6-, m. 107°; 1,5- $\text{HIO}_{10}\text{H}_6\text{SO}_2\text{NHPH}$ , m. 200°; 2,6-, m. 104°; 2,4'- $\text{ClC}_6\text{H}_4\text{CONHC}_6\text{H}_4\text{NH}_2$ , m. 153°; 4,2'- $\text{NO}_2\text{C}_6\text{H}_4\text{CONHC}_6\text{H}_4\text{Cl}$ , m. 160°; 4,2'- $\text{NHC}_6\text{H}_4\text{CONHC}_6\text{H}_4\text{Cl}$ , m. 145°; 2,4,4'-( $\text{NO}_2$ ) $\text{MeC}_6\text{H}_3\text{SO}_2\text{NHC}_6\text{H}_4\text{OMe}$ , m. 135°; 2,4,4'-( $\text{NH}_2$ ) $\text{MeC}_6\text{H}_3\text{SO}_2\text{NHC}_6\text{H}_4\text{OMe}$ , m. 128°; 2,4,2'-( $\text{NH}_2$ ) $\text{MeC}_6\text{H}_3\text{SO}_2\text{NHC}_6\text{H}_4\text{OMe}$ , gave a *hydrazine-HCl*, m. 196°, and from this a *methylpyrazolone*, m. 118°; in what follows, the values after each formula are resp. the m. ps. of the *amine*, the *hydrazine HCl*, and the *methyl- and phenylpyrazolone derivs.*: 2,4,4'-( $\text{NH}_2$ ) $\text{MeC}_6\text{H}_3\text{SO}_2\text{NHC}_6\text{H}_4\text{Me}$ , 128°, 168°, 129°, —; 2,4,2'-( $\text{NH}_2$ ) $\text{MeC}_6\text{H}_3\text{SO}_2\text{NHC}_6\text{H}_4\text{Me}$ , 148°, 199°, 116°, —; 2,3- $\text{NH}_2\text{C}_{10}\text{H}_6\text{CONHPh}$ , 192°, 110°, 179°, 186°; 2,3,2'- $\text{NH}_2\text{C}_{10}\text{H}_6\text{CONHC}_6\text{H}_4$ , 110°, 145°, 129°, 155°; 4,3'- $\text{NH}_2\text{C}_6\text{H}_4\text{SO}_2\text{NHC}_6\text{H}_4\text{NH}_2$ , —, 179-80°, 147°, 168°; 4- $\text{NH}_2\text{C}_6\text{H}_4\text{CONHPh}$ , —, 235°, 271°, —; 4- $\text{BzNHC}_6\text{H}_4\text{NH}_2$ , —, 273°, 233°, 268°; 4,2'- $\text{NH}_2\text{C}_6\text{H}_4\text{CONHC}_6\text{H}_4\text{Cl}$ , —, 180°, 231°, 238°; 2,3,4'- $\text{HIO}_{10}\text{H}_6\text{CONHC}_6\text{H}_4\text{NH}_2$ , —, 295°, 310°, 195°; 2,3,3'- $\text{HOC}_{10}\text{H}_6\text{CONHC}_6\text{H}_4\text{NH}_2$ , —, 175°, 203-5°, 194°.

BEN H. NICOLET

**The *m*-hydroxytolyl sulfones and the *m*-cresolsulfonic acids.** JOSEF ZEHENTER, HANS BOHUNEK and EDUARD NOWOTNY. *J. prakt. Chem.* [2], 121, 223-36 (1929).—The action of  $\text{H}_2\text{SO}_4$  on *m*-cresol gives  $\alpha$ - and  $\beta$ -*m*-hydroxytolyl sulfone ([2,4-Me-(HO) $\text{C}_6\text{H}_3$ ] $_2\text{SO}_2$  (I), and [4,2-Me(HO) $\text{C}_6\text{H}_3$ ] $_2\text{SO}_2$  (II), resp.), with I the chief product. In  $\text{Na}_2\text{CO}_3$ , I gives the *mono-Na salt* (4 $\text{H}_2\text{O}$ ); with alc.  $\text{NaOEt}$ , the *di-Na salt* (1 mol.  $\text{EtOH}$ ). In 4 parts concd.  $\text{H}_2\text{SO}_4$  at room temp., I slowly dissolves to form a *disulfonic acid* of I (III) (isolated through the Pb salt), hygroscopic, m. 65-6°; *di-K salt* (4 $\text{H}_2\text{O}$ );  $\text{Ba salt}$ ,  $\text{C}_{14}\text{H}_{11}\text{O}_{10}\text{S}_2\text{Ba}_{1.5} \cdot 9.5\text{H}_2\text{O}$ , loses 8.5  $\text{H}_2\text{O}$  at 140-50°; *Pb salt*, difficulty sol.,  $\text{C}_{14}\text{H}_{11}\text{O}_{10}\text{S}_2\text{Pb}_{1.5} \cdot 8\text{H}_2\text{O}$ . When I is sulfonated 2 hrs. at 100-20°, there is formed, besides some III, an acid probably 2,4-Me(HO) $\text{C}_6\text{H}_3\text{SO}_3\text{H}$ , since at 170° with *m*-cresol and  $\text{P}_2\text{O}_5$ , I was formed; *K salt* (2 $\text{H}_2\text{O}$ ); *Ba salt* (5 $\text{H}_2\text{O}$ ) (loses 3 $\text{H}_2\text{O}$  at 140°); *Pb salt* (4 $\text{H}_2\text{O}$ ). With  $\text{Na}_2\text{CO}_3$  II gave a *salt*  $\text{C}_{28}\text{H}_{27}\text{O}_8\text{S}_2\text{Na} \cdot \text{H}_2\text{O}$ ; in 4 parts concd.  $\text{H}_2\text{SO}_4$  II dissolved and after some days the mass solidified; through the Pb salt a *disulfonic acid* (IV) of II (with 4.5 $\text{H}_2\text{O}$ , m. 139-40°) was obtained; *K salt*,  $\text{C}_{14}\text{H}_{10}\text{O}_{10}\text{S}_2\text{K}_4 \cdot 4.5\text{H}_2\text{O}$ . Sulfonation of II at 100-20° gave no IV, but cresolmono- and -disulfonic acids. With  $\text{Br}_2$  in  $\text{Et}_2\text{O}$ , II yielded a *tetra-Br deriv.*, m. 220° (decompn.). 4,2-Me(HO) $\text{C}_6\text{H}_3\text{SO}_3\text{H}$  (V) was isolated as a solid (? $\text{H}_2\text{O}$ ), m. 109-10°; *Cu salt* (3 $\text{H}_2\text{O}$ ), loses 2 $\text{H}_2\text{O}$  at 100°. Action of  $\text{Br}_2$  on V or on 2,4-Me(HO) $\text{C}_6\text{H}_3\text{SO}_3\text{H}$  in  $\text{Et}_2\text{O}$  or in  $\text{AcOH}$  gave only 2,4,6-tribromocresol; in  $\text{H}_2\text{O}$  there was also formed a small amt. of a less sol., yellow, *isomeric tribromo-m-cresol*, m. 131° (decompn.).

BEN H. NICOLET

**Nitrating phenol.** STIG VERBEL. *III Nord. Kemistmöte* (Finland) 1926, 193 (1928).—Norwegian abstract. Phenols were nitrated in  $\text{H}_2\text{O}$  with 1-14 *N*  $\text{HNO}_3$  and also 0.0009 *N*  $\text{HNO}_3$ . Advanced nitration sets in at 5 *N*  $\text{HNO}_3$  and even at 4 *N* some dinitro deriv. could be detected. The *o*/*p*-ratio increases with the  $\text{HNO}_3$  concn.,

approaching 1. Arnall (C. A. 18, 674, 2142) reports this ratio 1.5 for nitration tests in org. solvents.

**The constitution of some dichlorophenetidines.** G. BARGELLINI (WITH PIETRO LEONE AND LYDIA MONTI). *Gazz. chim. ital.* 59, 16-32(1929).—In view of the possible value of halogen derivs. of phenetidine in pharmacology and dye manuf., a few Cl derivs. were prepd. and their constitution was established as a beginning of an extensive study in this field. The best conditions for the prepn. of the di-Cl deriv. obtained by Jaeger (cf. *Ber.* 8, 895(1875)) were first detd. but did not establish its constitution, so this problem also had to be solved. Ice-cold abs. EtOH (100 cc.) satd. with HCl gas, dry *p*-HOC<sub>6</sub>H<sub>4</sub>NO (I) (10 g.) added slowly (cooling with ice), let stand several hrs. at room temp., dild. with water, the EtOH removed by distn., made alk. with NaOH, steam-distd. and the solidified distillate recrystd. from dil. EtOH, yields 8 g. of 3,5-dichlorophenetidine (II), m. 46°, b. approx. 275°. HCl and H<sub>2</sub>SO<sub>4</sub> salts, by cooling solns of II in the acids, both hydrolyze readily with boiling water. II refluxed with aq. HCl (10 parts, d. 1.70) for 8-10 hr., poured into water contg. Na<sub>2</sub>SO<sub>3</sub>, neutralized with NH<sub>4</sub>OH, and the ppt. recrystd. from boiling water, yields 3,5,4-Cl<sub>2</sub>(H<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>OH (III), m. 174-5°, which was therefore the compd. obtained by Jaeger from I and HCl in Et<sub>2</sub>O. Aq. K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub> added to III in dil. H<sub>2</sub>SO<sub>4</sub>, filtered, steam-distd. and recrystd. from EtOH, yields 2,6-dichloroquinone, m. 118-20° (cf. *Ber.* 3, 646(1870)), which limits the constitution of III to 2,6,4-Cl<sub>2</sub>(H<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>OH or 3,5,4-Cl<sub>2</sub>(H<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>OH, and of II to 2,6,4-Cl<sub>2</sub>(H<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>OEt or 3,5,4-Cl<sub>2</sub>(H<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>OEt. Whereas aromatic amines condense with aromatic aldehydes and with other compds. which react with NH<sub>2</sub>, II does not react in these ways, probably because of steric impedance which the NH<sub>2</sub> group exercises on the 2 Cl atoms in *o*-position to it, which indicates that the formula of II is 3,5,4-Cl<sub>2</sub>(H<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>OEt. This was proved by prepn. of the 2,6-compd. which had different properties. II (3 g.) suspended in water (10 cc.), let stand several hrs. with Ac<sub>2</sub>O (10 cc.), and the ppt. recrystd. from MeOH, yields the 3,5-dichlorophenacetin, 3,5,4-Cl<sub>2</sub>(AcHN)C<sub>6</sub>H<sub>2</sub>OEt (IV), m. 129-30°. II or IV refluxed 4-5 hrs. with Ac<sub>2</sub>O (10 parts) and AcONa (2 parts), poured into water and the ppt. recrystd. from dil. EtOH, yields the *di-Ac* deriv., 3,5,4-Cl<sub>2</sub>(Ac<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>OEt, m. 86-8°, is converted to IV by heating with NH<sub>4</sub>OH and to II by heating with 20% HCl or with 25% KOH. II (1.7 g.) let stand a few mins. with BzCl (1 g.) in anhyd. Et<sub>2</sub>O, distd., the residue filtered, washed with water contg. HCl, and the residue recrystd. from EtOH, yields the *Bz* deriv., C<sub>15</sub>H<sub>13</sub>Cl<sub>2</sub>O<sub>2</sub>N, m. 188°. II (2 g.) heated 1 hr. at 170-80° with C<sub>6</sub>H<sub>5</sub>(CO)<sub>2</sub>O (1.4 g.), dissolved in boiling water and cooled, deposits 3,5-dichloro-1-ethoxyphenyl *phthalimide*, m. 193-4°. In a similar way was obtained 3,5-dichloro-1-ethoxyphenyl *succinimide*, m. 137°. II diazotized in the ordinary way, treated with alk. β-naphthol and the ppt. washed with water and recrystd. from boiling EtOH, yields the compd., C<sub>15</sub>H<sub>11</sub>Cl<sub>2</sub>O<sub>2</sub>N<sub>2</sub>, red, m. 120°. No phenol could be isolated after boiling the diazo compd., and numerous attempts to couple PhN<sub>2</sub>Cl with II and to condense II with BzH, piperonal, ClC<sub>6</sub>H<sub>3</sub>(NO<sub>2</sub>)<sub>2</sub>, CS<sub>2</sub>, PhNCS, KSCN, etc., were unsuccessful. Besides the method of Hollemann (cf. C. A. 12, 1542), 2,6,4-Cl<sub>2</sub>(H<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>OH (V) can be prepd. conveniently by adding Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> slowly to hot alk. 2,6,4-Cl<sub>2</sub>(O<sub>2</sub>N)C<sub>6</sub>H<sub>2</sub>OH until colorless, cooling, neutralizing with AcOH and recrystg. from C<sub>6</sub>H<sub>6</sub>. V heated 2-3 hrs. with BzH (equimol. parts) in EtOH, the EtOH evapd., let crystallize and the product recrystd. from petroleum ether, yields 1-hydroxy-2,6-dichlorobenzylideneaniline (VI), yellow, m. 99-101°. VI (6.7 g.) in alc. KOH (6 g. in 30 cc.) refluxed with EtI (10 g.) for 3-4 hr., evapd., the residue dissolved in water, extd. with Et<sub>2</sub>O, the ext. evapd., the residue hydrolyzed by boiling with HCl (1:1) for 2-3 hr., dild. with water, cooled, extd. with Et<sub>2</sub>O, NH<sub>4</sub>OH added to the aq. liquor, and the solidified oily ppt. recrystd. from petroleum ether, yields 2,6-dichlorophenetidine (VII), m. 105-7°, sol. in concd. H<sub>2</sub>SO<sub>4</sub>; HCl and H<sub>2</sub>SO<sub>4</sub> salts, prepd. from VII and the boiling acids. VII (2 g.) suspended in water (5 cc.), agitated several min. with Ac<sub>2</sub>O (5 cc.), water added, filtered, washed and recrystd. from boiling EtOH, yields the *mono-Ac* deriv. of VII, 2,6,4-Cl<sub>2</sub>(AcHN)C<sub>6</sub>H<sub>2</sub>OEt, m. 176-8°. VII diazotized in the ordinary way, the product poured into alk. β-naphthol, the ppt. washed and recrystd. from EtOH, yields the *azo* deriv., C<sub>17</sub>H<sub>11</sub>Cl<sub>2</sub>O<sub>2</sub>N<sub>2</sub>, m. 171-3°. VII (2 g.) and piperonal (1.6 g.) refluxed in EtOH for 4 hr., cooled, and the ppt. recrystd. from EtOH, yield 1-ethoxy-2,6-dichloropiperonalaniline, 3,5,4-Cl<sub>2</sub>(EtO)C<sub>6</sub>H<sub>2</sub>N:CHC<sub>6</sub>H<sub>3</sub>:O.CH<sub>2</sub>:O, m. 133-5°. VII (2 g.) refluxed with 1-(O<sub>2</sub>N)<sub>2</sub>C<sub>6</sub>H<sub>3</sub>Cl (2 g.) in EtOH, cooled and the ppt. recrystd. from EtOH, yields 1-ethoxy-2,6-dichloro-2',4'-dinitrodiphenylamine, golden yellow, m. 160-2°. V (3 g.), CS<sub>2</sub> (5 g.), S and EtOH refluxed for 5 hr., evapd., and the residue recrystd. from dil. EtOH, yield 2,6,2',6'-tetrachloro-1,1'-dihydroxydiphenylthiourea, 3,5,4-Cl<sub>2</sub>(HO)C<sub>6</sub>H<sub>2</sub>

$\text{NHCSNHC}_6\text{H}_4(\text{OH})\text{Cl}_2$ -4,3,5, softens  $200^\circ$ , m. around  $210^\circ$  (decompn.). **V** (2.5 g.) and  $\text{PhNCS}$  (2.5 g.) refluxed in EtOH for 2-3 hrs., cooled, filtered, washed, and the residue recrystd. from boiling EtOH, yield 2,6-dichloro-1-hydroxydiphenylthiourea 3,5,4- $\text{Cl}_2(\text{HO})\text{C}_6\text{H}_2\text{NHCNSNHPH}$ , m.  $138-40^\circ$ . **V** (2 g.), 2,4-( $\text{O}_2\text{N}$ ) $_2\text{C}_6\text{H}_3\text{Cl}$  (2.2 g.),  $\text{AcONa}$  (1 g.) and EtOH (20 cc.) refluxed 4 hrs., cooled, filtered and the residue recrystd. from AcOH, yield 2,6-dichloro-1-hydroxy-2',4'-dinitrodiphenylamine, 3,5,4- $\text{Cl}_2(\text{HO})\text{C}_6\text{H}_2\text{NHC}_6\text{H}_3(\text{NO}_2)_2$ -2,4, red, m.  $208-10^\circ$ . **V** (9.3 g.), piperonal (7.6 g.) and EtOH (50 cc.) refluxed 3 hr., cooled, filtered and recrystd. from dil. EtOH, yield 2,6-dichloro-1-hydroxypiperonalaniline, 3,5,4- $\text{Cl}_2(\text{HO})\text{C}_6\text{H}_2\text{N}:\text{CHC}_6\text{H}_3.\text{O}.\text{CH}_2.\text{O}$ , m.  $151-$

$33^\circ$ . The properties of a dichlorophenacetin (**VIII**), m.  $162^\circ$ , prepd. by Reverdin and During (cf. *Ber.* **32**, 154(1899)) were then confirmed, and its constitution was established. **VIII** and concd.  $\text{HCl}$  (10 parts) refluxed 3 hr., dild. with water, neutralized with  $\text{NH}_4\text{OH}$ , steam-distd., and recrystd. from dil. EtOH, yield 2,5-dichlorophenetidine (**IX**), m.  $64^\circ$  (cf. Reverdin and Düring, *loc. cit.*); *picrate*, yellow, m.  $148-50^\circ$ . **VIII** (10 g.) refluxed 6 hr. with aq.  $\text{HI}$  (d. 1.70), poured in water contg.  $\text{Na}_2\text{SO}_3$ , neutralized with  $\text{NH}_4\text{OH}$ , and the ppt. purified with boiling  $\text{C}_6\text{H}_6$ , yields 2,5-dichloro-4-amino-phenol (**X**), m.  $178-9^\circ$ . Aq.  $\text{K}_2\text{Cr}_2\text{O}_7$  added to **X** in dil.  $\text{H}_2\text{SO}_4$ , filtered, washed and steam-distd., yields 2,5-dichloroquinone, m.  $161^\circ$  (cf. *Ann.* **210**, 138(1881)), which establishes the constitution of **X** and therefore of **IX**. **IX** (3 g.), 2,4-( $\text{O}_2\text{N}$ ) $_2\text{C}_6\text{H}_3\text{Cl}$  (**XI**) (2 g.),  $\text{AcONa}$  (2 g.) and EtOH (20 cc.) refluxed 3 hr., dild. with water, steam-distd., to eliminate EtOH and excess **XI**, filtered, and the residue recrystd. from EtOH, yield 1-ethoxy-2,5-dichloro-2',4'-dinitrodiphenylamine, red, m.  $136-8^\circ$ . **IX** (3 g.) and piperonal (2 g.) refluxed in a little EtOH for 3 hr., cooled, and the ppt. recrystd. from boiling EtOH, yield 1-ethoxy-2,5-dichloropiperonalaniline, 2,5,4- $\text{Cl}_2(\text{EtO})\text{C}_6\text{H}_2\text{N}:\text{CHC}_6\text{H}_3.\text{O}.\text{CH}_2.\text{O}$ , yellowish, m.  $148^\circ$ , gives a yellow soln. in concd.  $\text{H}_2\text{SO}_4$ . Expts.

are in progress to prep. the 4th isomeric phenetidine, *viz.*, 2,3-dichlorophenetidine.

C. C. DAVIS

The juxtaposition of carbocycles and heterocycles in organic molecules. HANS v. EULER and EDVARD BRUNIUS. *Svensk Kem. Tid.* **40**, 233-42, 264(1928); cf. Meyer, *C. A.* **23**, 1623.—A brief review of the question of the relative positions of the rings in  $\text{C}_{10}\text{H}_8$ , anthracene, quinhydrone, and disaccharides. In the absence of  $\text{O}_2$ , quinhydrone solns. have a color which deepens with increasing alky. and which is stronger than that of hydroquinone or quinone alone. The authors conclude that quinhydrone forms a colored ion and propose the following structure for quinhydrone:

D. D.

*p*-Methoxycinnamaldehyde and 5-*p*-methoxyphenyl-1-pentadienal. D. VORLÄNDER and KURT GIESELER. *Univ. Halle. J. prakt. Chem.* [2], **121**, 237-46(1929).— $p\text{-MeOC}_6\text{H}_4\text{CH}:\text{CHCHO}$  (**I**) (20-3 g. from 100 g.  $\text{MeOC}_6\text{H}_4\text{CHO}$ ) was condensed with a no. of amines and ketones, and the tendency of the products to form liquid crystals examd. In the following,  $\text{R} = p\text{-MeOC}_6\text{H}_4\text{CH}:\text{CH}-$ ;  $\text{RCH:NPh}$ , from the components (**I** and  $\text{PhNH}_2$ ) in alc., m.  $125^\circ$  (all m. ps. cor.);  $p\text{-RCH:NC}_6\text{H}_4\text{Me}$ , from alc., m.  $126^\circ$ ,  $138^\circ$ ; from  $\text{C}_6\text{H}_6$ , m.  $122^\circ$ ,  $129^\circ$  (where 2 m. ps. are given, they are for the solid and for the liquid crystals, resp.);  $p\text{-RCH:NC}_6\text{H}_4\text{Cl}$ , m.  $133^\circ$ ,  $147^\circ$  (gives also a 2nd monotropic solid phase);  $p\text{-RCH:NC}_6\text{H}_4\text{OH}$ , m.  $196^\circ$ ;  $p\text{-RCH:NC}_6\text{H}_4\text{OMe}$ , m.  $167^\circ$ ,  $180^\circ$ ;  $p\text{-RCH:NC}_6\text{H}_4\text{OEt}$ , m.  $146^\circ$ ,  $181^\circ$ ;  $p\text{-RCH:NC}_6\text{H}_4\text{N}_2\text{Ph}$ , m.  $168^\circ$ ,  $240^\circ$ ;  $p\text{-RCH:NC}_6\text{H}_4\text{CO}_2\text{H}$ , m.  $200-2^\circ$ , decomp. below the m. p. of the liquid crystals; *Et ester*, m.  $97^\circ$ ,  $129^\circ$ ;  $p\text{-RCH:NC}_6\text{H}_4\text{CH}:\text{CHCO}_2\text{Et}$ , m.  $134^\circ$ ,  $188^\circ$ , on cooling the melt gives also a 2nd liquid crystal form, uniaxial, also optically positive.  $\beta\text{-RCH:NC}_6\text{H}_4\text{H}$ , m.  $171^\circ$  (liquid crystal phase monotropic);  $\text{RCH:NNH}_2$ , m.  $210-2^\circ$ ,  $231^\circ$ . Condensation of **I** with ketones gave  $\text{RCH:CHCMe}$ , m.  $108^\circ$ ;  $(\text{RCH:CH})_2\text{CO}$  (**II**), m.  $168^\circ$ ,  $183^\circ$ ; octobromide of **II**, m.  $164^\circ$  (decompn.); *bis-p*-methoxycinnamylidenecyclopentanone, m.  $237^\circ$ ; *bis-p*-methoxycinnamylidenecyclohexanone, m.  $201^\circ$ ,  $212^\circ$ ;  $p\text{-RCH:CHCO}_2\text{C}_6\text{H}_4\text{OH}$  (**III**), m.  $169^\circ$ ;  $p\text{-RCH:CHCO}_2\text{C}_6\text{H}_4\text{OMe}$ , m.  $112^\circ$ ; *Ac deriv.* of **III**, m.  $134^\circ$  (liquid crystals monotropic). With  $\text{AcH}$  in  $\text{MeOH}$  and alkali, **I** gave 5-*p*-methoxyphenyl-1-pentadienal (**IV**),  $\text{RCH:CHCHO}$  (2 g. b<sub>9-11</sub>  $203-11^\circ$  from

50 g. I);  $\text{Ag}_2\text{O}$  with IV gave *p*-methoxycinnamylidenecetic acid (V), m.  $176^\circ$ ,  $216\text{--}8^\circ$ . From the fraction boiling just above IV in its prepn., was isolated *p*-methoxy- $\alpha,\beta$ -dihydrocinnamylidenecetic acid, m.  $136\text{--}8^\circ$  (proof of structure by  $\text{KMnO}_4$  oxidation to  $\text{H}_2\text{C}_2\text{O}_4$  and *p*- $\text{MeOC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{CO}_2\text{H}$ ) which was shown to be formed during the distn. Condensation products of IV with the following amines were made: *PhNH}\_2, m.  $125^\circ$ ,  $135^\circ$ ; *p*- $\text{MeC}_6\text{H}_4\text{NH}_2$ , m.  $133^\circ$ ,  $180^\circ$ ; *p*- $\text{MeOC}_6\text{H}_4\text{NH}_2$ , m.  $192^\circ$ ,  $218\text{--}20^\circ$ ; *p*- $\text{EtOC}_6\text{H}_4\text{NH}_2$ , m.  $167^\circ$ ,  $217^\circ$ ; *p*- $\text{PhN}:\text{NC}_6\text{H}_4\text{NH}_2$ , m.  $174^\circ$ , decomp. below the m. p. of the liquid crystals;  $\beta$ - $\text{C}_{10}\text{H}_7\text{NI}_2$ , m.  $162^\circ$ ,  $200^\circ$ ;  $\text{PhN}_2\text{H}_3$ , m.  $174^\circ$ ,  $183^\circ$ . B. H. N.*

*p*-Methoxycinnamylidenecetic acid. D. VORLÄNDER AND KURT GIESELER. *J. prakt. Chem.* [2], 121, 247-54 (1929).—With  $\text{H}_2\text{C}(\text{CO}_2\text{H})_2$  and  $\text{Ac}_2\text{O}$ , *p*- $\text{MeOC}_6\text{H}_4\text{CH}:\text{CHCHO}$  gave *p*- $\text{MeOC}_6\text{H}_4\text{CH}:\text{CHCH}:\text{C}(\text{CO}_2\text{H})_2$  (I), red, m.  $182^\circ$ ; monohydrate, orange-yellow. Heated with  $\text{C}_6\text{H}_5\text{N}$ , I gave the stable (*trans-trans*?) *p*-methoxycinnamylidenecetic acid (II), yellow needles, m.  $179^\circ$  (all m. p.'s cor.) to liquid crystals, m.  $222\text{--}3^\circ$ ; in sunlight adds  $\text{Br}_2$  in  $\text{CHCl}_3$  giving a tetrabromide, m. about  $180^\circ$  (strong HBr evolution); reduction of II with Na-Hg (using  $\text{CO}_2$ ) gave *p*- $\text{MeOC}_6\text{H}_4\text{CH}(\text{H})\text{CH}(\text{H})\text{CH}_2\text{CO}_2\text{H}$ , m.  $57^\circ$ , which, boiled 6 hrs. with 10% NaOH, gave the isomeric *p*- $\text{MeOC}_6\text{H}_4\text{CH}_2\text{CH}_2\text{CH}:\text{CHCO}_2\text{H}$ , m.  $136\text{--}8^\circ$  (see preceding abstr.). The following derivs. of II were made: *Me*, m.  $129^\circ$ ; *Et*, m.  $66\text{--}8^\circ$ ; *Pr*, m.  $47\text{--}9^\circ$ ; acid chloride (with  $\text{SOCl}_2$ ), m.  $110^\circ$ ; *p*- $\text{EtOC}_6\text{H}_4$  ester, m.  $150^\circ$ , liquid crystals m.  $211^\circ$ ; anilide, m.  $189^\circ$ ; *p*-toluide, m.  $214^\circ$  (monotropic liquid crystals); *p*-aniside, m.  $193^\circ$ , liquid crystals m.  $218^\circ$ ; *p*-phenetide, m.  $182^\circ$ , liquid crystals m.  $220^\circ$ ; piperide, viscous oil. Heated 17-20 min. at  $158\text{--}60^\circ$  with 0.5 its wt. of quinoline, I gave, in addn. to II, an isomer (*trans-cis*?) (III) of II, m.  $128\text{--}31^\circ$ , about 10% of which could be sepd. with petroleum ether. On melting, III partially changed to II; also, more readily, with a trace of  $\text{I}_2$  in sunlight. When II was dissolved in  $\text{Na}_2\text{CO}_3$  soln. and exposed 120 hr. to ultraviolet light, a portion was converted to further isomers. The 2 fractions, m.  $90\text{--}6^\circ$  and  $106\text{--}10^\circ$ , readily gave II with  $\text{I}_2$  in sunlight, and may be the remaining isomers of II. BEN H. NICOLET

Synthesis of ephedrine and structurally similar compounds. III. A new synthesis of  $\alpha$ -diketones. HAROLD W. COLES, RICHARD H. F. MANSKE AND TREAT B. JOHNSON. *J. Am. Chem. Soc.* 51, 2269-72 (1929); cf. *C. A.* 23, 3454.—1-Phenyl-1,2-propanedione is obtained in 26-8 g. yields by passing  $\text{N}_2\text{O}_4$  into a mixt. of 134 g  $\text{PhEtCO}$ , 35 g.  $\text{CaCl}_2$  and 1 cc.  $\text{EtOH-HCl}$  maintained at  $60^\circ$ , interrupting the reaction after 3-4 hr.; the ketone is isolated through the bisulfite compd. From 60-70 g  $\text{PhEtCO}$  is recovered. Examples of other syntheses are given, the yields varying from 30 to 40%. 1-Phenyl-1,2-butanedione,  $b_p$   $130\text{--}2^\circ$ ; 1-*p*-ethylphenyl-1,2-propanedione,  $b_p$   $138\text{--}40^\circ$ ; 1-[2,5-dimethylphenyl]-1,2-propanedione,  $b_p$   $140\text{--}4^\circ$ . Isonitroso- $\alpha$ -hydrindone exhibits considerable stability toward  $\text{N}_2\text{O}_4$  and when reaction does ensue deep-seated changes result and no diketohydrindone could be isolated. Small amounts of  $\text{N}_2\text{O}_4$  cause rapid and complete decompn. of  $\alpha$ -ketotetrahydronaphthalene. C. J. WEST

Amino alcohols. I. Phenylpropanolamine and *p*-tolylpropanolamine. WALTER H. HARTUNG AND J. C. MUNCH. *J. Am. Chem. Soc.* 51, 2262-6 (1929).—Compounds of the type  $\text{ArCHOHCHRNH}_2$  have been synthesized because of their possible physiol. activity. The method consists of the catalytic reduction of the appropriate isonitroso ketones (Hartung, *C. A.* 23, 599). Isonitrosopropiophenone, prepd. from the ketone and  $\text{BuNO}_2$  in 72.5% yield, on reduction in  $\text{EtOH-HCl}$  with Pd on charcoal, gives 84-98% of  $\text{PhCH}(\text{OH})\text{CH}_2\text{CH}_2\text{NH}_2$ , m.  $103^\circ$ . When the reduction was carried out in the absence of HCl, the reaction was slow and incomplete. *p*-Tolyl- $\alpha$ -oximinobutyrate ketone, m.  $125^\circ$  (74% yield); reduction gives *p*-tolylpropanolamine, m.  $112^\circ$ ; HCl salt, m.  $205^\circ$ . Deamination by means of  $\text{HNO}_2$  gives the original aryl alkyl ketones. Pharmacologically both compds. produce effects paralleling those of ephedrine, they exert as great an effect on the blood pressure of an anesthetized dog as does the natural alkaloid and are also effective when administered orally. Their mydriatic action was found to be greater than that of either ephedrine or phenylethanolamine. Both compds. had a potentiating effect when epinephrine was subsequently administered. The *Ph* deriv. is less and the tolyl deriv. more toxic than ephedrine. C. J. WEST

Is the chloride of anthranilic acid capable of existence? LUDWIG ANSCHUTZ AND HERMANN BORDEKER. *Ber.* 62B, 826-30 (1929).—Anthranilic acid (I) with  $\text{PCl}_5$  gives not the chloride but a compd.  $\text{Cl}_2\text{PONHC}_6\text{H}_4\text{COCl}$  (Uhlfelder), and from their behavior toward salicylic acid  $\text{PCl}_5$  and  $\text{POCl}_3$  would seem still less adapted to prepg. the chloride. Of the ordinary reagents for prepg. acid chlorides, there was left only  $\text{SOCl}_2$ , therefore, which gave some hope of yielding the chloride of I. In view of the experience of Michaelis and Siebert with *m*- $\text{H}_2\text{N}\cdot\text{C}_6\text{H}_4\cdot\text{CO}_2\text{H}$ , it seemed best not to start

from the free I but from 1 of its salts. The Na salt tenaciously holds 1 mol. of  $H_2O$  of crystn. even at high temps. and it was soon given up. The Ba salt is unsuitable for the same reason, but the Ag and Pb salts are anhyd. and the latter, under the proper conditions, gives with  $SOCl_2$  not only anhydrides but also a compd. (II) which proved to be *N*-thionylantranilyl or *o*-*N*-thionylaminobenzoyl chloride,  $O:S:NC_6H_4COCl$ . The course of the reaction also shows why it is not possible to obtain the chloride; A. and B. believe that the  $NH_2$  group in I is attacked in part by the  $SOCl_2$  and in part also by the newly formed  $COCl$  group, thus resulting in the formation of considerable amts. of anhydrides of amide-like structure (or their transformation products). The Pb salt of  $p$ - $H_2NC_6H_4CO_2H$  gave the *p*-isomer of II but the *m*-isomer could not be obtained. II (7.5 g. from 20 g. Ag (or the equiv. amt. of Pb) salt of I in  $Et_2O$  suspension slowly treated with 25 g.  $SOCl_2$  in  $Et_2O$  and gently boiled 3–4 hr.), yellow,  $b_p$  98°, m. 34–5°, exceedingly sensitive to  $H_2O$ , at once liberating  $SO_2$  in the air, reacts very violently with  $MeOH$ , at once gives with *p*-toluidine the  $HCl$  salt of the latter and a substance, m. 150–1°, which is presumably the *p*-toluimide of I (Mehner). C. A. R.

**Mixed glycerides of salicylic acid.** I. W. HUMNICKI. *Bull. soc. chim.* 45, 275–9 (1929).— $HOC_6H_4COCl$  was treated with an equiv. quantity of 1,3-dichloro-2-propanol (I), giving the *salicylate* (II) of I, m. 46–8°, after ether extrn. and recrystn. from  $EtOH$ . II was identical with the product obtained by Fritsch (*Ber.* 24, 779). Heating II with aq.  $KI$  at low pressure or at 150° in a sealed tube, or any usual method for the replacement of  $Br$  or  $Cl$  by  $I$ , gave no result. Two mols. of  $PbI_2$  and 1 mol. of II at 150° gave an unidentified compd. contg. 33.8% of I. Heating 38 g. of  $HOC_6H_4CO_2H$  in 100 g. of glycerol at 130°, while gaseous  $HI$  was bubbled through (8 hrs.), gave a yellow soln. which was extd. with  $Et_2O$ , the oil washed with  $NaHCO_3$  soln. and fractionated, giving 1,3-di-*o*-2-propanol *salicylate*,  $d_{15}$  2.61. II. *Ibid* 279–83.—Two methods have been employed for the prepn. of esters of I: (a) acyl chlorides were treated with  $I$ ; (b) acids and glycerol were subjected to a stream of dry  $HCl$  while heated on a  $H_2O$  bath. The following esters were prepd.: *acetate*, b. 193–5°,  $n_D^{20}$  1.4542,  $d_{20}$  1.281; *isovalerate*,  $b_p$  127–40°,  $n_D^{20}$  1.450,  $d_{20}$  1.444; *caproate*,  $b_{15}$  140–5°,  $n_D^{20}$  1.4403,  $d_{20}$  1.074; *laurate*,  $b_{12}$  200°,  $n_D^{25}$  1.459,  $d_{20}$  1.032; *myristate*, m. 27–9°; *stearate*, m. 36–7°; *oleate*,  $b_{15}$  260–75°,  $n_D^{20}$  1.4754,  $d_{20}$  0.994. With *acetylsalicylic acid*, method (b) gave  $HOC_6H_4CO_2H$  and II. Also in *Roczniki Chem.* 9, 390–5, 396–401 (1929).

A. S. CARTER

**Amino derivatives of hydroxybenzoic acids.** E. PUXEDDU. *Gazz. chim. ital.* 59, 10–5 (1929).—The expts. are a continuation of earlier ones in which a rapid method of prepn. of amino derivs. of hydroxybenzoic acids was described (cf. *Gazz. chim. ital.* 36, ii, 87, 305 (1906); 37, i, 68 (1907)). The method is somewhat modified, *e. g.*, in the purification of the aminohydroxy acids, while several new compds. and a new method of prepn. of gentisinic acid (I) are described. Benzeneazosalicylic acid (II) (5 g.) heated with  $PhHNNH_2$  (III) (12 g.) in a flask (instead of a porcelain dish as in the earlier work), the product washed with  $Et_2O$  and then with boiling  $EtOH$ , dissolved in dil.  $HCl$ , reprecipd. with  $NaHCO_3$ , and the ppt. recrystd. from water (using animal charcoal for purification), yields 2,5- $HO(H_2N)C_6H_3CO_2H$  (IV), bluish rose color, turns brown at 239°, m. 259° (decompn.). There are no previous reliable data in the literature on this compd. 2,5- $AcO(AcHN)C_6H_3CO_2H$  (V) also reacts readily with III, giving IV. Acetylation of II yields, after crystn. from  $EtOH$ , the compd.  $C_{15}H_{12}N_2O_4$ , orange-yellow, m. 145°. Diazotization of *o*-toluidine and coupling with *o*- $HOC_6H_4CO_2H$  yields *o*-tolueneazosalicylic acid,  $C_{14}H_{12}O_3N_2$  (VI), m. 186°. VI is a convenient compd. from which to prep. IV, VI crystg. in purer form from  $C_6H_6$  than II, and reacting more easily with III. IV can be transformed by the method of Goldberg (*J. prakt. Chem.* 19, 359) into diazosalicylic acid (VII), which gave quant. a bluish gray product which exploded at 162°. The product obtained by Auden (*Proc. Chem. Soc.* No. 215) was considered to be  $O.OC.C_6H_3(OH).N:N$  and exploded at 155°. VII

heated 1 hr. in  $H_2SO_4$  (cf. Goldberg, *loc. cit.*), yields I, m. 199°. When VII is heated with aq.  $CuSO_4$ , there is obtained instead of I a compd., m. 173° which gives a blue color with  $FeCl_3$ . It may be a mixt. of hydroquinone and I. IV,  $Ac_2O$  and  $AcONa$  boiled 1 hr., let stand 4 hrs. for the oil to solidify and washed with  $CHCl_3$ , yield a diacetylaminoazosalicylic acid, m. 184°, sol. in aq. alk. hydroxides, insol. in dil. acids. Benzeneazo-*m*-hydroxybenzoic acid (cf. *Gazz. chim. ital.* 36, 305 (1906)) mixed with III, the product washed with  $Et_2O$ , then with boiling  $EtOH$ , and crystd. from boiling water with animal charcoal, yields 6,8- $H_2N(HO)C_6H_3CO_2H$  (VIII), light violet, turns brown at 235°, m. 252° (decompn.) (cf. *Ann.* 263, 234; *Ber.* 27, 1933).  $NaNO_2$  (2.5 g.)

in a min. of water added to an ice-cold filtered soln. of VIII (5 g.) in dil. HCl (8 cc. HCl + 150 cc. water) gives *diazo-m-hydroxybenzoic acid* (IX), explodes at 169°, the product of this decompn. being insol. in all org. solvents, but giving a red soln. in dil. KOH. IX (10 g.) and excess dil. H<sub>2</sub>SO<sub>4</sub> boiled 1 hr., filtered, extd. with Et<sub>2</sub>O, the ext. evapd., and the residue recrystd. from water (with animal charcoal) yields I.

C. C. DAVIS

**New syntheses among the amino acids. III. The behavior of  $\alpha$ -arylideneamino- $\beta$ -cinnamolactones with phenylhydrazine and with hydroxylamine, and a new method for the substitution of hydrogen by the amino group.** GAETANO MINUNNI (WITH I. OTTAVIANO AND V. SPINA). *Gazz. chim. ital.* 59, 116-28 (1929); cf. preceding abstr.—In the earlier expts. it was proved that  $\alpha$ -arylideneamino- $\beta$ -croto lactones react with great ease with PhHNNH<sub>2</sub> (I) with elimination of the arylidene group as a phenylhydrazone, and this fact was of great aid in explaining the reaction between aldoximes and  $\beta$ -ketonic ethers. Nevertheless not even I furnishes a reaction which is suitable for prepg.  $\alpha$ -amino- $\beta$ -lactones, for the present paper shows that when I and arylideneaminocinnamolactones react, the decompn. is not limited to elimination of the arylidene group, for the aminolactone group also reacts and in a 2nd stage addn. occurs. Benzylideneaminocinnamolactone (II) (cf. C. A. 23, 1120) warmed a few mins. with excess I and a little EtOH, cooled, filtered, washed with EtOH, and purified from boiling EtOH, yields  $\alpha$ -amino- $\beta$ -hydroxycinnamic acid phenylhydrazide, PhC(OH):C(NH<sub>2</sub>)CONHNHPh (III), decomp. 148-9°, gives in CHCl<sub>3</sub> a brown soln., which on standing turns brown-violet with pptn. of a trace of a pulverulent substance. III is also formed at room temp. and in C<sub>6</sub>H<sub>6</sub>. Thus II (2 g.) in C<sub>6</sub>H<sub>6</sub> (50 cc.) and I (2.5 g.) let stand several hr., filtered and washed with C<sub>6</sub>H<sub>6</sub>, yields III. In all cases PhCH.NNHNHPh (IV) was obtained as a 2nd product. Similarly anisylideneaminocinnamolactone (V) (cf. C. A. 23, 3676) (4 g.), I (4 g.) and EtOH (50 cc.) heated about 0.25 hr. on a water bath, filtered, washed with EtOH, and the residue purified with boiling C<sub>6</sub>H<sub>6</sub>, and final crystn. from anhyd. AcMe, yields III. Na<sub>2</sub>CO<sub>3</sub> (1 g.) in water (2 cc.) added to HONH<sub>2</sub>Cl (1.5 g.) in water (1.5 cc.), the mixt. added to II (2.5 g.) suspended in EtOH (15 cc.), let stand 1 hr., filtered, the filtrate allowed to evap. (about 1 week), filtered, washed with aq. EtOH (1:2), and the filtrate steam-distd., yields PhCH·NOH, while the residue from the 2nd filtration, purified with boiling C<sub>6</sub>H<sub>6</sub>, yields 80% of  $\alpha$ -amino- $\beta$ -cinnamolactone PhC:C(NH<sub>2</sub>).CO.O (VI), turns brown around 152°, m

154.5-5.0°. With excess Na<sub>2</sub>CO<sub>3</sub> (5 g.) the yield is low. V (2.5 g.) in EtOH (15 cc.), HONH<sub>2</sub>Cl (1.5 g.) in water (1.5 cc.), Na<sub>2</sub>CO<sub>3</sub> (1 g.) in water (2 cc.) let stand several days, filtered washed with dil. EtOH (1:2) and the residue crystd. from EtOH and then from C<sub>6</sub>H<sub>6</sub>, yields 65% of VI, while the EtOH wash liquor contains anisaldoxime. In general, the expts. on the reaction between aldoximes and  $\beta$ -ketonic ethers lead to a new method for substituting H by an NH<sub>2</sub> group, which is applicable to those compds. which can be transformed by aromatic aldoximes, or otherwise, into arylideneamino compds. capable of reacting with NH<sub>2</sub>OH like arylideneaminocinnamolactones, i. e., by elimination of the arylidene group as aldoxime. The general reactions:  $\text{>C(H) + HON:CHAR} \rightarrow \text{>CN:CHAR + H}_2\text{O}$  and  $\text{>CN:CHAR + NH}_2\text{OH} \rightarrow \text{>CNH}_2 + \text{ArCH:NOH}$  represent the 2 stages which in certain cases lead to amino compds. which could not be obtained by any reactions known previously. This is well illustrated by the prepn. of VI, which is the 1st known unsatd. aminolactone and the structure of which suggests many interesting transformations.

C. C. DAVIS

**Preparation of some methylated gallic acids.** R. J. SHRINER AND P. MCCUTCHAN. *J. Am. Chem. Soc.* 51, 2193-5 (1929).—3,4-Dimethylgallic acid, m. 184-5°, was obtained in 20% yield by heating 10 g. 5,3,4-Br(MeO)<sub>2</sub>C<sub>6</sub>H<sub>2</sub>CO<sub>2</sub>H, 200 cc. 8% NaOH and 2 g. Cu 1 hr. at 200°. 3-Methylgallic acid, m. 131-2°, was obtained in 1 g. yield by heating 5 g. 5-bromovanillin with 100 cc. 8% NaOH and 2 g. Cu 1 hr. at 200-10°. FeCl<sub>3</sub> gives a light green color. The diacetate m. 102-3°.

C. J. WEST

**Polynuclear aromatic hydrocarbons and their derivatives. II. 2',3'-Naphtho-1,2-anthracene, its homologs and oxidation products.** E. CLAR, FR. JOHN AND B. ILAWRAN. *Ber.* 62B, 940-50 (1929); cf. C. A. 23, 2966.—It was shown in the 1st paper that polynuclear aromatic ketones with a Me group adjacent to the C:O group condense on heating, with loss of H<sub>2</sub>O, to polynuclear hydrocarbons, just as anthracene derivatives had previously been prepd. from *o*-methylated benzophenones. It has now been found that the method can be used for double ring formation and that *di o* toluylbenzenes (I) and their homologs readily yield *ang*-2',3'-naphtho-1,2-anthracene (II) and its derivs. The angular structure of these compds. is proved by the fact that both *o*- and *p*-I yield the same II, which is not identical with the known *lin*-2,3,6,7-

dibenzanthracene (III) and on energetic oxidation gives *ang*-1,2-*o*-phthalylanthraquinone (IV); furthermore, *o*-bis[2',5'-dimethylbenzoyl]benzene (V) and the *p*-2',4'-isomer (VI) likewise yield the same di-Me deriv. (VII) of II; and finally, the *m*-2',4'-isomer (VIII) of V gives a hydrocarbon (IX) yielding on energetic oxidation a diquinone (X) which, like IV, forms an azine (XI) with  $N_2H_4 \cdot H_2O$ . As was to be expected, the double ring formation takes place in 2 stages. In all these reactions the (sometimes even abundant) formation of anthracene,  $\beta$ -methylanthracene (XII) (in the case of the  $C_{14}H_8(COC_6H_3Me_2)_2$ ) and of 2,5-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO<sub>2</sub>H (XIII) (in the case of V) was observed; the formation of these compds. can be ascribed only to the cleavage of anthracene ketones. Thus, V probably first forms 2,5-xylyl 7-methyl-1-anthryl ketone which changes partially into VII by loss of H<sub>2</sub>O and partially into XII and XIII by addn. of H<sub>2</sub>O at the high temp. (around 400°). This cleavage is especially troublesome with the *o*-diketones for the intermediate  $\alpha$ -anthracene ketones are decompd. more easily than the  $\beta$ -isomers formed from the *m*- and *p*-diketones. II differs from its Me homologs neither in appearance, m. p., soly. nor fluorescence and the absorption curves in the ultraviolet all follow the same course, any slight deviations observed lying far within the range of exptl. error of the method. Hot benzene solns. are turned red by 2 mols. picric acid but the hydrocarbons sep. unchanged on cooling; only with a 10-fold amt of picric acid are there obtained brown-red picrates which at once decomp. when the excess of picric acid is washed away. *p*-I, from *p*-C<sub>6</sub>H<sub>4</sub>(COCl)<sub>2</sub> and *o*-Me-C<sub>6</sub>H<sub>4</sub>MgBr, m. 82°, sol. in H<sub>2</sub>SO<sub>4</sub> with orange-yellow color; at the same time is formed *p*-*o*'-tolylbenzoic acid, m. 177°, sol. in H<sub>2</sub>SO<sub>4</sub> with greenish yellow color, almost quantitatively oxidized by alk. KMnO<sub>4</sub> to 2,4'-HO<sub>2</sub>CC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>C<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>II, m. 234°. *o*-I is a viscous, non crystallizable, almost colorless substance. VIII, from *m*-C<sub>6</sub>H<sub>4</sub>(COCl)<sub>2</sub> and AlCl<sub>3</sub> in *m*-xylene, b<sub>12</sub> 243°, solidifies to a glassy viscous mass, sol. in H<sub>2</sub>SO<sub>4</sub> with orange-red color. VI, m. 128°, sol. in H<sub>2</sub>SO<sub>4</sub> with orange-red color. *o*-2',5'-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>CO-C<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>II, from C<sub>6</sub>H<sub>4</sub>(CO)<sub>2</sub>O, excess of *p*-xylene and AlCl<sub>3</sub>, m. 147.5°, can be obtained pure without difficulty by recrystn. from PhMe; refluxed with Zn in AcOH, it gives 3-*p*-xylylphthalide, m. 112°, sol. without color in cold, with dark color in hot H<sub>2</sub>SO<sub>4</sub>; thus with 2,5-Me<sub>2</sub>C<sub>6</sub>H<sub>3</sub>MgBr yields 1,3-di-*p*-xylylbenzofuran whose C<sub>6</sub>H<sub>5</sub>-Et<sub>2</sub>O soln. shows the blue-green fluorescence characteristic of isobenzofuran derivs. but the substance could not be isolated in cryst. form; the concd. soln. of the furan, boiled in AcOH (previously purified with CrO<sub>3</sub>) to drive off the C<sub>6</sub>H<sub>6</sub> and Et<sub>2</sub>O and then 10 min. with a 10% excess of CrO<sub>3</sub>, gives V, m. 138.5°, sol. in H<sub>2</sub>SO<sub>4</sub> with brown-yellow color and faint red fluorescence; on heating, the color changes through red-brown and green to a dirty brown; with Zn and AcOH it yields a soln. with blue-green fluorescence, and with excess of N<sub>2</sub>H<sub>4</sub> · H<sub>2</sub>O in boiling alc. 1,4-di-*p*-xylylphthalazine, m. 136.5°, sol. in cold H<sub>2</sub>SO<sub>4</sub> with a golden yellow color which disappears on heating. The yield of hydrocarbons from the *o*-diketones is small, from the *m*- and *p*-compds., 20-5%. II, very faintly greenish yellow, m. 265°, sol. in H<sub>2</sub>SO<sub>4</sub> with dirty brown color. Dil. solns. in org. solvents have a blue-violet, more concd. solns. a blue-green fluorescence. It sublimes under 12 mm. about 230°. 6',7'- (IX) and 7,7'-Di-Me deriv. (VII), from VIII and from V and VI, resp. 6',7'-Dimethyl-1',4'-dihydro-1'(or 4')-keto-2',3'-naphtho-1,2-anthraquinone (XIV), from IX and 4 mols. CrO<sub>3</sub> in boiling AcOH, yellow, m. 323°, sol. in H<sub>2</sub>SO<sub>4</sub> with deep emerald-green color, forms an orange-red Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> vat from which air throws out a blue ppt. 7,7'-Di-Me isomer, m. 332°. IV, yellow, m. 322-3°, forms an orange-red Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> vat yielding with air a blue to greenish blue ppt. which becomes faintly red on acidifying. 1',4'-Diketo deriv. (X) of XIV, from 7 g. XIV with 7 g. CrO<sub>3</sub> in boiling AcOH, yellowish to greenish yellow, m. 338°. Dimethyl-1,2,3,4-diphthalylbenzene azine (XI), red-brown, does not m. 380°, sol. in H<sub>2</sub>SO<sub>4</sub> with orange-red color, forms a cherry-red Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> vat. 1,2,3,4-Diphthalylbenzene-4',4''-dicarboxylic acid, from XIV with dil. HNO<sub>3</sub> at 190-200°, does not m. 380°, sol. in H<sub>2</sub>SO<sub>4</sub> with light red color, forms a dark blood-red Na<sub>2</sub>S<sub>2</sub>O<sub>4</sub> vat turned violet-red by the air; attempts to convert it into IV by decarboxylation failed. III. Anthracenoanthracenes and their quinones. E. CLAR, H. WALLENSTEIN AND R. AVENARIUS. *Ibid* 950-5.—The study of the condensation of ketones to polynuclear hydrocarbons has been extended to 1,5-dibenzoyl-2,6-dimethylnaphthalene (I) and the 1,8,2,7-isomer (II). I is readily obtained from 2,6-C<sub>10</sub>H<sub>6</sub>Me<sub>2</sub>, AlCl<sub>3</sub> and BzCl even in the cold, but 2,7-C<sub>10</sub>H<sub>6</sub>Me<sub>2</sub> gave no homogeneous compd., the product being apparently a mixt. of II and the 1,5-Bz<sub>2</sub> isomer, of which only the former is capable of double ring formation. On heating, I and II yield 2',1'-anthraceno-1,2-anthracene (III) and the 1',2'-isomer (IV), resp., but as at the high temp. required there is also much decompn. of the diketones the yields are poor. Attempts were made to synthesize IV by the condensation of 1,8-di-*o*-tolyl-naphthalene (V) but the decompn. of the V was so great that not enough IV was obtained

for identification. Only with a 30-fold excess of picric acid can red-brown needles occasionally be obtained from III or IV in  $C_6H_6$ .  $CrO_3$  in AcOH readily converts the III and IV into 1,2,5,6- and 1,2,7,8-diphthalyl-naphthalene (2',1'- and 1',2'-anthraquinone-1,2-anthraquinone) (VI and VII), resp. The absorption of III and IV in the ultraviolet was also measured. I (120 g. from 52 g.  $C_{10}H_8Me_2$  in  $CS_2$ ), m. 262.5-4°, sol. in  $H_2SO_4$  with light red color; with  $Ac_2O$  instead of  $BzCl$  there is obtained only the 1-mono-Ac deriv., b. 310-1°, m. 70-1°, sol. in  $H_2SO_4$  with yellow color (picrate, lemon-yellow, m. 139-40°). The product (70 g.) from 2,7- $C_{10}H_8Me_2$ ,  $BzCl$  and  $AlCl_3$  in  $CS_2$ , sepd from solvents as an oil; on distn. under 12 mm. at about 300° it yielded a glassy mass from which could be isolated no cryst. diketone but only a small amt. of IV. 9,10-Di-tolyl-9,10-dihydroxyacenaphthene (9,10-di-o-tolylacenaphthene-glycol) from acenaphthenequinone and o-MeC<sub>6</sub>H<sub>4</sub>MgBr, m. 164°, sol. in  $H_2SO_4$  with yellow color, gives with  $CrO_3$  in AcOH V, m. 238°, sol. in  $H_2SO_4$  with crimson color. III, intensely yellow, m. about 400°, forms solns. with deep blue fluorescence, dissolves in  $H_2SO_4$  with brown, then green color. IV, golden yellow, m. 308°, sol. in  $H_2SO_4$  with violet color changing on long standing through brown to olive-green, forms solns. with greenish blue fluorescence. VI, golden yellow to brass-colored, m. about 395°, forms a red-brown  $Na_2S_2O_4$  vat, sol. in  $H_2SO_4$  with red-brown color. VII, greenish yellow, does not m. 360°, sol. in  $H_2SO_4$  with orange-yellow color, forms a red-brown vat from which air throws out a green ppt changed to VII on acidification or long standing. C. A. ROHLER

**Asymmetric induction. I. Asymmetric synthesis and asymmetric induction.** ALEX. MCKENZIE AND AGNES GELLATLY MITCHELL. *Biochem. Z.* **208**, 456-70 (1929). - The optical activity of *l*-menthyl benzoylformate in 15 different solvents was investigated with 3 different wave lengths. Mutarotation was observed in Et, Pr, Bu, iso-Bu and in *l*-Am alcs. The interpretation of the results is fully discussed. II. The influence of the solvent of the optical activity of menthyl- and bornyl esters of  $\alpha$ -ketone acids. *Ibid* 471-81. - No mutarotation was observed in solns. of *d*- or *l*-bornyl benzoylformate in acetone, benzene or  $CHCl_3$ ; weak mutarotation in EtOH, and distinct mutarotation in Pr, Bu, iso-Bu and Am alcs. The mutarotation, however, was less pronounced than in the case of *l*-menthyl benzoylformate. The *d*- and the *l*-esters were different in their behavior in MeOH, only the latter displaying mutarotation. The asym. synthesis of *d*-Ph $\beta$ C(OH)CO<sub>2</sub>H was accomplished through the reaction of *d*-bornyl benzoylformate with EtMgI. Certain theoretical expectations were substantiated by the exptl. results. S. MOROGLIS

**The pinene in Cunninghamia konishi Hayata.** TESSAKU IKEDA AND YASUJI FUJITA. *J. Chem. Soc. Japan* **50**, 66-70 (1929). - Very pure pinene was obtained from *C. konishi* and its phys. consts., especially its rotatory power, were detd. The following facts show the complexity of the mol. construction of terpene compds.: (1) When I. and F. tried to get the nitrosochloride by Lynn's method (*C. A.* **13**, 1853), they got a small quantity of inactive and no active nitrosochloride. (2) The rotatory power of the pinene, obtained from the active nitrosochloride by Lynn's method and of that from *C. konishi* Hayata are not equal. (3) Though the pinene from that plant does not form a nitrosochloride by Ihestadt's method, Tsutiihashi and Tasaki got some inactive and active nitrosochloride from the Formosan cypress by the same method. T. IRIE

**Hydration of pinene by Bertram and Walbaum's method.** YASUJI FUJITA. *J. Chem. Soc. Japan* **50**, 70-3 (1929). - F. obtained borneol and isoborneol from pure pinene by applying Bertram and Walbaum's hydration method. He concludes "This shows that to prove the existence of camphene by the hydration method great care must be used." T. IRIE

**Radical nature of the deeply colored dimeric diaryl ketenes (preliminary communication).** WOLFGANG LANGENBECK. *Ber.* **62B**, 962-3 (1929). - It is not easy to decide definitely between the formula I provisionally assigned by Langenbeck and Langenbeck to the deep red compd. they obtained by the pyrogenic decompn. of benzoic acid and the radical formula II suggested by Wittig and Lupin (*C. A.* **23**, 133). The

most important criterion of dissocn., viz., mol. wt. detns., is of no help in this case, neither is the additive ability of the substance decisive evidence of its radical structure. It shows no deviation from Beer's law, which would indicate that the radical is completely dissociated. A deriv. has now been found, however, which is not completely dissociated. If 0.1 g. of anisilic acid is heated in a test tube a few sec. over a free flame

there results a deep blue-green melt which completely loses its color on cooling; in PhMe the soln. is pure yellow at room temp., becomes greenish at 50° to 80° and greenish blue on boiling and again yellow on cooling; the cycle can be repeated at will. At 80° the soln. deviates greatly from Beer's law. The associated substance has not yet been isolated in cryst. form.

C. A. ROUILLER

**Stereochemistry of aromatic ring systems. II.** W. SCHLENK and ERNST BERGMANN. *Ber.* 62B, 745-50 (1929); cf. *C. A.* 22, 4495.—In the 1st paper was reported the discovery of a no. of isomeric derivs. of indene, fluorene and anthracene whose existence cannot be explained on the basis of the present stereochem. views on these condensed systems. There exist, *e. g.*, 2 stereoisomeric 1,1,3-triphenyldihydroindenes, 2-mirror-image isomeric 2,3-diphenylindones, 2 stereoisomeric fluorene-9-carboxylic acids (I), etc. To depart, at least provisionally, as little as possible from the conceptions of classical stereochemistry, S. and B. assumed that, contrary to the view hitherto prevailing, such condensed ring systems are not uniplanar but the individual rings are inclined at an angle to each other in space. Where there are 3 rings in the system (fluorene, anthracene), the no. of isomers found makes it necessary to assume 2 possibilities for the ring inclination. Thus, while the two I can be explained by assuming that both  $C_6H_5$  rings are inclined in space toward the same side of the 5-membered ring, for the biphenylenediphenylethylenes it must be assumed that in one the 2 outer rings extend in the same direction from a given point (*cis*-position), in the other in opposite directions (*trans*-position). The existence of two 9,10-diphenylanthracenes and two 9,9'-bianthryls leads to the same conclusion. The investigation has been extended to a no. of relatively easily available fluorene derivs. From a mixt. of Bz-OMe and fluorene Werner obtained with Na a 9-benzoylfluorene (II), m. 138°, but from 1,1-fluorene and BzCl is obtained a II, m. 180°. 9-Phenyl-9-benzylfluorene (III), from the 9 Cl deriv. with  $PhCH_2MgCl$  (Gomberg and Cone), m. 139°, whereas Na 9-phenylfluorene and  $PhCH_2Cl$  give a III, m. 125-6°, along with the 139°-form. In attempting to oxidize the 125°-form to the 9-Bz compd. with  $CrO_3 \cdot AcOH$ , it changed in the cold  $AcOH$ , in about 3 mins. after adding the  $CrO_3$ , almost quant. into the 139°-form. Thiele and Henle obtained a colorless benzalfluorene, m. 76°, from fluorene and BzH but at the same time there is formed a deep yellow isomer, m. 153°. Similarly, anisaldehyde gives not only T. and H.'s almost colorless anisalfluorene, m. 138°, but also an intensely yellow isomer, m. 143°, and Na with a mixt. of fluorene and Michler's ketone gives, together with the yellow-green needles of Rodd and Lynch's [tetramethyldiaminodiphenyl]methylene, m. 237-8°, about an equal amt. of more sol.  $K_2Cr_2O_7$ -colored prisms of an isomer, m. 238-40°; the 2 forms greatly depress each other's m. p. (to 214°) and are not interconvertible by seeding in soln. or in fused form; the orange-red can be converted into the yellow form, however, by adding Na at the double bond and then removing it with Hg. Cf. following abstr. for a possible exact phys. basis for the hypothesis advanced by S. and B. to explain the isomerism of these substances. In the prepn. of the II, m. 180°, there is also formed *di*[9-fluorenyl]phenylcarbinol, m. 290°.

C. A. ROUILLER

**Explanation of the Schlenk isomerism.** ERNST BERGMANN and HERMANN MARK. *Ber.* 62B, 750-7 (1929); cf. preceding abstr.—Roentgenographic lattice detns. on  $C_{16}H_{14}$  and its completely and identically substituted derivs. ( $C_6Cl_6$ ,  $C_6Br_6$ ,  $C_6Me_6$ ) have shown that these substances have a center but no planes of symmetry, whence it is probable that the  $C_6H_6$  ring is not a plane regular hexagon but a "puckered" ring in which the six C atoms are arranged in 2 parallel planes about 0.2-0.4 A. U. apart (I, black circles in 1 plane, white circles in the other,  $\alpha$  center of symmetry). If it is attempted

to construct of such "puckered"  $C_6H_6$  rings a  $C_{10}H_8$  which likewise has a center but no planes of symmetry, there are only the 2 possibilities II or III (dotted circles in a plane

for identification. Only with a 30-fold excess of picric acid can red-brown needles occasionally be obtained from III or IV in  $C_6H_6$ .  $CrO_3$  in AcOH readily converts the III and IV into 1,2,5,6- and 1,2,7,8-diphthalyl-naphthalene (2',1'- and 1',2'-anthraquinone-1,2-anthraquinone) (VI and VII), resp. The absorption of III and IV in the ultraviolet was also measured. I (120 g. from 52 g.  $C_{10}H_6Me_2$  in  $CS_2$ ), m. 262.5-4°, sol. in  $H_2SO_4$  with light red color; with  $Ac_2O$  instead of  $BzCl$  there is obtained only the 1-mono-*Ac* deriv., b. 310-1°, m. 70-1°, sol. in  $H_2SO_4$  with yellow color (*picrate*, lemon-yellow, m. 139-40°). The product (70 g.) from 2,7- $C_{10}H_6Me_2$ ,  $BzCl$  and  $AlCl_3$  in  $CS_2$ , sep'd from solvents as an oil; on distn. under 12 mm. at about 300° it yielded a glassy mass from which could be isolated no cryst. diketone but only a small amt. of IV. 9,10-Di-tolyl-9,10-dihydroxyacenaphthene (9,10-di-*o*-tolylacenaphthene-glycol) from acenaphthene-quinone and *o*- $MeC_6H_4MgBr$ , m. 164°, sol. in  $H_2SO_4$  with yellow color, gives with  $CrO_3$  in AcOH V, m. 238°, sol. in  $H_2SO_4$  with crimson color. III, intensely yellow, m. about 400°, forms solns. with deep blue fluorescence, dissolves in  $H_2SO_4$  with brown, then green color. IV, golden yellow, m. 308°, sol. in  $H_2SO_4$  with violet color changing on long standing through brown to olive-green, forms solns. with greenish blue fluorescence. VI, golden yellow to brass-colored, m. about 395°, forms a red-brown  $Na_2S_2O_4$  vat, sol. in  $H_2SO_4$  with red-brown color. VII, greenish yellow, does not m. 360°, sol. in  $H_2SO_4$  with orange-yellow color, forms a red-brown vat from which air throws out a green ppt changed to VII on acidification or long standing.

#### Asymmetric induction. I. Asymmetric synthesis and asymmetric induction.

ALEX. MCKENZIE AND AGNES GELLATLY MITCHELL. *Biochem. Z.* **208**, 456-70(1929). The optical activity of *l*-menthyl benzoylformate in 15 different solvents was investigated with 3 different wave lengths. Mutarotation was observed in Et, Pr, Bu, iso-Bu and in *l*-Am alics. The interpretation of the results is fully discussed. II. The influence of the solvent of the optical activity of menthyl- and bornyl esters of  $\alpha$ -ketone acids. *Ibid* 471-81.—No mutarotation was observed in solns. of *d*- or *l*-bornyl benzoylformate in acetone, benzene or  $CHCl_3$ ; weak mutarotation in EtOH, and distinct mutarotation in Pr, Bu, iso-Bu and Am alics. The mutarotation, however, was less pronounced than in the case of *l*-menthyl benzoylformate. The *d*- and the *l*-esters were different in their behavior in MeOH, only the latter displaying mutarotation. The asym. synthesis of *d*-PhEtC(OH)CO<sub>2</sub>H was accomplished through the reaction of *d*-bornyl benzoylformate with EtMgI. Certain theoretical expectations were substantiated by the exptl. results.

S. MORRIS.

The pinene in *Cunninghamia konishi* Hayata. TESSAKU IKEDA AND YASUJI FUJITA. *J. Chem. Soc. Japan* **50**, 66-70(1929).—Very pure pinene was obtained from *C. konishi* and its phys. consts., especially its rotatory power, were det'd. The following facts show the complexity of the mol. construction of terpene compds.: (1) When I. and F. tried to get the nitrosochloride by Lynn's method (*C. A.* **13**, 1853), they got a small quantity of inactive and no active nitrosochloride. (2) The rotatory power of the pinene, obtained from the active nitrosochloride by Lynn's method and of that from *C. konishi* Hayata are not equal. (3) Though the pinene from that plant does not form a nitrosochloride by Ehestadt's method, Tsutishashi and Tasaki got some inactive and active nitrosochloride from the Formosan cypress by the same method.

T. IRIE.

Hydration of pinene by Bertram and Walbaum's method. YASUJI FUJITA. *J. Chem. Soc. Japan* **50**, 70-3(1929).—F. obtained borneol and isoborneol from pure pinene by applying Bertram and Walbaum's hydration method. He concludes "This shows that to prove the existence of camphene by the hydration method great care must be used."

T. IRIE.

Radical nature of the deeply colored dimeric diaryl ketenes (preliminary communication). WOLFGANG LANGENBECK. *Ber.* **62B**, 962-3(1929).—It is not easy to decide definitely between the formula I provisionally assigned by Langenbeck and Langenbeck to the deep red comp'd. they obtained by the pyrogenic decompn. of benzilic acid and the radical formula II suggested by Wittig and Lupin (*C. A.* **23**, 133). The

most important criterion of dissoen., viz., mol. wt. detns., is of no help in this case, neither is the additive ability of the substance decisive evidence of its radical structure. It shows no deviation from Beer's law, which would indicate that the radical is completely dissociated. A deriv. has now been found, however, which is not completely dissociated. If 0.1 g. of anisilic acid is heated in a test tube a few sec. over a free flame

there results a deep blue-green melt which completely loses its color on cooling; in PhMe the soln. is pure yellow at room temp., becomes greenish at 50° to 80° and greenish blue on boiling and again yellow on cooling; the cycle can be repeated at will. At 80° the soln. deviates greatly from Beer's law. The associated substance has not yet been isolated in cryst. form.

C. A. ROUILLER

**Stereochemistry of aromatic ring systems. II.** W. SCHLENK and ERNST BERGMANN. *Ber.* 62B, 745-50 (1929); cf. *C. A.* 22, 4495.—In the 1st paper was reported the discovery of a no. of isomeric derivs. of indene, fluorene and anthracene whose existence cannot be explained on the basis of the present stereochem. views on these condensed systems. There exist, *e. g.*, 2 stereoisomeric 1,1,3-triphenyldihydroindenes, 2-mirror-image isomeric 2,3-diphenylindones, 2 stereoisomeric fluorene-9-carboxylic acids (I), etc. To depart, at least provisionally, as little as possible from the conceptions of classical stereochemistry, S. and B. assumed that, contrary to the view hitherto prevailing, such condensed ring systems are not uniplanar but the individual rings are inclined at an angle to each other in space. Where there are 3 rings in the system (fluorene, anthracene), the no. of isomers found makes it necessary to assume 2 possibilities for the ring inclination. Thus, while the two I can be explained by assuming that both  $C_6H_5$  rings are inclined in space toward the same side of the 5-membered ring, for the biphenylenediphenylethylenes it must be assumed that in one the 2 outer rings extend in the same direction from a given point (*cis*-position), in the other in opposite directions (*trans*-position). The existence of two 9,10-diphenylanthracenes and two 9,9'-bianthrils leads to the same conclusion. The investigation has been extended to a no. of relatively easily available fluorene derivs. From a mixt. of Bz-OEt and fluorene Werner obtained with Na a 9-benzoylfluorene (II), m. 138°, but from Li fluorene and BzCl is obtained a II, m. 180°. 9-Phenyl-9-benzylfluorene (III), from the 9 Cl deriv. with  $PhCH_2MgCl$  (Gomberg and Cone), m. 139°, whereas Na 9-phenylfluorene and  $PhCH_2Cl$  give a III, m. 125-6°, along with the 139°-form. In attempting to oxidize the 125°-form to the 9-Bz compd. with  $CrO_3$ -AcOH, it changed in the cold AcOH, in about 3 mins. after adding the  $CrO_3$ , almost quant. into the 139°-form. Thiele and Henle obtained a colorless benzalfluorene, m. 76°, from fluorene and BzH but at the same time there is formed a deep yellow isomer, m. 153°. Similarly, anisaldehyde gives not only T. and H.'s almost colorless anisalfluorene, m. 138°, but also an intensely yellow isomer, m. 143°, and Na with a mixt. of fluorene and Michler's ketone gives, together with the yellow-green needles of Rodd and Lynch's [tetramethyldiaminodiphenyl]methylene, m. 237-8°, about an equal amt. of more sol.  $K_2Cr_2O_7$ -colored prisms of an isomer, m. 238-40°; the 2 forms greatly depress each other's m. p. (to 214°) and are not interconvertible by seeding in soln. or in fused form; the orange-red can be converted into the yellow form, however, by adding Na at the double bond and then removing it with Hg. Cf. following abstr. for a possible exact phys. basis for the hypothesis advanced by S. and B. to explain the isomerism of these substances. In the prepn. of the II, m. 180°, there is also formed *di*[9-fluorenyl]phenylcarbinol, m. 290°.

C. A. ROUILLER

**Explanation of the Schlenk isomerism.** ERNST BERGMANN and HERMANN MARK. *Ber.* 62B, 750-7 (1929); cf. preceding abstr.—Roentgenographic lattice detns. on  $C_6H_6$  and its completely and identically substituted derivs. ( $C_6Cl_6$ ,  $C_6Br_6$ ,  $C_6Me_6$ ) have shown that these substances have a center but no planes of symmetry, whence it is probable that the  $C_6H_6$  ring is not a plane regular hexagon but a "puckered" ring in which the six C atoms are arranged in 2 parallel planes about 0.2-0.4 Å. U. apart (I, black circles in 1 plane, white circles in the other,  $\alpha$  center of symmetry). If it is attempted

to construct of such "puckered"  $C_6H_6$  rings a  $C_{10}H_8$  which likewise has a center but no planes of symmetry, there are only the 2 possibilities II or III (dotted circles in a plane

above, ringed circles in a plane below that of the black circles). In principle, in models with symmetry  $C_1$  monosubstitution products should be asym. and exist in optical antipodes but since, in the gaseous state and in soln., there is the symmetry  $D_{2h}$  the monosubstitution products have a mirror plane and do not become asym. Of a  $C_6H_6$  ring with this symmetry, mirror image disubstitution products would also be expected if the substituents are different. That no such optical antipodes have ever been isolated may be because the form I easily changes into IV. Of anthracene, 2 forms (V and VI) can be built up from "puckered"  $C_6H_6$  rings; anthracene itself and all of its derivs. with a quinoid system should therefore be capable of existing in 2 stereo-isomeric forms and Schlenk and Bergmann have actually obtained 2 isomers in 3 cases. What the relations are in dihydroanthracene (VII) cannot be stated without further assumptions, for VII has not been studied roentgenographically, but there are certain indications that a hydrogenated  $C_6H_6$  ring is plane. Assuming such to be the case, there are 2 possible forms for VII, from 1 of which can be derived 2 mono- and three 9,10-disubstitution products, from the other 1 mono- and 2 disubstituted derivs. Two isomeric monosubstituted and 3 disubstituted derivs. have been obtained in several cases, as would be expected from the 1st of the 2 possible forms of VII; this form, moreover, has the advantage over the 2nd that in it the center of symmetry of an thracene is retained. With phenanthrene and fluorene, the Roentgen analysis sets no limits on the symmetry. For phenanthrene 3 forms can be constructed from puckered  $C_6H_6$  rings, according as all 3 rings are puckered in the same sense or the middle ring or 1 of the outer ones is puckered differently. For fluorene there are 2 possibilities, according as the 2 rings are puckered in the same way or differently; where the 9 C atom is involved in a double bond (in the dibenzofulvenes) each of these possibilities can exist in only 1 form and S. and B. in numerous instances have obtained 2 stereo-isomers; when the  $CH_2$  is normally substituted ( $(C_6H_4)_2C_{ab}$ ), the form with both rings similarly puckered should correspond to 2 isomers, the other form to 1 isomer, or 3 isomers in all. So far, only 2 have been isolated, possibly because of too great instability of the 3rd or because no suitable method of prepn. has yet been devised. For the indene system it is certain, on geometrical grounds, that the 1-, 2- and 3 C atoms of the 5-membered ring are in a plane, but it is not immaterial whether the 3 C atom is united to a C atom of the upper or the lower plane of the  $C_6H_6$  ring; for 1,1,3-triphenylindene 2 stereoisomers would correspond to these 2 possibilities while for 2,3-diphenylindene 2 mirror image isomers would be predicted, conceptions which are fully borne out by the facts. C. A. ROELLER

**Appearance of free substituted methylenes in chemical reactions.** ERNST BERGMANN and JENÖ HERVEY. *Ber.* 62B, 893-916 (1929).—After Schlenk and Bergmann showed (*C. A.* 22, 4498), by the isolation of di-Na tetraphenylallene,  $(Ph_2CNa)_2C$  (I), that free substituted methylenes are capable of existence under certain conditions the question arose whether compds. with bivalent C may not be intermediate stages in certain chem. reactions. The great ease with which I changes into compds. with normal valence indicated that such substances would in general be very short-lived and that it would be necessary to "intercept" (*abfangen*) them, *i. e.*, stabilize them by a reaction, the course of which would give unequivocal evidence of their formation. The formation of  $(p-O_2NC_6H_4CH_2)_2$  from  $O_2NC_6H_4CH_2Cl$  (I) with alc. alkali and of  $((C_6H_4)_2C:)_2$  from 9-chlorofluorene (II) is easily explained by assuming the intermediate formation of free methylene radicals, with elimination of HCl; with  $p-O_2NC_6H_4CHO$ , these radicals can be "intercepted" as the 2-*p,p*-dinitrostilbene oxides and as a *p*-nitrobenzalfluorene oxide (III), resp. To remove the HCl B. and H. finally adopted alc. suspensions of  $K_2CO_3$  instead of the sol. KOH, because otherwise so much of the free methylene is formed at once that it in part polymerizes even in the presence of an intercepting agent. The investigation was extended in 2 directions: the detn. of what substances can act as intercepting agents and of what compds. can yield free methylene radicals. Aromatic aldehydes (also  $Ph_2CHCHO$ ), *o*-diketones, fluorenones, thioketones and NO all proved to be excellent intercepting agents whereas compds. with C:C and C:N bonds are surprisingly unreactive toward free methylenes. But even among C:O compds. there are distinct differences in reactivity; aromatic ketones like  $Ph_2CO$ ,  $(p-MeOC_6H_4)_2CO$ , 9,9-diphenylanthrone, do not react at all. In addn. to I and II the only arylmethyl halides which gave free methylenes were *o*- $O_2NC_6H_4CH_2Cl$  (IV),  $PhCH_2Cl$  and 9-bromoanthrone (V), whereas  $Ph_2CHBr$ ,  $(p-MeOC_6H_4)_2CHCl$  (VI) and 9,9-diphenyl-10-chloro-9,10-dihydroanthracene (VII) did not; with alkali in MeOH or EtOH in the presence or absence of an intercepting agent they yielded only the corresponding Me or Et ether. B. and H. believe that there are 2 groups of aromatic substituted Me halides which behave radically differently toward alkali:

those which, like **II**, primarily form a free methylene, and those, like  $\text{Ph}_2\text{CHBr}$ , which merely exchange their halogen for OR (ROH = alc. medium). Nor is it merely chance, they think, that the halides corresponding to aromatic C:O compds. which are not suitable as intercepting agents are not capable themselves of forming free methylenes while those corresponding to compds. which are intercepting agents do give with alkali radicals with bivalent C. As far as they know, no reaction has been observed which does not agree with the generalization that biphenylenemethylenes, anthronylidenes and monoarylmethylenes are capable of existence while diarylmethylenes are not. **III**, from **II** and  $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$  boiled in MeOH with  $\text{K}_2\text{CO}_3$ , yellowish, m. 153°. With BzH the expected *9-benzalfluorene oxide*, m. 131–2°, was obtained only once as the chief product; in all the other expts. there was obtained a product with 1 mol. MeOH more, viz., *9- $\alpha$ -hydroxybenzylfluorenyl Me ether*,  $(\text{C}_6\text{H}_4)_2\text{C}(\text{OMe})\text{CH}(\text{OH})\text{Ph}$ , m. 186–7°, identical with a product obtained by decomp.  $(\text{C}_6\text{H}_4)_2\text{C}(\text{OMe})_2$  with Na and treating the resulting  $(\text{C}_6\text{H}_4)_2\text{C}(\text{OMe})\text{Na}$  with BzH. **I** and *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$  gave the 2 stilbene oxides, m. 200–1° and 153–4°, sep'd. by crystn. from dioxan, while with *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$  were obtained 2 *o,p'*-*dinitrostilbene oxides*, m. 158–60° and 112°, also formed from *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{Cl}$  and *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$ . *m,p'*-*Isomers*, m. 148° and 116°. *p*-*Nitrostilbene oxide*, obtained with BzH, m. 125–6°. *p*-*Nitro-p'-methoxy analog*, m. 138°. *1 p* Nitrophenyl-2-benzohydrylethylene oxides, from  $\text{Ph}_2\text{CHCHO}$ , m. 147° and 118°. That these compds. are really ethylene oxides and not C O derivs. resulting from their rearrangement is indicated by the fact that they are smoothly converted into the corresponding ethylenes, with liberation of I, when treated with KI in AcOH; the *cis* *trans*-isomers give the same ethylene.  $\text{PhCH}_2\text{Cl}$  gives with *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$  only a very small amt. of *p*-nitrostilbene oxide; the main product is *p*-nitrobenzyl Me ether, b.p. 145–7°; the mechanism of its formation is not clear. **V** with BzH gave an exceedingly difficultly separable mixt. of benzalanthrone oxide and anthraquinone; with anisaldehyde it yielded  $\text{C}_6\text{H}_4(\text{CO})_2\text{C}_6\text{H}_4$  exclusively. Benzil with **I** gave the cyclic *p*-nitrobenzyl deriv. (**VIII**) of stilbenediol, m. 138°. *Phenanthrenehydroquinone analog*, yellow brown, m. 153°. **II** and fluorenone yield both *dibiphenylenethene oxide*, m. 234° (decompn.), and the ethene itself; **B**. and **H**. believe that possibly 2 isomeric oxides are formed but only **I** is stable at room temp. while the other decomps. spontaneously into O and the ethene. With **I** fluorenone gives a compd. identical with **III**. *p*-*Nitrobenzal 2,7-dibromofluorene oxide* (**IX**), from **I** and 2,7-dibromofluorenone, yellow, m. 230°. *o*-*Nitrobenzalfluorene oxide*, from *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{CH}_2\text{Cl}$  and fluorenone, m. 111°. *Biphenylenemethylenecanthrone oxide*, from **V** and fluorenone, m. 252–4°. **II** and *p*- $\text{ONC}_6\text{H}_4\text{NMe}_2$  give a carboxy compd. (**X**) which, since these compds. are tautomeric with the nitrones, may be designated as *biphenylenemethylene-N-p*-dimethylaminophenyl nitrone, red-brown rods with violet reflex, m. 223–4° (decompn.). The nitrones can change, by loss of O, into Schiff bases, which explains why **I** and  $\text{ONC}_6\text{H}_4\text{NMe}_2$  do not form a nitrone but *p*-nitrobenzaldehyde *p*-dimethylaminoanil, violet, m. 206°, very similar to but not identical with the product (probably a *cis-trans*-isomer), m. 221°, obtained from *p*- $\text{O}_2\text{NC}_6\text{H}_4\text{CHO}$  and *p*- $\text{Me}_2\text{NC}_6\text{H}_4\text{NH}_2$ ; *di-Et* homolog, ruby-red, m. 136°; *o*-nitrobenzaldehyde *p*-dimethylaminoanil, red-brown, m. 94–5°; anthraquinone mono-*p*-dimethylaminoanil, from **V**, blue-black cubes with metallic reflex, m. 238° (Kaufler and Suchanek (*C. A.* 1, 1280) give 138°). As a representative of the thioketones as intercepting agents, **B**. and **H**. wished to use thiofluorenone. Smedley describes a "dimeric thiofluorenone" (**XI**) which, however, really contains 2 more H atoms and is *di-9* fluorenyl disulfide (**XV**, below): from fluorenone with  $\text{H}_2\text{S}$  in the presence of HCl is obtained a true thiofluorenone (**XII**), but as it is dimeric it was useless for **B**. and **H**'s present purpose. They therefore used Michler's thioketone (**XIII**). The **XII**, m. 232°, mol. wt. in  $\text{CHBr}_3$  370 (in camphor no const. m. p. could be obtained; the 1st detn. indicated a mol. wt. of 579). The ethylene sulfide primarily formed from **I** and **XIII** loses its S and the product is *1,1-bis-p*-dimethylaminophenyl-2-*p*-nitrophenylethylene, m. 175–6°. **V** yields the  $\text{K}_2\text{Cr}_2\text{O}_7$ -colored labile form (**XIV**), m. 238–40°, of  $(\text{C}_6\text{H}_4)_2\text{C}:-\text{C}(\text{C}_6\text{H}_4\text{NMe}_2)_2$ . In these reactions the S is doubtless split off in at. form and might therefore be expected to be especially reactive; as a matter of fact it reacts with the **XIV** to form thiofluorenone and **XIII** which are unstable and reduced to **XV** and *tetra-p*-dimethylaminodibenzohydryl disulfide (**XVI**), both of which were found in the reaction mixt. along with the **XIV**. The **XVI**, red, m. 163–4°, mol. wt. in camphor 569; the **XV**, golden yellow with reddish surface luster, m. 169–70°, is identical with Smedley's **XI**. **XV** is insol. in MeOH but on addn. of a drop of alc. KOH it dissolves at once with red color, showing that it contains substitutable H atoms, and its structure was definitely established by the synthesis of **XV** from **II** and  $\text{Na}_2\text{S}_2$  after it had been shown that  $\text{Na}_2\text{S}_2$  with  $\text{PhCH}_2\text{Cl}$  gives the same  $(\text{PhCH}_2)_2\text{S}_2$ , m. 74°, as is obtained by oxidizing

$\text{PhCH}_2\text{SH}$ . **II** and  $\text{NaSH}$  give the *monosulfide*, becomes discolored  $238^\circ$ , m.  $250^\circ$ . *Benzohydril Me ether*, from  $\text{Ph}_2\text{CHBr}$  and  $\text{KOH}$  in  $\text{MeOH}$ ,  $b_{17}$   $147-8^\circ$ , also obtained with  $m\text{-O}_2\text{NC}_6\text{H}_4\text{CHO}$  and  $\text{KOH}$  in  $\text{MeOH}$ , gives  $\text{Ph}_2\text{CHCSNHPh}$  when treated in  $\text{Et}_2\text{O}$  with  $\text{Na}$  powder and, after decanting, with  $\text{PhNCS}$ . (*p*- $\text{MeOC}_6\text{H}_4$ ) $_2\text{CHOH}$  with  $\text{SOCl}_2$  in  $\text{PhMe}$  gives *di-p-anisylchloromethane*, m.  $83-4^\circ$ , which likewise merely exchanges its  $\text{Cl}$  for  $\text{MeO}$  with  $\text{KOH}$  in  $\text{MeOH}$ . Similarly, **VII** gives *10-Me ether*, m.  $147^\circ$ , and in  $\text{EtOH}$  the *Et ether*, m.  $163^\circ$ .

C. A. R.

**Two supposed cases of isomerism in the aromatic series.** OTTILIE BLUM, *Ber. 62B*, 881-93(1929).—There are in the literature 2 supposed cases of isomerism which might be interpreted as being examples of the new type of isomerism of condensed ring systems observed by Schlenk and his collaborators (C. A. 22, 4493). Brand by an unequivocal although tedious method synthesized 1,1,4,4-tetraphenylbutatriene, yellow, m.  $240^\circ$ , while Purdie and Arup by  $\text{Zn}$  dust distn. of  $\text{Ph}_2\text{C}:\text{CH}:\text{CH}(\text{CPh}_2)_2$

obtained a colorless compd., m.  $158^\circ$  (**I**), to which they assigned the same structure, this substance was also obtained by Bittenberg from  $\text{Ph}_2\text{C}:\text{CHOEt}$  and concd.  $\text{H}_2\text{SO}_4$ . In the course of a study of the behavior of aromatic halogenated ethylenes toward  $\text{Na}$ , Blum treated  $\text{Ph}_2\text{C}:\text{CHBr}$  in  $\text{Et}_2\text{O}$  with  $\text{Na}$  powder and on hydrolysis of the resulting product obtained a hydrocarbon  $\text{C}_{28}\text{H}_{22}$  (**II**) which on gentle oxidation most characteristically lost in part two  $\text{H}$  atoms and yielded **I**. Further oxidative degradation of **I** gave *o*- $\text{C}_6\text{H}_4\text{Bz}_2$  and, as an intermediate product, the *keto acid*, *o*  $\text{HO}_2\text{CCHPhC}_6\text{H}_4\text{CHPhBz}$  (**III**). **II** can therefore be only 1,2,4-triphenyl-1,4-dihydronaphthalene and **I** 1,2,4-triphenylnaphthalene and not  $(\text{Ph}_2\text{C}:\text{C})_2$ . With  $\text{Na}$  and  $\text{AmOH}$  **I** gives chiefly a *tetrahydro deriv.* (**IV**) which, naturally, is not  $(\text{Ph}_2\text{CHCH}_2)_2$ . Toward catalytic hydrogenation it is entirely resistant while **II** takes up 2 atoms of  $\text{H}$  and forms **IV**. The intermediate  $\text{Na}$  compd. in the prepn. of **II** has the compn.  $\text{C}_{28}\text{H}_{14}\text{Na}$  for with  $\text{CO}_2$  it gives an *acid*  $\text{C}_{28}\text{H}_{12}\text{CO}_2\text{H}$  (**V**) and with  $\text{PhNCS}$  the *thioanilide* (**VI**). The reaction possibly proceeds as follows: The  $\text{Ph}_2\text{C}:\text{CHBr}$  is decompd. by the  $\text{Na}$  partly into  $\text{Ph}_2\text{C}:\text{CH}$  and  $\text{Br}$  and partly into  $\text{Ph}_2\text{C}:\text{C}$  and  $\text{HBr}$ ; the  $\text{Ph}_2\text{C}:\text{C}$  at once rearranges into  $\text{PhC}:\text{CPh}$  which combines with  $\text{Ph}_2\text{C}:\text{CH}$ , with migration of  $\text{H}$  and closure of the ring, to form the free radical  $\text{C}_6\text{H}_4\text{CHPhCH}:\text{CPhCPh}$ —(**VII**) and thus adds

$\text{Na}$  in the usual way. Fischer and Besthorn by condensation of  $\text{Ph}_2\text{NH}$  with  $\text{AcOH}$  by means of  $\text{ZnCl}_2$  obtained a base, m.  $98^\circ$ , whereas Bernthsen obtained a base, m.  $114^\circ$ . Condensation of  $\text{Ph}_2\text{NH}$  with acids gives acridines; the 2 substances were therefore presumably 9-methylacridines. Blum likewise obtained 2 products: **VIII**, m.  $117-8^\circ$ , and **IX**, m.  $99-100^\circ$ . Only **VIII**, however, is 9-methylacridine; **IX** is a *new compd.* **VIII**,  $\text{Ph}_2\text{NH}$ . **VIII** adds 2 atoms  $\text{Na}$  and the resulting red-violet soln. on hydrolysis yields 9,10-dihydro-9-methylacridine (**X**), whereas **IX** adds also  $\text{Na}$  with red-violet color but the addn. product reacts with the  $\text{Ph}_2\text{NH}$  to form the 2 colorless products  $\text{Ph}_2\text{NNA}$

and  $\text{C}_6\text{H}_4 \begin{array}{c} \diagup \text{CHMe} \\ \diagdown \text{NNa} \end{array} \text{C}_6\text{H}_4$  and the soln. becomes colorless; hydrolysis yields a mixt

of  $\text{Ph}_2\text{NH}$  and **X**. **IX** is also formed from benzene solns. of  $\text{Ph}_2\text{NH}$  and **VIII**. Other secondary amines can likewise form mol. compds. with acridines. As their formation is accompanied by a deepening in color they are probably quinhydrone-like compds. in which the acridine functions as the quinoid component; this seems to be strong

evidence that acridines have the quinoid structure  $\text{C}_6\text{H}_4 \begin{array}{c} \diagup \text{CH} \\ \diagdown \text{N} \end{array} \text{C}_6\text{H}_4$  rather than a

*meso*-bond. **II** (yield, 10%), m.  $142.5-4^\circ$ , mol. wt. in  $\text{C}_6\text{H}_6$  341. The  $\text{PrOH}$  mother liquors give crystals,  $\text{C}_{14}\text{H}_{14} \cdot \text{C}_{14}\text{H}_{12}$ ,  $b_{24}$   $173-200^\circ$ , m.  $82-4^\circ$ , mol. wt. in camphor 182, add  $\text{Br}$  in  $\text{CHCl}_3$  and can be hydrogenated to a mobile oil, and a yellowish-green oil,  $\text{C}_{28}\text{H}_{26}$ ,  $b_{13}$   $283-5^\circ$ , solidifies to a glass, mol. wt. in  $\text{C}_6\text{H}_6$  316-9. **V**, m.  $238-9^\circ$ , **VI**, yellow, m.  $243-4^\circ$ , partially decompd. by alc. and  $\text{AcOH}$ , mol. wt. in camphor 430. **IV**, m.  $126-9^\circ$ . **III**, m.  $232-3^\circ$  (decompn.), mol. wt. in camphor 396. The action of  $\text{Li}$  on  $\text{Ph}_2\text{C}:\text{CHBr}$  is more complicated; very small amts. of **II** were always obtained but the normal reaction was as follows: the  $\text{Ph}_2\text{C}:\text{CH}$  residues formed primarily stabil-

ized themselves as  $(\text{Ph}_2\text{C}:\text{CH})_2$ , which added Li normally and the  $(\text{Ph}_2\text{CLiCH})_2$ , with alc gave the high-melting  $(\text{Ph}_2\text{CHCH})_2$  (XI), m. 139–40°, and with I or  $\text{PhNCS}$ ,  $(\text{Ph}_2\text{C}:\text{CH})_2$ , m. 200–1°. If the Li is allowed to react only a short time (24 hr.), there is obtained, along with XI, an isomer, m. 126.5–7.5° which is different from the low melting (126–7°) isomer of XI and from IV. It is hydrogenated to an oil  $\text{C}_{24}\text{H}_{26}$  and on oxidation gives  $\text{Ph}_2\text{CO}$  and  $\text{BzOH}$ ; not enough was available to establish its structure. 9-Methylacridine-9,10-dihydro-9-methylacridine mol. compd., from benzene solns. of the components, m. 99–100°. Acridine-diphenylamine mol. compd., lemon-yellow, m. 84–6°.

C. A. ROUILLER

The structure of Boyd's chloroanhydride from triphenylcarbinol and phosphorus trichloride. A. E. ARBUZOV AND B. A. ARBUZOV. *J. Russ. Phys.-Chem. Soc.* **61**, 217–53 (1929); cf. *C. A.* **17**, 2274; **18**, 3178; **21**, 61.—A. and A. modified Boyd's method for prep. the chloroanhydride (I) by working in  $\text{PhH}$ , thus increasing the yield considerably—52 g., m. 189.5–90°, from 42.5 g.  $\text{Ph}_3\text{COH}$  (II)—and cutting down the total time required to 3–4 hrs. B. observed that his I was always accompanied by smaller amts. of triphenylmethylphosphonic acid,  $\text{Ph}_3\text{CP}:\text{O}(\text{OH})_2$  (III) which he explained by supposing the formation of a tautomeric mixt. of  $\text{Ph}_3\text{C}:\text{O}:\text{PCl}_2$  with small amts. of  $\text{Ph}_3\text{CP}:\text{OCl}_2$ . A. and A. have shown that III is probably formed in another manner since they were unable to prep. an isomer of I by treating it in  $\text{PhH}$  with triphenylchloromethane (IV), but could obtain III by various hydrolytic reactions from I and its derivs. They obtained III also by hydrolysis of the product of the interaction of I with II, and suggest that under B.'s exptl. conditions II may locally exist in excess and by reacting with I lead to III. No formation of III was noticed when A. and A.'s modified method was used. A series of the Cl esters corresponding to I and the di-esters of III were prep'd. and these, together with I itself, were hydrolyzed under various conditions. The Cl esters (derivs. of either  $\text{Ph}_3\text{C}:\text{O}:\text{PCl}_2$  or  $\text{Ph}_3\text{CP}:\text{OCl}_2$ ) were obtained by treating the specially prep'd. (cf. *C. A.* **5**, 1397) corresponding K or Na alcoholate (2 mols.) in anhyd.  $\text{PhH}$  with 1 mol. of I. In no case could a di-ester be obtained by treatment of either I or the Cl ester with alcoholate. Chloro esters: *Et*, m. 125–6°; *iso Pr*, m. 164–5°; *iso-Bu*, m. 103–3.5°; *Me* (?), m. 179.5–80°; *Pr* (?), m. 107–8°. The last 2 derivs. gave inconsistent anal. results and were probably impure. The following di-esters of III were prep'd. from IV or triphenylbromomethane (V) and the corresponding alkyl esters (VI) of  $\text{H}_3\text{PO}_3$  with the elimination of 1 mol. of alkyl halide: *Me* (VII) brilliant orange-yellow crystals from  $\text{PhH}$  by pptn. with ligroin, m. 156–7° (8 g. from 10 g. V and 4 g. of VI); also colorless, m. 155–6° (5.8 g. from 15 g. V and 6 g. VI); colorless from  $\text{PhH}$  and ligroin followed by recrystn. from  $\text{Me}_2\text{CO}$ , m. 157–8° (19 g. from 21.2 g. IV and 9 g. VI); and brilliant yellow, m. 158–9° (3.2 g. from 4.5 g. IV and 2 g. VI); *Et* (VIII), m. 120–1° (almost quant. yield from V and VI); *Pr* (IX), m. 109–10° (15.5 g. from 25.5 g. V and 20 g. VI); *iso-Pr* (X), colorless, m. 122.5–23°; also, brilliant yellow, m. 119–20°; and colorless, m. 216.5–17°; *iso-Bu* (XI), m. 96–96.5° (poor yield). The formation of several modifications of VII and X could not be explained. Detns. of the mol. wt. and of P point to the same compn., the products of hydrolysis are the same, and the colored modifications are not decolorized by charcoal. The theoretical amt. of triphenylmethyl diphenylphosphine oxide,  $\text{Ph}_3\text{P}:\text{O}:\text{CPh}_3$ , m. 227.5–28°, was obtained from 5.03 g. V and 3.8 g.  $\text{Ph}_2\text{P}:\text{O}:\text{CHMe}_2$  (cf. *C. A.* **5**, 1397). For purposes of comparison the reaction of 5 g. II on 6 g.  $\text{EtOPCl}_2$  (cf. *Ann.* **139**, 34) was tried, 5 g. of faintly rose product (XII), m. 110–32° (not purified), was obtained. Contrary to B.'s earlier results, A. and A. were able to hydrolyze I in acid, basic, or neutral environment, in some cases, however, only with difficulty. By boiling in acid or alk. solns. either at ordinary pressure or in sealed tubes, I gave II and  $\text{H}_3\text{PO}_3$ . With dil. or abs.  $\text{EtOH}$  at ordinary pressure, II was formed, while in sealed tubes the same substances gave triphenylmethane and  $\text{AcH}$ . It is noteworthy that III was never obtained. III was formed in 21% yield by heating I with aq.  $\text{NH}_4\text{OH}$  and  $\text{NaHCO}_3$ . The Cl esters corresponding to I by hydrolysis with  $\text{HCl}$  or  $\text{H}_2\text{O}$  gave III, as did also XII. Thus these Cl esters may contain ter- or quinquivalent P. The di-esters of III all gave III by hydrolysis with dil.  $\text{HCl}$ . When heated under the same conditions, III itself was recovered unchanged. The above exptl. data do not solve the question of the constitution of I nor that of the mechanism of the formation of III, but they at least require the assumptions of B. to be experimentally confirmed. To this end, the action of  $\text{POCl}_3$  and  $\text{SOCl}_2$  on III and its esters was tried by A. and A., but no definite compd. could be isolated. The attempt to react  $\text{Ph}_3\text{CNa}$  and  $\text{Ph}_3\text{COMgCl}$  with  $\text{POCl}_3$ , also, was without result.

LEWIS W. BUTZ

A new series of sulfonephthaleins. WILTON C. HARDEN AND NATHAN L. DRAKE. *J. Am. Chem. Soc.* **51**, 2278–9 (1929); cf. *C. A.* **23**, 1404.—One of the compds. previously

described, tetrabromophenoltetrabromosulfonephthalein, has been found by Kolthoff to be a better indicator than bromophenol blue; it shows a color change from yellow to blue, just as bromocresol green and bromothymol blue but without the interfering dichromatism. The name *tetrabromophenol blue* is suggested. C. J. WEST

**Halogen-substituted aromatic pinacols and the formation of ketyl radicals  $R_2(IMgO)C$ .** M. GOMBERG AND JOHN C. BAILAR, JR. *J. Am. Chem. Soc.* 51, 2229-38(1929).—The method suggested by G. and Bachmann (*C. A.* 21, 3902) can be applied to the prepn. of many halobenzopinacols, especially those from ketones contg. Br or Cl atoms *m*- or *p*- to the CO group. When the halogen atom is in the *o*-position, however, the Mg of the reducing mixt. tends to remove the halogen atom from the ketone mol. and no pinacol is formed. Thus, *sym*-4,4'- and 3,3'-dibromobenzopinacol result in 94 and 85% yields, resp., while the 4,4',4'',4'''-tetra-Br deriv. results in 94% yield. In the prepn. of  $(3-BrC_6H_4)_2CO$ , m. 140°, there is also formed some diketone (?),  $(m-BrC_6H_4CO)_2C_6H_4$ , m. 172°. 3,3',3'',3'''-Tetrabromobenzopinacol, m. 152-6°; because of the difficulties of purification, only 40% of pure product was obtained. In the prepn. of  $(3-BrC_6H_4)(4-BrC_6H_4)CO$ , there also results a small amt. of the diketone,  $C_{12}H_8OBr_2$ , m. 217-20°. *sym*-3,3',4',4'''-Tetrabromobenzopinacol, m. 160-3°, results in 35% yield after heating the reduction mixt. at 75° for 4 days. 1-Chloro-4'-bromobenzophenone, m. 150° (60% yield); reduction gives *sym*-4,4'-dichloro-4'',4'''-dibromobenzopinacol, m. 169°. 4-, 3- and 2-Bromo-4'-phenylbenzophenone, prepd. from the  $BrC_6H_4COCl$  and  $Ph_2$ , m. 188°, 119° and 88.5°, resp. *sym*-4,4'-(I) and 3,3'-Dibromo-4'',4'''-diphenylbenzopinacol (II), m. 158-9° and 175°, resp. By a study of the iodomagnesium pinacولات from the point of view of Beer's law, the existence of the equil.: pinacolate  $\rightleftharpoons$  ketyl, has been demonstrated. The relative migratory tendencies of the *p*- $BrC_6H_4$ , *m*- $BrC_6H_4$  and *p*- $PhC_6H_4$  groups have been detd. by rearrangement of the appropriate pinacols to pinacolins. The results are in good agreement with those obtained by previous investigators on different examples. I, rearranged by heating with AcOH and AcCl in  $C_6H_6$  for 8 hrs., gives a mixt. of 4,5', of the pinacol,  $PhC_6H_4(p-BrC_6H_4)CCOC_6H_4Ph$ , and 96.5% of the pinacol  $(PhC_6H_4)_2p-BrC_6H_4CCOC_6H_4Br$ , m. 227°. Splitting of the latter pinacol gives 4,4'-diphenyl-4''-bromotriphenylmethane, m. 186°; the corresponding carbinol, m. 248.50°. Rearrangement of II gives a pinacolin,  $C_{18}H_{12}OBr_2$ , m. 202-3°; this rearrangement is due entirely to the migration of the  $PhC_6H_4$  group; splitting gives 4,4'-diphenyl 3'-bromotriphenylmethane, m. 143°; the corresponding carbinol, m. 304°. C. J. WEST

**Resolution of benzoin.** F. J. WILSON AND I. V. HOPPER. *J. Roy. Tech. Coll. (Glasgow)* 2, No. 1, 62-4(1929).—This is the first resolution by means of an optically active semicarbazide and the first resolution of benzoin although the two enantiomorphs have been obtained synthetically. *d*- and *l*-MeCHPhNHCONHNH<sub>2</sub>·HCl and *dl*-benzoin were used both in EtOH and  $C_6H_5N$  in the resolution. Since with *dl*-PhCH(OH)C(NNHCONHCHPhMe)Ph stereoisomerism of the Hantzsch-Werner type is possible, there should be 4 *dl*-modifications:  $\alpha = d-d$ , *trans* and *l-l*, *trans*;  $\beta = d-d$ , *cis* and *l-l*, *cis*;  $\gamma = d-l$ , *trans* and *l-d*, *trans*;  $\delta = d-l$ , *cis* and *l-d*, *cis*. The reaction ran smoothly in  $C_6H_5N$  and 3 of the 4 possible compds. were obtained:  $\alpha$ , m. 174°;  $\beta$ , m. 154°;  $\gamma$ , m. 137° (very small yield). Each gave benzoin on acid hydrolysis. EtOH was a less satisfactory medium,  $\alpha$ ,  $\beta$ , and unaltered benzoin being obtained. *dl*-Benzoin plus *d*-MeCHPhNHCONHNH<sub>2</sub> should give 4 active modifications but only 1 cryst. product was isolated from  $C_6H_5N$  soln., the other product being oily and very sol. This *l*-rotatory substance proved to be a *d*- $\delta$ -[ $\alpha$ -phenylethyl] semicarbazone of *d*-benzoin, m. 181-2°,  $[\alpha]_D^{14} -141.5^\circ$  in abs. EtOH; its constitution was confirmed by its identity with the semicarbazone of synthetic *d*-benzoin  $l$ -PhCHMeNHCONHNH<sub>2</sub>·HCl with *dl*-benzoin gave *l*-benzoin *l*- $\delta$ -[ $\alpha$ -phenylethyl] semicarbazone, m. 181-2°,  $[\alpha]_D^{14} 140.9^\circ$  in abs. EtOH. The *l*-benzoin obtained by hydrolysis of this last deriv. agreed with the properties ascribed to it by McKenzie and Wren. Alkalies racemize active benzoin readily but *d*-benzoin remained optically unchanged after standing 1 week in  $C_6H_5N$  in a quartz vessel. C. H. PERT

**Reduction of aromatic 1,2-diketones by the binary system magnesium iodide (or bromide)-magnesium.** M. GOMBERG AND F. J. VAN NATTA. *J. Am. Chem. Soc.* 51, 2238-45(1929).—The unsatd. halo-Mg glycolates obtained by reduction of various aromatic diketones have been prepd. and their reactions studied. It has been found that  $MgI_2$  alone, even in the absence of metallic Mg, has a decided reducing action on the diketone; the amt. of glycolate formed is dependent upon the equil.: diketone +  $MgI_2 \rightleftharpoons$  glycolate +  $I_2$ . The amt. of I thus set free is from 16 to 50% of the theory. The characteristic color changes during and at the end of the re-

duction process suggest the possibility of the existence in the unsatd. glycolates of mols. contg. each 2 tervalent C atoms  $R(XMgO)C-C(OMgX)R$ . Reduction of

$(p\text{-Me-C}_6\text{H}_4\text{CO})_2$  gave over 90% of toluoin, when the decompn. was carried out with boiled  $H_2O$  in a stream of N. The reduction product from 1.19 g. tolii was treated with a slow stream of dried air and then hydrolyzed, giving 0.33 g. of insol. polymer, 0.54 g. of tolii and 0.32 g. toluoin; on hydrolysis the polymer gives *p*-tolilic acid. *p,p'*-Dimethylstilbenediol dibenzoate, m. 135°. With  $MgI_2$  alone about 42% of the tolii had reacted after 1 month in the dark. Reduction with  $MgBr_2$  and Mg gives 82% of toluoin. On reduction of *p*-anisil with  $MgI_2$  and Mg there results 62% of anisoin; the low yield is due to reoxidation by the air to anisil.  $MgBr_2$  forms a deep yellow insol. addn. compd. and so it was impossible to reduce anisil with  $MgBr_2$  and Mg. *p,p'*-Dichlorobenzil with  $MgI$  and Mg give 91% of the benzoin, m. 85-7°;  $MgBr_2$  could not be used because of the slight soly. of the double compd. With the theoretical amt of I, the glycolate gives after 2 weeks equal parts of benzil and benzoin; after 2 days' passage of air, the glycolate yielded 52% of the insol. anhydride of dichlorobenzilic acid polymer, decomp. 320-40°, 26% of dichlorobenzoin and 22% of the benzil. *p,p'*-Dichlorostilbenediol dibenzoate, m. 200-2°. The equil. with  $MgI_2$  alone was reached when 62% of the benzil had reacted.  $\alpha$ -Naphthoin, m. 138-9°, was obtained in 3.4 g. yield when 26.5 g.  $\alpha\text{-C}_{10}\text{H}_7\text{CHO}$ , 10 g. KCN, 100 cc. EtOH and 50 cc.  $H_2O$  were refluxed 3 hr., 5 g. KCN added and the heating continued for 8 hr.; from the EtO mother liquors there was obtained 3.4 g. naphthil, yellow, m. 188-9°. The prepn. from  $\alpha\text{-C}_{10}\text{H}_7\text{CO}_2\text{H}$  by reduction with  $MgI_2$  and Mg is preferable, because the acid is more accessible and the yield of naphthoin is somewhat larger.  $\alpha$ -Naphthilic acid, m. 137-8° (decompn.). Reduction of the naphthil by  $MgI_2$  and Mg is complete in 3 days, giving 91% of the naphthoin. When dried air is passed through the glycolate and the soln. hydrolyzed, there is no formation of the polymer-anhydride, but 40% formation of naphthilic acid. *p,p'*-Diphenylbenzoin, m. 168-70°, results in 95% yield from *p*-PhC<sub>6</sub>H<sub>4</sub>CHO and KCN; 1 g. dissolves in about 115 cc. cold C<sub>6</sub>H<sub>6</sub> or AcOEt. Oxidation with  $CuSO_4$  in dil. C<sub>6</sub>H<sub>5</sub>N gives 95% of *p,p'*-diphenylbenzil, light yellow, m. 141-2°; the quinoxaline is cream-colored and m. 209-10°. Reduction of the benzil with  $MgI_2$  and Mg gives 88% of the benzoin. The action of dry air gives 35% of the polymer of diphenylbenzilic acid, decomp. 250°. *p,p'*-Diphenylstilbenediol benzoate behaves as though it was a mixt. of 2 isomers, m. about 180° and 203°; when heated at 210° and crystd. from C<sub>6</sub>H<sub>6</sub>, it m. 200-3°. Equil. is obtained with  $MgI_2$  alone when about 33% of the benzil has reacted. *p*-Phenylbenzil, light yellow, m. 105°, in 64% yield from *p*-PhC<sub>6</sub>H<sub>4</sub>COCH<sub>2</sub>Ph; reduction with  $MgBr_2$  and Mg gives *p*-phenylbenzoin, m. 148-51°.

C. J. WEST

**1,8-Dibenzyl-naphthalene and two other isomeric hydrocarbons.** K. DZIEWOŃSKI AND J. MOSZEW. *Roczniki Chem.* 9, 361-9 (369-70, French) (1929).—In addn. to the compds. described in C. A. 23, 3220, there were prepd. in the presence of  $AlCl_3$  at 100°, 1,8-dibenzoylnaphthalene bisphenylhydrazone, m. 270-1°; *PhNH\_2* salt of 1,8-dibenzyl-naphthalene-4-sulfonic acid, m. 252-3°; 1,8-dibenzyl-naphthalene-4-sulfonyl chloride, m. 151°; 1,8-dibenzyl-naphthalene-4-sulfonamide, m. 167°; 1-benzyl-8-benzoylnaphthalene, light yellow, m. 113°.

JAROSLAV KUČERA

**Preparation of  $\alpha$ -chloronitronaphthalenes.** RYO ASAOKA. *Bull. Tokyo Ind. Research Inst.* 23 [9], 1-26 (1928).—For the study of the industrial use of chloronaphthalene in dye industry first  $\alpha$ -chloronaphthalene, and then its 3 mononitro derivs. and 2 dinitro derivs. were prepd. pure, the m.-p. diagrams for 2 component systems being then constructed. The eutectic points found are: in 1,4-1,5-system, 74-5° (1,4- 57%; 1,5- 43%), in 1,4-1,8-system, 52-3° (1,4- 57%; 1,8- 43%); in 1,5-1,8-system, 66-7° (1,5- 45%; 1,8- 55%). When more than 60% of the 1,8-compd. is present as a component the m.-p. curves of the 1,4- and 1,5-systems all coincide. In the 1,4,5-1,4,8-system the eutectic lies at 117-8°, the compn. being 1,4,5- 34%; 1,4,8- 66%. In prepg.  $\alpha$ -chloronaphthalene, naphthalene was dissolved in  $CCl_4$ , and  $Cl_2$  gas was passed at 50-60° into the soln. with  $FeCl_3$  as catalyst, or the naphthalene was melted and  $Cl_2$  gas was passed into the melt at 100°. The resulting product was fractionally distd. to remove unreacted naphthalene and dichloronaphthalene.  $I_2$ , Zn powder and Fe powder were also tried as catalysts. In prepg. 1,4-chloronitronaphthalene,  $\alpha$ -chloronaphthalene was nitrated by means of  $HNO_3$ , and the product was crystd. several times from EtOH to remove the 1,5- and 1,8-isomers. In prepg. 1,5-chloronitronaphthalene it was found convenient to start from 1,5-dinitronaphthalene, while in prepg. the 1,8-compd.  $\alpha$ -naphthylamine was taken as the starting substance. K. S.

**Mercuration in alkaline solution.** Preliminary paper. A. L. FOX AND FRANK

C. WHITMORE. *J. Am. Chem. Soc.* **51**, 2196-7(1929).—2,3-(HO)<sub>2</sub>C<sub>10</sub>H<sub>7</sub>CO<sub>2</sub>H (30 g.) in 500 cc. H<sub>2</sub>O and 150 cc. of *N* NaOH, heated to boiling and treated, with stirring, with 52 g. Hg(OAc)<sub>2</sub> in 300 cc. H<sub>2</sub>O and 10 cc. AcOH, gives a light yellow powder, probably *anhydro-4-hydroxymercuri-3-hydroxy-2-naphthoic acid*. Similarly 15 g. *o*-HOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H gives 27 g. Hg deriv. and 100 g. PhOH gives 215 g. Hg deriv. The reaction failed with *m*- and *p*-HOC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H,  $\alpha$ -C<sub>10</sub>H<sub>7</sub>OH, *o*-O<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>OH, *o*- and *p*-H<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CO<sub>2</sub>H, PhSO<sub>3</sub>H, 1-C<sub>10</sub>H<sub>7</sub>CO<sub>2</sub>H and *o*-C<sub>6</sub>H<sub>4</sub>(CO<sub>2</sub>H)<sub>2</sub>. C. J. WEST

$\beta$ , $\beta$ -Dinaphthyl sulfide as a by-product in the preparation of  $\beta$ -naphthonitrile. Reduction of the sulfone with sodium cyanide. N. A. LANGE AND H. S. HAUPT. *J. Am. Chem. Soc.* **51**, 2277-8(1929).—The unsaponifiable portion of crude  $\beta$ -C<sub>10</sub>H<sub>7</sub>CN, prep'd. by the fusion of  $\beta$ -C<sub>10</sub>H<sub>7</sub>SO<sub>2</sub>Na and NaCN, consists mostly of ( $\beta$ -C<sub>10</sub>H<sub>7</sub>)<sub>2</sub>S, m. 151°; this is probably formed by the reduction of the sulfone, which is present in the Na salt. C. J. WEST

New *meso*-derivatives of anthracene and of bianthryl. V. I. MINAEV AND B. P. FEDOROV. *J. Russ. Phys.-Chem. Soc.* **61**, 143-50(1929).—*Prepn. of the Na salts of ms-sulfonic acids of anthracene and of bianthryl*. Eighteen g. *ms*-nitroanthracene, which has previously been recrystd. from AcOH and finely pulverized, is made up into a paste with 45 g. of 19.3% NaHSO<sub>3</sub> and 3.35 g. NaOH in 10 cc. H<sub>2</sub>O, and the paste is transferred by means of 50 cc. H<sub>2</sub>O into a 200 cc. round-bottomed flask provided with a reflux condenser and heated to slight boiling 3.5-4 hr. When the mixt. turns into

a thick whitish mass it is poured into 50-cc. ice water and the contents of the flask is rinsed with another 50 cc. H<sub>2</sub>O. After 3 hr. the soln. cooled to 5-6° is filtered. The ppt., which consists of unchanged nitroanthracene and of II, is boiled first with a mixt. of 400 cc. H<sub>2</sub>O and 100 cc. EtOH, then with a mixt. of 200 cc. H<sub>2</sub>O and 20 cc. EtOH, being each time filtered boiling through a Büchner funnel, whereupon the filtrate immediately gives a beautiful ppt. of II. To agglomerate the ppt. the filtrate is evap'd. to 300-350 cc. and, while boiling, treated with 100 cc. of a 25% NaCl. After cooling, the beautiful ppt. is filtered and washed. The yield is 1.75 g. crude II and 1.53 g. unchanged *ms*-nitroanthracene. The yellowish brown filtrate obtained after pptg. nitroanthracene and II consists of I and NaNO<sub>2</sub>; it is treated with stirring and cooling by a slow SO<sub>2</sub> current as long as an I-starch paper moistened by dil. HCl ceases to indicate free I. The excess of SO<sub>2</sub> is neutralized by a NaHCO<sub>3</sub> soln., the liquid is evap'd. on a water bath to dryness and the residue is dried *in vacuo* over H<sub>2</sub>SO<sub>4</sub>. To sep. the admixt. of inorg. salts the dry residue is treated with warm EtOH, filtered, and the filtrate is evap'd. and dried. The yield of crude I is 17 g. *Properties of I*.—After several recrystns. from abs. EtOH I presents colorless flat little prisms very readily sol. in H<sub>2</sub>O, slightly in EtOH. On being boiled with dil. inorg. acids it very rapidly emits SO<sub>2</sub>, forming anthracene. This reaction proves that the group SO<sub>3</sub>Na is bound with the *ms*-C atoms, and this is confirmed by the fact that by oxidation with alk. KMnO<sub>4</sub> anthraquinone is formed almost quant. By fusing for a short time 1 g. I in a Ni crucible with 3 g. NaOH and 1 cc. H<sub>2</sub>O at 200-210°, dissolving the melt and filtering into dil. HCl, light-yellow flakes of anthrol, m. 163-4°, are pptd. On heating 1 g. I in a sealed tube with 15 cc. 20% NH<sub>4</sub>OH 4 hrs. at 200°, golden yellow leaves of *ms*-anthramine are obtained (yield, 20-25%). *ms*-Anthramine decomps. 115° without melting. *Properties of II*.—After 2 recrystns. from dil. EtOH, II presents oblong colorless prisms with 1 mol. H<sub>2</sub>O which disappears on drying in a vacuum desiccator at 102-5°. The anhyd. product is hygroscopic, almost insol. in H<sub>2</sub>O, hardly sol. in boiling H<sub>2</sub>O, readily sol. in hot EtOH. On being boiled with dil. inorg. acids it emits SO<sub>2</sub> and almost quant. turns into bianthryl; this reaction proves that SO<sub>3</sub>Na is bound with the *ms*-C atoms. On being fused with NaOH II gives *ms*-hydroxybianthryl (III); on being heated with NH<sub>4</sub>OH in a sealed tube II gives yellowish crystals of *ms*-bianthrylamine (IV), m. 305° (decompn.), III and IV have never hitherto been obtained and present the 1st instances

of nonsym. disubstituted derivs. of *ms*-bianthryl. While *ms*-anthramine is known to behave abnormally during diazotization, forming anthraquinone and diaminobianthryl, IV on the contrary diazotizes quite normally in EtOH and the product gives with  $\beta$ -naphthol a beautiful cherry-red *azo dyestuff* which is alterable on standing and becomes brown. The dyestuff has only a theoretical interest.

DAVID DAVIDSON

**Oxidizing nitration and quinonenitronic acids.** GUSTAV HELLER, ERHARD MERTZ AND ALFRED SILLER. *Ber.* 62B, 928-37 (1929).—Several instances are known, especially in the anthraquinone series, where  $\text{H}_2\text{SO}_4$  and  $\text{HNO}_3$  may not only act as sulfonating or nitrating agents but also introduce HO groups into the aromatic compd. Strecker from alizarin and cold concd.  $\text{HNO}_3$  obtained a  $\text{H}_2\text{O}$ -sol. "pseudonitropurpurin" (I) which readily rearranges into nitropurpurin and the present authors have now been able to obtain in pure form an analogous compd from rubiopin (1,2,5,6-tetrahydroxyanthraquinone) (II). II with nitrating acid gives first a yellow compd. which dissolves in  $\text{H}_2\text{O}$  with violet color; after washing away the mineral acid it can be obtained from AcOH in crystals (III) with 2 AcOH, is quite stable in the solid state and even after drying at  $120^\circ$  remains easily sol. in  $\text{H}_2\text{O}$  with violet color; in soln. mineral acids slowly, but not homogeneously, isomerize it into *dinitrohexahydroxyanthraquinone* (IV), and conversely IV is apparently smoothly converted into III by concd.  $\text{HNO}_3$  or alkali. In analogy with I of the structures proposed by Brasch for I, III can be represented by

HON(:O):C—CO—C.CO.C.C(OH).COH  
the formula  $\begin{array}{c} \text{HOC}:\text{C}(\text{OH}).\text{C}.\text{CO}.\text{C}.\text{CO}.\text{C}.\text{N}(:\text{O})\text{OH} \end{array}$  of a 1,2,5,6-tetra-

hydroxyanthraquinone-4,3,8,7-di[quinonenitronic acid]. III and IV are mutually interconvertible but they are not typical desmotropes, for the rearrangement is not an equil function but is brought about only by reagents and is accompanied in 1 direction by side reactions; also, on cautious dyeing they show characteristic differences, III having but little affinity for mordanted cotton. The violet soln. of III is strongly acid to litmus, forms a cryst. salt with NaOAc and dissolves Mg. On gentle reduction with  $\text{Na}_2\text{S}$  III forms the di[quinone oxime] or 3,7-dinitroso-1,2,4,5,6,8-hexahydroxyanthraquinone (V). The primary process in the formation of III is probably a dehydrogenation (a corresponding amt. of  $\text{HNO}_2$  is formed) followed by union of two  $\text{HNO}_2$  residues through the O atom to form a dinitrate which then isomerizes into III. III can be converted into still another form; when it is dissolved in  $\text{HNO}_3$  and allowed to evap. over KOH *in vacuo* it forms a faintly yellow cryst. substance (VI) (the form usually obtained first in prepg. III) insol. in anhyd. solvents, turned red by cautious addn. of  $\text{H}_2\text{O}$  and violet on further diln. Gentle nitration of II gives the 3,7-dinitro compd. (VII) which can likewise be converted into III. Similarly, from 1,2,7,8-tetrahydroxyanthraquinone (VIII) can be obtained a 3,6-dinitro deriv. (IX) and the 4,3,5,6-di[quinonenitronic acid] (X), which on standing in dil  $\text{H}_2\text{SO}_4$  rearranges even less homogeneously than III. VII, from 5 g. II in 40 cc. AcOH and 7 g. 100%  $\text{HNO}_3$  in 10 cc. AcOH in the cold, light brown, begins to darken  $225^\circ$ , does not m.  $300^\circ$ , difficultly sol. in concd.  $\text{H}_2\text{SO}_4$  with reddish color, forms difficultly sol. dark blue alkali salts, dyes mordanted cotton brown to black-violet, Cr-mordanted wool red-brown, reduced by  $\text{Na}_2\text{S}$  in NaOH to the di-Na salt, blackish needles, of the diamino compd., brown-violet; Ac deriv.,  $\text{C}_{26}\text{H}_{22}\text{O}_{12}\text{N}_2$ , does not m.  $300^\circ$ . III, from 1 g. II in 7 cc. concd.  $\text{H}_2\text{SO}_4$  cautiously nitrated with 2 cc. fuming  $\text{HNO}_3$  and 5 cc.  $\text{H}_2\text{SO}_4$ , dark blue needles with 2 AcOH, deflagrates around  $265^\circ$ , sol. in concd.  $\text{H}_2\text{SO}_4$  with dark blue, in  $\text{NH}_4\text{OH}$  with blue color, forms blue salts with alkalies, dyes mordanted cotton poorly, Cr-mordanted wool dark reddish; di-Na salt. III is also formed from II with  $\text{HNO}_3$  vapors and by nitration of 1,2,4,5,6,8-hexahydroxyanthraquinone in  $\text{H}_2\text{SO}_4$ ; phenylhydrazine salt,  $\text{C}_{26}\text{H}_{22}\text{O}_{12}\text{N}_6$ , red, does not m.  $290^\circ$ ; hydroxylamine salt. IV, red needles or leaflets with green luster, deflagrates around  $290^\circ$ , sol. in concd.  $\text{H}_2\text{SO}_4$  with reddish blue color, dyes mordanted cotton blue to dark brown, Cr-mordanted wool deep dark

blue. V, dark brown, does not m. 300°, sol. in H<sub>2</sub>SO<sub>4</sub> with blue-violet, in alkali with red-violet color, isolated as the *pyridine salt*, m. 224°; 3,7-diamino compd., sol. in concd. H<sub>2</sub>SO<sub>4</sub> with cherry-red, in dil. alkali with violet color, obtained from III or IV with Na<sub>2</sub>S-NaOH or SnCl<sub>2</sub>-HCl or from III in H<sub>2</sub>O with Pd-BaSO<sub>4</sub> and H<sub>2</sub>. IX, bright red, becomes discolored at 260°, m. 295-6° (decompn.), sol. in concd. H<sub>2</sub>SO<sub>4</sub> with yellow-red, in dil. NH<sub>4</sub>OH with crimson, in alkali with red-brown color. X, blue-violet needles with 2 AcOH, sol. in H<sub>2</sub>O with crimson, in concd. H<sub>2</sub>SO<sub>4</sub> with deep blue, in alkali and NH<sub>4</sub>OH with blue-green color, deflagrates about 246°; 1 g. in dil. H<sub>2</sub>SO<sub>4</sub> gives after 3 days 0.4 g. 1,2,4,5,7,8-hexahydroxy-3,6-dinitroanthraquinone, dark brown, deflagrates 285°, sol. in H<sub>2</sub>SO<sub>4</sub> with red-violet, in dil. alkalies and NH<sub>4</sub>OH with dark violet color.

**Optical researches on perylene and its derivatives. II. The visible absorption spectra of several bi-derivatives.** ARMIN DADIEU. *Z. physik. Chem., Abt. B*, 2, 253-61 (1929); cf. *C. A.* 23, 1351.—The influence of the following substituents was studied EtCO, PrCO, o-MeC<sub>6</sub>H<sub>4</sub>CO, COC<sub>6</sub>H<sub>4</sub>OCH<sub>3</sub>(*p*), NO<sub>2</sub>, NH<sub>2</sub>. The effect of these is essentially no different from the formerly investigated substituents. Curves are also given for the 1,12- and 3,10-quinones.

G. L. CLARK

**The structure of the furanmono- and dibasic acids.** I. A. TREFIL'EV. *Ukrainskii Khim. Zhur.* 1, Sci. Pt., 121-296(1925); cf. *Chem. Zentr.* 1906, II, 110; *C. A.* 2, 413, 1269, 3076, 3077; 3, 535, 636; 5, 1413.—A review of all T.'s work in this field, preceded by a historical survey of earlier work. Many references are included. The following new work is reported: By the action of Br in CS<sub>2</sub> on the *di-Et ester of carboxypyrotritaric acid*, HO<sub>2</sub>CC:CMc:O.CMc:CCO<sub>2</sub>H, also in CS<sub>2</sub>, 4 atoms of Br are

added. The bronze-yellow cryst. product decomp. so rapidly, even in a desiccator, that analysis is impossible. The *mono-Et ester* with Br in PhH also gives a *tetrabromide*, bronze-golden crystals, m. 78° (decompn.), which decomp. spontaneously. *Pyrotritaric acid*, CH:CMc:O.CMc:CCO<sub>2</sub>H (I), is obtained from 1 mol. Na malate, one

mol. AcCO<sub>2</sub>H (II) and 1.5 mols. Ac<sub>2</sub>O at 100-30° in 30-40 hr.; also from 1 mol. Na maleate and two mol. II at 105-40° in 30 hr. Since the yield does not change with the 2nd component, I is formed from AcCO<sub>2</sub>Na and AcCO<sub>2</sub>H according to the equation: AcCO<sub>2</sub>Na + 2AcCO<sub>2</sub>H → NaC<sub>7</sub>H<sub>7</sub>O<sub>3</sub> + 2CO<sub>2</sub> + 2H<sub>2</sub>O. Also succinic acid when used in the synthesis of I plays no essential part. For the formation of *methronic acid*, CH:C(CH<sub>2</sub>CO<sub>2</sub>H).O.CMc:CCO<sub>2</sub>H, from AcCH<sub>2</sub>CO<sub>2</sub>Et and succinic acid in the

presence of Ac<sub>2</sub>O, T. suggests the scheme: AcCH<sub>2</sub>CO<sub>2</sub>Et + (CH<sub>2</sub>CO<sub>2</sub>H)<sub>2</sub> → AcCH(CO<sub>2</sub>H)CH<sub>2</sub>CO<sub>2</sub>H → MeC(OH):C(CO<sub>2</sub>H)CH<sub>2</sub>CO<sub>2</sub>H → CH<sub>2</sub>:C(CO<sub>2</sub>H).CMc:O.CO

+ AcCH<sub>2</sub>CO<sub>2</sub>Et - EtO<sub>2</sub>CCHAcC:CH:C(CO<sub>2</sub>H):CMc:O - EtO<sub>2</sub>CCH<sub>2</sub>C:CH:C(CO<sub>2</sub>H):CMc:O. The formation of AcCH(CO<sub>2</sub>H)CH<sub>2</sub>CO<sub>2</sub>H from AcCH<sub>2</sub>CO<sub>2</sub>Et and

(CH<sub>2</sub>CO<sub>2</sub>H)<sub>2</sub> (not from (CH<sub>2</sub>CO<sub>2</sub>H)<sub>2</sub> and Ac<sub>2</sub>O) explains the increase in yield by using an excess of AcCH<sub>2</sub>CO<sub>2</sub>Et, and the elimination of AcOEt in the early stages of the synthesis. The scheme proposed has in its favor the fact that most of the intermediate products have actually been obtained. T. in detail compares his scheme with that proposed by Schroeter (cf. *Ber.* 39, 2129(1906)).

L. W. B.

**Addition reactions with indolenines. III. A procedure for the ketone cleavage of acetoacetic esters.** HERMANN LEUCHS, ARNOLD HELLER AND ALFRED HOFFMANN. *Ber. 62B*, 871-81(1929); cf. *C. A.* 22, 2165.—The reason earlier investigators did not observe the addn. of amines (PhNHNH<sub>2</sub>, NH<sub>3</sub>) or acid anhydrides to indolenines was the lack of reactivity of the -N:CR- group; the present authors were also not able to effect addn. on the indolenines from β-benzyl- and β-phenethyltetralone, which may be considered as carbazolenine derivs. Sometimes, too, there will be necessary for the reaction conditions under which the first product, with appropriate α-substituents, will undergo further transformation if this does not take place so easily that

it will occur under all conditions. In this group apparently belong bases like 3,3-diethyl-2-methylindolenine which with  $\text{Ac}_2\text{O}$  gave 3,3-diethyl-2-methyleneacetylindoline and with  $\text{BzCl}$  the 1-Bz deriv. Related to these compds. is 3,3-dibenzyl-2-methylindolenine (I), to obtain which it was necessary to start from *asym-dibenzylacetone* (II). II had hitherto not been obtained from  $\text{AcC}(\text{CH}_2\text{Ph})_2\text{CO}_2\text{Et}$  (III). The ketone cleavage of such esters is often repressed and Fittig from III obtained only  $\text{AcOH}$  and  $(\text{PhCH}_2)_2\text{CHCO}_2\text{H}$ , the products of acid cleavage. Instead of trying to improve the old methods, the authors used a new procedure based on the Zeisel anal. method; the III was gently boiled 2 hrs. at  $115^\circ$  with 10 parts each of  $\text{AcOH}$  and  $\text{HI}$  (b.  $168-70^\circ$ ), whereupon  $\text{EtI}$  distd. off. Extn. with  $\text{C}_6\text{H}_6$  gave 80% II and left the acid mixt. ready for use again. No  $(\text{PhCH}_2)_2\text{CHCO}_2\text{H}$  was formed. I, prepd. from the phenylhydrazone of II, added neither  $\text{PhNHNH}_2$  nor  $\text{NaHSO}_3$ , but with  $\text{Ac}_2\text{O}$  and  $\text{Bz}_2\text{O}$  gave *N*-acetyl (IV) and *N*-benzoyl-3,3-dibenzyl-2-methyleneindoline (V) which were hydrolyzed to the I and  $\text{AcOH}$  or  $\text{BzOH}$  by  $\text{AcOH}$  at  $100^\circ$  but not by aq.  $\text{NH}_4\text{OH}$  nor by  $\text{NaOH}$  at  $20^\circ$ . This easy hydrolysis must be related to the  $\text{CH}_2$  group and its tendency to attract to itself the H on the N when hydrolysis begins; the authors therefore believe that the 1st stage in the acylation is not the tautomeric rearrangement  $-\text{N}:\text{CMe}- \rightarrow$

$-\text{NHC}(\text{CH}_2)-$  but an addn. of 1 mol.  $(\text{RCO})_2\text{O}$  to  $-\text{N}:\text{CMe}-$  to form  $\text{RCONC}-$

$\text{MeO}_2\text{CR}$  which then splits off 1 mol.  $\text{RCO}_2\text{H}$  and gives  $\text{RCONC}:\text{CH}_2$ . Such a reaction cannot take place if the  $\alpha$ -C atom carries only a H atom or an aryl group or, in general, is combined with a C atom which carries no H. To test the influence of substitution by a simple aryl group, 2-phenyl-3,3-dimethylindolenine (VI) was prepd. from iso-PrCOPh; it added neither  $\text{PhNHNH}_2$  nor acid anhydrides, but with  $\text{BzCl}$  and  $\text{Na}_2\text{CO}_3$  it gave a little (27%) 1-benzoyl-2-phenyl-3,3-dimethyl-2-indolinol (VII). As an example of a compd. with only a H atom on the  $\alpha$ -C atom was taken 3,3-dimethylindolenine (VIII); this also did not add  $\text{PhNHNH}_2$  but with  $\text{Ac}_2\text{O}$  and  $\text{Bz}_2\text{O}$  it easily and smoothly yielded *O*²,1-diacetyl- (IX) and *O*²,1-dibenzoyl-3,3-dimethyl-2-indolinol (X) which with  $\text{MeOH}$  give the 1-acyl-2-methyl ethers (XI and XII) and with  $\text{AcOH}$  both the IX and X and the XI and XII give the free 1-acyl-2-indolinols (XIII and XIV), while with  $\text{NH}_3$  IX and X give 10-20% of the cryst. 1-acyl-2-aminoindolines (XV and XVI). XIV is also obtained in 70% yield from VIII with  $\text{BzCl}$  and  $\text{Na}_2\text{CO}_3$ . The addn. of  $\text{BzCl}$  and the transformation of the 1st product are believed to proceed according to

the scheme  $-\text{N}:\text{CH}- \rightarrow \text{BzNCl}:\text{CH}- \rightarrow \text{BzNCHCl}- \rightarrow \text{BzNCH}(\text{OH})-$ . An addn. of  $\text{BzOH}$  is excluded by the alky. of the soln., as is also that of  $\text{Bz}_2\text{O}$  to di-Bz derivs. of type X, since these are stable even towards alkali at  $20^\circ$ . II, yellowish, m.  $186^\circ$ ; semicarbazone, m.  $153-4^\circ$  (decompn.); oxime, m.  $75-6^\circ$ ; phenylhydrazone, m.  $86-7^\circ$ , easily resinifies in the light and air. I, from the phenylhydrazone and  $\text{ZnCl}_2$ , m. alc. at  $100-20^\circ$  (yield, 50-60%), oil; picrate, yellow, m.  $180-1^\circ$  (decompn.); HCl salt, greenish, m.  $180-2^\circ$ . IV, m.  $96-7^\circ$ , unchanged by  $\text{MeOH}$  at  $100^\circ$  or even by  $\text{AcOH}$  at  $60^\circ$ . V, m.  $164^\circ$ , faintly yellowish. VI, oil, isolated as the picrate, light yellow, m.  $158-60^\circ$ . VII, m.  $138^\circ$ , stable toward aq.  $\text{NH}_4\text{OH}$ . Methiodide of VI, yellow, m.  $203^\circ$ , gives with  $\text{Ag}_2\text{CO}_3$  in alc. 70% of 2-phenyl-1,3,3-trimethyl-2-indolinol, m.  $107-8^\circ$ . 2-Phenyl-3,3-dimethylindoline, prepd. with  $\text{Zn-Hg}$ , m.  $93^\circ$ ; HCl salt, m.  $193-4^\circ$ ; nitrate, m.  $197^\circ$  (decompn.); Ac deriv., m.  $192-3^\circ$ . The base with  $\text{MeI}$  in  $\text{MeOH}$  at  $100^\circ$  gives 2-phenyl-1,3,3-trimethylindoline, m.  $88^\circ$ , and its methiodide, m.  $194-5^\circ$ . IX, m.  $60-1^\circ$ . XI, oil. XIII, m.  $117-8^\circ$ . XV, m.  $78^\circ$ , quite easily sol. in alk. water; picrate, yellow, m.  $159-61^\circ$ . X, m.  $147-8^\circ$ . XII, m.  $71-2^\circ$ . XIV, m.  $202-4^\circ$ . XVI, m.  $115-7^\circ$ , sol. in *N* HCl and repptd. by  $\text{NH}_4\text{OH}$ ; picrate, yellow, m.  $191-4^\circ$ .

C. A. R.

**Indolic compounds with mixed function.** QUINTINO MINGOLA. *Gazz. chim. ital.* 59, 105-15 (1929).—Oddo and Moschini (cf. *C. A.* 6, 3425) prepd. the pyridonium salt of chloromethylpyrrole and then attempted to obtain the corresponding keto alc. by the action of water and of dil. alkalis on the chlorinated ketone. However, the hydrolytic agents resinified the chloromethylpyrrole, and keto alcs. with a pyrrole nucleus have remained an unknown type of compds. This induced M. to prep. the analogous chlorinated indole ketones and their Me derivs. and to obtain the corresponding keto alcs., which have never been described, and then to obtain various derivs., with a mixed function, e. g., keto amines, keto nitriles, keto acids and keto amino acids, and finally to utilize these last compds. for the synthesis of indolic polypeptides, which are not described in the literature. In the present paper the results obtained with  $\alpha$ -methylindole (I) are described.  $\beta$ -Chloroacetyl-methylketole (II), (prepd. from I by the

method of Salway, *C. A.* **7**, 2217) (1 g.) heated nearly to boiling with 2.5% aq. KOH (50 cc.), cooled, acidified, with dil.  $\text{H}_2\text{SO}_4$ , the ppt. washed, dried, and recrystd. repeatedly from  $\text{C}_6\text{H}_6$  and a little AcMe, yields  $\alpha$ -methyl- $\beta$ -indoylcarbinol  $\text{C}_6\text{H}_4\text{.NH.CMe:CCOCH}_2\text{OH}$  (III), lustrous yellow, m.  $196^\circ$ . Unlike II, which was

found to have a highly irritant action on the skin and mucous membranes, III was non-irritant. In dil. EtOH, III gives with aq.  $\text{NH}_3\text{-AgNO}_3$  a *Ag deriv.*  $\text{C}_6\text{H}_4\text{.NAg.CMe:CCOCH}_2\text{OH}$ . III,  $\text{Ac}_2\text{O}$  and  $\text{AcONa}$  boiled 0.25 hr. and the product

recrystd. from EtOH, yields a *di-Ac deriv.*,  $\text{C}_{16}\text{H}_{15}\text{O}_4\text{N}$ , m.  $101^\circ$ . III (0.5 g.) dissolved in hot water by the addn. drop by drop of the necessary dil.  $\text{Na}_2\text{CO}_3$ , aq.  $\text{KMnO}_4$  (0.22 g.) added very slowly, heated 0.5 hr. on a water bath, cooled, filtered, acidified with dil.  $\text{H}_2\text{SO}_4$ , extd. repeatedly with  $\text{Et}_2\text{O}$ , the combined exts. concd., and the ppt. recrystd. from EtOH, yields  $\text{C}_6\text{H}_4\text{.NH.CMe:CCOCO}_2\text{H}$ , m.  $186^\circ$  (cf. Oddo and Albanese,

*C. A.* **22**, 1775). The notable reactivity of the Cl atom in II is not limited to hydrolytic agents. Dil. alc. II (1 g.) and KCN (0.35 g.) refluxed for 0.5 hr., cooled, and the ppt. recrystd. from hot EtOH, yield  $\alpha$ -methyl- $\beta$ -indoylacetonitrile,  $\text{C}_6\text{H}_4\text{.NH.CMe:CCO-}$

$\text{CH}_2\text{CN}$  (IV), yellowish, m.  $249^\circ$ , is non-irritant. Dil. alc. IV sapond. by heating for 2 hrs. on a water bath with 0.5 N KOH, cooled, acidified with dil.  $\text{H}_2\text{SO}_4$ , filtered, the residue washed, dried, and recrystd. from  $\text{C}_6\text{H}_6$ , yields  $\alpha$ -methyl- $\beta$ -indoylactic acid (V), m.  $199\text{--}200^\circ$ , sol. in cold aq. alk. carbonates and bicarbonates. *NI<sub>4</sub> salt*, yellowish, by evapn. of V and  $\text{NH}_4\text{OH}$ . *Hg salt*,  $\text{C}_{24}\text{H}_{20}\text{O}_6\text{N}_2\text{Hg}$ , brick-red ppt. *Ag salt*, yellow ppt. *Cu salt*, yellow ppt. *Ferric salt*, yellow ppt. *Stannous salt*, yellow ppt. No ppts. were formed with  $\text{Pb(OAc)}_2$ ,  $\text{Ba(NO}_3)_2$ ,  $\text{AuCl}_3$ , or  $\text{CaCl}_2$ . V is a homolog of the acid prepd. by Oddo and Albanese (*loc. cit.*). II (1 g.) heated 2 hrs. at  $90\text{--}5^\circ$  in a closed tube with concd. aq.  $\text{NH}_4\text{OH}$ , cooled, concd. and the ppt. recrystd. from AcMe or EtOH, yields methylindoylmethylamine  $\text{C}_6\text{H}_4\text{.NH.CMe:CCOCH}_2\text{NH}_2$  (VI), brick-red,

m. around  $240^\circ$  (decompn.), is non-irritant, gives in concd.  $\text{H}_2\text{SO}_4$  a dark blue color, changing to green. *Ag deriv.* Treated first with HCl and  $\text{NaNO}_2$  and then with alk.  $\beta$ -naphthol, VI forms an orange-red coupled compd. Alc. VI treated with hot satd. alc. picric acid (calcd. quantity) and the ppt. recrystd. from EtOH, yields a *picrate*  $\text{C}_{17}\text{H}_{10}\text{O}_8\text{N}_5$ , yellow, m.  $207\text{--}10^\circ$  (first becoming green). VI dissolved in fuming HCl, evapd. on a water bath, yields a *HCl salt*, which in water gives with Dragendorff reagent a brown-yellow ppt., with Bouchardat reagent a brown-red ppt., with tannic acid a brown ppt. and no ppts. with  $\text{AuCl}_3$ ,  $\text{PtCl}_4$  or  $\text{HgCl}_2$ . II (1 g.) in abs. EtOH heated 4 hr. in a closed tube at  $100^\circ$  with glycocoll (VII) (0.4 g.), yields no  $\text{C}_6\text{H}_4\text{.NH.CMe:CCOCH}_2\text{NHCH}_2\text{CO}_2\text{H}$  (VIII). Further tests with heating up to

$130^\circ$  and for 6 hr., with the acetate of VII and with 95% EtOH, gave only negative results. Likewise II and alanine (equimol. parts) heated 4-6 hr. at  $120^\circ$  in a closed tube gave no  $\text{C}_6\text{H}_4\text{.NH.CMe:CCOCH}_2\text{NHCHMeCO}_2\text{H}$  (IX). If it had been possible

to obtain VIII and IX, it might have been found possible to obtain the corresponding methylketolic dipeptides. The results lend support to the hypothesis maintained by many, viz., that amino acids have the structure of  $\text{NH}_4$  salts formed by the combination of the acid and  $\text{NH}_2$  groups: thus  $\text{RCHNH}_2\text{CO}_2\text{H} \longrightarrow \text{RCH.CO.O.NH}_3$ , as in

taurine, betaine, etc. To confirm this hypothesis, exts. are planned in which II is to be condensed with free amino acids and with their esters to obtain methylketolic dipeptides by the following reactions:  $\text{C}_6\text{H}_4\text{.NH.CMe:CCOCH}_2\text{Et} \longrightarrow \text{C}_6\text{H}_4\text{.NH.-}$

$\text{CMe:CCOCH}_2\text{NHCH}_2\text{CO}_2\text{Et} \longrightarrow \text{C}_6\text{H}_4\text{.NH.CMe:CCOCH}_2\text{NHCH}_2\text{CONHCH}_2\text{CO}_2\text{H}$ .  
C. C. DAVIS

**5,8-Dihydroxy- $\beta$ -anthrapyridinequinones.** H. RAUDNITZ (WITH GRETE LAUBE). *Ber.* **62B**, 938-9 (1929).—Cinchomeric anhydride behaves in the  $\text{Na-AlCl}_3$  fusion like quinolinic anhydride (*C. A.* **23**, 3471), condensing with 1,4-nucleus-hydroxylated aromatic compds. to derivs. of 5,8-dihydroxy- $\beta$ -anthrapyridinequinone (I). Thus with  $p\text{-C}_6\text{H}_4(\text{OH})_2$  it gives I itself ( $\beta$ -pyrquinizarin) and with 1,4- $\text{C}_{10}\text{H}_6(\text{OH})_2$  the 6,7-benzo deriv. (II). I (obtained in 49% yield as the blue-black *Na salt*), bronze-colored leaflets subliming *in vacuo* in bright red scales, m.  $211^\circ$ . II, red-brown needles subliming *in vacuo* in brown-red needles, m.  $343^\circ$ . In continuation of the spectroscopic

study of the influence of the  $C_6H_5N$  ring on the anthraquinone complex, it was found that the  $\beta$ -N atom has a stronger color-deepening effect than the  $\alpha$ -N atom. Below are given the color and absorption max. in KOH,  $H_2SO_4$  and  $H_2SO_4 \cdot H_3BO_3$ , resp.:  $\alpha$ -I, violet, 600.7, 561.5; crimson, 574, 532.2; pink, 547.5, 506.5, 473.5.  $\beta$ -I, blue, 618, 573; violet, indistinct bands in the yellow-green; red, 559, 518.5, 483.  $\alpha$ -II, red-violet, 586.5, 544; yellow-red, 1-sided absorption from 590; orange, 541.5, 503, 467.  $\beta$ -II, blue-violet, 600.5, 555.5; wine-red, indistinct at 540, 500; orange, 552, 513, 576.

C. A. ROUILLER

**Quinazolines. II. Synthesis of 6-ethoxy-3-[4-ethoxyphenyl]-3,4-dihydroquinazoline.** G. MAFFEI. *Gazz. chim. ital.* 59, 3-9(1929); cf. C. A. 22, 4464.—2,5- $O_2N(HO)-C_6H_3CHO$  (cf. *Ber.* 34, 4000(1901)) (0.9 g.) heated with KOH (0.3 g.) and EtI (1 g.) in a sealed tube for several hr. at 100°, extd. with  $Et_2O$ , evapd., and the residual oil crystd. several times from dil. EtOH, yields 2-nitro-5-ethoxybenzaldehyde (I), m. 62°. I (0.5 g.) heated with  $p-H_2NC_6H_4OEt$  (0.35 g.) at 120° until water is no longer evolved, and the cold product recrystd. repeatedly from dil. EtOH, yields 2-nitro-5-ethoxybenzal-*p*-phenetidine (II), golden yellow, m. 92°, turns red on exposure to light. II (8 g.) in boiling EtOH (200 cc.) poured into  $Na_2S$  (12 g.) in hot 50% EtOH (20 cc.), cooled, and the ppt. recrystd. several times from MeOH, yields 2-amino-5-ethoxybenzal-*p*-phenetidine (III), light yellow, m. 156°, gives an intense color with acids (like its analogs already known). Na (3 g.) added little by little to III (1.7 g.) in hot abs. EtOH (50 cc.), poured into water, and the sepd. oil crystd. from dil. EtOH, yields 2-amino-5-ethoxybenzyl-*p*-phenetidine (IV), m. 81°. IV (0.5 g.) boiled 0.5 hr. with 85%  $HCO_2H$  (3 cc.), cooled, a little water and then dil.  $NH_4OH$  added, and the ppt. crystd. several times from EtOH, yields 6-ethoxy-3-*p*-phenetidino-3,4-dihydroquinazoline (V), m. 140°. Na (5 g.) added little by little to V (3 g.) in boiling abs. AmOH (70 cc.), water added, filtered, and the residue recrystd. from cold EtOH, yields 6-ethoxy-3-*p*-phenetidino-tetrahydroquinazoline, m. 144°. I heated with  $HONH_2Cl$  and NaOAc, and the product recrystd. from dil. EtOH, yields 2-nitro-5-ethoxybenzaloxime (VI), pale yellow, m. 125°. Conc'd.  $NH_4OH$  (300 cc.) added to VI (25 g.), in 50% EtOH (300 cc.),  $H_2S$  passed through the product, first while cold and then while refluxing, for 2 hr., the excess  $H_2S$  expelled, cooled, the solid part of the product dissolved in EtOH, filtered, excess water added to the filtrate, and the ppt. recrystd. repeatedly from  $C_6H_6$  and from dil. EtOH, yields 2-amino-5-ethoxybenzaloxime (VII), m. 132°. VII (1.2 g.) in abs. EtOH (40 cc.) agitated with 2% Na-Hg (60 g.), maintaining the soln. acid by AcOH, after 1.2 hr. dild. with water, the EtOH eliminated *in vacuo*, made alk. with NaOH, extd. with  $Et_2O$ , evapd., and the residue recrystd. from EtOH, yields 2-amino-5-ethoxybenzylamine-HCl,  $C_9H_{14}ON_2 \cdot 2HCl$  (VIII), begins to decomp. around 200°, decomps. completely 235-7°, turns rose on exposure to light and air, has a bitter taste. The free base,  $C_9H_{14}ON_2$ , is an oil, absorbs  $CO_2$  from air, forming the carbonate of VIII. VIII (1 g.) refluxed 1 hr. with  $HCO_2Na$  (0.6 g.) and abs.  $HCO_2H$  (10 cc.), excess NaOH added, and the ppt. recrystd. from EtOH- $Et_2O$  and then from  $C_6H_6$ , yields 6-ethoxy-3,4-dihydroquinazoline, m. 125-7°. V is an anesthetic, but its physiol. properties disappear when it is oxidized, when its C:N double bond is destroyed, when 1 or both of its  $OEt$  groups are eliminated or replaced by Me, and when the  $-C_6H_4OEt$  group is eliminated. On alkylation of the imine group, the anesthetic properties remain, though in a modified way.

C. C. DAVIS

**The structure of narceine.** J. J. L. ZWIKKER. *Pharm. Weekblad* 66, 461-4 (1929); cf. C. A. 23, 3539.—An attempt is made to explain the recent observation that methylnarceine gives a color reaction with  $Na_2Fe(CN)_6NO$  while narceine does not. The accepted formula for narceine contains a  $BzCH_2Ph$  grouping.  $BzCH_2Ph$  was accordingly prep'd. and found to give the nitroprusside reaction. From this it is concluded that the  $CH_3CO$  grouping of  $BzCH_2Ph$  is not present in narceine, but that a ring closure between the  $CH_3$  and a neighboring  $NMe_2$  has occurred whereby the CO group is attached directly to 2 rings and is therefore no longer reactive. The rearrangement may be represented as follows:

Narceine would then have the same ring structure as the parent substance narcotine. If the acidic H of the  $CH_3CO$  grouping, which makes possible a ring closure with the basic  $NMe_2$ , is replaced by Me, ring closure is no longer possible. The resulting methyl-

narceine would then have the  $\text{BzCH}_2\text{Ph}$  structure which is reactive toward nitroprusside. Possibly narceine possesses structure I in acid soln. and structure II in alk. soln. This, however, cannot be demonstrated because the color reaction between  $\text{Na}_2\text{Fe}(\text{CN})_5\text{NO}$  and  $\text{CH}_2\text{CO}$  derivs. in general requires an alk. soln. A. W. DOX

**Alkaloids of *Fritillaria verticillata*, Wild. var *thunbergii*, Baker. I.** MASAO FUKUDA. *J. Chem. Soc. Japan* 50, 74-8(1929).—Yagi had previously studied the alkaloids in the bulb of this plant and found 2 substances: (1) amorphous (m.  $117^\circ$ ) and (2) cryst. (m.  $214^\circ$ ). F. has studied the alkaloids further and succeeded in sepg. the following 4 substances: (A) Colorless needles, m.  $224-5^\circ$ , with mol. formulas corresponding to  $\text{C}_{18}\text{H}_{33}\text{NO}_2$  or  $\text{C}_{17}\text{H}_{35}\text{NO}_2$ . It has one —OMe group. (B) Colorless needles, decomp.  $148-50^\circ$ , with the mol. formula  $\text{C}_{17}\text{H}_{33}\text{NO}_2$ . (C) Amorphous. (D) Pale yellow powder, m.  $130-1^\circ$ , with the formula  $\text{C}_{17}\text{H}_{33}\text{NO}_2$ . It does not crystallize as salt with any kind of acid. T. IRIE

**Bixin.** FRANZ FALTIS AND FRANZ VIEBÖCK. *Ber.* 62B, 701-8(1929).—Kuhn and Winterstein (*C. A.* 22, 2950) concluded, from the similarity of carotene and related plant dyestuffs to their synthetic diphenylpolyenes, that the color and the color reaction with  $\text{H}_2\text{SO}_4$  of these substances are conditioned by the no. of conjugated double bonds, although, since 1,8-dibenzyl-octatetraene is perfectly colorless while the 1,8-di-Ph compd. is a bright greenish chrome-yellow it would seem that immediate proximity of the aliphatic double bond to the  $\text{C}_6\text{H}_5$  nuclei is the essential prerequisite for color. For bixin (I), K. adopts Heiduschka and Panzer's formula  $\text{C}_{25}\text{H}_{40}\text{O}_4$  instead of that of Herzig and Faltis,  $\text{C}_{26}\text{H}_{40}\text{O}_4$ . In this connection, F. and V. refer to H. and F.'s reply to H. and P. On the basis of the  $\text{C}_{25}$  formula for I and of II, and F.'s observation that it adds 18 H atoms on catalytic hydrogenation K. assigns to perhydrobixin (II) the compn.  $\text{C}_{25}\text{H}_{48}\text{O}_4$  and to hydrogenated norbixin (III) the compn.  $\text{C}_{24}\text{H}_{46}\text{O}_4$  which would make it a purely aliphatic di- $\text{CO}_2\text{H}$  acid. On the other hand, on the basis of the  $\text{C}_{26}$  formula III ( $\text{C}_{26}\text{H}_{46}\text{O}_4$ ) would have to contain a ring system in the mol.; this F. and V. consider of material significance for the intense color of I which they regard as a fulvene deriv. Faltis formerly believed that the fulvene ring is at the end of the mol. but more thorough study of the work of Rinkes and van Hasselt on the ozonization of methylbixin and I has shown that the  $\text{CO}_2\text{H}$  groups are at the end of the system and hence the fulvene ring is probably to be sought in the middle of the mol. I with  $\text{O}_3$  gives  $\text{AcCH}:\text{CHCO}_2\text{Me}$  and  $\text{OHCCH}:\text{CHCMe}:\text{CHCO}_2\text{H}$ , indicating the structure  $\text{MeO}_2\text{CCH}:\text{CHMe}:\text{CHCH}:\text{CHCMe}:\text{CHCO}_2\text{H}$  for I, and if the 3 other isoprene units and at the same time a fulvene ring are introduced between the 2 ends of the mol. a structure somewhat like  $\text{MeO}_2\text{CCH}:\text{CHCMe}:\text{CHCMe}:\text{CHCH}:\text{C}:\text{CMe}:\text{CH}:\text{CH}:\text{CCMe}:\text{CHCH}:\text{CHCMe}:\text{CHCO}_2\text{H}$  would result for I. Certain

other expts. bearing on the structure of I are reported. To prove that I does not contain a grouping  $-\text{CO}:\text{CH}:\text{C}(\text{OH})-$  which might perhaps escape catalytic hydrogenation and simulate the presence of  $\text{CO}_2\text{H}$  groups, III was treated with  $\text{PCl}_5$  and the 2 Cl groups thus introduced were replaced by  $\text{NH}_2$ , giving a diamide (IV), also obtained with  $\text{SOCl}_2$  followed by  $\text{NH}_3$ . In attempts to convert III by the Hell-Volhard-Zelinskii method into the dibromide of the  $\alpha,\alpha'$ -dibromodicarboxylic acid, it was found that about five H atoms were replaced by Br. Since in the vacuum distn. of II slight decompn. with elimination of  $\text{CO}_2$  cannot be avoided and the C and H content of the product is therefore somewhat too high, it was converted, before distn., into perhydro-methylbixin,  $b_{12}$  278-85°, C 74.06-74.42, H 11.94-11.53. IV (yield, 20%), sinters  $100^\circ$ , m.  $107-9^\circ$ . C. A. R.

**Synthesis of pyrimidine-nucleosides.** TREAT B. JOHNSON AND GUIDO H. HILBERT. *Science* 69, 579-80(1929).—The lactim ether, 2,4-dimethoxypyrimidine (I), is rearranged by heating above its b. p. to the lactam ether, 1,3-dimethyluracil. At room temp. MeI converts I to the lactim lactam ether, 1-methyl-2-keto-4-methoxy-1,2-dihydropyrimidine (II). Likewise MeI converts 2,4-diethoxypyrimidine into 1-methyl-2-keto-4-ethoxy-1,2-dihydropyrimidine (III). Hydrolysis of II and III with acids yields 1-methyluracil. With bromotetraacetylglucose I yields the pyrimidine nucleoside  $\text{CH}_2(\text{OAc})\text{C}(\text{H})(\text{OAc})\text{CH}(\text{OAc})\text{CHN}-\text{CH}:\text{CH}:\text{C}(\text{OMe})\text{N}:\text{CO}$  (IV), m.  $221^\circ$

(decompn.). No reducing substances are formed on mild hydrolysis with HCl. Intense hydrolysis converts it into sol. reducing substances. DAVID DAVIDSON

**The molecular constitution of cholesterol and the chemistry of bile acids.** L. CUNY. *J. pharm. chim.* [8], 8, 18-34, 62-85(1928).—A detailed review, with bibliography (107 references). S. WALDBOTT

Comparison of the Zennström and other processes for the production of paper pulp and by-products from maritime pine and other resinous woods [recovery of MeOH] (RIVIÈRE) 23. Beilsteins *Handbuch der organischen Chemie*. Bd. II. Als Ergänzung d. 2. Bds. d. Hauptwerkes. 4th ed. Issued by Deutschen Chemischen Gesellschaft. Edited by FRIEDRICH RICHTER Berlin: J. Springer. 355 pp. Linen, M. 70.

KOPP, J.: *Études sur les 1,4-diphenylpyrazolones*. Strassburg: Éditions universitaires de Strassburg. 64 pp.

**Lead tetra-alkyl.** HERBERT W. DAUDT, ALFRED I. PARMELEE and KENNETH P. MONROE (to E. I. Du Pont de Nemours & Co.). U. S. 1,717,961, June 18. Mono-sodium-lead is reacted on with an alkylating agent such as EtCl in the presence of a small proportion of a catalyst such as ether and alc.

**Hexamethylenetetramine.** S. KARPEN & BROS. Ger. 477,051, July 1, 1924. See Brit. 235,015 (C. A. 20, 918).

**Hydrocyclic  $\omega$ -aminoalkyl compounds.** HANS RUPE. Ger. 477,050, Sept. 29, 1925. Corresponds to Brit. 240,814 (C. A. 20, 2167) but gives an addnl. example describing the prepn. from cyanomethone of  $\alpha$ -menthomethylamine,  $b_{10}$  126–128°, the hydrochloride of which m. 205°.

**Benzyl-oxyethanol.** I. G. FARBENIND. A.-G. Fr. 655,871, June 11, 1928. Benzyl-oxyethanol and secondary products are prepd., (1) by treating a metallic benzylate with a halogenated alc., (2) or a metallic glycolate with a benzyl halide, (3) or a benzyl alc. with ethylene oxide. E. g.,  $\text{PhCH}_2\text{ONa}$  heated with  $\text{ClCH}_2\text{CH}_2\text{OH}$  on distn. gives  $\text{PhCH}_2\text{OCH}_2\text{CH}_2\text{OH}$  at 132–135°, and *benzyl-oxyethoxyethanol* at 171–173°. These are also obtained from  $\text{BzOH}$  and  $(\text{CH}_2)_2\text{O}$ .  $\text{PhCH}_2\text{OCH}_2\text{CH}_2\text{OH}$  and *benzyl-oxyethyl benzyl ether*,  $b_{20}$  210°, are obtained from K or Na glycolate and  $\text{PhCH}_2\text{Cl}$ .

**Trichloroethane.** ALBERT MAIER. Fr. 655,930, June 14, 1928. One vol. of  $\text{C}_2\text{H}_4$  is mixed with 2 vols. of Cl at 25° giving  $\text{C}_2\text{H}_3\text{Cl}_3$  70,  $\text{C}_2\text{H}_4\text{Cl}_2$  15,  $\text{C}_2\text{H}_5\text{Cl}$  5, and higher Cl compds. 10%. The first 3 may be used as solvents for fatty substances, resins, etc.

**Halooacylated diphenyl ethers.** OTTO VON SCHICKH (to Schering-Kahlbaum A.-G.). U. S. 1,717,424, June 18. By the suitably controlled reaction of halogenated acyl halides on diphenyl ether or its substitution products (as in the presence of  $\text{AlCl}_3$ ),  $\omega$ -halogenated phenoxyacetophenones and their substitution products are produced, which may be used as *therapeutic agents*. Details are given of the production of dichloroacetylated diphenyl ether, m. 102°, dibromoacetylated diphenyl ether, m. 121°, dichloroacetylated *o*-methoxydiphenyl ether, m. 148°, dichloroacetyl-*p*-hydroxydiphenyl ether, m. 155°, and dichloroacetyl-*o,o'*-methoxydiphenyl ether, m. 154°.

**Complex metal compounds of pyrocatechol.** HANS SCHMIDT (to Winthrop Chemical Co.). U. S. 1,718,492, June 25. Complex compds. many of which are suitable for *therapeutic uses*, contg. metals such as Cd, Fe, Mn, Zn, Cr, Sn, V, Cu, Au, Ca, As, Pb or Bi, are made by causing a compd. of the metal to react with a pyrocatecholsulfonic acid or a salt of such an acid. Numerous examples and details are given. U. S. 1,718,493 relates to similar compds., particularly those contg. Sb.

**8-Hydroxyquinoline, etc.** I. G. FARBENIND. A.-G. Brit. 301,545, Sept. 2, 1927. 8-Hydroxyquinoline and its derivs. are prepd. from 8-aminoquinoline and its derivs. by heating with acid reagents such as  $\text{H}_2\text{SO}_4$ , alc. and aq.  $\text{ZnCl}_2$  or HBr.

**1,3-Diamino-2-hydroxyanthraquinone.** I. GUBELMANN, H. J. WEILAND and O. STALLMANN. Brit. 301,119, Aug. 29, 1927. 4'-Hydroxy-*o*-benzoylbenzoic acid is nitrated to form the 3',5'-dinitro-deriv., the latter is reduced to the corresponding diamino compd., and ring closure is effected by elimination of water as by use of  $\text{H}_2\text{SO}_4$ .

**Xylenes.** I. G. FARBENIND. A.-G. Brit. 300,540, Aug. 20, 1927. See Fr. 639,252 (C. A. 23, 611).

**Acetone.** DR. A. WACKER GES. FÜR ELEKTROCHEMISCHE INDUSTRIE GES. Brit. 300,548, Nov. 14, 1927. Liquors produced in the pptn. of acetylated cellulose or starch

are subjected to vaporization and the crude vapor is passed over a catalyst such as one contg. Ce carbonate at 300–500° to produce acetone. Various details are described.

**Menthol.** WALTER SCHOELLER and HANS JORDAN (to Chemische Fabrik auf Actien vorm. E. Schering). U. S. 1,718,666, June 25. A methylisopropylphenol is acted on, at a temp. of 100–200°, with H in the presence of a hydrogenation catalyst such as Ni, Cu, Co, Fe or their compds. until 8 H atoms have entered into combination.

**Menthol.** HOWARDS AND SONS, LTD. and JOHN W. BLAGDEN. Fr. 655,433, June 6, 1928. See Brit. 297,019 (C. A. 23, 2449).

**Chlorination of methane.** HOLZVERKOHLUNGS-INDUSTRIE A.-G. Ger. 477,494, Dec. 21, 1921. CH<sub>4</sub> is chlorinated at 400° or above in the presence of a gaseous diluent comprising an amt. of added HCl in excess of that produced in the reaction, with or without steam. The necessary heat for the reaction may be supplied by means of the diluents, *e. g.*, with superheated steam. Alk. earth halides may be present as catalysts.

**Hydroxy acids.** I. G. FARBENIND. A.-G. Fr. 655,579, June 11, 1928.  $\alpha$ -Hydroxy acids are prepd. by hydrolysis of the corresponding nitriles in the presence of an indifferent solvent, dissolving the compds. entering into the reaction as well as those produced by the reaction, with the exception of the ammoniacal salt, by means of acids, preferably HCl, and the amt. of water necessary for the sapon. In examples, AcH is added to a mixt. contg. NaOH lye, HCN and dioxan and heated to 80° to form lactonitrile, which is hydrolyzed to lactic acid by adding HCl and boiling. BzH is converted in similar manner, with C<sub>2</sub>Cl<sub>4</sub> as solvent, to phenylglycolonitrile and by sapon. to phenylglycolic acid.

**Mucic acid.** ARLIE W. SCHORGER (to Wood Conversion Co.). U. S. 1,718,837, June 25. In the oxidation of solns. of galactose or galactan with HNO<sub>3</sub>, N oxides given off during the oxidation are recovered by absorption in galactan or galactose solns. and the solns. are heated with HNO<sub>3</sub> to destroy their tendency to foam prior to the absorption.

**Salts of bile acids.** CHEMISCHE FABRIK VORM. SANDOZ. Fr. 655,282, Jan. 5, 1928. Salts of bile acids are obtained by the reaction of these acids with amino- or diamino-acridines or their hydroxyalkyl or haloalkyl derivs. In an example, the cholate of 3,6-diamino-10-methylacridinium is prepd. by adding drop by drop a soln. of Na cholate in water to 3,6-diamino-10-methylacridinium chloride in water. Fr. 655,283 describes the prepn. of salts of bile acids with emetine. Thus the cholate of emetine is prepd. by adding a soln. of emetine in alc. to cholic acid, and the desoxycholate of emetine by adding Na desoxycholate to a soln. of emetine hydrobromide in water.

**Acetic acid.** SOC. ANON. DES DISTILLERIES DEUX-SÈVRES. Brit. 301,415, Nov. 29, 1927. In extg. HOAc from its aq. solns. by a solvent such as AmOAc having a b. p. between that of HOAc and 150°, as described in Brit. 296,974 (C. A. 23, 2449), when the aq. HOAc soln. contains substances such as mucilaginous matter which would hinder the sepn. in the extn. column (as in the case of HOAc from cellulose fermentation), the acid is vaporized and led to the middle of the sepg. column to which the solvent is supplied. An arrangement of app. is described.

**Concentrating acetic acid.** I. G. FARBENIND. A.-G. Brit. 300,923, Nov. 19, 1927. HOAc is sepd. from its aq. solns. by addn. of a chlorinated hydrocarbon deriv. such as C<sub>2</sub>HCl<sub>3</sub> at ordinary temp. and then distg. off the water. Distn. may be effected in a rectifying app. comprising columns and a dephlegmator, the condensate sepg. into 2 layers and the chlorinated hydrocarbon layer being returned to the distn. vessel. The process may be made continuous.

**Extracting acetic or similar acids from aqueous solutions.** HERBERT E. MARTIN (to Celanese Corp. of America). U. S. 1,717,719, June 18. In obtaining concd. acid from various aq. solns. or liquors, solvents are used comprising a methylene halide; *e. g.*, a mixt. of methylene chloride 80 and ether 20% may be used in countercurrent extn.

**Acetic anhydride.** I. G. FARBENIND. A.-G. Brit. 300,563, Nov. 14, 1927. In a process such as described in Brit. 285,090 (C. A. 22, 4539), a dephlegmator is placed at the top of the column used and the org. solvent such as benzene, toluene or benzene and trichloroethylene is admitted at the bottom of the column only. Cf. C. A. 23, 3716.

**Isopropyl acetate.** STANDARD OIL DEVELOPMENT CO. Brit. 300,418, Dec. 24, 1927. Iso-Pr acetate is obtained by distg., at a temp. of 70–76°, a mixt. contg. "commercial" iso-Pr alc., HOAc, water and an esterifying catalyst such as H<sub>2</sub>SO<sub>4</sub>, fractionating the vapors, and condensing and sepg. the iso-PrOAc. Part of the acetate-contg.

layer may be returned to the distn. zone and the operation may be continued until the HOAc becomes dild.

**Condensation products from acetylene and ammonia.** I. G. FARBERIND. A.-G. (Leo Schlecht and Hans Rötger, inventors). Ger. 477,049, Aug. 9, 1927. See Brit. 295,276 (C. A. 23, 2188).

**Benzanthrone derivatives.** I. G. FARBERIND. A.-G. Brit. 300,331, Aug. 25, 1927. Benzanthrone or its substitution products having free 2- and Bz-1- positions are heated with caustic alkali and aromatic hydroxy compds. having a free *p*- or *o*-position (the quantity of alkali not substantially exceeding that required for the formation of a phenolate). Examples are given of the condensation of benzanthrone with  $\alpha$ - and  $\beta$ -naphthols, 6-bromo-2-naphthol, 2-chloro-1-naphthol or *v-m*-xylenol, etc.

**Alcohols.** I. G. FARBERIND. A.-G. Fr. 656,178, June 21, 1928. Uni- or multivalent alcs. are prep'd. by catalytic hydrogenation of mixts. resulting from the condensation of an aldehydic or ketonic compd. on itself or with one or more compds. of the same group in the presence or absence of solvents, at ordinary or raised temp., under pressure, directly or after elimination of the unaltered aldehydes or ketones, but without elimination of the condensing agents. The condensing agents may be converted to insol. compds. before hydrogenating. Examples are given of the prepn. of 1,3-butyleneglycol,  $\alpha$ -ethylhexanol, b. 180-181°, glycerol and glycol with other multivalent alcs., as well as sirupy products.

**N-aminoalkylamino compounds.** I. G. FARBERIND. A.-G. Brit. 301,401, May 24, 1927. N-aminoalkylamino compds. are prep'd. by treating an amine or substitution product such as aniline or 8-aminoquinoline with a salt of an amino alc. sulfonic acid ester such as the hydrochloride of *p*-toluenesulfonic acid ester of  $\alpha$ -diethylamino- $\delta$ -pentanol or the hydrochloride of the  $\gamma$ -*p*-toluenesulfonic acid ester of  $\alpha$ -piperidyl- $\beta$ , $\gamma$ -dihydroxypropane.

**1,8-Naphthoxyphenanthrene, etc.** I. G. FARBERIND. A.-G. Brit. 300,771, Oct. 25, 1927. See Fr. 642,946 (C. A. 23, 1418).

**Catalytic oxidation of aromatic hydrocarbons and other compounds.** A. O. JAEGER (to Selden Co.). Brit. 300,968, Nov. 21, 1927. An app. is described in which vapor of the substance to be oxidized in admixt. with oxidizing gas is passed through heat-exchanging elements at least partly embedded in a catalyst layer in indirect heat-exchange relation with the catalyst, and then in successively reversed flows through the catalyst. Numerous details and uses of the app. are described.

**10-Chloroanthracene-9-aldehyde.** GEORG KALISCHER, HEINZ SCHEYER and KARL KELLER (to Grasselli Dyestuff Corp.). U. S. 1,717,567, June 18. This compd. crystallizes from org. solvents such as alc. as bright yellow needles, m. about 216°, and may be made by reaction between formylmonomethylaniline and P oxychloride and anthrone. Production of the following compds is also described: 3,10-dichloro-9-anthracenealdehyde, m. 174°; 1,5,10-trichloro-9-anthracenealdehyde, m. 197°; 1,2-dimethoxy-10-chloro-9-anthracenealdehyde, m. 172°; 2,6-dimethoxy-10-chloro-9-anthracenealdehyde, m. 233°.

**Azides of sodium and other metals.** O. MATTER. Brit. 300,401, Nov. 25, 1927. Na azide is freed from carbonate to render it suitable for use in the prepn. of azide of Pb or other heavy metals free from carbonate, by the addn. to its aq. soln. of hydrates or salts of alk. earth metals such as those of Ba.

**Alkali metal xanthates.** THOMAS W. BARTRAM and HAROLD P. ROBERTS (to Rubber Service Laboratories Co.). U. S. 1,718,937, July 2. Equimol. proportions of alc. and a metallic hydroxide such as KOH are mixed, cooled to about 20° and an equimol. proportion of CS<sub>2</sub> is added at a rate of 0.1-2.0% per min. while maintaining the temp. of the reacting mixt. between 0° and 50°; on completion of the reaction the product is heated to about 70° to decompose and volatilize unstable by-products. An arrangement of app. is described.

**Oxalates and formates.** GUY H. BUCHANAN, KENNETH D. ASHLEY and GEORGE BARSKY (to American Cyanamid Co.). U. S. 1,717,353, June 18. Ca cyanamide and Ca cyanide are treated with water to dissolve out substantially all the nitrogenous materials and form a soln. contg. a preponderance of Ca cyanamide; this soln. is digested under pressure at a temp. above 60°, NH<sub>3</sub> produced is removed, and the digestion sludge obtained is filtered to sep. solids contg. oxalates from soln. contg. formate. Cf. C. A. 23, 2254.

**Emetine.** CHEMISCHE FABRIK VORM. SANDOZ. Fr. 655,312, Apr. 21, 1928. See Brit. 291,088 (C. A. 23, 1216).

**Synthetic oxygenated organic compounds by catalytic hydrogenation of carbon oxides.** I. G. FARBERIND. A.-G. Brit. 300,294, July 7, 1927. Various compds. such

as alcs., esters and acids are made by passing C oxides and H at an elevated temp. (suitably 250–350°) and either under ordinary or under elevated pressure (which may be up to 1000 atm.) over catalysts comprising a mixt. of considerable amts. of Fe, Co, Ni, Pt, Pd or other metal of the 8th periodic group with Cd or Tl, with or without other materials such as Cu, Au, Ag, Ce, Zr, Al, V, U, Cr, Mo, W, Mn, alkali or alk. earth metals or their compds. Numerous details are given.

**Hydrogenated aromatic amino compounds.** I. G. FARBENIND. A.-G. Brit. 300,285, May 4, 1927. Hydrogenation with H under pressure in the presence of catalysts such as those contg. Ni, Co or Cu or their mixts. is applied to compds. in the liquid phase as in treating ethylaniline and dimethylaniline to produce the corresponding hexahydro compds. and various similar reactions. Compds. of the naphthalene series by this treatment yield tetrahydro compds. and those of the benzene series hexahydro compds. When an acyl group is present, it may be removed from the product by sapon.; a carboxylic ester product may be similarly treated. *ar*-Tetrahydro-1-amino-2-naphthol ethyl ether couples with *p*-nitrodiazobenzene to form a yellowish and with diazoazobenzene to form a brownish red dye. Its diazo compd. couples with 2-naphthol-3,6-disulfonic acid to form a pink dye. Other similar dyes also are described.

**Desulfurizing organic substances.** I. G. FARBENIND. A.-G. Fr. 655,230, June 5, 1928. Org. substances such as industrial benzenes are desulfurized by treatment either as liquid or vapor with H or gases capable of liberating it, at a high temp. under ordinary or raised pressure, in the presence of metallic sulfides stable under the conditions of working and either alone or with activating agents. H<sub>2</sub>S is formed which is easily sepd.

**Anthracene derivatives.** I. G. FARBENIND. A.-G. Brit. 300,407, Dec. 9, 1927. Condensation products (some of which are vat dyes) are obtained from  $\alpha$ - and  $\beta$ -mono or polyhydroxy compds of anthracene and  $\alpha$ -naphthoquinones negatively substituted in the 2- and 3-positions (at least one of the substituents being halogen). Several examples are given. The prepn. of nitro-2,3-dichloro- $\alpha$ -naphthoquinone is described.

**Dibenzanthrone.** I. B. ANDERSON, R. F. THOMSON, J. THOMAS AND SCOTTISH DYES, LTD. Brit. 301,403, July 22, 1927. B<sub>2</sub>-1-B<sub>2</sub>-1-dibenzanthronyl is treated with KOH and an alc. at temps. up to about 130° in the presence of an indifferent solvent or diluent such as kerosene, xylene or "petrol." Examples and details are given.

**Cymene derivatives.** J. SCHNIDELMEISER AND J. A. F. BEAVIS. Brit. 300,760, Oct. 18, 1927. Cymene is nitrated by use of org. nitrates such as alkyl nitrates and diacetylnitric acid or other acylnitric acid; H<sub>2</sub>SO<sub>4</sub> also may be added; cooling is preferably employed and after washing the product is distd. *in vacuo*. Cymene hydroxylamine and aminocymene are produced by reduction of nitrocymene.

**Benzidine and its derivatives.** RALPH A. NELSON (to National Aniline & Chemical Co.). U. S. 1,718,373, June 25. In forming compds. of the benzidine series from hydrazo compds., as in the formation of dianisidine from hydrazoanisole, H<sub>2</sub>SO<sub>4</sub> is added to a soln. of the hydrazo compd. in a solvent of the benzene series of low b. p. and inert character such as C<sub>6</sub>H<sub>6</sub> with vigorous agitation, so that the benzidine compd. seps out as sulfate in the form of a stiff paste.

**Thiourea.** I. G. FARBENIND. A.-G. Fr. 655,457, June 7, 1928. See Brit. 297,999 (C. A. 23, 2725).

**Apparatus for producing benzene by condensation of acetylene.** J. YLLA-CONTE Brit. 301,325, Nov. 26, 1927.

**Hydrogenated amines.** I. G. FARBENIND. A.-G. Fr. 655,810, May 7, 1928. Homologs of PhNH<sub>2</sub> are hydrogenated by heating them under pressure with H at a high temp. and in the presence of catalysts. Examples are given of the hydrogenation of *o*- and *m*-toluidine with a Co catalyst, and of *p*-xylylidine with Ni<sub>2</sub>O<sub>3</sub> as catalyst, and of  $\beta$ -naphthylamine to obtain tetrahydro- $\beta$ -naphthylamine and an alicyclic tetrahydro- $\beta$ -naphthylamine with a Ni catalyst.

**Continuous esterification processes.** IMPERIAL CHEMICAL INDUSTRIES, LTD., AND G. F. HORSLEY. Brit. 301,523, Aug. 3, 1927. In a continuous process for forming iso-BuOAc from iso-BuOH and HOAc or in similar processes in which the ester is removed in the form of vapor of an azeotropic mixt. of ester, alc. and water, water and in some cases ester is added to the reacting mixt. to facilitate the formation of the azeotropic mixt. A catalyst such as H<sub>3</sub>PO<sub>4</sub> may be used. An arrangement of app. is described.

## 11—BIOLOGICAL CHEMISTRY

PAUL E. HOWE

A—GENERAL

FRANK P. UNDERHILL

**The vitality of dental enamel.** WM. J. GIES. *Proc. Soc. Exptl. Biol. Med.* **26**, 69 (1928).—Pulverized normal enamel did not give the conventional reactions for proteolytic and amylolytic enzymes. This substantiates the belief that the contained protein, probably keratin, is not assocd. with intrinsic nutritional changes in the enamel of erupted teeth. C. V. BAILEY

**Stability of luminous substances of luminous animals.** E. NEWTON HARVEY. *Proc. Soc. Exptl. Biol. Med.* **26**, 133-4 (1928).—In 1918 the luminous materials, *luciferin* and *luciferase*, were extd. from the luminous ostracod crustacean, *Cypridina*. The animals were collected, dried quickly over  $\text{CaCl}_2$ , and powdered. Luciferin soln. is obtained by making a hot water ext. Heating destroys luciferase which can be extd. from *Cypridina* with cold water. The luciferin which dissolves at the same time is allowed to oxidize in the air, leaving luciferase alone in soln. These 2 substances when mixed together in water contg.  $\text{O}_2$  become brilliantly luminescent. Dry luciferin and luciferase can be kept unharmed for long periods. An aq. soln. of luciferin is also stable in the absence of  $\text{O}_2$ . Luciferase undergoes destructive changes in water soln. Luciferase pptd. with alc.; the ppt. dried and kept over  $\text{CaCl}_2$  for 10 years gave a good luminescence when mixed with luciferin soln. C. V. BAILEY

**Ultra-violet radiation; stimulation and inhibition in lower organisms.** MARIE A. HINRICHS. *Proc. Soc. Exptl. Biol. Med.* **26**, 175-7 (1928).—The amt. of radiation in a given region of the spectrum, which is absorbed by the protoplasm in a given period of time, detrs. whether there is to be an increase or decrease in the speed of physiol. processes. C. V. BAILEY

**Note on the penetration of electrolytes.** W. J. V. OSTERHOUT. *Proc. Soc. Exptl. Biol. Med.* **26**, 192-7 (1928).—When a weak electrolyte penetrates a living cell, and if the time curve of penetration is of the 1st order, the rate of penetration of undissocd. mols. may be regarded as  $(dx/dt) M = D_M P_M (M_o - M_i)$ , where  $D_M$  is the rate of progress through the protoplasm,  $P_M$  is the permeability of the protoplasm to mols.,  $M_o$  is the external and  $M_i$  the internal concn. of undissocd. mols. The corresponding value, when ion pairs alone enter (in the case of a binary electrolyte with no exchange of ions), is  $(dx/dt) P = D_P P_P K (M_o - M_i)$ , where  $K$  is the disson. const. If the protoplasm is equally permeable to undissocd. mols. and the ion pairs (*i. e.*, if  $P_M = P_P$ ) the penetration of ion pairs will be very small when  $K$  is small. When  $K$  is large the high elec. resistance of the protoplasm in *Nitella* and *Valonia* suggests that either  $D_P$  or  $P_P$  is small (*i. e.*, when a substance is present largely as ions there is very little penetration). If the external concn. remains const. while the  $p_H$  value changes so as to decrease the concn. of undissocd. mols., the rate of penetration will diminish even when the protoplasm is permeable to ion pairs only. These conclusions apply qualitatively when the time curve of penetration is not of the 1st order. With an exchange of ions the rate will be proportionate to the product of the exchanging ions on opposite sides. The fact that certain weak electrolytes enter rapidly and that the elec. resistance of the protoplasm in contact with strong electrolytes is very high suggests that strong electrolytes may enter largely as undissocd. mols. formed at the surface by collision of ions. C. V. BAILEY

**The thermal increments and critical temperatures of biological reactions.** ELLIS I. FULMER AND R. E. BUCHANAN. *Proc. Soc. Exptl. Biol. Med.* **26**, 446-9 (1929).—It is common practice to express temp. effects on rates of biological reactions in terms of van't Hoff-Arrhenius relationship by the use of the equation  $\log K = \mu/4.6T + \text{const.}$  or  $\mu = [4.6(\log K_2 - \log K_1)T_2T_1]/(T_2 - T_1)$ , in which  $K_2$  and  $K_1$  are the velocity coeffs. at abs. temps.  $T_2$  and  $T_1$ . The symbol  $\mu$  has been called the thermal const. Conclusion:  $\mu$  varies continuously with the temp. in the several biological reactions examd. The supposed const. value for  $\mu$  through a given temp. range has probably resulted from the use of a graph with too small scale ordinates to account in full for the exptl. inaccuracy of the velocity coeffs. C. V. BAILEY

**Reaction between proteins and diazotized aromatic amines in neutral solution.** MICHAEL HEIDELBERGER AND FORREST E. KENDALL. *Proc. Soc. Exptl. Biol. Med.* **26**, 482-4 (1929).—True chem. interaction, with resulting dye formation, takes place in neutral mixts. of diazotized aromatic amines and proteins. Neutral solns. contain

mixts. of unchanged protein, unchanged diazo compd. and a small quantity of protein dye; if a buffer or alkali is present to neutralize the acid liberated, the reaction goes in the direction of complete dye formation. Enough colored compd. is formed even in faintly acid soln. to be readily observed and to be detected by the specific precipitin test. The chem. data support Lansteiner's conception of the reaction and are contrary to Klopstock and Selter.

**X-ray diffraction of glycine.** MAURICE H. SIMMERS. *Proc. Soc. Exptl. Biol. Med.* 26, 527-9(1929).—Glycine crystallizes in plate crystals from water and in needle forms when alc. is added to an aq. soln. A study of x-ray diffraction patterns does not indicate any difference in the structure of the glycine mol. in these 2 forms.

**Behavior of pepsin.** F. GALLI. *Folia Clinica* 3, 191-208(1928).—Gross' caseinogen method for detg. the peptic activity of gastric juice is found unsatisfactory and a new method, which depends on the liquefaction of gelatin and gives more certain and exact results, is described. Examn. of a no. of patients suffering from gastric troubles shows that, although as a rule variation of the pepsin content of the gastric juice is accompanied by variation of the content of HCl, there is no fixed relationship between the two. When the free acid is lacking, pepsin also is usually absent but is occasionally present in small proportion.

**Osmotic pressure of egg albumin.** J. MARRACK AND L. F. HEWITT. *Proc. Physiol. Soc., J. Physiol.* 66, v(1928).—The osmotic pressure of isoelectric egg albumin has been measured by the use of NaCl solns. buffered with Na acetate and AcOH as external fluid. The calcd. mol. wt. is 43,000.

**Identity of glucide content in living plasma and in fluoride plasma.** GEORGES FONTÈS AND LUCIEN THIVOLLE. *Compt. rend. soc. biol.* 100, 1196-7(1929); cf. *C. A.* 21, 2712.—Plasma treated with NaF (0.2%) has the same amt of glucides as living plasma. There is no immediate exchange of glucides between plasma and cells.

**The permeability of red blood cells to plasma glucides.** GEORGES FONTÈS AND LUCIEN THIVOLLE. *Compt. rend. soc. biol.* 100, 1198-9(1929).—Red blood cells are only slowly permeable to glucides. Though their glucide content does not increase after a plasma hyperglucidemia of only a few min. duration, yet they show a marked increase in glucides after the plasma hyperglucidemia has been prolonged 30 min to 9 hr.

**A spectrographic study of constitutive lipides.** V. BRUSTIER AND L. BUGNARD. *Compt. rend. soc. biol.* 101, 420-2(1929).—An ext. of the total lipides of the whole rabbit and an ext. of the saponified residue (constitutive lipides) showed in 1% abs. alc solns. 4 absorption bands: 2823, 2684, 2628 and 2550. Conclusion: Ergosterol and its active transformation products exist in the constitutive lipides of the organism.

**Formation of urocanic acid in the tryptic digestion of edestin.** EMIL ABDERHALDEN, WILHELM IRION AND HANS SICKEL. *Z. physiol. Chem.* 182, 201-4(1929).—From the hydrolyzate obtained by 50 days' digestion of 300 g. edestin in 3 l. H<sub>2</sub>O with 48 g. pancreatin and 55 g. Na<sub>2</sub>CO<sub>3</sub>, the residual protein was removed by coagulation and the tryptophan, tyrosine and histidine were pptd. in 2 fractions by means of HgSO<sub>4</sub> in H<sub>2</sub>SO<sub>4</sub>. Fractional crystn. of the 2nd fraction yielded 0.12 g. of urocanic acid. A 2nd expt. under the same conditions gave no urocanic acid, but a 3rd yielded 0.1 g. urocanic acid from 200 g. edestin in 35 days. The substance was probably formed by bacterial action on histidine, despite the fact that the edestin suspension had been boiled and the digestion performed in the presence of CHCl<sub>3</sub> and PhMe. No urocanic acid could be obtained from the H<sub>2</sub>SO<sub>4</sub> hydrolyzate of edestin, nor by tryptic digestion of casein, yeast protein and Witte peptone. Another product obtained in working up the digestion mixt. was at first thought to be hydroxytryptophan, but was identified microscopically as a mixt. of tryptophan and tyrosine. This illustrates the necessity of caution before describing new protein-cleavage products.

**The influence of blood serum from normal and alkaptonuric individuals on homogentisic acid.** FRANZ LANYAR AND HANS LIEB. *Z. physiol. Chem.* 182, 218-26(1929), cf. *C. A.* 23, 2998.—Under the influence of atm. O at room temp. or at 37° free homogentisic acid in aq. soln. does not undergo any appreciable loss. The colorless oxidation product "oxyalkapton" postulated by Katsch and Stern (*Arch. klin. Med.* 151, 329) does not exist. The slight discoloration resulting from several days exposure of aq. homogentisic acid to the air has no effect on the detn. A diminution occurs only when the acid has been neutralized or free alkali is present. When free homogentisic acid in H<sub>2</sub>O or physiol. NaCl soln. is mixed with serum from individuals with normal metabolism a small loss occurs because of adsorption by the protein. This loss varies between 4 and 10% under the exptl. conditions studied. If the acid is par-

tially neutralized to the point where its addn. does not alter the  $p_H$  of the serum, the loss is greater, but this is due to oxidation at faintly alk. reaction by atm. O. The same result is obtained when egg albumin is substituted for serum. The identical phenomena are observed if the blood serum of an alkaptonuric is used. The assumption of Gross (C. A. 8, 1993) that human serum contains an enzyme which oxidizes homogentisic acid, and that of Katsch and Stern who claim that alkaptonuric serum contains a substance which inhibits the oxidation, are not supported by these expts.

A. W. DOX

**Biochemical synthesis of fumaric acid from pyruvic acid.** ALFRED GOTTSCHALK. *Z. physiol. Chem.* 182, 311-2(1929); cf. C. A. 22, 789.—A repetition of the previous expts., in which the fungus *Rhizopus nigricans* grown on a culture medium contg.  $Ac-CO_2H$  produced fumaric acid, failed to yield any trace of fumaric acid. The organism had evidently undergone a mutation, whereby this particular chem. activity had been lost. A similar instance of sudden loss of metabolic activity by another organism is cited from recent literature.

A. W. DOX

**Influence of various substances on lipase action.** ROBERT F. CORRAN. *Biochem. J.* 23, 188-94(1929).—Cholesterol and lecithin have little influence on lipase action. NaCl and KCl oppose the action of  $CaCl_2$ . Cu and Hg inhibit and Pb augments the effect of lipase. By fractionating ox serum, C. has shown that the albumin + pseudoglobulin fraction contains the greater part of the lipolytic co-enzyme. B. H.

**Glucolysis in muscle and other tissues.** EDWIN M. CASE. *Biochem. J.* 23, 210-8 (1929).—In the presence of small quantities of brain and kidney tissue, a muscle enzyme prepn., which alone is incapable of glucolysis, ferments glucose and gives lactic acid. This activation is compared with that brought about by addn. of the substance obtained by Meyerhof from yeast. The activation of glucose by brain and kidney tissue is assocd. with the presence of intact cell structures.

BENJAMIN HARROW

**Phosphoric esters in alcoholic fermentation. I.** The sequence of the formation of phosphoric esters and carbon dioxide in fermentation by dried yeast. ERIC BOYLAND. *Biochem. J.* 23, 219-29(1929).—The ratio of the various enzymes in dried yeast is such that under equil. conditions there is a large amount of hexosediphosphate together with a little monophosphoric ester. In presence of dried yeast the monophosphoric esters are produced late in the reaction with phosphate, and the P found in this form appears to liberate two equivalents of  $CO_2$ .

BENJAMIN HARROW

**The equation of alcoholic fermentation. II.** ARTHUR HARDEN AND FRANCIS R. HENLEY. *Biochem. J.* 23, 230-6(1929); cf. C. A. 22, 249.—The mol. ratio of  $CO_2$  to the total P esterified falls within the limits of 0.9 to 1.1, the tendency being for a low ratio with yeast juice, maceration ext. with zymine, and for a high ratio with dried yeast.

BENJAMIN HARROW

**Preparation and use of the bone phosphatase.** MAJORIE MARTLAND AND ROBERT ROBISON. *Biochem. J.* 23, 237-42(1929).—The phosphatase is extd. from the bones of young growing rabbits by means of water in the presence of  $CHCl_3$  and filtered. It may be further purified by pptn. with alc. and ether, by removing the protein by pptn. at its isoelec. point, and by dialysis and ultrafiltration. Its use in the hydrolysis of hexosediphosphoric acid is illustrated.

BENJAMIN HARROW

**Molecular constitution and accessibility to enzymes.** The effect of various substances on the velocity of hydrolysis by pancreatic lipase. DAVID R. P. MURRAY. *Biochem. J.* 23, 292-308(1929).—Ketones and aldehydes inhibit markedly the velocity of lipase hydrolysis. By converting the ketone to its oxime, this inhibitory power is lost. Secondary alcs. also inhibit, but this may be due to reversal of hydrolysis. A specific affinity exists between the carbonyl group and the active center of the enzyme.

BENJAMIN HARROW

**Recent advances in science : Biochemistry.** P. EGGLETON. *Science Progress* 24, 15-9(1929).—A review of recent work on the synthesis of thyroxine, the production of  $NH_3$  in muscular activity, and the curative action of the liver in pernicious anemia.

JOSEPH S. HEPBURN

**Asymmetric ester hydrolysis by enzymes. II.** The configuration specificity of the liver esterase of different animals and its dependence upon the concentration of the substrate. EUGEN BAMANN. *Ber.* 62B, 1538-48(1929).—The hydrolysis of *d*- and *l*-mandelic acid ethyl esters by the liver esterase of different animals depends upon the concn. of the substrate. The optimum for the (–) ester  $p_H = 7$ , with dog, human and rabbit enzymes, is 0.24 *M*. With increasing concn. the amount of acid formed by these three enzymes decreases. With horse and cattle enzymes, the max. is not yet reached at 0.96 *M*. Only with sheep enzyme has a max. been obtained in the (+) ester substrate because of its limited soly. Dissocn. consts. are tabulated for the dif-

ferent enzymes.  $K(-):K(+)$  equals 1.6:1 for hog esterase and 1.44:1 for sheep. Both esters were hydrolyzed with equal velocity by the hog and sheep enzymes and increase in the substrate concn. favors the (+) ester action. A greater decompn. velocity of the (-) reaction stands opposite a greater affinity of the enzyme for the (+) ester. The human, cat and dog enzymes have a greater affinity for the (-) ester. The checking of the velocity in higher concn. is unequal in the different enzymes. This is shown in the fall of the activity  $[P_n]$  curves for the (-) ester but only by a delay in the rise of the (+) ester curves. This has not yet been explained. With the racemic acid ester as a substrate, the specific rotation depends upon the concn. The change in direction of the rotation on increasing the concn. in small quantities is explained by the cooperation of the affinities of the enzymes for both optically active forms with the decompn. velocity of the (-) and (+) substrate-enzyme compds. With low ester concn. multiple (-) ester enzyme compds. form which cause a negative rotation of the racemate. In most concd. soln. the greater velocity of the (+) ester, the decisive factor for optical choice, reverses the rotation. Methods, data and curves are given

MARY E. LEAR

**The behavior of aromatic esters toward organic extracts. I. The action of pulped organs on the ethyl esters of benzoic and salicylic acids.** GUNSHI YOSHIMATSU. *Acta Schol. Med. Univ. Imp. Kyoto* 11, 599-615 (1929).—Solns. contg. 1.5 g. of  $BzOEt$  or  $o-HOC_6H_4CO_2Et$  in 100 cc. of  $CHCl_3-H_2O$ , 5 cc. of toluene and 3 g. of organ pulp were digested for periods up to 96 hr. at  $37^\circ$ . From time to time 5-cc. portions of the solns. were pipetted off and the amts. of acid split off estd. by titration with 0.1 *N* NaOH. For controls similar ester solns. were digested with 3 g. of organ pulp which had been heated on a water bath for 30 min. Furthermore in order to be certain that the acid formed was due to the splitting of the ester 3 g. of organ pulp, 100 cc. of  $CHCl_3-H_2O$  and 5 cc. of toluene were digested; analyses were made on 5-cc. portions of the controls. At the end of the digestion the benzoic or salicylic acid was recovered and the crystals were identified. The organs employed were (rabbit) kidney, muscle, spleen and pancreas. Liver was the most active with the benzoic ester while kidney was next; muscle was inactive. With the salicylic ester the result was similar to that with the benzoic ester but muscle showed some activity. Pancreas was active in each case but the figures are not comparative as the sample employed was only 0.6 g. **II. The action of organ extracts on the isobutyl, amyl and glyceryl esters of benzoic acid and on the isobutyl and amyl esters of salicylic acid.** *Ibid* 617-38.—In a manner somewhat similar to that described above the ester-splitting power of the glycerol ext. of organs of the hog was measured on various aromatic esters and on tributyrin. The action on isobutyl benzoate decreased in the order: liver, pancreas, kidney, intestinal mucous membrane and stomach mucous membrane, while on tributyrin the order was pancreas, liver, kidney, intestinal mucous membrane and stomach mucous membrane. The hydrolytic effects of the organ exts. on amyl benzoate were much less than on tributyrin; liver ext. was most active. A similar effect was found with glyceryl benzoate. Isobutyl salicylate was scarcely attacked even by liver. Amyl salicylate was still more difficult to hydrolyze in comparison with tributyrin and the effect of liver ext. was almost nil. **III. The action of organ extracts on the phenyl ester of benzoic and salicylic acids.** *Ibid* 639-48.—Phenyl benzoate was more or less split by organ exts. of the hog; liver ext. was the strongest. In comparison with tributyrin phenyl salicylate was but little attacked; liver ext. proved the strongest while pancreas was the weakest. Pig liver and kidney in comparison with pancreas are richer in esterase and poorer in lipase. G. H. W. LUCAS

**The behavior of ethyl- and phenylsulfuric acids towards organ extracts.** GUNSHI YOSHIMATSU. *Acta Schol. Med. Univ. Imp. Kyoto* 11, 649-60 (1929).—The action of the glycerol exts. of liver, kidney, pancreas and stomach and intestinal mucous membranes of the pig were studied on  $KEtSO_4$  and  $KPhSO_4$ ; sulfatase, the enzyme which splits  $H_2HSO_4$ , has been found by Neuberg in muscle and kidney of rabbits and guinea pigs. In the expts. of the author the exts. exerted no influence on these salts, while control expts. on tributyrin solns. showed much action. G. H. W. LUCAS

**The mass and size of protein molecules.** THE SVEDBERG. *Nature* 123, 871 (1929).—By means of measurements of sedimentation equil. and sedimentation velocity in strong centrifugal fields at const. temp. a systematic study of the mass and size of the mols. of various proteins has been carried out. All native proteins can be divided into two groups, hemocyanins with mol. wt. of the order of millions and all other proteins of the order 35,000 to 210,000. Two members of the first group have been studied. The proteins of the second group are divided into 4 sub-groups; the mol. mass, size and shape are about the same for all proteins within such a sub-group. The mols. of sub-groups 1 and 2 are spherical with a radius of 2.2  $\mu\mu$  and 4.0  $\mu\mu$ , while those of group

3 are non-spherical. Mols. of sub-group 4 are easily disaggregated with increasing  $p_H$ . Thus *R-phycoeyan* at  $p_H$  4.6 belongs to the 4th sub-group while at  $p_H$  6.8 it belongs to sub-group 3; its mols. have disaggregated into halves and have lost their spherical shape. In nature it would seem that numerous proteins are all built up according to some general plan which secures for them only a very limited number of different mol. masses and sizes when present in aq. soln. G. H. W. LUCAS

**The surface of the white rat with its application to the expression of metabolic results.** M. O. LEE WITH ELIZABETH CLARK. *Am. J. Physiol.* **89**, 24-33(1929).—Skin areas of 72 rats were measured by applying a coat of quickly drying varnish to the animals before skinning, thus preventing stretching. A modified Meeh-Rubner formula for the calcn. of area from body wt. is proposed, viz.,  $S = 12.54 W^{0.60}$ , where  $S$  = area in sq. cm. and  $W$  = wt. in g. A better formula involves a correction for the nutritional state, viz.,  $S = 10.76 W^{0.61} \times 0.310/N_{obs.}$ ;  $N_{obs.} = W^{1/3}/L$ ,  $L$  = length from nose to anus. The heat production of the rat with reference to body surface, as predicted by these formulas, is brought into closer agreement than hitherto with the heat production of humans. J. F. LYMAN

**Effect of anoxemia, carbon dioxide and lactic acid on electrical phenomena of myelinated fibers of the peripheral nervous system.** PETER HEINBECKER. *Am. J. Physiol.* **89**, 58-83(1929).—Anoxemia,  $CO_2$  and lactic acid, in general, raised the threshold, lengthened the abs. refractory period, decreased the cond. and the amplitude of the action potential of nerves. These effects were reversed during recovery induced by  $O_2$  and washing with Ringer's soln. J. F. LYMAN

**The reversible loss of excitability in isolated amphibian voluntary muscle.** W. DULIERE AND H. V. HORTON. *J. Physiol.* **67**, 152-65(1929).—Isolated frog's sartorius muscles, dissected without the use of Ringer's soln., and suspended at room temp. in moist  $O_2$ ,  $N_2$ , air, air with 5%  $CO_2$ , paraffin oil or Hg rapidly became reversibly inexcitable. This loss of excitability was shown not to be due to changes in phosphagen or to the accumulation of lactic acid in the muscles. Excitability could be restored by immersing the inexcitable muscles in Ringer's soln. It is suggested that inexcitability may be caused by the accumulation of K ions in the interspaces between the muscle fibers. J. F. LYMAN

**The disappearance of histamine from autolyzing lung tissue.** C. H. BEST. *J. Physiol.* **67**, 256-63(1929).—Lung and other tissues (kidney and liver), when suspended in saline and incubated at 37° with toluene, caused the disappearance of naturally occurring or added histamine. The disappearance of histamine was completely prevented by heating the suspension at 90° for 4 min.; it proceeded rapidly during the first period, became slower and practically ceased while there was still histamine available and the addn. of more histamine to this mixt. produced a renewed disappearance of histamine. An enzyme action is suggested. J. F. LYMAN

**The effect of temperature on the equilibrium of carbon dioxide and blood and the heat of ionization of hemoglobin.** G. S. ADAIR, N. CORDERO AND T. C. SHEN. *J. Physiol.* **67**, 288-98(1929).—The  $CO_2$  dissoen. curves of blood and of hemoglobin solns. were measured at 0°, 15° and 38°. The heat of ionization calcd. from the observation was less than that observed by calorimetric methods. The discrepancy can be explained on the assumption that the heat is partly due to the ionization of the COOH groups and partly due to the ionization of  $H_2O$  and the combination of OH ions with the proton. The fraction of the heat due to the ionization of COOH groups is a function of the  $p_H$  and in the calorimetric detns. recorded, the  $p_H$  is greater than that which obtains in the blood. The magnitude of the heat of ionization indicates that neutral proteins may exist as doublet ions. J. F. LYMAN

**Gas tensions at the skin surface of man.** J. A. CAMPBELL. *Proc. Physiol. Soc., J. Physiol.* **67**, viii(1929).—When the hand and lower forearm were enclosed in a glass cylinder in such a way that gaseous equil. could be attained between the gas of the cylinder and the skin,  $CO_2$  equil. was reached at about 40 mm.  $CO_2$  tension. At  $O_2$  tensions of the surrounding gas less than 50 mm.,  $O_2$  neither diffused into the hand nor out of it. At tensions above 50 mm.,  $O_2$  slowly diffused in. Conclusion: The skin is impermeable outwards to  $O_2$ . J. F. LYMAN

**Diffusion through the wall of the living and the dead intestine.** H. E. MAGEE AND J. J. R. MACLEOD. *Proc. Physiol. Soc., J. Physiol.* **67**, xvii(1928).—Glucose or KI diffused much more rapidly through dead intestine than it did through the living intestine. J. F. LYMAN

**Claude Bernard's conception of the internal environment.** J. S. HALDANE. *Proc. Physiol. Soc., J. Physiol.* **67**, xxii(1929).—Bernard first formulated the view that the blood of a living animal is an internal medium kept remarkably const. as regards

its physico-chem. conditions by the coordinated influence upon it of the various organs of the body. Objection is made to the title of L. J. Henderson's book "A Study in General Physiology" when it is, in fact, a study in phys. chemistry, since he regards the blood as something which, as the result of various buffer reactions occurring within itself, is not as readily disturbed in its physico-chem. conditions as other liquids would be.

The molecular constitution of cholesterol and the chemistry of biliary acids (CUNY)

10.

**Enzymic reactions.** FRIEDRICH F. NORD. Fr. 655,664, June 13, 1928. The speed of enzymic reactions is increased by increasing the surface of the colloiddally dissolved enzymes, before coming in contact with the substratum to be transformed, by an increased peptonization and protecting it with easily absorbable compds. The absorptive layer is produced on the active material or on the substratum or on both by treatment with  $N_2O$ ,  $C_2H_2$ ,  $C_2H_4$ , propylene, butylene, amylene or mixts. thereof

## B—METHODS AND APPARATUS

STANLEY R. BENEDICT

**The peroxidase reaction. XXV. The oxidase and the peroxidase reaction in different leucocytes of the blood.** KOJI TOKUŌ. *Tohoku J. Exptl. Med.* **12**, 445-58 (1929); cf. *C. A.* **23**, 3245.—An extensive review of the literature is given. Reliable counter-stains are developed for the oxidase and peroxidase reactions, which are investigated for each type of leucocyte. Two plates are given. **XXVI. The blood mast cell and its oxidase and peroxidase reactions.** *Ibid* 459-96. Blood mast cells of all the animals examd., including man, are all with the exception of those of the guinea pig, oxidase- as well as peroxidase-negative. Two plates are given. B. C. B.

**The ammoniacal silver solutions used in neuropathology: Their staining properties, chemistry and methods of preparation.** L. S. KUBIE AND D. DAVIDSON. *Arch. Neurol. and Psychiat.* **19**, 888-903 (1928); *Physiol. Abstracts* **13**, 551. H. I. D.

**A chemical study of the Manoilov test for the differentiation of the sexes.** K. G. FALK AND I. LORBERBLATT. *Brit. J. Exptl. Biol.* **4**, 305-12 (1927); *Physiol. Abstracts* **13**, 598.—This test is shown to be independent of the presence of enzymes in the substances tested or the reagents used. Its chemistry is still uncertain, though probably dependent on an oxidation, and possibly on the content of glutathione. An investigation on ovarian and orchidic exts. has indicated various substitutions and simplifications which improve the test. Where  $FeCl_3$  produces obscuring ppts. in the material under examn., the use of permanganate and afterward thiosulfate is recommended. In testing bloods and leaves, cases are recorded in which the normal color reaction is reversed. H. I. D.

**The determination of phosphatides.** BRUNO REWALD. *Allgem. Oel- u. Fetttech.* **25**, 35-6; *Chem. Zentr.* **1928**, I, 1239; cf. *C. A.* **22**, 4591.—In obtaining phosphatides from spinal cord, egg yolk, brains, etc., a single extn. with solvents never gave good results, but yielded a series of more or less sol. phosphatides. The soly. depends upon whether or not the proteins have been sep'd out. The detn. is made most rapidly by washing in a Kjeldahl flask, subsequently dilg. with  $H_2O$  and  $NH_4NO_3$  and pptg. the  $P_2O_5$  by the use of  $NH_4$  molybdate soln. C. R. FELLERS

**Progress in the standardization of stains. Definiteness in staining formulas.** H. J. CONN. *Stain Tech.* **4**, 33-5 (1929); cf. *C. A.* **23**, 403.—A plea is made that investigators be more precise in stating all staining formulas. There are 3 primary types of basic fuchsin and since stains purchased may consist of various mixts. of these 3 compds. it is desirable to state the color index no., dye content and precise methods of procedure. C. R. FELLERS

**The history of staining. Logwood dyes.** H. J. CONN. *Stain Tech.* **4**, 37-48 (1929); cf. *C. A.* **23**, 403.—*Hematoxylin*, a glucoside, is a purified form of the dye present in logwood ext. and is manufactured by extn. with  $Et_2O$  and subsequent crystn. with  $H_2O$ . In staining, hematoxylin must be oxidized into *hematein*. Waldeyer (1863) first used hematoxylin as a biol. stain. The  $SO_2$ -bleached dye proved unsatisfactory. A full bibliography is appended. C. R. FELLERS

**The chemical analysis of thiazine eosinates.** W. C. HOLMES. *Stain Tech.* **4**, 49-52 (1929).—The constituents of blood stains are normal eosinates of the thiazine series of dyes. Methods are outlined for the chem. examn. of blood stains which are based upon the complete reduction of all dye components present in buffered solns. of limited acidity and the reduction of their thiazine components alone in strongly acid solns.

Chem. analysis should include moisture (drying to const. wt. at  $110^{\circ}$ ), thiazine and total dye content. The thiazine content is detd. by dissolving a 0.2 g. sample in 50 cc. glacial AcOH, adding 100 cc. of alc., heating to boiling and titrating with  $N\ TiCl_3$  in a current of  $CO_2$ . The final disappearance of a green tint in the orange soln. is considered the end point. The total dye content is detd. by dissolving a 0.2 g. sample in 100 cc. alc., adding 100 cc. of  $H_2O$  and 50 cc. of a 20% Rochelle salt soln., heating to boiling and titrating under  $CO_2$ . The final disappearance of the pink tint is the end point. The character of the thiazine components of the eosinates in blood stains can be best detd. spectrophotometrically but chem. examn. is a useful supplementary procedure.

*Science* **69**, 631-6 (1929).—An address.

W. D. LANGLEY

The oxidative determination of phospholipid (lecithin and cephalin) in blood and tissues. W. R. BLOOR. *J. Biol. Chem.* **82**, 273-86 (1929).—Bang's principle of measurement of the non-phosphate part of the lecithin and cephalin mol. is followed; oxidation with  $N\ K_2Cr_2O_7$ , and the ordinary method of isolation of the phosphatides by pptn from  $Et_2O$  or petroleum ether with  $Me_2CO$  and  $MgCl_2$  gives satisfactory results on mg. amts. of lecithin and cephalin. Methods are described for whole blood, plasma or serum, corpuscles and tissues. With blood plasma the oxidative and ordinary nephelometric methods agree quite well. With tissues the 2 methods give comparative results, provided the phospholipid is pptd. by  $Me_2CO$  and  $MgCl_2$  before it is detd. nephelometrically. The use of this method avoids the assumptions that (a) all significantly important phospholipids are of the nature of lecithin and cephalin and (b) all alc.- or  $Et_2O$  sol. P is of the lecithin-cephalin type of combination, assumptions generally near enough to the truth for practical purposes but not true nevertheless. A. P. LOTHROP

Acetone as a control substance for respiration and gas analysis apparatus. THORNE M. CARPENTER, EDWARD L. FOX AND ARTHUR F. SEREQUE. *J. Biol. Chem.* **82**, 335-43 (1929).—Acetone possesses certain qualities that render its use superior to that of alc. as a control substance for respiration and gas analysis app. It can be bought in a high degree of purity and therefore does not have to be standardized, it is not hygroscopic, it burns readily in air and the ratio of  $CO_2$  produced to  $O_2$  required in its combustion is 0.75, a quotient within the range of normal respiratory quotients of man. Its use as a substance for control tests of the gasometer method and of the Haldane portable and the Haldane-Carpenter gas analysis app. is described and also the use of combinations of acetone and alc. with the Benedict universal app. No rubber connections can be used with acetone. A. P. LOTHROP

Determination of sugar in blood. I. Observations upon Benedict's alkaline copper solution. MARK R. EVERETT. *J. Biol. Chem.* **82**, 369-76 (1929).—The presence of sulfite in alk. Cu mixts. lowers the apparent blood sugar values regardless of the nature of the other components of the solns. With these reagents there is an unequal and deceptive fading of the colors in the standard and unknown. Benedict's new blood sugar method (*C. A.* **22**, 1375) therefore does not give true blood sugar values. The use of 4 cc. of Folin's acid molybdate soln. is suggested as a possible modification. A. P. L.

The Van Slyke method for the determination of chlorides in blood and tissue. ANNA J. EISENMAN. *J. Biol. Chem.* **82**, 411-4 (1929).—"Although Wilson and Ball (*C. A.* **22**, 4557) claim that the Van Slyke chloride method gives low results in some human and dog sera, we were unable, in a series of 7 bloods and 11 sera (human), to obtain any higher results by the Wilson and Ball modification than by the Van Slyke method. It therefore seems justifiable to assume that the Van Slyke method for the detn. of chlorides is accurate and reliable." A. P. LOTHROP

The colorimetric determination of the serum proteins. DAVID M. GREENBERG. *J. Biol. Chem.* **82**, 545-50 (1929).—The colorimetric method described is based on the color developed with Folin's phenol reagent. Howe's method of sepg. the serum proteins by  $Na_2SO_4$  is employed. The results obtained are accurate to about 5% and the

method provides a rapid and relatively simple means of detg. the serum proteins for clinical purposes. A. P. LOTHROP

**The determination of the inorganic phosphate of the serum on the filtrate from calcium analysis.** LEWIS GUNTHER AND DAVID M. GREENBERG. *J. Biol. Chem.* **82**, 551-3(1929).--A method is described for the detn. of the inorg. phosphate in the supernatant fluid from serum Ca or ultrafiltrate Ca detns. The Fiske and Subbarow method is used, the excess of oxalate from the Ca detn. being removed by oxidation with  $\text{KMnO}_4$ . The supernatant fluid from the Ca detn. on a 2 cc. sample is sufficient. The variation from the direct detn. on the original serum is on an av. less than 3%. A. P. L.

**The determination of the rate of hemolysis by the measurement of light transmission.** H. D. KESTEN AND T. F. ZUCKER. *Am. J. Physiol.* **87**, 263-73(1928).--The transmission of light by dil. blood suspensions to which hemolytic agents had been added was recorded from moment to moment by a potassium hydride photoelectric cell as a measure of the rate of hemolysis. J. F. LYMAN

**An improved method for the determination of cardiac output in man by means of ethyl iodide.** ISAAC STARR, JR., AND C. J. GAMBLE. *Am. J. Physiol.* **87**, 450-73(1928).--The method previously described (*C. A.* **21**, 2712) for the detn. of small amts. of  $\text{EtI}$  in blood has been adapted for larger samples (60 cc.). The distribution coeff. for  $\text{EtI}$  between air and blood at  $37^\circ$  is independent of changes in concn. from 1.2 to 48 mg per 1000 cc. of air. The av. value for 7 normal human subjects was 6.1, varying from 5.6 to 6.5. To det. blood flow the subject breathes a gas mixt. contg.  $\text{EtI}$ . After 12 min. samples of inspired air, expired air and alveolar air are taken for  $\text{EtI}$  detn. The subject then rebreathes 1000 cc. of air for 30 secs., and the rebreathed air is analyzed for  $\text{EtI}$  as a measure of the venous concn. of  $\text{EtI}$ . Blood flow is calcd. from the  $\text{EtI}$  content of (1) inspired air,  $I$ , (2) expired air,  $E$ , (3) alveolar air,  $A$ , (arterial blood), (4) rebreathed air,  $R$ , (venous blood), (5) respiration vol. and (6) distribution coeff. Blood flow =  $(I - E) \times \text{respiration} / (A - \text{corrected } R) \times \text{temp. correction} \times \text{distribution coeff}$ . The method has been checked, perfused dog lungs being used. Consecutive detns. on 2 human subjects supine and at rest give confidence in the method. J. F. LYMAN

**The behavior of ethyl iodide in the body.** ISAAC STARR, JR., AND C. J. GAMBLE. *Am. J. Physiol.* **87**, 474-85(1928).--Contrary to the belief of Henderson and Haggard (*C. A.* **22**, 3184) the  $\text{EtI}$  method of H. and H. of detg. the rate of blood flow in man is faulty because of the stability of  $\text{EtI}$  in the body and its presence in the venous blood.  $\text{EtI}$  behaves in large part like an indifferent gas and distributes itself in blood and tissues according to its soly. in their various components. Because part of the  $\text{EtI}$  is destroyed in blood and tissues satn. of the body at the concn. inspired is delayed and the difference between arterial and venous concns. remains large even after prolonged inhalation. J. F. LYMAN

**Physiological activity and the Manoilov reaction.** OSCAR RIDDLE AND W. H. REINHART. *Am. J. Physiol.* **87**, 517-25(1928).--See *C. A.* **23**, 1149. J. F. LYMAN

**The determination of the cardiac output in man by the use of acetylene.** ARTHUR GROLLMAN. *Am. J. Physiol.* **88**, 432-45(1929).--Acetylene has many advantages to recommend its use as a foreign gas for the detn. of cardiac output by the method of Marshall, Harrop and Grollman (*C. A.* **23**, 2455). Consecutive detns. on the same individual by the method showed a variation of about 2%. The cardiac output, like other bodily functions, is constant for an individual in a relative constant state of rest. J. F. LYMAN

**A microchemical method for determination of the absolute blood volume, with data upon the blood volume of the guinea pig, white rat, rabbit and cat.** STEPHEN WENT AND C. K. DRINKER. *Am. J. Physiol.* **88**, 468-78(1929).--The method employs a capillary scale, the tubes of which contain different known dilns. of vital red. The blood samples, collected after the injection of vital red, are sealed in similar capillary tubes, and, after centrifugalizing, the dye concn. in their plasma is detd. by comparison with the tubes of the standard scale. 0.01 cc. of blood suffices for a single detn. Blood vols. for the guinea pig were from 3.5 to 5.5% of the body wt., for the rat 7.4%, for the rabbit 8.7%, and for the cat 6.2%. J. F. LYMAN

**A method of oxygenating blood.** L. E. BAYLISS, A. R. FEE AND E. OGDEN. *J. Physiol.* **66**, 443-8(1928).--An artificial lung consisting of alternate revolving and stationary plates is described. Its advantages are that the production of foam is avoided and it permits rapid and effective oxygenation of blood. With 54 cc. of blood in the app. at any one moment and operating in  $\text{O}_2$ , it will introduce 19.0 cc. of  $\text{O}_2$  per min. into the blood flowing through it. J. F. LYMAN

**The determination of the carbon dioxide content of the mixed venous blood.** I.

**The effect of oxygenation and the critical oxygen tension.** M. C. G. ISRAËLS AND F. W. LAMB. *J. Physiol.* **67**, 49–61(1929).—If the  $\text{CO}_2$  content of the venous blood is to be detd. by the method of rebreathing a gas mixture until equil. is reached, care must be taken that the final  $\text{O}_2$  content of the rebreathed gas does not fall below the critical point, *i. e.*, sufficient to insure full oxygenation of the mixed venous blood, which is about 25% of an atm. A method is described for carrying out rebreathing expts. without a very rapid lowering of  $\text{O}_2$  tension in the rebreathing bag, and a method for rapid changing from one respiratory circuit to another. J. F. LYMAN

**Mercurimetry as a method for determining alkaloids.** M. AIAZZI-MANCINI. *Boll. soc. ital. biol. sper.* **4**, 222–3(1929).—This method is not adapted for detg. ethyl strychnine in urine. PETER MASUCCI

**Arrangement applicable to the mercury ureometer of A. Leclère.** J. EURY. *Bull. sci. pharmacol.* **36**, 291–2(1929).—The app. consists of a graduated tube with stopcocks on both sides and connected on the lower end by a rubber tube to a glass bulb contg. Hg. The upper end is prolonged into a funnel. A description of the manipulation is given. A. E. MEYER

**Comparative studies on the determination of cholesterol in blood serum by gravimetric and volumetric procedures.** V. N. NEKLUDOV AND S. S. CHALALOV. *Biochem. Z.* **208**, 60–72(1929).—The highest values for total blood cholesterol were obtained with serum boiled for 8 hrs. with 20 or 45% NaOH. The cholesterol is extracted with ether and after evapn. dissolved in hot 96% alc. and detd. by Windaus' method of pptn. with digitonin. For the detn. of the free cholesterol/cholesterol ester ratio the best results were obtained by Fex' procedure which detcs. 97% of the total cholesterol. The colorimetric method of Grigaut in at least a third of the detns. produces a variation from the standard which prevents the correct reading; where this difficulty does not occur the results are usually 8–12% too high. The colorimetric detn. by Krastelswsky' procedure is more reliable and allows the recovery of 95–98% of the total serum cholesterol. S. MORGULIS

**Titrimetric phosphorus determination in small quantities of serum and cerebrospinal fluid.** KURT SAMSON. *Biochem. Z.* **208**, 230 6(1929).—Serum is deproteinized with  $\text{CCl}_3\text{CO}_2\text{H}$ . Five cc. of the clear filtrate (dilm. 1:10 or 1:5) is measured into a 12 cc. centrifuge tube; to this are added 1.5 cc. of a soln. made up by mixing 400 cc. 50%  $\text{NH}_4\text{NO}_3$  with 100 cc.  $\text{HNO}_3$ , sp. gr. 1.4, and then 1 cc. of 10%  $\text{NH}_4$  molybdate soln. After the soln. stands overnight in an incubator, the sides of the tubes are washed with 1–2 cc. of 1%  $\text{KNO}_3$  soln. and the tube is centrifuged for 3–4 min. The ppt. is washed several times with  $\text{KNO}_3$  until the supernatant fluid turns alk. to phenolphthalein on adding a drop of  $N/40$  NaOH. The ppt. is dissolved in 2 cc.  $N/40$  NaOH, or more may be added if necessary. A similar amt. of alkali is measured into another tube (control). For each 2 cc. of the alkali 0.5 cc. of formalin is added and well shaken. The formalin soln. is prepd. by neutralizing 20 cc.  $\text{HCHO}$  in 50 cc.  $\text{H}_2\text{O}$ , contg. 1 cc. of 1% phenolphthalein, with 0.1  $N$  NaOH and dilg. to 100 cc. The soln. should retain a faint pink color. The mixt. is titrated now with  $N/40$  HCl until the phenolphthalein is decolorized. Amts. of P ranging between 0.15 and 0.01 mg. can be detd. with an accuracy of 0.001–0.002 mg. S. MORGULIS

**A new method for the simultaneous determination of pepsin and lipase in gastric juice.** L. GÓZONY AND F. HOFFENREICH. *Biochem. Z.* **208**, 259–61(1929).—To 2 cc. gastric juice enough 0.1  $N$  NaOH or HCl is added to bring the  $p_{\text{H}}$  to 5.6, bromocresol purple being used as indicator, and this is dild. with physiol. saline to 4 cc. A series of dilns. of this juice is prepd. (1:2, 4, 8, 16, etc.), and to each 1 cc. of satd. monobutyrin soln. is added and, after keeping 30 min. at  $37^\circ$ , 1 cc. of 0.2% casein soln. (made by dissolving 0.2 g. casein in 10 cc. 0.1  $N$  NaOH, followed by a little 0.1  $N$  HCl and sufficient physiol. saline to make up to 100 cc.; 0.5% AcOH is then added until a strong opalescence results when the  $p_{\text{H}}$  = 5.6). After another 30 min. in the water bath at  $37^\circ$ , if in certain dilns., the casein ppts. owing to the acidity due to the lipase action. The pepsin activity is detd. by the digestion of the pptd. casein. S. MORGULIS

**Microchemical determination of protein with the aid of the centrifuge.** K. SAMSON. *Biochem. Z.* **208**, 262–73(1929).—In special centrifuge tubes, having a portion of 0.08 cc. capacity calibrated in 0.002 cc., are placed 0.6 cc. of spinal fluid and 0.3 cc. Esbach's reagent, and 0.6 cc. spinal fluid and 0.6 cc. satd.  $(\text{NH}_4)_2\text{SO}_4$ . The solns. are thoroughly mixed and left standing exactly 30 min. and 2 hr., resp. They are then centrifuged at a speed of 3000 revolutions per min. for exactly 40 and 20 min., resp. The value obtained in the first tube represents the total protein content. In the second tube the supernatant fluid is removed with a fine pipet, the ppt. of globulin is dissolved in 0.6 cc.  $\text{H}_2\text{O}$ , then pptd. with 0.3 cc. Esbach's reagent. After standing exactly 30

min. it is centrifuged exactly 40 min. This gives the value for globulin, the albumin being the difference between these 2 results. S. MORGULIS

A new microcolorimetric method for the determination of chloride ions in organic fluids. RICARDO CALATRONI AND EMILIO TSCHOPP. *Biochem. Z.* 208, 274-8(1929).—The deproteinized org. soln. while hot is treated with an excess of a standard 0.005 N AgNO<sub>3</sub> soln. and the insol. Cl removed by centrifuging. To an aliquot of the supernatant fluid are added 0.5% gelatin and H<sub>2</sub>S, the resulting Ag<sub>2</sub>S being detd. colorimetrically. The calcn. is made according to the formula:  $[X - (A \cdot Y \cdot Z / C)] \times \text{factor} = \text{g. NaCl per l.}$ , where  $X$  = amt. of AgNO<sub>3</sub> (8.494 mg. per cc.),  $A$  = reading of known,  $b$  = reading of unknown soln.,  $Y$  = AgNO<sub>3</sub> of known soln. (4.247 mg.) and  $Z$  = diln. of the unknown. S. MORGULIS

A source of error in the blood sugar determination by Bang's microchemical method. EMMY RAITH. *Biochem. Z.* 208, 357-60(1929).—The filter papers, which are sold for the purpose of the blood sugar detn. by Bang's microchem. method, contain substances which reduce Fehling's soln. It is possible to free them from these reducing substances by a special process of washing but this alters their absorption power to such a degree as to make them useless for the analysis. S. MORGULIS

Microchemical determination of morphine. II. Morphine determination in serum and in whole blood. PETER FLEISCHMANN. *Biochem. Z.* 208, 392-414(1929), cf. C. A. 23, 3774—Expts. with sheep rabbit and guinea-pig blood show that it is possible to det. morphine exactly without the need for extraction and purification. The blood is deproteinized with 14.5% uranium nitrate; the excess of uranyl is removed with a very concd. phosphate soln. It was found possible to det. accurately as little as 0.01 mg. morphine per cc. with 5-7 cc quantities of blood. In blood serum, because smaller amts. of uranium nitrate are needed for the deproteinization and the removal of the excess is much less of a problem, the detn. is carried out with greater ease. The errors of analysis in blood and serum are about the same as those in pure solns. S. M

The problem of ashing biological material. II. ROSSENBECK. *Biochem. Z.* 208, 428-42(1929).—A method is described for ashing previously dried material with fuming HNO<sub>3</sub> in a closed system. S. MORGULIS

A simple method for the determination of color shades and color intensities of fluids. ERKKI LEIKOLA AND WM. KERPOLLA. *Skand. Arch. Physiol.* 56, 261-4(1929)

A Walpole comparator with 4 fundamental color solns. (6% Co(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O of sp. gr. 1.0323; 0.1% K<sub>2</sub>Cr<sub>2</sub>O<sub>7</sub>; 15% NiSO<sub>4</sub>; and a mixt. of 5 parts 10% CuSO<sub>4</sub> and 95 parts 5% NH<sub>4</sub>OH), red, yellow, green and blue, is used. Each of these solns. is prepd. in 15 different dilns. The color of the tested fluid is expressed by a formula giving the dilns. of the combination of fundamental colors, thus,  $R_i - Y_i - B_i$ , etc. S. M

The estimation of sugar in small quantities of blood. H. D. BARNES. *J. S. African Chem. Inst.* 10, No. 2, 48-50(1927) C. T. S

Determination of calcium in blood. TEIICHIRO HAMADA. Hokkaido Imp. Univ. Hokkaido J. Med. 6, 173-82(1928).—H. examd. the known methods of Ca detn. in the blood, finding that when the quantity of the blood is above 2 cc. the Clark method, and when it is less than 2 cc. the de Waad method as improved by H., are suitable. Method. Dry 2 cc. of the citric acid-blood mixt. and calcine. Treat the residue with 1 cc. of satd. (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> soln., warm and then further treat with NH<sub>4</sub>OH and glacial AcOH and digest for 10 min. on a water-bath. After allowing to cool, centrifuge the mixt., dissolve the ppt. in 2 cc. of 15% H<sub>2</sub>SO<sub>4</sub> and titrate with 0.01 N KMnO<sub>4</sub>. K. SOMEYA

Study of physiological conditions and functions of organs and glands by biological analysis of urines. I. Diagnosis of pregnancy. CASIMIR FUNK AND HENRI R. OLIVIER. *J. pharm. chim.* [8], 8, 449-53(1928).—The method used for the detection of folliculin (A) in the blood of pregnant women (Frank and Goldberger, *J. Am. Med. Assoc.* 90, 106 (1928)) is applied to urine. Evap. urine to near dryness, take up with EtOH, again evap., take up with Et<sub>2</sub>O or with CHCl<sub>3</sub> (Veler and Doisy, C. A. 22, 4553), dissolve the evapn. residue in olive oil and det. the biol. activity of the soln. by injection into rats (Burn method, C. A. 22, 1789). In urines of non-pregnant women, A could not be detected even in as much as 1400 cc. In the urine of pregnancy, A begins to appear in the 6th week, and may be detected in less than 30-50 cc. This confirms results by previous authors (Zondek, Aschheim, C. A. 22, 1182, 2597, 4600). The method of diagnosis by Zondek (detecting in the urine of pregnancy the hormone of the posterior lobe of the hypophysis) seems less sp. than that of detecting A. In doubtful cases of early pregnancy, a combination of both methods is suggested. S. W.

Detection of biliary pigments in urine. CHARLES KUHN. *J. pharm. chim.* [8], 8, 546-9(1928).—To 20 cc. of urine in a test tube add 2 cc. of soln. A (5% aq. CuSO<sub>4</sub>·5H<sub>2</sub>O,

20 cc.,  $\text{NH}_4\text{OH}$  22°Bé. 10 cc.), mix, add at once 2 cc. of soln. B ( $\text{H}_3\text{PO}_4$  60° Bé. 20 cc.,  $\text{H}_2\text{O}$  20 cc.), mix and at once add 6 drops of  $\text{C}_6\text{H}_5\text{Me}$ ; shake well and upon standing allow the insol. biliverdin to collect on top. Overlay with 3–4 cc. of 95% EtOH. Even small quantities of biliary pigments present in urine cause a green coloration of the EtOH layer. If none is present, the EtOH is colorless or pink, or at most bluish gray. The test is not interfered with by albumin, dextrose, indoxyl, urobilin or uric acid, and compares well with the exact methods based on pptg. bile pigments as Ca or Ba compds. Addn. of  $\text{H}_2\text{O}_2$  to the EtOH may give misleading results; but a 2% addn. of a 40% HCHO soln. may eliminate slight secondary colorations. S. WALDBOTT

**Simple apparatus for the determination of sugar in urine.** H. CITRON. *Z. Urol.* 23, 161–2(1929); *J. Am. Med. Assoc.* 92, 2148.—The app. consists of a glass cylinder with an outlet tube a short distance from the top, and a urinometer, to the top of which is attached an indicator arm that projects through a hole in the cover of the cylinder. Enough urine-yeast emulsion is run into the cylinder so that the zero point of the indicator arm is above the level of the cover of the cylinder. Urine-yeast emulsion is then allowed to escape through the outlet tube until the zero point is on a level with the cover of the cylinder. After a few drops of tributyrin prepn. have been added to prevent excessive fermentation, the apparatus is placed in  $\text{H}_2\text{O}$  heated to 38–40°. The fermentation begins at once and the indicator arm of the hydrometer sinks accordingly. After 4 hrs. the amt. of sugar that was in the urine-yeast emulsion before fermentation began may be read from the scale. R. C. WILLSON

Preservation of animal materials by chemical means (DREWS) 18.

WOOD, P. C., et al.: **Laboratory Technique; The Methods Employed at St. Luke's Hospital, New York.** 3rd ed., revised. New York: J. T. Dougherty. 318 pp. \$3.75.

**Detecting acidity in the mouth.** JOHN O. MCCALL (to Calsodent Co.). U. S. 1,717,723. June 18. Phenolphthalein 8 is used with Congo red 3 parts.

## C—BACTERIOLOGY

CHARLES B. MORREY

**Biochemical studies of streptococci.** FRANCES KRASNOW AND WILLIAM J. GIES. *J. Dental Research* 9, 29–35(1929).—Study was made of the growth of 50 strains of streptococci on 9 different media. The Jablons liver-peptone medium was most useful for longevity of cultures without transplant; 28 strains retained undiminished viability after storage for 3 yrs. without transplant; it was also useful for storage of other bacterial species. JOSEPH S. HEPBURN

**Biochemical studies of streptococci. II. Availability of 671 synthetic media.** FRANCES KRASNOW AND MARGARET L. ROSENBERG. *J. Dental Research* 9, 123–69(1929).—Of the 671 synthetic media used, 441 permitted the streptococci to remain viable through 1 or more transplants. However, only 1 medium supported growth on the 3d series of transplants, and none of the media showed growth on the 4th, 5th and 6th transplants. The media did not permit continuance of normal physiol. function including propagation. Growth in the first two transplants was due to a small reserve store of a necessary nutrient or nutrients, or else to transfer of small amounts of the constituents of the parent culture. A bibliography of 82 references is appended. JOSEPH S. HEPBURN

**Biochemical studies of streptococci. III. Availability of carbon compounds.** FRANCES KRASNOW AND MARGARET L. ROSENBERG. *J. Dental Research* 9, 321–32(1929).—See C. A. 22, 2959. JOSEPH S. HEPBURN

**The oxidation of benzene hydrocarbons by bacteria.** V. O. TAUSON. *Planta (Abt. E. Z. wiss. Biol.)* 7, 735–57(1929); cf. C. A. 23, 1431.—A study was made of the ability of 4 strains of *B. toluolicum* to oxidize benzene and some of its hydrocarbon derivatives. Toluene and ethylbenzene were oxidized readily by all 4 strains, but the greatest no. of compds. was oxidized by strain c. The introduction of one  $\text{CH}_3$  group retarded the reaction. Compds. with long side chains or with either a  $\text{CH}_3$  group or a double bond between 2 Ph groups were not easily oxidized. The bacteria were easily grown in several kinds of nutrient media, those contg.  $\text{NH}_4$  salts as a source of N being more efficient than those contg.  $\text{NO}_3$  salts. A. E. HITCHCOCK

**A simple glycerol water crystal violet potato cylinder medium for diagnostic cultures of tubercle bacilli.** H. J. CORPER AND N. AND N. UYEL. *Arch. Path.* 7, 835–8(1929).—In the  $\text{H}_2\text{SO}_4$  potato culture method for the diagnosis of tuberculosis, 6% glycerol  $\text{H}_2\text{O}$  can be used to replace the 5% glycerol broth previously recommended for the prepn.

of the crystal violet potato cylinder medium. This simplifies the prepn. of the culture medium used in this new diagnostic method. Human and bovine tubercle bacilli grow with equal facility when present in small numbers in tuberculous materials on the crystal violet potato cylinder medium with glycerol  $H_2O$  in the absence of broth.

HARRIET F. HOLMES

A quantitative study of the effect of ultra-violet rays upon the bacteriophage. I. A comparison between the lethal effects of ultra-violet rays upon the bacteriophage, *B. coli* and some enzymes and antibodies. S. I. BAKER AND S. H. NANAVUTTY. *Brit. J. Exptl. Path.* 10, 45-61(1929).—Enzymes and antibodies are much less susceptible to the destructive effects of ultra-violet rays than are bacteria. The susceptibility of the bacteriophage is of the same order as that of bacteria. The relative lethal efficiencies of different regions of the spectrum are the same for the bacteriophage as for *B. coli*. The work of Rivers and Gates (*J. Exptl. Med.* 47, 45 (1928)) indicates that the susceptibility of vaccinia virus to irradiation is of the same order as that of bacteria. The present work, therefore, strongly supports the view that the bacteriophage is of the nature of a virus and has little in common with enzymes. HARRIET F. HOLMES

The exhaustion of media in bacterial culture. J. C. BROOM. *Brit. J. Exptl. Path.* 10, 71-83(1929).—The power of fruit juice to allow of regrowth of an organism on an agar slope on which that organism has already been grown for some days is dependent, not on its vitamin content, but on the presence of C compds. which the organism can assimilate. With regard to the coli-typhoid group, certain evidence has been brought forward to show that the power of a bacterium to inhibit the growth of others is related to its fermentative activities of "sugars" and org. salts. It is suggested that this inhibition is caused by a deficiency of available C due to the original growth, and that this explains why bacteria with greater powers of fermentation inhibit those which are less active in this respect.

HARRIET F. HOLMES

Studies on the metabolism of *Cl. tetani*. II. The bases in the culture medium. H. SIEVERS AND E. MÜLLER. *Z. Biol.* 88, 553-60(1929); cf. *C. A.* 22, 2184. The medium was treated with hot, satd., baryta soln.; the filtrate satd. with  $CO_2$  and coned. to a sirup. This residue was dild. to 1 l. with  $H_2O$ , acidified with  $H_2SO_4$  and phosphotungstic acid added. Upon concn. of the filtrate there appeared fine, slightly yellow crystals, easily sol. in HCl. This was hypoxanthine, which was finally identified as the chloroaurate,  $C_8H_4N_4O_3 \cdot HAuCl_4$ . Carnitine was isolated from the lysine fraction as the chloroaurate,  $C_7H_{15}NO_3 \cdot HAuCl_4$ , m.  $152^\circ$ . The residue from the lysine fraction yielded  $\beta$ -bromobutaine, the aurate of which is  $C_8H_{14}NO_3AuCl_4$ , m.  $205-210^\circ$ , and methylamine, which was obtained as the chloroplatinate. FRANCES KRASNOW

A medium for the isolation of *Salmonella pullorum* and other members of the paratyphoid group from avian tissues. W. W. MALLMANN, FRANK THORP, JR., AND MARGARET SEMMES. *J. Am. Vet. Med. Assoc.* 73, 825-38(1928).—A brilliant green-liver infusion agar is recommended.

FRANCES KRASNOW

Morphologically or physiologically definable iron bacteria. EINAR NAUMANN. *Ber. deut. botan. Ges.* 47, 262-5(1929); cf. *C. A.* 22, 3189.—Reply to Chododui

LAWRENCE P. MILLER

The effect of antiseptics on tissues in vitro. WM. J. GERMAN. *Arch. Surg.* 18, 1920 6(1929).—Calcd. on the basis of a perfect antiseptic, *i. e.*, having a bactericidal action and a tissue viability each of 100%, the max. indices of efficiency for the antiseptics tested were: gentian violet 0.03, acriflavine 0.1914, K Hg iodide 0, mercurochrome 0.0132, and picric acid 0.0975. The tests for antiseptic action were made on *Staphylococcus aureus*, *Streptococcus hemolyticus* and *B. coli*. The tests for cell viability were made on tissue cultures of the skin of embryonic chicks. The index of efficiency was calcd. by multiplying the bacteriostatic effect by the percentage of viability of the tissue cultures.

JOHN T. MYERS

The value of oxidation reactions with *p*-phenyldiamine in bacteriology. W. LOELE. *Centr. Bakt. Parasitenk.*, I Abt., 111, 325-35(1929).—Bacteria can be divided into 4 groups according to their reactions with *p*-phenyldiamine; those which produce oxidases and peroxidases; those which produce only peroxidases; those which produce neither, but form color; and those which produce no oxidizing substances and no color. The bacterial oxidizing substances are called "oxidoreductases" because enzyme poisoning substances and heat inhibit them. Their production by microorganisms varies with species, age of the culture, nature of the medium and the OH and  $H_2O_2$  concn. The *p*-phenyldiamine oxidase gives the indolphenol blue reaction.

JOHN T. MYERS

Comparative studies on the cultivation of the tubercle bacillus by the methods of

Uhlenhuth and Hohn. GERHARD ORZECOWSKI. *Centr. Bakt. Parasitenk.*, I Abt., 111, 362-7(1929). JOHN T. MYERS

An ectoplasmic inhibiting substance in filtrates of old cultures. LEO OLITZKI. *Centr. Bakt. Parasitenk.*, I Abt., 111, 491-3(1929).—Bouillon cultures of *B. proteus* about a month old contained substances injurious to the ectoplasmic substances of proteus bacilli. JOHN T. MYERS

The biological difference between native and heated water-soluble antigen of the cholera vibrio. II. The inhibition of spontaneous phagocytosis. K. FUJIMORI. *Centr. Bakt. Parasitenk.*, I Abt., 112, 11-6(1929); cf. *C. A.* 23, 3510; *Centr. Bakt. Parasitenk.*, I Abt., 109, 93(1928).—The causation of toxicity and of inhibition of phagocytosis is not identical. Heated water-sol. substances of the cholera vibrio have a greater immunizing power, interfere less with phagocytosis and are less toxic than those which are unheated. JOHN T. MYERS

Studies of the B. C. G. strain in relation to the action of lipid material of the tubercle bacillus. M. ISABOLINSKII AND V. GITOVICH. *Centr. Bakt. Parasitenk.*, I Abt., 112, 35-44(1929).—This strain exhibits different biological properties from the usual virulent strain. It is highly resistant to lipolytic agents, as bile, both *in vitro* and *in vivo*. It seems to have considerable antigenic and hence protective action in children. In guinea pigs, its virulence is low and it has almost no antigenic power, as it will not protect against later inoculation with virulent strains. B. C. G. equals *Bacillus Calmette guerin*. JOHN T. MYERS

The question of aerobic cellulose cleavage at high salt concentrations. L. RUBENCHIK. *Centr. Bakt. Parasitenk.*, II Abt., 76, 304-14(1928); cf. *C. A.* 22, 3189. —Some cellulose-cleaving organisms from the mud of the Odessa salt marsh are halo-tolerant and others are halophilic. In some instances salt hastens the action of the organisms and in others slows it. Further work is necessary on the chemistry of aerobic cellulose destruction. JOHN T. MYERS

The assimilation of nitrogen by pure cultures of *Clostridium pasteurianum* and related organisms. ELIZABETH MCCOY, W. M. HIGBY AND E. B. FRED. *Centr. Bakt. Parasitenk.*, II Abt., 76, 314-20(1928). The ability of 37 strains of anaerobic butyric-acid forming bacteria, isolated from soil, to assimilate free N was found quite variable. *Cl. acetobutylicum* Weizmann fixes comparatively little N. The 4 strains studied fixed from 0.69 to 1.06 mg. in 100 cc. of medium. The 33 "true" butyric-acid-forming organisms were of 3 physiol. types. The *Cl. pasteurianum* type is the most active in assimilation, amts. ranging from 0.66 to 3.98 mg. per 100 cc. of medium being found. The *B. saccharobutylicus* type fixed from 0.61 to 2.35 mg., and the plectridia from 0.68 to 2.75 mg per 100 cc. of medium. Study of a single-cell culture of *Cl. pasteurianum* showed a general correlation between N assimilation and the consumption of sugar, although relative efficiency in N assimilation seems to vary with the stage of the growth period. JOHN T. MYERS

The action of streptococci upon casein. G. J. HUCKER. *Centr. Bakt. Parasitenk.*, II Abt., 76, 321-8(1928). —Chemically pure casein was not available to the streptococcus if the organisms were previously washed free from extra cellular enzymes and traces of protein disintegration products. Certain strains of streptococci, especially those isolated from dairy products, utilized casein when a large unwashed inoculum was used. Under similar conditions the pyogenic group would not grow in casein solns. Many of the organisms which will not grow in pure casein solns., when grown in milk, increased the amt. of free amino acids, indicating that casein acts similarly to simple proteins in resisting bacterial attack, if no other available nitrogenous material or enzyme was present to initiate growth. Paracasein behaved in the same way as casein. JOHN T. MYERS

Nitrification at high salt concentrations. L. RUBENCHIK. *Centr. Bakt. Parasitenk.*, II Abt., 77, 1-18(1929).— $N_2O_5$  is always formed when media for the first phase of nitrification are inoculated with mud from the Kujalniczki salt marsh. The richer the specimen in  $H_2S$  the later was the beginning of  $N_2O_5$  formation and the slower its course. Nitrification continued up to a NaCl concn. of 15%. The optimum was 5% and the min. 1%. The newer culture methods of Winogradsky (silicic acid and  $MgNH_4PO_4$ ) are useful in such studies. Nitrite-forming organisms identical with the *Nitrosomonas* of Winogradsky were isolated in pure culture. It is an obligate halophile 0.02% Witte peptone, or 0.05% glucose had a harmful effect. 0.2% peptone or 0.2% glucose prevented growth. Equimol. solns. of NaCl, KCl,  $MgCl_2$  or  $CaCl_2$  had similar stimulating effects. *Nitrosomonas* was not found in brine from the Liman. Media for the second phase of nitrification gave no  $N_2O_5$  when inoculated with either Liman mud or brine. JOHN T. MYERS

The influence of the concentration of sodium chloride on several biochemical processes in the Liman. A. S. ZASLAVSKII AND S. S. CHAIT. *Centr. Bakt. Parasitenk.*, II Abt., 77, 18-21(1929).—The growth of reducing organisms was greatest in salt marsh brines with the highest salt concn. and *vice versa*. JOHN T. MYERS

Production of carbon dioxide by the streptococci. G. J. HUCKER. *Centr. Bakt. Parasitenk.*, II Abt., 77, 145-50(1929).—All the streptococci studied, with certain exceptions, produced small amts. of CO<sub>2</sub> from peptone. This was demonstrated by a corresponding increase in the amt. of CO<sub>2</sub> with increase of peptone in the medium. The presence of sugar in most cases did not markedly affect the production of CO<sub>2</sub>. Representative strains of *Strep. kefir* and *Strep. citrovorus* produced no CO<sub>2</sub> from peptone but relatively large amts. from glucose. Certain strains of *Strep. cremoris*, *milior*, *stenos* and *ignavius* were not affected in their ability to produce CO<sub>2</sub> by the amt. of peptone in the medium; they usually formed only a small amt. in the presence of glucose. JOHN T. MYERS

Biological nitrite formation in organic media. V. RUNOV. *Centr. Bakt. Parasitenk.*, II Abt., 77, 193-205(1929).—The oxidation of NH<sub>3</sub> to NO<sub>2</sub> is possible by heterotrophic but not by prototrophic bacteria. A heterotrophic organism was isolated which produced NO<sub>2</sub> in various org. media. Its cultural characteristics are given in detail. It also reduces NO<sub>3</sub> to NO<sub>2</sub>. JOHN T. MYERS

The effect of filtrates of certain intestinal microbes upon bacterial growth. MARGARET F. UPTON. *J. Bact.* 17, 315-27(1929).—*B. coli* and *M. ovalis* are inhibited in filtrates of cultures of *B. coli*, *M. ovalis* and *B. bifidus* at a *p*<sub>H</sub> of 4.5-5.0, owing to some factor aside from increase in H ions. Acetic and formic acids show similar effects. Lactic acid has a slight inhibitory effect. Under the same conditions, *B. coli*, *M. ovalis* and *B. bifidus* utilize lactose differently, giving different proportions of volatile and lactic acids. The large amt. of volatile acid produced by *B. bifidus* in the intestine of the breast-fed infant may be the factor which inhibits *B. coli* and *M. ovalis*. JOHN T. MYERS

The use of culture media made from commercial dried yeast as a routine substitute for meat infusion peptone media. JAMES M. NEILL, JOHN Y. SUGG, LURLINE V. RICHARDSON AND WM. L. FLEMMING. *J. Bact.* 17, 329-37(1929).—Five % dried yeast broth and agar were satisfactory for all routine purposes for which meat infusion media are commonly used. It is cheap, uniform and easy to prepare. JOHN T. MYERS

Effect of hydrogen-ion concentration on the toxicity of sodium benzoate to microorganisms. W. V. CRUESS AND P. H. RICHERT. *J. Bact.* 17, 363-71(1929).—The retarding value of Na benzoate on the rate of multiplication of *S. ellipsoideus* is much stronger at *p*<sub>H</sub> values of 2.5-4.5 than at 5.0-9.0. A similar effect holds for alc. fermentation by this organism. The concns. of benzoate required to prevent the growth of certain yeasts, molds and bacteria were greatly affected by the *p*<sub>H</sub> value of the medium. Much more benzoate was required near neutrality, *p*<sub>H</sub> 5-8, than in the moderately acid range of 2.5-4.5. Preliminary expts. indicate that similar relationships hold for certain other food preservatives. JOHN T. MYERS

The value of vegetable extracts in culture media. LUTHER THOMPSON. *J. Bact.* 17, 379-86(1929).—Aq. exts. of potato, carrot, spinach, radish and beef heart were sterilized by filtration and added to nutrient broth aseptically. As little as 0.01 cc. of these exts. added to 6-7 cc. of nutrient broth would promote growth of many streptococci which failed to grow in the broth alone, while 0.02 cc. was sufficient to induce the growth of most streptococci. Potato ext. was best because of its keeping qualities and high nutritive value. The deteriorating effect of heat was proportional to the resulting precipitation. Both the protein and non-protein fraction of potato ext. will stimulate growth but not so well as the whole ext. Potato ext. may be used in many instances instead of fresh blood where it is not essential to observe hemolysis. The substance in the ext. responsible for promoting growth is thought to be nitrogenous material rather than food accessory substances. JOHN T. MYERS

The effect of certain factors upon the growth of the pneumococcus. HEDLEY D. WRIGHT. *J. Path. Bact.* 32, 203-27(1929).—For the full growth of the pneumococcus a small amt. of fermentable carbohydrate is necessary (0.2% glucose). Excess leads to high acidity, hastening autolysis. Thermostable nitrogenous substances are adequately supplied by 1% peptone; relatively thermolabile constituents, essential to growth, are present in yeast ext. and blood in large amts., in meat ext. and serum in small amts., and in a slight amt. in peptone. Heating org. fluids, especially peptone, serum and yeast ext., causes them to become inhibitory to the growth of the pneumococcus. This inhibitory effect is lessened or prevented by reducing conditions. The pneumococcus is inhibited by excess of salts, and readily destroyed by salts in the absence of colloids. Small amts. of Ca favor growth in the presence of yeast ext. but not with blood or serum.

The length of the lag and the rate of growth depend on all of the nitrogenous constituents of the medium and not solely on the so-called accessory factors. JOHN T. MYERS

An improved medium for the isolation of *Corynebacterium diphtheriae*; trypticized serum tellurite copper sulfate agar. W. D. ALLISON AND T. H. AYLING. *J. Path. Bact.* 32, 299-308(1929).

The action of x-rays of long wave length on microbes. Establishment of precise measurements of the death of the irradiated bacteria. A. LACASSAGNE. *Compt. rend.* 188, 200-2(1928); cf. Holweck, *C. A.* 23, 1928.—A homogeneous suspension of *B. pyocyaneus* was carefully prepd. and irradiated with the K ray of Al (8 A. U.), and the L ray of Ag (4 A. U.). The number of quanta absorbed by the organism to produce death depends upon the quanta in the sensitive zone of the organism. There is in each organism a sensitive zone and the quanta must act on this zone to be lethal.

M. H. SOULE

Canned vegetable troubles arising from sugar (GORDON) 12.

## D—BOTANY

THOMAS G. PHILLIPS

The physiology of organic acids in green plants. III. *Rheum hybridum*. W. RUHLAND AND K. WETZEL. *Planta (Abt. E Z. wiss. Biol.)* 3, 765-9(1927); *Expt. Sta. Record* 59, 426.—In continuation of accounts previously noted (*C. A.* 22, 3192) the authors here consider, as regards *R. hybridum*, the assimilation of N and of O and the relation between the assimilation of each and that of the other leaf petioles. H. L. D.

The method of formation and the detection of alkaloids in the young tobacco plant. J. CHAZRE. *Bull. Histol. Appl.* 5, 253(1928); *Stain Tech.* 4, 61.—Detection of nicotine and the mode of formation in the young plant was detd. by the use of the 2 following methods. Plants, in the stage where the radicle is just leaving the teguments, were pressed lightly between a slide and cover slip and were treated with a dil. soln. of neutral red. The aleurone granules are shown in the process of transformation into semifluid vacuoles which are colored by neutral red. Since aq. neutral red tends to dissolve the nicotine, use of Bouchardat's reagent is recommended for the demonstration of nicotine in plants at this stage of development. Combination of the 2 above methods clearly demonstrated that nicotine appears in the plant during the process of germination. It was found in the interior of the vacuoles which arise from the hydration of the aleurone granules when these often still contained crystalloid protein. C. R. FELLERS

Hydrostatic-pneumatic system of certain trees: movements of liquids and gases. D. T. MACDOUGAL, J. B. OVERTON AND GILBERT M. SMITH. *Carnegie Inst. Washington Pub.* 397, 1-99(1929).—The chief finding of chem. interest is that the proportions of the component gases in the trunks of trees are widely different from those of the atm.

JOSEPH S. HEPBURN

Role of the young lucerne plant in determining the infection of the root by the nodule-forming bacteria. H. G. THORNTON. *Proc. Roy. Soc. (London)* B104, 481-92(1929).—The appearance of nodules on the root hairs of seedlings of lucerne (*Medicago sativa* L.) coincides with the opening of the first true leaf. However, the active substance inducing infection by the nodule bacteria is not formed by the first true leaf, for removal of this leaf while still closed has no influence on nodule appearance.

JOSEPH S. HEPBURN

Experimental researches on vegetable assimilation and respiration. XX. The energetic efficiency of photosynthesis in green plants: some new data and a discussion of the problem. G. E. BRIGGS. *Proc. Roy. Soc. (London)* B105, 1-35(1929).—A study of photosynthetic efficiency, and of the amt. of energy fixed in the immediate products of photosynthesis.

JOSEPH S. HEPBURN

The molecular structure of the plant cell. HENRI DEVAUX. *Bull. soc. botan. France* 75, 88-96(1928).—A discussion is given of theories relating to cell structure, special emphasis being placed upon the conception that the cell is a dynamic unit. The plasma membrane is regarded as the principal tool of the protoplasm. The membrane is pictured as being the seat of various mol. activities which involve adsorption, orientation, polarity, surface tension phenomena, and purely chem. reactions.

A. E. HITCHCOCK

The necessity of atmospheric oxygen for the growth of roots in water. H. BOUYGUES. *Bull. soc. botan. France* 75, 469-72(1928).—Cuttings of willow (*Salix purpurea*) were placed in H<sub>2</sub>O which had had a 2-cm. layer of oil on the surface to exclude the air. Root growth was noticeably retarded, as compared to that of cuttings in H<sub>2</sub>O without the oil layer. Removal of cuttings from H<sub>2</sub>O with the oil layer to H<sub>2</sub>O without an

oil layer (the oil being carefully washed from the stems) resulted in normal root growth. Since willow cuttings are able to endure comparatively high concns. of  $\text{CO}_2$ , it is believed that the retardation of root growth was due to lack of  $\text{O}_2$  and not to the accumulation of  $\text{CO}_2$ .

A. E. HITCHCOCK

The liberation of free iodine by algae. PIERRE DANGEARD. *Bull. soc. botan. France* 75, 509-19(1928); cf. *C. A.* 22, 3193.—Iodine compds occur in various tissues of algae, but the process by which free I is liberated is confined to the epidermal cells. This process functions for 1-2 days even in detached tissue. Starch paper or cresol blue was used to test for the presence of I.

A. E. HITCHCOCK

Iodides in the cells of algae. G. MANGENOT. *Bull. soc. botan. France* 75, 519-38 (1928).—The localization of iodides in cells of different species of algae was studied by the cresol blue method. The formation of red or blue crystals was confined to the vacuoles. Not all species of algae reacted to this test, although analyses showed a high iodide content. Since the reaction occurs in living cells, this method is believed to be more sensitive than the  $\text{H}_2\text{SO}_4$ -starch paper test. It is suggested that the accumulation and liberation of I represent 2 phases of an excretory process.

A. E. H.

Growth of hypocotyls during geotropic bending in relation to the hormone theory of tropism. N. CHOLODNIL. *Planta (Abt. F., Z. wiss. Biol.)* 7, 702-19(1929).—The growth of hypocotyls of *Lupinus angusti folius* and *Helianthus annuus* during geotropic bending was measured by a "micropotometer." Growth, as detd. by the vol. intake of  $\text{H}_2\text{O}$ , was the same for stems placed vertically as for those placed horizontally. It is believed, therefore, that under the stimulus of geotropic bending there is no increase in growth materials nor is there a formation of special substances such as tropic hormones to account for growth during the bending process. The measurement of a vol. increase is regarded as more significant than that of a linear increase. This app. is sensitive to  $0.1^\circ$  change in temp. and requires 30 mm. on the scale to record an av. stem elongation of 1 mm.

A. E. HITCHCOCK

*Pythium aphanidermatum* (Eds.) Fitz. on *Opuntia dillenii*, Haw. T. S. RAMAKRISHNA AVYAR. *Mem. Dept. Agr. India, Botan. Ser.* 16, 191-201(1929).—The fungus *Pythium aphanidermatum* was isolated from diseased and rotting plants of *Opuntia dillenii* and its growth on several culture media was studied; papaya fruit ext. agar and Quaker oats agar gave the best results. A luxuriant growth of the fungus was obtained on media varying in acidity from -10 to +10 on Fuller's scale and at +25 there was very little growth.

K. D. JACOB

A laboratory study of oily plants. N. M. TULAIOV. *Zhur. Opit. Agron. Yugo Vostoka* 6, No. 2, 105-38(1928).—A partial report is presented on the compn. of sunflower, flax and mustard plants and the accumulation of oil as affected by the type of soil, methods of tilling the soil and care of plants. The soil conditions and the weather influenced the amt. of dry matter accumulated in sunflower. The highest accumulation takes place when the plants fill out, i. e., during the ripening of the seeds; in the early period of growth very little accumulation occurs. The accumulation in the stems and cup takes place up to the time when the seeds begin to fill out, after that in the leaves and seeds. The accumulation drops again in all parts of the plant after ripening of the seeds. With flax the most intensive growth takes place during blooming. The stems give 50% of the dry matter of the crop and the seeds 30%. The transpiration coeff. under field conditions for sunflower was 487 and in the greenhouse 405. For flax the transpiration coeff. varied within wide limits depending on the rainfall. Under field conditions it was 1861 in 1924 and 492 in 1925. The highest amt. of ash in sunflower is found in the leaves. The seasonal variations in respect of moisture and the soil type do not seem to influence the ash content. When the plants have 2 pairs of leaves only the ash content amounts to 17.8% of its dry matter; at the time of cup formation it is 12.5% and at harvest 10.7%. The highest ash content is found in the leaves (50%) and the lowest in the roots (5-8% of the total). Data are given for ash compn. The N content is high in the early period of growth and diminishes with the advancement of the growth of the plant. The accumulation of ash and N in flax takes place up to the time of harvest. In the beginning it is 10% of the total dry matter; it drops as the plants advance until they reach 6-6.5% and this amt. persists up to harvest time. The amt. of N fluctuates around 2.32%, which the plant attains long before ripening. Other analyses are to follow.

J. S. JOFFE

Plant hemagglutinins with special reference to a preparation from the navy bean. VERZ R. GODDARD AND LAFAYETTE B. MENDEL. *J. Biol. Chem.* 82, 447-63(1929).—A non-toxic, sol., and highly potent hemagglutinating protein having the characteristics of an albumin has been prepd. in dry form from the navy bean, *Phaseolus communis*. Electrolytes are indispensable for its action and egg albumin and the serum proteins

have a marked inhibiting influence. Denaturation or hydrolytic cleavage is accompanied by a lessened hemagglutinative potency of the protein. Hemagglutinating preps. of this sort may well have a larger field of usefulness in the prepn. of therapeutic scrums than has hitherto been accorded to them as they can be sterilized and preserved in dry form for long periods ready for instantaneous use. Danger of anaphylaxis can be avoided by giving doses so selected after testing that an excess of unfixed protein will not remain in the serum. A *quant. macroscopic method for measuring hemagglutination* is described.

**The reducing properties of *Aspergillus niger*.** G. ROSSI. *Biochim. terap. sper.* 16, 96-102(1929).—*Aspergillus niger* contains reducing enzymes which are destroyed by heat at 100°. An aq. or glycerol, but not an alc., ext. can be obtained. The glycerol ext. is less active than the aq. The enzymes appear to differ from the reductases found in beer yeast. They reduce S to H<sub>2</sub>S and nitrates to nitrites but do not reduce indigo carmine or nitrobenzene. A 2% colloidal S soln. inhibits the development of *Aspergillus* colonies and the S is not reduced but a 0.4% soln. permits growth and the S is readily reduced. Bubbling air through the exts. diminishes their activity.

A. P. LOTHROP

**Changes in pyrenoids in *Spirogyra* cells during starch formation.** VIKTOR CZURDA. *Ber. deut. botan. Ges.* 47, 181-5(1929).—A criticism of Steinecke and Ziegenspeck, C. A. 23, 2201.

LAWRENCE P. MILLER

**Experiments on the influence of colloidal calcium fluoride and mercurous chloride on *Aspergillus niger*.** E. WEDEKIND AND E. BRUCH. *Biochem. Z.* 208, 273-84(1929).—The expts indicate that the growth-inhibiting effect of colloidal CaF<sub>2</sub> or HgCl<sub>2</sub> is entirely due to the ionized portion.

S. MORGULIS

**Studies on the peroxidase of phanerogams.** D. MICHLIN AND P. KOPELOVICH. *Biochem. Z.* 208, 288-94(1929).—Peroxidase preps. were made from the bark of fir which differ from peroxidase prepds. from the phanerogams by their thermostability and sensitivity to HCN. They contain no Fe and do not give the aldehyde reaction. Oxidized fir bark juice oxidizes HI, but gives no peroxidase reaction or blueing of guaiacol.

S. MORGULIS

**Secretin in Japanese plants.** TOMOZO OKANO. *Japan J. Internal Secretion* 4, 1350-4(1928).—O. treated many fresh plants with warm dil. HCl. The exts. were found to contain either a substance which excites or inhibits the motion of isolated intestine of the rabbit, sometimes both. Both of these substances dissolve in H<sub>2</sub>O or EtOH but are insol. in Et<sub>2</sub>O. The substance which excites the motion is a so-called vegetable secretin, while that which inhibits the motion resembles adrenaline.

K. SOMEYA

**The action of halogens upon vegetable seeds and their young sprouts, and the relation between the quantity combined with the seed and the degree of poisoning.** TATSUYA SHINTOKU. *Natl. Hyg.* 5, 746-85(1928).—Seeds were immersed in 0.01 N solns. of halogen for from 10 min. to 3 hr. at room temp., washed with H<sub>2</sub>O, and made to sprout on a degreased cotton. The poisoning action of the halogens is in the order I<sub>2</sub> > Br<sub>2</sub> > Cl<sub>2</sub>. Seeds or sprouts were dipped into the halogen solns., then taken out and the quantity of the free halogens was measured in order to obtain indirectly the quantity which has combined with the seeds. The quantities of the combined halogen are in the order Br<sub>2</sub> > Cl<sub>2</sub> > I<sub>2</sub>.

K. SOMEYA

**The variation in the color of plants during the course of desiccation.** The glucoside of *Lathraea clandestina* L. is aucubin. MARC BRIDEL. *Compt. rend.* 188, 1182-4(1929).—A glucoside was obtained by the usual EtOH extn. method from the flowers of *Lathraea clandestina* L. which was hydrolyzable with the formation of a black ppt. One kg. of fresh flowers gave 1.66 g. of the glucoside. The const. of the extd. glucoside were identical with those of aucubin.

M. H. SOULE

**Equations for the photosynthetic reaction.** ROBERT B. GORDON. *Ohio J. Sci.* 29, 131-2(1929).—In contrast to the usual formulas for the photosynthetic reaction wherein it is assumed that CH<sub>2</sub>O is formed and then polymerized to glucose the following two reactions are suggested:

(Chlorophyll "b" + water  $\longrightarrow$  Chlorophyll "a" + oxygen)  
(Chlorophyll "a" + carbon dioxide  $\longrightarrow$  Chlorophyll "b" + glucose)

M. H. SOULE

**Experimental investigations on the glutathione contents of peas at the beginning of germination.** M. I. FIRKET AND Mlle. COMHAIRE. *Bull. acad. roy. méd. Belg.* [5], 9, 93-122(1929).—The exptl. material reported in detail shows the following facts. Glutathione, or at least —SH substances, appear in peas since the beginning of their hydration, as has been observed by others. This appearance of glutathione takes place

in the whole of the reserve material of the pea; it precedes, and probably conditions, the beginning of the germ development. The high content of the reserve and of the germ maintains itself during the first few days of regular growth. There is no parallelism between the intensity of growth and the relative content of glutathione; on the contrary, it is evident that the proportion of glutathione diminishes more rapidly in the normal plants than in plants, the growth of which has been retarded by irradiation of the peas, before germination, with strong x-ray dosages. 15-30,000 are necessary to produce a marked growth retardation. The glutathione is not localized in any predominant manner in the regions of cell multiplication. The glutathione disappears from the plantule in proportion as it grows green. In the plantules that are grown in darkness (the growth sometimes being faster than in the light) the glutathione contents remain high. A number of tables and graphs and a bibliography accompany the paper.

G. TOENNIES

**Titanium in the phanerogamic plants.** GABRIEL BERTRAND AND C. VORONCA-SPIR. *Compt. rend.* 188, 1199-202(1929).—The Ti content of plant ashes was estd. by the orange-yellow color of  $TiO_2$  produced by  $H_2O_2$ . References are given for details of analytical procedure. The conclusions derived from the investigation of 55 species of mono- and dicotyledons may be summarized as follows. Definitely estimable amounts of Ti are present in all phanerogamic plants. The Ti content of the ashes is not due to external contamination by dust, etc. As with other metals a positive relation between the concn. of chlorophyll and of Ti in various parts of the same plant is evident. In seeds almost all of the Ti present is concd. in the tegument. Buck-wheat and leguminous plants are much richer in Ti than the ordinary cereals, while peanut and hazelnut are much poorer, and no Ti was found in the cotyledons of the walnut and the coconut. Storage parts, such as the flesh of fruits, the roots of carrots and the tuber of potatoes are also poor in Ti, while the contents of bulbs formed by modified leaves, such as the onion, are distinctly higher. The quantity of Ti varies between about 1:10,000,000 and 1:200,000 of fresh weight.

G. TOENNIES

**The composition of the cell wall of oats in different stages of growth.** F. ROGÓZIŃSKI AND M. STARZEWSKA. *Bull. intern. acad. polonaise* 1928B, 127-32(In French).—The ash content of both stalks and panicles decreased during the whole period of investigations (145 days). Their cellulose, pentosans and methoxyl content increased, reaching a max. in about 85-100 days, viz., the time of the panicle development, and then remained const. The main constituents of the stalks are lignin and cellulose, those of the panicles, pentosans.

J. WIERTELAK

**Preservation of plant materials by chemical means (DREWS) 18. Study of I in South Carolina [in vegetables] (MITCHELL) 15. The acrolein group as a most probable component of all plant lignins (KLASON) 10.**

## E—NUTRITION

PHILIP B. HAWK

**Relationship between the ability to darken photographic plates and the vitamin-A content of cod-liver oil and pig's fat.** L. S. FRIDERICIA AND S. V. GUDJONSSON. *Bibl. for Laeger* 1927, 12 pp.—No. parallelism was detected.

B. C. A.

**Effect of dextrose on the metabolism of growing rats.** W. ARNOLDI AND S. UENO. *Z. ges. expl. Med.* 61, 424-37(1928).—Protein and fat were gradually replaced in the diet by sugar. There was at first increase in wt., pos. N balance and diminished urinary elimination of C; then (9% protein, 35% fat-cal.) the wt. became stationary and afterwards (6%, 2%) fell.

B. C. A.

**Treatment of diabetes with vitamin B.** C. A. MILLS. *Am. J. Med. Sci.* 175, 376(1928); *Quart. J. Pharm.* 1, 657-8.—Acid alc. exts. of many plants were used. The menstruum employed was 40% EtOH contg. 0.4% of HCl and the plants dealt with were alfalfa, sweet clover, corn silk, onions, carrots, spinach, rice polishings and bran. No heat was used in the prepn. of the exts. All the exts. were treated with NaOH to render them almost neutral, and the protein was filtered off. Thirty cc. of the vitamin soln. thus prepd. was estd. to be roughly equiv. to 30 units of insulin. The use of this in 7 cases reported on by the author affords evidence of the effect of vitamin B in lowering sugar excretion, and he believes that the treatment gives the pancreas an opportunity for functional recovery. It has the advantage of oral administration, and it might, in combination with insulin, give better results than would either alone.

H. L. D.

**A color test for radio-sensitive substances.** C. J. BOND. *Brit. Med. J.* No. 3483,

637(1927); *Expt. Sta. Record* 59, 596.—A simple test for the detection of ergosterol and other substances capable of being rendered active by irradiation is described. As applied to ergosterol, the test is as follows: A small quantity of crystalline ergosterol is rubbed with a heated glass rod on a previously warmed microscopic slide until a thin translucent covering is formed. Half of the slide is then exposed to the rays of a quartz mercury vapor lamp for half an hour at a distance of 12 in., the other half being protected from the rays. The whole film is then covered with a starch soln. which has been boiled in a 5% aq. soln. of KI. After a short time the film of ergosterol on the irradiated slide takes on a rich pink color which, on washing with water, changes into the clear blue of iodized starch. It is stated that the test is so delicate that it shows the different intensities of irradiation in ergosterol irradiated through water and in the air. H. L. D.

The study of the protein in a commercial meat product. R. W. PRANGE, S. M. HAUGE AND C. W. CARRICK. *Poultry Sci.* 6, 302-7(1927); *Expt. Sta. Record* 59, 164.—In a biol. test to det. the amino acid deficiencies of a certain meat-meal product contg. 70% of protein and 9.2% of ash, 4 lots of 18 newly hatched White Leghorn chicks were fed at the Indiana Experiment Station. The basal ration in all lots consisted of ground yellow corn 37.15, wheat middlings 15, wheat bran 15 (except lot 4 which received 25%), cod-liver oil 3, salt 1, meat meal 14.26 and steamed-bone meal 4.59%. In addn. lot 1 received 10% degerminated white corn, lot 2 10% gelatin and lot 3 5% each of degerminated white corn and specially treated casein. Lot 4 grew more rapidly than any of the other lots and was followed in order by lots 3, 1 and 2. Gelatin was used in this test since it was known to be low in the amino acids, tyrosine, cystine and tryptophan. The tyrosine is adequately supplied by the corn and wheat. The special treatment of the casein lowered the cystine content to such a small quantity that it was a negligible factor. This process of elimination indicates that meat meal is deficient in tryptophan. No reasons were apparent for lot 2 growing at a slower rate than lot 1.

H. L. D.

Nutritive value of the garbanza pea. H. S. MITCHELL. *West. Hosp. and Nurses' Rev.* 11, No. 6, 26, 27, 52, 53(1928); *Expt. Sta. Record* 59, 792-3.—The garbanza pea, otherwise known as the chick or Idaho pea, has been found by biol. tests to be somewhat superior to the soy bean and approx. equiv. to casein in the quantity of its protein, to be a rich source of vitamin B, and to have slight potential alky. In the Sherman units the vitamin B value is given as 5 units per gram.

H. L. D.

The part played by the carbohydrates of rations in the formation of milk fat and milk sugar. A. BUSCHMANN. *Z. Tierzücht u. Zuchtungsbiol.* 10, No. 1, 47-68(1927); *Intern. Rev. Agr. [N. S.]*, 19, 473.—Four cows during a period of 112 days received rations poor in proteins and fats, but rich in carbohydrates. The results agree with the hypothesis that a milk cow is able to form the greater part or even the whole of the milk fat from the carbohydrates in her ration, but that the fat content falls when the carbohydrates are given in excess of a definite amt. Appreciable changes in the compn. of the milk fat, especially an increase in the actual content of fatty acids, only occur when large amts. of sugar are given in the ration in conjunction with unchanged amts. of proteins and fats.

H. L. D.

Determination of vitamins A, B and C in collards and turnip greens. G. W. BURTON. *J. Home Econ.* 20, 35-42(1928).—A quant. study of the vitamin B content of turnip greens showed that 0.8 g. raw was sufficient for maintenance of rats over an 8-week period or that 1 g. contained 1.25 units of vitamin B. With raw collards 0.9 g. was sufficient for maintenance of rats over that period. Cooking turnip greens for 30 min. in just sufficient H<sub>2</sub>O to take up the greens at the end of the period resulted in a 10% loss of vitamin B. Similar cooking of collards for 2 hr. resulted in a 40 to 50% loss of vitamin B. No loss of vitamin A was noted. Five-tenths g. raw collard and slightly over 1.0 g. raw turnip greens contained enough vitamin C to protect against scurvy while with cooked collards the equiv. of 10 g. raw did not contain sufficient vitamin C to protect guinea pigs.

L. D. ELLIOTT

The vitamin-A content of avocados. LEROY S. WEATHERBY, J. ELLSWORTH YONTZ AND RUTH V. WATSON. *J. Home Econ.* 21, 360-4(1929); cf. *C. A.* 22, 4155.—Feeding expts. by the curative method with albino rats using the Calavo grade of avocado meeting the highest standards of maturity and oil content showed it to be high in vitamin A. The quantity of avocado necessary to maintain an av. growth of 3 g. per week during an 8-week test period, the standard suggested by Sherman for the unit of vitamin A, would be considerably less than the smallest quantity used, 2.5 g. Based on the U. S. P. unit for vitamin A the quantity of avocado required would be less than that required for the Sherman unit.

L. D. E.

The mineral content of grain. J. E. GREAVES AND C. T. HIRST. *J. Nutrition* 1,

293-8(1929); cf. *C. A.* **23**, 2779.—Max., min. and av. ash analyses of 1755 samples of wheat gave as % minerals 2.94, 1.35 and 1.85; for oats, 4.87, 1.68 and 4.05; for barley, 3.71, 2.08 and 3.00 and for corn 1.79, 1.65 and 1.73. The av. % Ca for oats was 0.117, wheat 0.09, barley 0.086 and corn 0.15. Mg % in wheat was 0.184, oats 0.181, barley 0.181 and corn 0.203. S % in wheat was 0.204, oats 0.19 and barley 0.155. K % in wheat was 0.476, oats 0.57, barley 0.561 and corn 0.39. P % in wheat was 0.331, oats 0.364, barley 0.351 and corn 0.334. Fe % in wheat was 0.005, oats 0.007 and in barley 0.006. Wide variations were attributed to variations in the irrigation water compn. The Ca, Mg and S in grains are higher than are usually reported, while P is lower. The question is raised whether these factors would not materially modify the nutritive value of grains grown on highly fertile calcareous soils. C. R. F.

Blood formation of the albino rat on a standard dietary regime. BARNETT SURE, M. C. KIK AND DOROTHY J. WALKER. *J. Nutrition* **1**, 299-310(1929).—Albino rats were fed a diet consisting of whole wheat 27%, rolled oats 26%, yellow corn 25%, oil meal 15%, com. casein 5%, cod-liver oil 1%, NaCl 0.5%,  $\text{Na}_2\text{CO}_3$  0.5% and a liberal supply of fresh whole milk daily. Hemoglobin detns. and erythrocyte counts were made from the day of birth until the 340th day. Age plays a detg. role in the concn. of hemoglobin and erythrocytes in the blood of the albino rat during the period of growth. Sex plays a relatively insignificant role. The total leucocytes varied so widely in individuals at different stages of growth that the influence of age and sex could not be detd. Pregnancy on the above diet produced anemia which was marked on the day of delivery, but which disappeared with the advance of lactation. A marked drop in serum proteins occurred late in pregnancy. The concn. of hemoglobin and red corpuscles in the lactating rat is greatest near the weaning period of the young when the nurslings begin to partake of the maternal diet. C. R. FELLERS

The effect of purified diets and their modification on growth and testicular degeneration in male rats. KARL E. MASON. *J. Nutrition* **1**, 311-34(1929).—Approx. 200 male rats and 27 diets were used. Wt. of the testes at autopsy as compared with normal is a fairly accurate indicator for their histological condition. Macroscopic and histological examns. for degeneration were also used. Many of the diets were deficient in vitamin E. Testicular degeneration occurred not only when the basal purified diet was fed (18% casein, 51% starch, 15% lard, 9% butter fat, 4% salts and 0.2-0.4 g yeast daily), but was equally bad in animals fed similar dietaries in which the protein constituent was casein, edestin or lactalbumin at a 35% level or meat residue at a 20-30% level. As little as 5 g. of fresh lettuce and 1.6 g. of dried lettuce supplied sufficient vitamin E to prevent degeneration. Daily supplements of 0.68 g. dried lettuce or 0.4 g. dried alfalfa were inadequate. Fresh lettuce was approx. 8 times as rich in vitamin E as its dried equiv. Since both fresh and dried supplements induced very rapid growth, it is possible that vitamin E is associated with a growth factor. Blood counts, as well as adrenals, thyroids, liver, pancreas, lymph glands and spleen were normal in sterile male rats fed vitamin E-deficient diets. The literature on the subject is critically surveyed. C. R. FELLERS

Obesity as a precursor of diabetes. S. FRANKLIN ADAMS. *J. Nutrition* **1**, 339-42 (1929).—From the histories of 673 cases largely from rural districts, it was found that 91% of the patients were overweight and 82.9% were more than 10% overweight when their diabetes began. As age increases to the 5th decade, the candidates for diabetes increase in wt.; after the age 50, the % overweight is slightly lower. Obesity may be an important factor in young persons because more than 30% of persons less than 20 yr. of age were more than 10% overweight before diabetes began. Diabetes appears to be associated with an excessive amt. of total food intake rather than the amt. of carbohydrates. C. R. FELLERS

The heat production of the albino rat. I. Technic, activity control and influence of fasting. FRANCIS G. BENEDICT AND GRACE MACLEOD. *J. Nutrition* **1**, 343-66 (1929).—A closed-circuit respiration chamber, held at 25-28° for 2 hr., was used. Both  $\text{O}_2$  consumption and  $\text{CO}_2$  production were measured. Numerous expts. covering several years show that the ideal expts. are those where muscular repose is complete. Momentary or intermittent excessive activity, if not long continued, causes an increase in metabolism of not over 15-20%. Ocular observation is sufficient in metabolism expts., and only those results obtained when the animal is constantly moving need be discarded. Heat production of rats over 4½ months old, at 26°, decreased from 7 to 13% during the first 17-24 hr. of fast, but remained nearly const. thereafter up to 64 hr. With animals under 4 months old, the metabolism decreased 28% during the first 24 hr. of fasting, i. e., the young and immature do not withstand fasting as well as the mature animals. II. Influence of environmental temperature, age and sex; comparison with

the basal metabolism of man. *Ibid* 367-98.—The heat production, measured 17 hr. after food, decreases as the temp. increases up to 28°, at and above which temp. heat production is const. Heat production is 10-12% lower in summer than in winter. Animals studied at 28° after living 24 hr. at this temp. have a lower heat production (av. 4.5%) than rats studied at 28° after living 24 hr. at 21°. Both male and female rats show a trend of increased heat production with advancing age. This increase cannot be ascribed to increased activity, lactation or pregnancy. Male rats have a higher metabolism than females up to at least 14 months of age, both at 25° and 29°. Heat production showed a very great decrease as death approached, in 3 instances. The female albino rat over 2 months of age at 28° had a basal metabolism averaging 800 cal. per sq. meter of body surface per 24 hr., and with complete muscular repose averaging 720 cal. in females and 800 cal. in males. In spite of a shorter life cycle, small size and high heart rate rats have a metabolism on the body surface basis distinctly low as compared to man. In comparative physiology, the influence upon metabolism of both the active mass of protoplasmic tissue and the stimulus to this mass should be taken into consideration. Possibly the heart rate and blood vol. may serve as approx. measures of this stimulus. C. R. FELLERS

Utilization of fatty oils given parenterally. MARTHA KOEHNE and LAFAYETTE B. MENDEL. *J. Nutrition* 1, 399-443(1929).—Coconut, peanut butter and cod-liver oils, when injected parenterally into albino rats and dogs, were utilized only to a very slight degree if at all. The metabolism of the oils is extremely slow and is surely not a dependable source of energy to animals. Coconut oil was better tolerated than the rest and seemed to have a definite though sparing effect upon protein catabolism. Starvation had little influence in forcing the utilization of oils by the exptl. animals. Both vitamins A and D in cod-liver oil can be utilized by young rats when administered parenterally; the vitamins of butter oil could not be so utilized. The dog is unable to utilize peanut oil. The utilization or non-utilization of fat-sol. vitamins A and D and Sudan III present in an oil at the time of its injection cannot be regarded as proof of the utilization or non-utilization of the oil which held it in soln. Fats administered parenterally are too slowly metabolized to exert a sufficient influence on N catabolism to make this method of evaluation practicable. A bibliography of 44 references is appended. C. R. FELLERS

The influence of ultra-violet rays and vitamin D on the growth of fall farrowed pigs. R. D. SINCLAIR. *Sci. Agr.* 9, 629 48(1929).—Exposure of fall pigs to sunlight resulted in an increase in the percentage of bone ash, and Ca in the ash. By supplying vitamin D with cod liver oil, a marked increase occurred in the total % bone ash and an increase in % of Ca in the bone. While there was some variation on the total amt. of bone ash in the several series, all groups yielded what might be regarded as "strong" bone. Ca and P detns. on the blood, because of individual variability, proved of little value. The small proportion of alfalfa meal supplied in the basal ration combined with the ample Ca and P supply of the supplemental mixt. served greatly to retard development of rachitic symptoms. Ca and P were present in the bone in the ratio of 2:1, and in the ration fed in the ratio of 1.7:1. The role of vitamin D in animal nutrition is thoroughly considered. A bibliography of 22 references is appended. C. R. FELLERS

Irradiated ergosterol, the modern antirachitic principle. FREDERICK R. GREENBAUM. *Am. J. Pharm.* 101, 417-25(1929).—A review with bibliography appended. W. G. GAESSLER

Experimental studies on vigantol prophylaxis. H. EUFINGER, H. WIESBADER and L. FOCSEANU. *Klin. Wochschr.* 8, 826-8(1929).—Colostrum or milk obtained from healthy human mothers does not contain sufficient vitamin D to cure severe rickets in rats. It is possible to enrich these excretions with vitamin D by feeding vigantol. The transfer appears to be an immediate one because severely rachitic rats can be completely cured by feeding either colostrum or milk from human mothers who have been taking vigantol for only a few days. MILTON HANKE

The antirachitic action of a protein-free egg yolk extract (Heliocitin). H. STUDEL. *Klin. Wochschr.* 8, 830-3(1929).—Heliocitin is a concd. vitamin prepn. obtained from egg yolk. Vitamins A and D are present in abundance. It is not an irradiated product and it is, therefore, free from any possible toxic products that might be developed by irradiation. MILTON HANKE

The action of large doses of vigantol on the bones and teeth. J. WEINMANN. *Klin. Wochschr.* 8, 841-2(1929).—The daily administration of 0.5 cc. vigantol to normal rats leads to a cachexic death within 1 to 4 weeks. The lumen of the bones of these animals contains an unusually large number of osteoclasts as well as fine and coarse threads of calcification. The newly formed bone is excessively calcified. The canines

grow less in these animals than in control animals. Changes in the dentine are not unidirectional. Increments of uncalcified fibrous tissue are deposited upon the cementum. The peridontium contains scattered threads of excessively calcified connective tissue. There are no changes in the pulp nor in the dentine of the molars. The cementum has increased in thickness due to a deposition of uncalcified fibrous tissue upon the normal cementum. The alveolar bone surrounding the molars has increased in thickness in a similar manner. In consequence, the cementum and the alveolar bone have become continuous.

MILTON HANKE

**Should whole wheat products displace the refined products?** VICTOR E. LEVINE. *Arch. Pediatrics* 46, 281-96(1929).—The substitution of whole wheat for the refined products would tend to enhance the nutritional quality of the American diet by increasing the intake of Fe, indigestible residue and several vitamins (fat-sol. E, and the water-sol. antiberiberi and antipellagra vitamins). A bibliography of 52 references is appended.

JOSEPH S. HEPBURN

**Study of the antirachitic value of irradiated powdered whole milk.** ADOLPH C. DESANTIS, LESLIE O. ASHTON AND OLIVER L. STRINGFIELD. *Arch. Pediatrics* 46, 297-311(1929).—A group of 30 infants was fed 100% irradiated powdered whole milk for a period of several months without the use of any other antirachitic agent. The infants apparently thrived as well as those fed on mixts. prepd. from liquid cow milk; secondary anemia did not develop; 24 of the infants were wholly protected from rickets; 5 were protected clinically but the x-ray revealed dietary disturbances in the epiphyses of their long bones; 1 was not protected. When a small group of babies was fed 25% irradiated powdered milk, rickets developed in 50% of the subjects. To be antirachitic, powdered whole milk must be 100% irradiated.

JOSEPH S. HEPBURN

**Absorption spectrum of vitamin D.** R. B. BOURDILLON, CATHERINE FISCHMANN, R. G. C. JENKINS AND T. A. WEBSTER. *Proc. Roy. Soc. (London)* B104, 561-83(1929).—Study was made of both the absorption spectra and the antirachitic activity of the products formed by the action of ultra-violet radiation on ergosterol; 3 substances or groups of substances are formed in succession. The first product has an absorption band approx. similar to that of ergosterol (max. 280 A. U.) but more than twice as intense, possesses great antirachitic power and probably is vitamin D. The second product (formed by further irradiation of the first) has a strong absorption band (max. 240 A. U.) and no antirachitic power. The third product (formed by further irradiation of the second) has neither antirachitic power nor marked absorption. The purest preps. studied contained over 50% of vitamin D.

JOSEPH S. HEPBURN

**Nutritive value of ice cream.** I. S. PALMER. *Am. J. Pub. Health* 19, 601-4(1929).—Groups of rats were fed on (1) a basal diet, (2) this same diet mixed with  $\frac{1}{3}$  its wt. of ice cream and (3) an all ice-cream diet. The ice cream contained 30% total solid and 12% fat. The rate of growth of all these animals was considerably slower than that of animals fed the breeding diet; but by the end of 10 months group (2) had reached the same wt. as the breeding animals. The animals of group (3) were still gaining at that time and eventually attained the full mature wt. The animals of group (1) ceased gaining when they attained  $\frac{1}{2}$  this wt. At the end of the 90-day period none of the group (1) animals attained the wt. of the poorest animal fed the diet of group (2), although the mean consumption of the total nutrients was the same. Only 1 animal in group (1) attained the wt. of the poorest animal of group (3). Dry matter consumed for each g. gained per 100 g. body wt. was for group (1) 8.74 g.; for group (2) 6.04 g.; for group (3) 5.44 g.

J. A. KENNEDY

**Biochemical investigation of vitamin B.** H. D. KRUSE AND E. V. MCCOLLUM. *Physiol. Rev.* 9, 126-239(1929).—Review with extensive bibliography. E. R. LONG

**Factors in the metabolism of lactose. IV. The disposal of lactose administered to the rabbit.** RALPH C. CORLEY. *J. Biol. Chem.* 81, 541-4(1929); cf. C. A. 22, 1383.—After intravenous injection of 1 g. of lactose, the unfermentable reducing substances of the blood returned to normal in 3 hr. and within this time over 75% of the lactose was accounted for in the urine. Lactose in the tissues past the intestinal threshold is a very difficultly metabolized sugar; in tartrate nephritis the failure of urinary secretion was associated with a decreased rate of removal from the circulation.

A. P. LOTHROP

**Growth of rats on "fat-free" diets.** AVA J. MCAMIS, WM. E. ANDERSON AND LAFAYETTE B. MENDEL. *J. Biol. Chem.* 82, 247-62(1929).—"In order to study the compn. of body fat yielded by an animal grown under a dietary regime in which there was no ingested fat, a diet of extremely low fat content (consisting of extd. casein, sucrose, Osborne and Mendel salt mixt., yeast concentrate, cod-liver oil concentrate, irradiated ergosterol, and hot H<sub>2</sub>O ext. of liver) was fed to albino rats. Comparatively

good, though by no means optimal, growth has been recorded for these animals. The best growth, however, was exemplified by those animals which received small inclusions of fat (1 drop each of cod-liver oil and peanut oil) in their diet. Whether this apparent beneficial effect of a small quantity of fat is due to its content of vitamin A or other vitamins, or to its action as a vehicle for the fat-sol. vitamins, or whether fat *per se* is essential, is not conclusively demonstrated." A. P. LOTHROP

**Pentose metabolism. III. A comparison of the rates of disposal of *d*-arabinose and *l*-arabinose in the rabbit.** RALPH C. CORLEY. *J. Biol. Chem.* 82, 269-2(1929); cf. *C. A.* 22, 974.—Studies of the rates of disposal of *d*- and *l*-arabinose in the rabbit indicate that both forms are handled with about equal facility. If there is any difference, it is in favor of the *d*-form. The simultaneous injection of insulin had no noticeable effect on the metabolism of *d*-arabinose. A. P. LOTHROP

**Vitamin requirements of nursing young. VI. Anhydremia associated with disturbance in hematopoietic function in nursing young of the albino rats suffering from a deficiency of the vitamin B complex.** BARNETT SURE, M. C. KIK AND DOROTHY J. WALKER. *J. Biol. Chem.* 82, 287-306(1929).—Hemoglobin detns., erythrocyte counts, detns. of total blood solids and studies of the refractive index of the blood serum indicate that the nursing young of the albino rat suffering from a deficiency of the vitamin B complex develop an anhydremia which is also associated with a marked disturbance in hematopoietic function. The entire regulatory mechanism by which this effect is produced is not fully understood but it is suggested that its controlling influence on food consumption may be a detg. factor. A. P. LOTHROP

**Effect of vitamin deficiencies on carbohydrate metabolism. I. Hypoglucemia associated with anhydremia and disturbance in hematopoietic function in nursing young of the albino rat suffering from uncomplicated vitamin B deficiency.** BARNETT SURE AND MARGARET E. SMITH. *J. Biol. Chem.* 82, 307-15(1929).—The lactating mothers were fed an abundance of vitamin F (stable antipellagic factor) in the form of autoclaved yeast which was deficient in vitamin B. The nursing young developed marked hypoglucemia before loss of body wt. had occurred, associated with anhydremia and marked disturbance in hematopoietic function. Vitamin B therapy produced a rapid increase in blood sugar together with a regeneration of blood. A. P. L.

**Tryptophan and growth. I. Growth upon a tryptophan-deficient basal diet supplemented at varying intervals by the separate feeding of tryptophan.** CLARENCE P. BERG AND WM. C. ROSE. *J. Biol. Chem.* 82, 479-84(1929).—"The frequency of administration of tryptophan to animals upon tryptophan-deficient basal diets exerts a marked influence upon the rate of increase in body wt. Feeding half the daily allowance at intervals of 12 hrs. induces better growth than when the total day's allotment is administered at one time. More frequent administration than twice daily appears to exert little further benefit. It is suggested that amino acids may differ as to the frequency with which they must be supplied when fed apart from the other components of the ration, but until more definite information is secured it appears desirable in such studies to administer the supplementing compd. at least twice daily." A. P. L.

**The metabolism of sulfur. XV. The relation of the protein and cystine content of the diet to the growth of the hair in the white rat.** HOWARD D. LIGHTBODY AND HOWARD B. LEWIS. *J. Biol. Chem.* 82, 485-97(1929).—The amt of hair produced in young white rats on diets in which the low cystine content of the protein fed (casein) was the chief factor limiting the rate of growth was related to the protein (and cystine) content of the diet but under the exptl. conditions employed the demand for protein (and cystine) for the growth of the hair appeared to be secondary in importance to the demands for the growth of the more essential tissues of the body. A. P. LOTHROP

**Ultra-violet wave lengths valuable in the cure of rickets in chickens.** GEORGE H. MAUGHAN. *Am. J. Physiol.* 87, 381-96(1928).—The effective wave lengths were between 3130 and 2650 A. U. Those shorter than 2896 A. U. were relatively weak in curative power, while wave lengths of 2968 A. U. were the most potent. **Determination of transmission of glasses.** C. V. SHAPIRO. *Ibid* 396-8.—The measurement of transmission of ultra-violet light by glass filters is described. J. F. LYMAN

**Bone marrow reactions. V. The influence of water- and alcohol-extracted liver on blood regeneration in pigeons.** G. L. MULLER assisted by EMILIE GOODE. *Am. J. Physiol.* 88, 130-42(1929); cf. *C. A.* 22, 3205.—Liver contains an excess of substances that inhibit red cell regeneration, probably by affecting the reticulo-endothelial system. **VI. The adequacy of kidney, pancreas, spleen and brain for blood regeneration in pigeons with nutritional anemia produced by starvation.** G. L. MULLER AND ANGELO SCORPIO. *Ibid* 259-66.—In pigeons, in which partial bone marrow aplasia and thus anemia had been produced by starvation, an exclusive diet of broiled kidney was not

as effective as broiled pancreas or broiled spleen for blood regeneration, while broiled brain was inadequate. J. F. LYMAN

**Proof that the stimulating effect of fat on metabolism is due to the fatty acid radical of the fat molecule and not to the glycerol radical.** F. WILLIAMS, L. D. SEAGER AND W. E. BURGE. *Am. J. Physiol.* **88**, 237-9(1929).—Gold fish were placed in 0.1% glucose soln. contg. small amts. of various Na and K soaps (palmitate, stearate, oleate) or glycerol.  $O_2$  was bubbled through and after 30 hrs. the amt. of glucose remaining in the soln. was detd. Control tests were made by using gold fish in plain sugar solns. and by bubbling  $O_2$  through the various mixtures with no fish present. The presence of the soaps increased the rate of disappearance of the sugar while glycerol had little or no such effect. Conclusion. The fatty acid radical in the fat mol. and not the glycerol radical is responsible for the stimulating effect of fat on sugar metabolism. J. F. L.

**The effect of fasting on certain phases of carbohydrate metabolism.** H. M. HINES, J. D. BOYD AND C. E. LEESE. *Am. J. Physiol.* **88**, 240-4(1929). Fasted dogs showed a lower tolerance toward injected glucose, as shown by increase in blood sugar and excretion of sugar in the urine, than did fed dogs. Fasting probably results in a lowered function of the body as a whole rather than in an impairment of one organ in particular. J. F. LYMAN

**The influence of vitamin-A deficiency on the estrus cycle of the rat.** KATHARINE H. COWARD. *J. Physiol.* **67**, 26-32(1929).—It was impossible to use the vaginal smear test as a criterion in the diagnosis of vitamin-A deficiency. J. F. LYMAN

**Studies on the action of excessive doses of irradiated ergosterol in normal and rachitic animals.** M. COMEL. *Biochim. terap. sper.* **16**, 81-95(1929).—Irradiated ergosterol administered in large doses to young, adult, normal or rachitic rats cures rapidly and completely exptl. rickets, but does not in any way injure or produce any toxic effects in the animals. After it has exercised its Ca-fixing action, ergosterol remains inactive in the organism which perhaps stores some of it but certainly eliminates some of it in the excretions and secretions. PETER MASUCCI

**Experimental studies on the effect of irradiated ergosterol administered in large doses.** BRUNO BORCHI. *Biochim. terap. sper.* **16**, 113-19(1929).—The expts. were made on normal and splenectomized rats. Ten. mg. of ergosterol was injected subcutaneously on alternate days for the period of one month. On autopsy there was no evidence of any changes in the organs which would indicate a picture of hypervitaminosis (deposition of Ca on the walls of the vessels and in various organs). An occasional splenectomized animal showed a swelling of the myocardium and cells in the renal canaliculi. B., therefore, inclines to the view that the toxicity observed after administration of ergosterol was not due to the administration of vitamin D but to the presence of toxic substances associated with it. PETER MASUCCI

**Studies on the consumption of phosphorus, calcium and magnesium in a freely selected diet.** CARL TIGERSTEDT. *Skand. Arch. Physiol.* **56**, 265 90(1929).—An extensive investigation of the P, Ca and Mg intake of people of various social groups in Finland. Data are presented for the av. supply of these mineral components per 1000 cal. at various caloric intakes (2000 to 5000 cal) in the diet: 2.22 g.  $P_2O_5$ , 0.96 g. CaO and 0.50 g. MgO. The av. ratios  $P_2O_5$  : CaO : MgO were for men: 4.31 : 1.83 : 1.00, for women 4.44 : 1.95 : 1.00; and for children 4.07 : 1.72 : 1.00. S. MORGULIS

**Influence of thyroid gland feeding on the protein and fat metabolism.** BURKHARD KOMMERELL. *Biochem. Z.* **208**, 112-26(1929).—Two fasting expts. were performed on a dog at an interval of 5 weeks, thyroid gland being administered during the second period. Daily detns. were made of the basal metabolism and the N balance, from which the protein and fat contribution to the oxidative processes during muscle rest was calcd. Thyroid administration caused an increase of 30.5% in the basal metabolism, and 31.3% of this excess metabolism was accounted for by protein and 68.7% by fat. Under the thyroid influence the N loss of the dog during fasting was about doubled. S. MORGULIS

**The specific dynamic action of meat in dogs fed thyroid gland.** FRITZ MEYER. *Biochem. Z.* **208**, 127 50(1929).—The administration of thyroid gland substance can affect the progress and the extent of the sp. dynamic oxidation increase following meat feeding. With the thyroid the curve of the sp. dynamic action rises more sharply but the level of the curve is actually lower than normally, so that the total effect of the sp. dynamic action is considerably smaller. This is interpreted so that the sp. dynamic calories are made available for the thyroid metabolic increase. S. M.

**The phosphatide content of organs upon feeding of large amounts of phosphatides.** II. BRUNO REWALD. *Biochem. Z.* **208**, 179-84(1929); cf. C. A. **22**, 4591.—Prolonged feeding of large quantities of phosphatides (30 g. per day for 15 months) to dogs had no

ill effects but, on the contrary, improved the state of health. The organs are rich in phosphatides but this is not greater than was obtained in feeding expts. of much shorter duration so that a state of satn. apparently is soon attained and no further increase in phosphatide content follows. A particularly large accumulation of phosphatide was found in such glandular organs as the ovaries, pancreas, thyroid, etc., where the increase in phosphatide content may become double or triple the normal so that one may actually speak of a lipoid fattening in the case of these organs. S. MORGULIS

The changes in metabolism produced by radiation. V. Alterations in carbohydrate metabolism. 2. LUDWIG PINCUSSEN AND TOKIJI KAWAKAMI. *Biochem. Z.* 208, 185-90(1929); cf. *C. A.* 23, 3242.—In radiated animals there is an increase in glycogen at the expense of lactic acid both in liver and muscles. The glycogen lactic acid ratio is raised 55 and 45%, resp. In the heart the change is not outside the limits of error. The view is expressed that radiation acts in a manner similar to insulin. S. MORGULIS

Relation between phosphoric acid and the carbohydrate metabolism of the isolated liver. W. A. ENGELHARDT AND A. N. PARSHIN. *Biochem. Z.* 208, 221-9(1929).—The perfusion liquid of an isolated rabbit liver always contains inorg. P, but whereas this gradually increases in livers from well-nourished animals, it remains const. or diminishes in livers from starved rabbits. If the perfusion is made with a Ringer soln. contg. 0.2% glucose the inorg. P content of the fluid decreases markedly, this effect of the sugar being removed by adding F or increasing the Ca of the Ringer soln. The addn. of insulin to the glucose-contg. perfusion fluid caused a further decrease in the inorg. P content. There was no increase in lactic acid under these conditions, but the addn. of F does produce a marked rise in the lactic acid production. The inorg. P is formed from org. combinations. S. MORGULIS

The calcium and potassium content of serum of fasting dogs. SERGIUS MORGULIS. *Biochem. Z.* 208, 257-8(1929).—It is pointed out that the lowering of the serum Ca in advanced stages of fasting cannot be regarded as evidence of a change in the vegetative nervous reflexes since the K/Ca ratio remains practically const. during inanition. S. MORGULIS

The influence of iron on the resting metabolism of rachitic rats. HANS SEEL. *Biochem. Z.* 208, 295-8(1929).—Expts. on rats show that by feeding bivalent Fe( $\text{FeSO}_4$  or  $\text{Fe}(\text{HCO}_3)_2$ ) the lowering of the oxidative processes in rachitic animals can be prevented but this has no favorable effect on the rickets itself. The Fe, like P, therefore, acts quite differently from vitamin D which not only maintains the metabolism but also brings about healing of the bone lesions. S. MORGULIS

Vitamin activity and surface tension activity. II. Antiscorbutic action of certain plant juices and their surface tension activity. N. F. SHEPILEVSKII. *Biochem. Z.* 208, 334-51(1929); cf. *C. A.* 23, 1942.—A parallelism has been observed between the antiscorbutic and the surface tension activity of plant juices, the juice from plants with greater surface action being also more potent as antiscorbutics. S. MORGULIS

Hexosediphosphatase of chickens suffering from leg weakness. M. SCHLECHTER. *Biochem. Z.* 208, 443-4(1929).—The tissue from the region between the bone and the cartilage in chickens with leg weakness has greater ability to split hexosediphosphate than that of healthy chickens. S. MORGULIS

Studies on vitamin A and D. I. Color reactions of fish-liver oils with condensation substances. WM. KERPPOLA. *Skand. Arch. Physiol.* 56, 173-80(1929).— $\text{SbCl}_3$ ,  $\text{AsCl}_3$  and  $\text{CCl}_3\text{COOH}$  produce a color reaction with cod-liver oil which begins with the yellow, becomes reddish violet and finally blue. On standing exposed to the air the colors undergo a reversible change back to the initial tint. Certain other substances give a color reaction which covers only a very narrow range of the spectrum. Thus, benzoyl chloride together with  $\text{ZnCl}_2$  colors the oil rose,  $\text{H}_2\text{SO}_4$  +  $\text{P}_2\text{O}_5$  blue-violet. The color reaction depends also upon the grade of oil, the solvent used, etc., so that different results may be obtained even with the same reagent. Oxidation and ultra-violet radiation affect the reaction of the oil in about the same way. II. The antimony trichloride reaction in organs of rats on a vitamin-A-free diet. *Ibid* 181-7.—Liver, lung and intestines of healthy rats yield with  $\text{SbCl}_3$  a color reaction which beginning with green-blue ends finally with violet or rose, but in organs from rats on a vitamin-A-free diet the initial green-blue reaction is absent. The brain of healthy rats gives at once a rose color but in vitamin-A-free rats no color at all appears. III. Color reactions of ergosterol with condensation substances. *Ibid* 188-95.—The color reactions of cod-liver oil with  $\text{SbCl}_3$ ,  $\text{AsCl}_3$  or  $\text{CCl}_3\text{COOH}$  can be obtained even more strikingly with the ethereal ext. of the saponified oil. The reaction of the cod-liver oil corresponds very strikingly with that obtained with ergosterol. IV. Color reactions of vegetable

foods with antimony trichloride. *Ibid* 196-200.—The reaction with  $\text{SbCl}_3$  of a great variety of vegetable products is recorded. V. Crystallization of the cod-liver oil chromogen and its relation to cholesterol. *Ibid* 201-6.—Cod-liver oil is saponified with alc. KOH, the residue extd. with ether which is washed until neutral with 1% NaC and finally dried with  $\text{Na}_2\text{SO}_4$ . The dry ethereal ext. is partly evapd., mixed with MeOH and, after the ether is boiled off, cooled. Triclinic crystals separate out from the cold MeOH which resemble cholesterol. The yield of these moist crystals is about 1% of the wt. of cod-liver oil. The reagents produce color reactions with these crystals exactly like those with cod-liver oil. The refractive index is  $\alpha' = 1.496 \pm 0.003$ ;  $\gamma' = 1.548 \pm 0.003$ . The chromogen crystals from the cod-liver oil are considered related to cholesterol. VI. Color reactions of human and animal organs of animal products with antimony trichloride. *Ibid* 207-9.—The strongest reaction is obtained with brain, adrenal and ovarian follicles. VII. The color reaction of the blood with antimony trichloride in certain disease conditions. *Ibid* 210-5.—Human serum gives almost invariably a rose color with  $\text{SbCl}_3$ , accompanied by a green fluorescence. The erythrocytes give the same reaction, only not so strongly. S. MORGULIS

Calcium metabolism in the laying hen. III. Calcium carbonate and hatchability. G. D. BUCKNER, J. H. MARTIN AND A. M. PETER. Kentucky Agr. Expt. Sta., *Bull* 291, 23 pp. (1929); cf. *C. A.* 23, 1941 —In the absence of a  $\text{CaCO}_3$  supplement from the diet of laying hens on a ration consisting of yellow corn, wheat and buttermilk fed with green feeds the hatchability of fertilized eggs was diminished and percentage of infertile eggs was increased. Fewer eggs were laid and they became smaller, and smaller chickens resulted. J. J. SKINNER

Influence of carbohydrate consumption upon the protein metabolism at a high-temperature environment. SEIKO HAMADA AND MASAO IMA. *National Hyg.* 5, 718-34 (1928).—A dog was first fed with a protein-rich food at an ordinary environment (temp. 15-20°, humidity 60-70%) until the urinary N became const. Rice was next given in the same environment after which the animal was placed in an environment of a higher temp (35°, humidity 40-50%) for 3 days. After the animal was allowed to recuperate in the ordinary environment, it was again placed in a high-temp. environment (38°). The above expt. was repeated with the results that although feeding animals with carbohydrate inhibits the decompn. of protein at ordinary temps, it also has the power of reducing the increase of the protein decompn., but the latter inhibiting action is never complete. K. SOMEYA

The irradiation of ergosterol: the action of ultra-violet rays and of soft x-rays. RENÉ DELAPLACE AND G. REBIÈRE. *Compt. rend.* 188, 1169-72 (1929).—An alc. soln of ergosterol, 1.4000, was placed in a quartz dish to a depth of 5 mm. and irradiated at a distance of 25 cm. with a quartz lamp for various intervals of time. The soln became more absorbent when irradiated from 1 to 6 min. After 1 hr. of irradiation the principal band of absorption was between 3022 and 2600 A. U. This band of absorption has been attributed to vitamin D. Powdered ergosterol was placed in a filter paper and exposed to x-rays from a Cu cathode for intervals from 1 min. to 1 hr. The ergosterol was then dissolved in EtOH and examd. spectrographically. After 1 min. irradiation there was an increase in the absorption for the ray 2700 A. U. When irradiated from 10 min. to 1 hr. there was an increase in the transparency of the soln. M. H. SOULE

The role of food equilibrium in the utilization of lactose. MME. L. RANDOIN AND R. LECOQ. *Compt. rend.* 188, 1188-90 (1929).—Pigeons fed on a complete artificial diet contg. yeast and 66% of pure lactose usually died in from 18 to 30 days. A modification of the diet by lowering the amt. of lactose to 35% sustained the pigeons for 5 months. M. H. SOULE

The variations of the bones with the change in diet of albino rats. MEI IRO SAKURAI. *Sei-i-kyōi Med. J.* 48, No. 2, 1-23, Abstract sect. 1-2 (1929).—A very careful histological study was made of the ribs of rats fed yellow corn 160 parts, meat that had been heated 1 hr. at 120°, 20 parts, gelatin 12 parts, NaCl 2 parts and  $\text{CaCO}_3$  6 parts. M. H. SOULE

Influence of mineral salt allowance on magnitude of nitrogen retention during growth. ÉMILE F. TERROINE AND THÉRÈSE REICHERT. *Compt. rend.* 188, 1208-71 (1929).—Each of the single compds. NaCl, KCl,  $\text{K}_2\text{HPO}_4$ , and Ca citrate, is shown to be without influence on the N retention of young pigs, by the exptl. procedure used previously (*C. A.* 22, 973 4) in showing that a considerable increase in N retention is caused by a complex mineral salt mixt. G. TOENNIES

The blood sugar content of animals after feeding different foods. ANNA MITTELSTEDT. *Z. expil. Med.* 1, 87-96 (1928); *Ber. ges. Physiol. expil. Pharmacol.* 48, 222.—

The blood sugar of normal animals fasting for 24 hr. is not constant, but increases and decreases irregularly. The increase after feeding depends upon the type of food, carbohydrates producing a decided increase while the values remain at the fasting normal after feeding meat or milk. In overfeeding with carbohydrates the curve is distorted.

R. C. WILLSON

The nutritive value of pasture grass as influenced by management (FAGAN) 15. Comparative returns in feed units from crop rotation and pasture (WHITE) 15. Cure of Fe starvation (bush sickness) in stock (ASTON) 15. Lime-deficient areas in King-Country (WRIGHT) 15. The role of pasture in the mineral nutrition of farm animals (MAYNARD) 15.

## F—PHYSIOLOGY

E. K. MARSHALL, JR.

**The phosphatide content of various types of muscle.** KURT SORG. *Z. physiol. Chem.* 182, 97-106(1929).—By the following method the phosphatide content of small quantities of organs (0.5-2 g.) may be detd. with an accuracy of  $\pm 1\%$ . In a 100 cc. wide-neck graduated flask contg. 20 cc. MeOH weigh 2-3 g. of finely minced skeletal muscle or 0.5 g. heart muscle. Add 50 cc. MeOH, heat the flask a few min. on the water bath and crush the muscle with a glass rod, the lower end of which is widened like a pestle. Cool, fill to the mark with MeOH and place in the icebox overnight. Filter at icebox temp. through a small folded filter, keeping the soln. well covered. Pipet an aliquot (75 cc.) into an evap. dish, add a small quantity of  $\text{CaCO}_3$  and evap. to dryness at a temp. not exceeding  $35^\circ$ . Add a little anhyd.  $\text{Na}_2\text{SO}_4$ , rub with  $\text{Et}_2\text{O}$  and transfer to a centrifuge tube, rinsing with  $\text{Et}_2\text{O}$ . Centrifuge and decant the  $\text{Et}_2\text{O}$  into a digestion flask, stir the residue with  $\text{Et}_2\text{O}$  and centrifuge again, repeating this washing 4 times. Evap. the combined  $\text{Et}_2\text{O}$  exts., and ash with 2 cc. concd.  $\text{H}_2\text{SO}_4$  and perhydrol. Dissolve the residue in  $\text{H}_2\text{O}$ , neutralize with  $\text{NH}_4\text{OH}$  and det.  $\text{H}_3\text{PO}_4$  gravimetrically as strychnine phosphomolybdate. The value for phosphatide- $\text{H}_3\text{PO}_4$  thus obtained agrees very closely with the value for acid-insol. residual  $\text{H}_3\text{PO}_4$  obtained by difference between total  $\text{H}_3\text{PO}_4$  and total acid-sol.  $\text{H}_3\text{PO}_4$  of the tissue. The 3 types of muscle studied were the biceps femoris, the semitendinosus and the heart of rabbits. The phosphatide content parallels the endurance capacity of the muscle. The heart muscle shows the highest content (up to 0.43%), the red muscle considerably less (up to 0.173%) and the quicker acting but more easily fatigued white muscle still less (up to 0.128%). The acid-insol.  $\text{H}_3\text{PO}_4$  of the heart consists entirely of phosphatides; that of white muscle contains also small quantities of other P derivs. including nucleoproteins. For most purposes the phosphatide content of heart muscle may be obtained by subtracting the acid-sol. from the total  $\text{H}_3\text{PO}_4$ .

A. W. DOX

**The physical chemical behavior of magnesium in serum.** Z. STARY AND R. WINTER-NITZ. *Z. physiol. Chem.* 182, 107-16(1929).—The non-dialyzable portion of the Mg in native serum averages 28%. When serum is dialyzed against physiol. NaCl, the Mg predominates in the dialyate if the reaction is acid, and in the residual soln. if the reaction is alk. The turning point where complete compensation occurs is at  $pH$  5.5, the same as that for Ca. Notwithstanding the increased content of Mg in cerebrospinal fluid as compared to serum, it is shown that in serum the Mg follows the Donnan law.

A. W. DOX

**The cholesterol content of the human intestinal wall.** M. BÜRGER AND H. D. OETER. *Z. physiol. Chem.* 182, 141-7(1929).—According to Sperry (*C.A.* 21, 1295), the excretion of a large part of the fecal sterols occurs through the intestinal wall. By analyses of carefully prepd. segments from various parts of the intestinal tract it should be possible to det. in what region the cholesterol excretion is most active. In mg. per 100 g. dry substance the av. cholesterol values are: esophagus 325, duodenum 427, ileum 397, sigmoid 646. The large intestine thus shows the highest cholesterol content, from which it is inferred that the greatest excretion occurs here. Detn. of the Br-adding capacity of sterol isolated from the intestinal mucosa shows that only cholesterol is present and no coprosterol.

A. W. DOX

**Basal metabolism of Australian aborigines.** H. S. H. WARDLAW AND C. H. HORSLEY. *Australian J. Exptl. Biol. and Med. Sci.* 5, 263-72(1928).

H. L. D.

**Blood coagulation and the control of hemorrhage.** C. A. MILLS. *J. Oriental Med.* 8, 58-62, 85-93(1928).—A review of theories of blood-clotting: those of Bordet and Howell are contrasted and discussed. Tissue fibrinogen and its distribution, chemistry, and manner of action are next dealt with, and fresh and original observations reported. Finally, a new conception of blood-clotting is given. The excitator is placed in the

tissues and in the platelets; the blood no sooner escapes from the blood vessels than it receives some tissue-fibrinogen to start clotting. If no tissue juice is added, the platelets, since they disintegrate on leaving the vessels, supply the tissue fibrinogen by disintegration. H. L. D.

**Chemical processes in muscle.** F. LEHNARTZ. *Klin. Wochschr.* 7, 1225-8(1928); *Physiol. Abstracts* 13, 437.—A 0.01 N soln. of the Na salt of adenylic acid in 2% NaHCO<sub>3</sub> added to the press juice of rabbit muscle causes a rapid diminution of inorg. phosphates. At 14° the min. phosphate concn. is reached in 1 minute; thereafter the phosphate concn. slowly rises. In the first stage, where phosphate disappears, hexosemonophosphate is formed, and in the second, slower, reaction this breaks down to give lactic acid and free phosphate. The synthesis of hexosemonophosphate in the above reaction is accompanied by a rapid breakdown of phosphagen. In the later reaction phosphagen is resynthesized. Inosinic acid or adenosine, unlike adenylic acid, has no influence on the phosphate concn. of muscle press juice. The optimum  $p_H$  for the synthesis of hexosemonophosphate under the catalytic influence of adenylic acid is 7.25, and for the synthesis of phosphagen is 8.0. The latter reaction is not catalyzed by adenylic acid. The source of energy for the resynthesis of phosphagen is discussed, and it is concluded that this cannot be derived from the conversion of lactacidogen into lactic acid. H. L. D.

**Chemistry of hormones.** GUSTAV MOSSLER. *Pharm. Monatsh.* 10, 92-7, 109-11 (1929).—A review. W. O. F.

**Decomposition of glycogen in the vagina.** H. SCHULTHEISS. *Arch. Gynäkol.* 136, 48-65(1929).—Vaginal bacilli were grown under anaerobic conditions in bouillon contg. liver and 1% glycogen. The H-ion concn. and the amt. of glycogen were detd. in control tubes and compared with the values obtained after growth of the bacilli for 3 days. This gave a simple method for demonstrating the decompn. of glycogen by vaginal bacilli. When there was an intense production of acid the bouillon gave with the Uffelmann reagent the reaction characteristic of lactic acid. Pyogenic organisms did not break up glycogen nor did a bacteria-free vaginal secretion. HARRIET F. HOLMES.

**The biology of the vagina.** I. The behavior of the flora and the chemistry of the vagina in the non-pregnant state and its dependence on ovarian function. H. SCHULTHEISS. *Arch. Gynäkol.* 136, 66-93(1929).—The H-ion concn. and the flora of the vaginal secretion were studied in 332 non-pregnant women. The acidity was in direct relation to the bacteria present and was highest in the cases showing chiefly Gram-positive vaginal bacilli and decreased with the increase of other bacteria. This decrease in acidity is due to a disturbed glycogen metabolism in the mucous membrane of the vagina or to an increased flow of an alk. secretion from the upper genital tract. The highest acidity occurs as a rule in the premenstrual period and tends to approach alk. directly after menstruation. In functional ovarian disturbances there is a decrease in the degree of acidity and the vaginal flora becomes mixed. At the onset and during the course of the menopause there is a marked decrease in the acidity of the secretion and an increase in the vulnerability of the vagina. The flora of vaginal bacilli may be replaced by a mixed flora, or the vagina may remain relatively free from other organisms in spite of a low acidity of the secretion. II. The flora and chemistry of the vaginal secretion in pregnancy. *Ibid* 94-110. The H-ion concn. and the flora of the vaginal secretion were studied in 546 pregnant women. The flora of the pregnant women showed a greater degree of purity, and in 3/5 of the cases was composed of vaginal bacilli as compared to 2/5 of the cases in non-pregnant women. In the pregnant as in the non-pregnant women the H ion concn. of the vaginal secretion is related to the vaginal flora but the acidity does not decrease with a mixed flora to the degree that it does in non-pregnant women. This is in part due to an increase in glycogen in the mucous membrane of the vagina in pregnancy and to the presence in the mixed flora of other acid producers. The greatest increase in acidity of the vaginal secretion takes place in the first half of pregnancy and increases but little later. No cyclic changes in the acidity of the vaginal secretion could be made out. HARRIET F. HOLMES.

**Oxidation disturbances in carbon metabolism during pregnancy.** A. BOCK. *Arch. Gynäkol.* 136, 197-212(1929).—In a series of healthy pregnant women the C and N intake and excretion were detd. The ratio of C excreted to N excreted in pregnant women reached the high value of 1.21, which is much higher than is physiologic for a healthy normal person. This result is an indication that pregnancy is accompanied by a lessened oxidation. Similar results were obtained in animals. HARRIET F. HOLMES.

**The relative and absolute acidity of the stomach contents and the acidity coefficient of the gastric juice.** N. ZVONITZKII AND V. ISAEV. *Arch. Verdauungs-Krankh.* 44, 106-13(1929).—The "total acidity" or the HCl concn. of the stomach contents is not

a quant. measure of the acid-building function. The detn. of the acid concn. of the stomach contents in the clinic has no great value without consideration of its abs. quantity in a definite unit of time. Since the acidities in different portions of the stomach contents are really only percentage relationships to entirely different amts., they are not truly comparable. The course of the curve for relative acidity in no way corresponds to the actual course of the acid-building function of the stomach. F. K.

**The gastric function test. II. Absolute evaluation of gastric function.** A. E. LEVIN. *Arch. Verdauungs-Krankh.* **44**, 257-66(1928).—A formula is given. F. K.

**Studies of the secretion and evacuation functions of the stomach.** A. E. LEVIN, O. B. MAKAREVICH AND M. N. SISSMAN. *Arch. Verdauungs-Krankh.* **44**, 338-55(1928).—The secretion after 400 cc bouillon is 100-250 cc. Variations in the same person were never more than 20%. HCl secretion varied between 0.3 and 0.6%. From 400 to 600 cc. of stomach contents was transferred to the intestine in an hr. Increase in acidity ran parallel to the gastric secretion, and depended on the secretion velocity, the evacuation, abs. acidity and the amt. of neutralization by mucus and duodenal contents. FRANCES KRASNOW

**Colorimetric blood reaction to determine sex.** V. N. KRAINSKA-IGMATOVA. *Dent. Z. ges. gericht. Med.* **13**, 278-85(1929).—Checks on the reaction worked out by Bernatzky (resulting from the reduction of rosaniline and methyl green) and Manoilov (ozonizing and chlorination of the *Dahlia* colors and Hb) with the result that neither can be used for sex detn. FRANCES KRASNOW

**The inorganic phosphorus of frog muscle in relation to lactacidogen and phosphocreatine.** G. M. BASTEDO AND LAURENCE IRVING. *Am. J. Physiol.* **86**, 505-19(1928).—The lactate ion showed a pronounced disintegrating action on phosphocreatine when the muscle was anaerobic. In a thin muscle with an adequate  $O_2$  supply no hydrolysis of phosphocreatine was detected even in the presence of lactate. The facts (1) that inorg. phosphates of muscle are const. when synthesis of lactacidogen and hydrolysis of phosphocreatine is taking place; (2) that lactacidogen synthesis is obtained in muscle hash, with a max. at a time when the phosphocreatine has completely disappeared and (3) that anaerobiosis breaks down phosphocreatine without any synthesis of lactacidogen suggests that hydrolysis of phosphocreatine and synthesis of lactacidogen are independent processes, but are indirectly related, in that both compds. are in equil. with inorg. P, and that the amt. of inorg. P liberated by the one process may be used in the synthesis of the other. J. F. LYMAN

**The embryonic circulatory system. I. The influence of hydrogen-ion concentration on the yolk sac blood vessels of the chick embryo.** FREDERICK S. HAMMETT AND DOROTHY ZOLL. *Am. J. Physiol.* **86**, 520-7(1928).—The blood vessels of the yolk sac of the 4-day chick embryo were not detectably influenced by acid ( $p_H$  5.0) or alkali ( $p_H$  9.0), but they were specifically constricted by  $CO_2$ . J. F. LYMAN

**A hormone mechanism for gall bladder contraction and evacuation.** A. C. IVY AND ERIC OLDBERG. *Am. J. Physiol.* **86**, 599-613(1928). A purified ext. of the intestinal mucosa injected intravenously caused the gall bladder to evacuate. The active substance is not histamine or choline. It is probably not secretin. The name *cholecystokinin* is suggested. J. F. LYMAN

**The estrous cycle in the rat. IV. Basal metabolism during the estrous cycle** MILTON O. LEE. *Am. J. Physiol.* **86**, 694-705(1928); cf. *C. A.* **22**, 3688. —An increased basal metabolic rate of 5 to 20% was observed in rats in the last 10 hr. of stage V (diestrus) and in the first 6 hr. of stage I (proestrus). J. F. LYMAN

**Regulation of respiration. XXI. Effects of intravenous injections of sodium cyanide on the hydrogen-ion concentration of the cerebrospinal fluid of the dog.** ROBERT GESELL AND A. B. HERTZMAN. *Am. J. Physiol.* **87**, 8-14(1928); cf. *C. A.* **23**, 3725. —Simultaneous detns. were made of  $p_H$  in the blood and spinal fluid of dogs that had been given NaCN with or without artificial respiration. On the assumption that intracellular acidity increases as a result of impaired oxidation produced by NaCN, and that the acidity of the cerebrospinal fluid represents the acidity of the immediate external environment of the respiratory neurone, increased pulmonary ventilation was assocd. with increased intracellular acidity but variably accompanied by increasing, by const. or by decreasing alky. of the extra-cellular environment. XXII. Effects of low alveolar oxygen on the hydrogen-ion concentration of the cerebrospinal fluid of the dog. A. B. HERTZMAN AND ROBERT GESELL. *Ibid* 15-9. —Changes in acidity of the cerebrospinal fluid, accompanying impaired oxidation produced by limitation of the  $O_2$  supply, were similar to those produced by NaCN administration. XXIII. Effects of hemorrhage and reinjection on the hydrogen-ion concentration of the cerebrospinal fluid of the dog. *Ibid* 20-3. —The impaired oxidation during hemorrhage,

accompanied by increased acidity of the cerebrospinal fluid, is indicative of increased anaerobic acid metabolism. XXIV. A comparison of the effects of mechanical asphyxia with the lungs filled with room air and with oxygen on the hydrogen-ion concentration of the cerebrospinal fluid of the dog. ROBERT GESELL AND A. B. HERTZMAN. *Ibid* 24-8.—Mech. asphyxia with the lungs filled with room air as compared with O<sub>2</sub> increased the acidity of the cerebrospinal fluid more and that of the blood less. It is thus likely that the brain turns more acid during mech. asphyxia when the lungs are filled with room air even though the blood may turn less acid. The greater stimulation of respiratory movements resulting from the greater impairment of oxidation may consequently be accounted for on an acid basis. The fact that the MnO<sub>2</sub> electrode dissolved rapidly in the cerebrospinal fluid of asphyxiated animals suggests the presence of unusually large amts. of reducing substance. J. F. LYMAN

The physiology of reproduction in birds. XXV. The action of the ovarian and placental hormone in the pigeon. OSCAR RIDDLE AND MASAHARU TANGE. *Am. J. Physiol.* 87, 97-109(1928).—The ovarian and placental hormone had an adverse, not favorable, effect upon ovarian development and growth in pigeons. XXVI. The role of the anterior pituitary in hastening sexual maturity in ring doves. OSCAR RIDDLE AND FLORENCE FLEMION. *Ibid* 110-23.—The anterior pituitary contains a hormone which accelerates the attainment of sexual maturity. J. F. LYMAN

Effect of different food substances upon emptying of the gall bladder. W. F. KRAUSE AND L. R. WHITAKER. *Am. J. Physiol.* 87, 172-9(1928).—Fats and fatty acids were active foods in emptying the gall bladder; carbohydrates were practically ineffective; while proteins produced slight emptying. J. F. LYMAN

The hemoglobin of smooth and striated muscle of the fowl. R. P. KENNEDY AND G. H. WHIPPLE. *Am. J. Physiol.* 87, 192-5(1928).—The spectrophotometric analysis of the muscle hemoglobin of the fowl is identical with that of the dog. Chicken gizzard muscle (smooth muscle) contained about twice as much hemoglobin as was present in the skeletal leg muscles. The hemoglobins from the 2 types of muscle appeared to be identical but differed slightly from blood hemoglobin. J. F. LYMAN

The tension of oxygen in human urine. G. A. BUCKMASTER AND H. R. B. HICKMAN. *Proc. Physiol. Soc., J. Physiol.* 65, xv-vi(1928).—CO<sub>2</sub> tension in human urine was about 45 mm. Hg. O<sub>2</sub> tension in human urine varied usually between 50 and 60 mm.; in no case was it less than 39.5 mm. J. F. LYMAN

Carbon dioxide and oxygen tensions in the bladder. J. A. CAMPBELL. *Proc. Physiol. Soc., J. Physiol.* 65, xviii(1928).—Gas mixts. were introduced into the urinary bladder (rabbit) and left for 3 hrs. after which samples were withdrawn for analysis. The CO<sub>2</sub> tensions in the cavity of the bladder varied between 40 and 50 mm. Hg while the O<sub>2</sub> tensions were usually 35-45 mm. J. F. LYMAN

The effect of cold on the adrenaline content of the suprarenal glands. G. P. CROWDEN AND M. G. PEARSON. *Proc. Physiol. Soc., J. Physiol.* 65, xxv.—When cold produced a marked fall in body temp. of the cat there was a considerable depletion of the adrenaline content of the suprarenal gland with normal innervation as compared with the denervated gland. J. F. LYMAN

Placental glycogen. A. ST. G. HUGGETT. *Proc. Physiol. Soc., J. Physiol.* 66, xi(1928).—The glycogen content of the maternal portion of the rabbit placenta at 21 days was unchanged by starvation, carbohydrate feeding, carbohydrate injections, adrenaline or thyroid feeding. Repeated injections of insulin during starvation of several days or repeated injections of phlorhizin caused some decrease of placental glycogen. The only influence having any marked action on the maternal placenta is a profound disturbance of metabolism. J. F. LYMAN

The cholesterol content of normal tissues and the effect of intravenous injections of cholesterol thereon. E. N. CHAMBERLAIN. *J. Physiol.* 66, 249-61(1928).—Cholesterol emulsions injected intravenously into rabbits were rapidly eliminated from the circulation. Following an injection the adrenals showed a decreased cholesterol content; the liver and particularly the spleen gained cholesterol; while the lungs, kidneys, brain and muscle showed no appreciable change. J. F. LYMAN

The production of carbon dioxide during the respiratory inhibition of the duck. U. LOMBROSO AND C. ARTOM. *Boll. soc. ital. biol. sper.* 4, 103-6(1929).—The inhibition of respiratory movements by stimuli acting on the respiratory tract failed to modify, through reflex action, the production of CO<sub>2</sub> by the tissues of the duck. P. M.

The total nitrogen content of rats with blocked renal function. U. LOMBROSO AND S. DI FRISCO. *Boll. soc. ital. biol. sper.* 4, 129-32(1929); cf. C. A. 23, 3492.—If the elimination of urine in rats is impeded, the total N of the animals at death is less than

the amt. they contained before the expt. This again gives rise to the conception that there is a loss of N in the organism that cannot be accounted for. PETER MASUCCI

**Pancreatic secretion from secretin with unblocked vagus and with vagus blocked by stovaine.** U. LOMBROSO AND A. TOMASINO. *Boll. soc. ital. biol. sper.* 4, 136-8 (1929).—The object was to det. if stovaine block influenced pancreatic secretion caused by secretin injections. The results indicate that on dogs with a permanent Pavlov fistula, there is a diminution of secretion as a result of blocking the vagus. P. M.

**Total base in gastric contents and gastric secretion.** KATHERINE M. CLOSE. *Ann. Internal Med.* 2, 1185-93 (1929).—The lowest concn. of total base occurs in cases with hyperacidity and the highest in achlorhydria, particularly following gastroenterostomy. This is true for secretion during fasting and after stimulation by histamine. The secretion of total base after histamine is inverse to that of free and total acid, in the normal human and dog and in various pathological conditions. Gastric secretion includes changes in the concn. of both acid and base, and the study of the latter is worthy of consideration as well as the former.

JOHN T. MYERS

**Separation of the growth-promoting hormone from that producing premature estrus in the anterior pituitary gland.** TRACY J. PUTMAN. *Arch. Surgery* 18, 1699-707 (1929).—The residue left after extn. of beef anterior pituitary glands with mild alkalis, acid, alc., and acetone will produce premature estrus when implanted intraperitoneally in young mice or rats. The effect seems to differ from that of aq. alk. exts. Thus there seems to be at least 2 chemically distinct hormones in the anterior pituitary gland.

JOHN T. MYERS

**Cerebrospinal fluid changes in composition and drainage after intravenous administration of various solutions.** R. G. SPURLING. *Arch. Surgery* 18, 1763 (1929).—Expts. were performed on dogs with freely draining cisterna magna. Isotonic (Ringer's) soln. injected intravenously dild. the blood, increased the drainage, and dild. the spinal fluid. Hypotonic solns. behaved in the same general way. Distd. water gave a surprisingly small increase in spinal fluid. Hypertonic solns. of NaCl or dextrose gave an initial increase in spinal fluid which was almost immediately reversed, the fluid becoming concd. In one instance air was spontaneously drawn into the ventricles. These expts. support the theory that dialysis is responsible for the production of spinal fluid. The interchange of water and solids in blood and spinal fluid is very rapid. The effect of continuous drainage is imperfectly understood.

JOHN T. MYERS

**Studies in blood and urinary chemistry during pregnancy. Blood sugar curves.** E. C. PILLMAN WILLIAMS AND L. WILLS. *Quart. J. Med.* 22, 493-505 (1929).—There is no definite blood sugar change in normal non-glucosuric pregnant women, except a slight drop as pregnancy progresses, and a slight rise during the early puerperium with a return to normal in a few weeks. The renal threshold seems slightly lowered in the majority of normal pregnant women. The incidence of symptomless glucosuria in 640 cases was 5.4%. The incidence of renal leaks after 100 g. of glucose was 60%. These leaks are of no significance.

JOHN T. MYERS

**The chemical composition of follicular liquid (fats, lipoids and mucoids).** MATTEO TESTA. *Arch. farm. sper.* 46, 174-6 (1929).—In continuation of earlier studies (C. A. 22, 2954, 3920) the following values were found in the analysis of follicular liquid: free cholesterol 29.32, cholesterol esters 28.70, neutral fat 13.05, fatty acids 34.66 and phosphatides 30.70 mg. %. A mucoid was isolated with Needham's method (C. A. 21, 3089); it contained 9.192% total N, 0.392% melanin N, 3.721% basic N and 5.075% amino N. The last 3 values were obtained after hydrolyzing the mucoid with 20 parts of 20% HCl for 10 hr. on the water bath. For detg. the reducing substances the mucoid was hydrolyzed with a mixt. of KCl soln. and dil. HCl for 10 hrs. at 120°. The analysis yielded 5.75% of reducing substances (calcd. as glucose). When Needham's method for hydrolyzing the mucoid was used, the value found was 16.49%. G. S.

## G—PATHOLOGY

H. GIDEON WELLS

**Influence of calcium salts on snake-venom hemolysis.** S. KANISAWA. *Acta Dermatol.* 1927, 479-90.—In the cases studied, hemolysis was arrested by Ca chloride or lactate in concns. >0.025% and accelerated in concns. <0.01%. B. C. A.

**Coagulation of the blood in parathyroid tetany.** J. C. BROUGHER. *Am. J. Physiol.* 87, 221-4 (1928).—Blood coagulation is delayed in parathyroid tetany. One ounce of cod-liver oil given by stomach tube restores the coagulation time to normal after a period of 2-4 hrs. B. C. A.

**Dextrose content of the vitreous humor.** F. ASK. *Särl. acta ophthalm.* 5, 23-8

(1928).—In pathol. conditions, especially glaucoma, the vitreous humor contains less dextrose than the aq. humor. B. C. A.

**Immune substances.** TH. THJØRTA. *Tids. Kemi Bergvesen* 8, 88-91, 102-5

(1928).—A survey and discussion of previous work.

A. DROGSETH

**Significance of arsenic in excretions.** K. VOGEL. *Am. J. Med. Sci.* 176, 215 (1928); *Quart. J. Pharm.* 1, 655.—Arsenic is present in the excretions of many individuals without discoverable cause and without giving rise to symptoms. Examin. of 100 cases showed that As occurred with especial frequency in patients with jaundice. If As is found in the urine of a patient with jaundice, eliminative treatment with thiosulfate should, if feasible, be carried out before any operation is undertaken. Arsenic is considered to be a contributory factor in many of the cases reported as acute yellow atrophy of the liver. H. L. D.

**Basal metabolism in blood diseases.** M. R. CASTEX AND M. SCHTEINGART. *Rev. soc. med. internat.* 4, 139-46 (1928); *Physiol Abstracts* 13, 504; cf. *C. A.* 22, 2198.—In leucemia the basal metabolism is constantly increased. Treatment of leucemia with benzene or radiotherapy lowers the basal metabolism coincidently with the no. of leucocytes. H. L. D.

**The relation of the sugar concentration of the blood to that of the urine.** ERNST STEINITZ. *Deut. med. Wochschr.* 55, 871-3 (1929).—The threshold value of the blood-sugar concn. at which sugar appears in the urine varies greatly in the case of diabetics, depending upon the severity of the disease. The clinical significance of this threshold value, in the treatment of diabetes, is discussed. ARTHUR GROLLMAN

**Importance of indicanuria, stool fat, and Schmidt fermentation test in the practice of pediatrics.** ROWLAND G. FREEMAN, EDGAR G. MILLER, JR., AND ROWLAND G. FREEMAN, JR. *Arch. Pediatrics* 46, 269-80 (1929).—Normal children show infrequent indicanuria, and their stools contain less than 6.5% total lipins, and yield less than 4 cc. of gas in the Schmidt fermentation test. Children with symptoms of abnormal alimention practically always show either an indicanuria, an excess of stool lipins, an excessive fermentation, or even all 3 of these phenomena. JOSEPH S. HEPBURN

**Calcium studies in jaundice with special reference to the effect of parathyroid extract on the distribution of calcium.** A. CANTAROW, S. M. DODEK AND BURGESS GORDON. *Trans. Coll. Physicians Phila.* [3], 49, 132-43 (1927).—In jaundice, a functional deficiency in Ca exists, probably due to the increased concn. of bile pigments in the blood and tissues. Detn. was made of the coagulation time and the Ca content of whole blood, plasma and serum at 3-hr. intervals after the injection of parathyroid ext., in jaundice patients and in non-jaundiced individuals. In jaundice, the Ca content of the serum varied slightly (9.3 to 12 mg. Ca per 100 cc.), but the Ca content of the whole blood showed an extremely wide variation (4.8 to 12 mg. per 100 cc.). However, 12 hrs. after administration of the parathyroid hormone, the variation in the Ca of the whole blood was practically identical in jaundiced and non-jaundiced persons. This hormone acts as a mobilizer of Ca, and, in jaundice, tended to restore the normal distribution and functional availability of Ca. Its favorable action on the tendency of jaundiced tissue to bleed was due largely to the increased coagulability of the blood and probably to the decreased permeability of the walls of the capillaries resulting from the increase in functioning Ca. JOSEPH S. HEPBURN

**Lipoids of the blood plasma in internal diseases.** JENO FRIESZ AND GEZA SZABÓ *Z. klin. Med.* 106, 701-16 (1927).—In obstructive jaundice the total cholesterol is appreciably increased, but decreases again with recovery. In arsphenamine jaundice the free cholesterol is increased but the total cholesterol lies within normal values. In catarrhal jaundice the total cholesterol may change, but usually lies within normal limits. Cholelithiasis is accompanied by hypercholesterolemia, even if the blood bilirubin be normal and the patient be free from attacks. In luetic hepatitis the total cholesterol increases as the jaundice decreases. Pernicious anemia shows hypocholesterolemia, a decrease even to 0 of free cholesterol, and hyperbilirubinemia; with recovery both forms of cholesterol increase and the bilirubin decreases. In chlorosis hypocholesterolemia and a decrease in free cholesterol occur. In the leucemias the total cholesterol is approx. normal, the free cholesterol subnormal. In thrombopenia and lymphogranuloma, cholesterol values are normal. In cirrhosis and cardiac decompensations, the cholesterol values are either normal or irregular. Lecithin increases with the jaundice in mechanical, catarrhal, and arsphenamine icterus, and remains normal in pleiochromic icterus, anemias, leucemias, cirrhosis and cardiac diseases. No relationship exists between cholesterol, lecithin and bilirubin in the diseases accompanied by enlargement of the liver. Liver function cannot be measured by the detn. of blood lipids.

JOSEPH S. HEPBURN

**Thiocyanate content of serum and cerebrospinal fluid.** ROBERT BLUM. *Z. klin. Med.* 107, 61-71(1928).—In normal individuals the serum contained from 0.03 to 0.06 mg. thiocyanate per 100 cc. This value remained without any definite change in disease, was not decreased in genuine hypertension, was increased 2-fold and even 4-fold in tobacco users, rose rapidly to 1.5 mg. per 100 cc. after oral administration of thiocyanates and returned to the normal value 3 weeks after administration ceased. The thiocyanate content of cerebrospinal fluid was usually the same as in the serum, never higher, sometimes lower than in the serum. In pathological body fluids, the concn. lay between 0.03 and 0.06 mg. per 100 cc.

JOSEPH S. HEPBURN

**Phosphorus content of the serum in kidney diseases.** K. GRASSHEIM AND E. LUCAS. *Z. klin. Med.* 107, 172-80(1928).—Normally 100 cc. of serum contains 2 to 3.5 mg. acid-sol. P and 7 to 9 mg. org. P. These values, especially the former, are higher in hot weather, and an increase in either or both forms of P runs parallel to renal disturbances. Both forms should be detd., and their total should not exceed 12 mg. per 100 cc.

JOSEPH S. HEPBURN

**Metabolic studies in hepatic diseases. I. Carbohydrate metabolism.** ALBERT OPPENHEIMER. *Z. klin. Med.* 107, 467-75(1928).—The concn. of lactic acid in the blood is not increased in hepatic diseases, even after work or ingestion of sugar. Disturbances in carbohydrate metabolism are compensated by the tissues. J. S. H.

**The etiology of the toxicoses of pregnancy. (Are isoagglutinins, isohemolysins or anaphylactins of etiologic importance?)** F. ISBRUCH AND T. WOHLFEIL. *Arch. Gynäkol.* 136, 19-36(1929).—In a series of 410 mothers and children the blood groups were detd. There was no evidence that the toxicoses of pregnancy occurred more frequently in cases where mother and child belonged to different blood groups. The sex of the child also played no part. A passage of fetal agglutinins through the placenta and an unfavorable action of the fetal agglutinins on the mother can, therefore, not be considered as the cause of the toxicoses of pregnancy. In 18 cases the action of the serum of the mother on the blood corpuscles of the child and that of the serum of the child on the blood corpuscles of the mother were studied but isohemolysis only took place in 3 cases, all of which showed active syphilis. In 2 cases of latent syphilis there was little or no hemolysis. In 15 cases guinea pigs were injected with serum from the mother and after the period necessary for the development of passive anaphylaxis were injected with the serum of the child. No anaphylactic symptoms developed either with serum from normal pregnancies or from cases with toxicosis, indicating that the toxicoses of pregnancy are not due to anaphylaxis.

HARRIET F. HOLMES

**The hydrogen-ion concentration of the cerebrospinal fluid in eclampsia, in reference to the etiology of eclamptic convulsions.** G. SCHPOLJANSKY AND A. DANZIG. *Arch. Gynäkol.* 136, 37-47(1929).—The  $p_H$  of the cerebrospinal fluid in eclampsia varies from a high degree of acidosis to a high degree of alkalosis, 6.36-8.9. Neither the acidosis nor the alkalosis of the cerebrospinal fluid is dependent on the severity of the case, the number of attacks or the functional disturbance of the kidneys. Alkalosis is more frequent before labor and acidosis after labor. In the second half of pregnancy an acidosis of the blood frequently develops, accompanied by a diminution of the alkali reserve of the blood. The higher the alkalosis of the cerebrospinal fluid, the lower is the alkali reserve of the blood. The alkali reserve of the blood binds first the acidosis of the brain and this probably explains a displacement of the cerebrospinal fluid to alkalosis. In addition to a disturbance in the acid-base equil., in the cerebrospinal fluid in eclampsia, there is also a disturbance in ionic equil., particularly of Na, K and Ca, and not only in the cerebrospinal fluid but in the other fluids and tissues of the body. The disturbance of ionic equil., particularly of univalent and bivalent ions, alters the permeability and the excitability of the cells and is probably the immediate cause of the irritability of the motor centers of the cortex.

HARRIET F. HOLMES

**The mineral content of cysts.** A. SCHEPETINSKY AND M. KAFITIN. *Arch. Gynäkol.* 136, 130-40(1929).—The mineral content of follicular cysts varies greatly. The mineral content of corpus luteum cysts as compared with that of persistent follicles is high in Na and Cl and particularly in P. Parovarial cysts as compared with tubo-ovarial cysts have a high Ca, K, P and Cl content but a low Na content. Dermoid cysts have a high Ca and Cl content. Follicular cysts have a low Ca, K and P content as compared with the blood serum, while the Na and Cl contents vary. In corpus luteum cysts the Ca, K and Cl contents and K/Ca coeff. are low and the Na content is high as compared with the blood serum. In cystadenoma simplex Ca, K and P are low as compared with the blood serum, Na and Cl showing little change. In pseudomucinous cysts Ca and P are low as compared with the blood serum while K is high. In parovarial cysts Ca is low as compared with the blood serum while K, K/Ca coeff., Na, P and Cl are

high. In the blood serum the coeff.  $K/Ca$  is usually altered by an increase in either  $Ca$  or  $K$ . HARRIET F. HOLMES

The effect of heat on  $O$  and  $H$  immune bodies. A. FELIX AND L. OLITZKI. *Brit. J. Exptl. Path.* 10, 26-34(1929).—The  $O$  (heat-labile) and the  $H$  (heat-stable) agglutinins for *B. typhosus* and the *Salmonella* group of organisms possess heat resistances as markedly different from each other as those already described in the case of *B. proteus* (4 strains). This const. property of the 2 kinds of agglutinins is additional evidence of the qual. difference between the 2 types of bacterial antigens and immune bodies. Its application as a diagnostic measure, while useful in the special case of typhoid patients' serum, does not appear to be of importance in other infections. Normal and immune agglutinins possess the same resistance to heat. The close relationship between complement binding and bactericidal immune bodies and  $O$  agglutinins already established by other means is also demonstrated by their similar heat resistances. H. F. H.

Distribution of endemic goiter in the United States as shown by thyroid surveys. ROBERT OLESEN. *U. S. Pub. Health Repts.* 44, 1463-87(1929). J. A. KENNEDY

Notes on the work of von Vondorfy: "Anacidity, pseudoanacidity and histamine reaction." ARNOLD FÜRGL. *Arch. Verdauungs-Krankh.* 45, 271-2(1929); cf. C. A. 23, 3737.—Discussion. FRANCES KRASNOW

Lipoid and iron deposition in the adrenals and testes of boys 1 to 15 years old. CARL BLUMENSAAT. *Arch. path. anat. (Virchow's)* 271, 639-69(1929).—The lipid content of the adrenals is influenced by disease in childhood as in adult life. When the lipid content is increased, neutral fats partake least in the addn., phosphatides partake more, and the doubly refracting lipoids most. Lipoid poverty of the adrenals is found particularly in long-continued suppurations and other infections, and in less degree in malignant tumors. In the germ cells of the child's testis, up to the 5th year, neutral fats and phosphatides are rare. Cholesterol esters are quite absent. After the 5th year the lipid content increases slowly. After the 12th year the three types of lipoids are present in moderate concn. and in the same proportion. In the interstitial cells in the early years there is a slight physiological lipid content, which, however, decreases up to the 8th year. It is preponderantly neutral fat. After the 12th year there is marked storing of the three types of lipid in equal amt. and in the same amt. as in the germ cells. The lipid content of the germ cells is not markedly influenced by disease, except in the case of purulent meningitis, in which an increase occurs. In the interstitial cells, on the other hand, slight increase in lipid content is the rule in infectious disease. No relation is to be observed in the lipid content of the cells of the adrenal cortex and the interstitial cells of the testis in childhood. A storage of Fe pigments brought in from the blood stream is not observed in the adrenals and testes in the infectious diseases. The hemosiderin which is occasionally found is of other origin. E. R. LONG

The mode of action of formaldehyde on complement-fixation systems. C. E. REYNER. *J. Immunol.* 16, 1-16(1929).—Low concns. of  $HCHO$  increase the absorption of dye by bacteria, while high concns. diminish the absorptive power. Bacteria treated with certain concns. of  $HCHO$  and washed so that no free  $HCHO$  is left, absorb more homologous antibody than untreated bacteria, but heterologous antibodies are not absorbed in greater amt. There is an apparent relationship between the altered surface tension of a bacterial suspension, due to the action of  $HCHO$ , and the increased absorption of antibodies. Of several aldehydes tested only  $HCHO$  and paraformaldehyde had the effects described. Apparently the mode of action of  $HCHO$  as exhibited in the Wassermann reaction and in sp. complement-fixation systems is primarily due to the reaction of antigen with  $HCHO$ , increasing the capacity and velocity of antibody fixation. Specificity is exhibited in the enhanced fixation capacity. E. R. LONG

Surface tension of blood serum in syphilis. ELIZABETH M. YAGLE. *J. Immunol.* 16, 17-25(1929).—Surface-tension estns. of serum in different dilns. indicate that 1:5000 is the optimum diln. for max. time drop. Av. time drops of 25 negative and 25 positive sera, heated and unheated, show the time drop to be slightly greater in positive than negative sera. The time drop is slightly greater in heated than unheated sera. Study of individual sera shows that there may be a greater difference in time drop between individual sera of the positive or of the negative group, than between positive and negative sera. The drop of surface tension is not correlated with positive or negative complement fixation and pptn. reactions. Surface-tension detns. are therefore of no value as a means of differentiating between syphilitic and normal sera. E. R. LONG

The relation of serum dilution and of antigen density to the non-specific precipitation of fowl serum. S. J. SCHILLING AND G. S. SCHILLING. *J. Immunol.* 16, 61-70(1929).—The presence of organisms in bacterial suspensions or antigens acts as a stabiliz-

ing influence on the unstable element in fowl serum. This element appears to be absorbed or adsorbed to the bacterial bodies and rendered inoperative. Increasing diln. of serum or of density of antigen reduces the amt. of, and tendency to, non-sp. pptn. The most abundant ppts. are frequently found in dilns. of phenolized saline soln. It is probable that in undild. fowl serum the unstable element is held in soln. by assocn. with serum albumin and globulin, but as these colloids become dild. and dispersed in phenolized saline soln. they lose their capacity for holding the unstable element, and hence pptn. follows. A lipoidal element is probably responsible for the non-sp. pptn.

E. R. LONG

**Immunization and the nitrogenous constituents of the blood.** M. F. GUYER AND S. LEPKOVSKY. *J. Immunol.* **16**, 175-207(1929).—When a foreign protein, such as typhoid bacillus vaccine, is injected into the blood stream of rabbits, the following changes occur: (1) a tendency toward diminution in the amino N of the blood (except in moribund animals); (2) a marked rise in non-protein N; (3) an increase in urea, but not enough to account for the full excess of non-protein N; (4) a rise in the number of leucocytes, as a rule; (5) fever, as a rule; (6) a lowering of the alkaline reserve; (7) a lowering of the  $p_H$ ; (8) a rather prolonged inhibition of renal secretion; (9) water retention and lowered sp. gr. of the blood and (10) acidosis of the body tissues. The fact that animals made febrile by infra-red irradiation do not show these changes indicates that they are due to the foreign protein itself rather than the fever caused by its injection.

E. R. LONG

**The effect of formalin on botulinus toxins A, B and C.** ROBERT GRAHAM AND FRANK THORP, JR. *J. Immunol.* **16**, 391-401(1929).—Formalin added to potent botulinus toxins A and B to make a concn. of 0.5% detoxified the toxins at 37°. Lower concns. detoxified the C toxin. Potent toxoids so produced protected a majority of guinea pigs against later injection of toxin.

E. R. LONG

**Studies of the antigenic substances of *Cl. botulinum*. XXXIII. I. Complement-fixing substances in alcoholic extracts.** JEANNE LOMMEL AND JANET B. GUNNISON. *J. Immunol.* **16**, 403-9(1929).—Substances giving strong complement-fixation reactions with antibacterial serums were obtained from *Cl. botulinum* by extn. with 75% EtOH. These contained carbohydrate, as indicated by a strong Molisch reaction, and contained little or no protein. They were insol. in salt soln. and therefore failed to react in the precipitin test. They seemed to possess species specificity. The exts. had neither specificity for the serologic group nor for the toxicologic type. They apparently contained the non-sp. factor responsible for the cross reactions among the serologic groups when intact organisms were used as antigens.

E. R. LONG

**Observations on the proposed gold chloride titration for determining the toxicity of diphtheria toxin.** EVERETT SANDERSON AND JOHN H. YOE. *J. Immunol.* **16**, 429-38(1929).—Six different diphtheria toxins when tested by the gold chloride and guinea pig methods failed to show any parallelism as to toxicity. The green color zone produced in mixts. of gold chloride and toxic broths is not sp. for toxin, for, (a) inactivated (heated) and non-inactivated toxins gave almost identical gold chloride figures; (b) the amt. of gold chloride necessary to bring about the max. green coloration with toxic broths can be entirely altered by changing the initial H-ion concn. and the buffer capacity of the broths; (c) several batches of uninoculated 1% dextrose ext. broth gave a green color zone when mixed with gold chloride. Max. green color in mixts. of broths and gold chloride is obtained at approximately  $p_H$  4.5. The gold chloride test therefore is not satisfactory for standardizing bacterial toxins in its present form.

E. R. L.

**The chemical nature of the constituent of fowl serum responsible for non-specific precipitations.** GEO. S. SCHILLING. *J. Immunol.* **16**, 439-49(1929).—Ultramicroscopic examn. of pptd. sera, non-pptd. clouding sera and normal, non-clouding sera of fowls revealed fat globules in all cases, especially in the pptd. and the non-pptd. clouding serum. Microchem. tests on the ppts. resulting in the agglutination system from the addn. of clouding sera show that these ppts. contain neutral fats and fatty acids. Spontaneous ppts. in fowl sera which induce non-sp. ppts. of serologic antigens carry a significantly higher lipid content than sera which do not produce the cloudy reaction; significant differences in their protein content do not appear. The lipoproteins and neutral fats appear to be the constituents in fowl sera responsible for these non-sp. ppts.

E. R. LONG

**The reaction of the blood in cancer.** HORACE MILLET. *J. Biol. Chem.* **82**, 263-7(1929).—The  $p_H$  values were detd. by means of the glass electrode and no difference was found in the av.  $p_H$  of bloods from normal and cancerous individuals. The cancer cases were fairly advanced and had not been treated. It is suggested that discordant

results obtained by other investigators are due mainly to less satisfactory exptl. methods.

**The lipide distribution in normal and abnormal liver tissue. III. The effect of disease upon the lipide distribution in human liver tissue.** EDWIN R. THEIS. *J. Biol. Chem.* **82**, 327-34(1929); cf. *C. A.* **22**, 2209.—The lipide and fatty acid distribution in human liver tissue is approx. the same as that for beef and rabbit tissue. In pneumonia, tuberculosis and fatty degeneration there is an alteration in the phospholipide-fat ration, the former decreasing proportionally with the stage of the disease. "It has been suggested that both phospholipides and neutral fats are stored in the liver tissue, but the author believes only the neutral fat to be stored material and the phospholipides to be active in the actual metabolism of the organ. In every case in which the actual functioning of the organ is disturbed, the lipide distribution is changed to the disadvantage of the phospholipide content."

**The prevention of the tetany of parathyroidectomized dogs. I. Cod-liver oil.** With a note on the effect of cod-liver oil on calcium assimilation. ISIDOR GREENWALD AND JOSEPH GROSS. *J. Biol. Chem.* **82**, 505-30(1929).—Protection against the occurrence of tetany afforded by the administration of cod-liver oil before thyroparathyroidectomy was much less frequently attained in the present expts. than has been claimed by others and, in fact, the expts., considered by themselves, would indicate that the oil has no protective action. To explain these differences it is suggested that: "(1) Almost all dogs possess accessory parathyroid tissue which is not removed in the course of the ordinary thyroparathyroidectomy. (2) Tetany, following parathyroidectomy, is due not only to the low concn. of diffusible Ca in the plas mabut also to the rapidity with which this low concn. is attained. If the diminution is made sufficiently slowly, the animal may adjust itself to such low level of plasma Ca. (3) The administration of cod-liver oil stimulates parathyroid tissue to increased activity. Therefore, after ordinary thyroparathyroidectomy, animals that have previously been treated with cod-liver oil are left with a larger store of parathyroid tissue than are animals that have not been so treated. Consequently, the concn. of Ca in the plasma falls more slowly and acute tetany is avoided or delayed. The organism is given a longer time in which to adjust itself to the low concn. of plasma Ca or the remaining tissue has a better opportunity to hypertrophy sufficiently to supply the animal's needs. Possibly, both processes are involved. (4) The opinion is expressed that the effect of cod-liver oil, and of the administration of parathyroid ext., upon Ca metabolism will be found to vary with the Ca content of the diet, the age of the animal, and the need for Ca in the organism. II. Lactose-containing diets. *Ibid* 531-44.—"Lactose-contg. diets protect dogs against tetany only if large amts. of Ca are also contained in the diet. It is believed that the lactose acts by making the Ca more available to the animal. Metabolism studies showed the usual retention of P after thyroparathyroidectomy but, on high Ca diets, the retention of Ca seemed to be decreased. Since the N excretion was also increased, the significance of the increased Ca excretion is not unequivocal. In any case, it is believed not to be inconsistent with the hypothesis that the parathyroid hormone, directly or indirectly, increases the soly. of Ca in the blood plasma and other body fluids."

**The catalase of malignant tissue.** MARGARET R. LEWIS AND HARRIET COSSMAN. *Am. J. Physiol.* **87**, 584-93(1929).—The infectious tumor of the chicken contained only small amts. of catalase, resembling in this respect the muscle which it invades. The rat sarcoma and carcinoma contained more catalase than did chicken tumor. Chicken tumor virus was destroyed by dil.  $H_2O_2$  soln.

**Diabetes insipidus. III. The diuretic substance.** HELEN BOURQUIN. *Am. J. Physiol.* **88**, 519-28(1929).—The urine was made slightly acid, evapd. to a sirup, extd. with 95% EtOH, the residue redissolved in  $H_2O$ , neutralized with  $Ba(OH)_2$ , filtered and the final filtrate tested for diuretic action. The urine of dogs with exptl. diabetes insipidus contained a diuretic substance which was not present in like amts. in the urine of normal dogs. A similar diuretic substance was extd. from the mammillary bodies and brains of normal dogs.

**Toxic effects of defibrinated blood when perfused through the isolated mammalian heart.** JULIA HERRICK AND J. MARKOWITZ. *Am. J. Physiol.* **88**, 698-705(1929).—Defibrinated rabbit blood was actively toxic when perfused through the isolated rabbit heart. The toxic substance is "ovasoconstrictin" in action and may be produced from the disintegration of the blood platelets. Blood toxins of the nature here dealt with may take a part in the production of certain pathol. conditions in animals such as shock and arteriosclerosis.

**Experimental studies in gall-stone formation. I.** KATASHI INOUE AND RYUICHI

OHTA. *Japan J. Gastroenterol.* **1**, 14-7(1929).—*In vivo* bile is assumed to consist of hydrosols of cholesterol and bilirubin. These appear hydrophilic due to the action of some protecting substance. In order to establish an analogous system *in vitro* 2 hydrosols were prepd. The first was made by pouring an  $\text{Me}_2\text{CO}$  soln. of cholesterol into warm water followed by distn. *in vacuo* to remove the final traces of acetone. The second hydrosol of cholesterolstearin ester was prepd. similarly except warm  $\text{EtOH}:\text{Me}_2\text{CO}$  served as solvent in place of  $\text{Me}_2\text{CO}$ . Both hydrosols were stable for 6 weeks. The coagulating values of a series of electrolytes upon these emulsions were detd. Inorg. salts can be arranged in the following order:  $\text{Ce} > \text{Ca}, \text{Ba} > \text{K}, \text{Na}$  when the valency of the cations is considered. Acids have a strong coagulating power and fall into the following series:  $\text{H}_2\text{SO}_4 > \text{HCl} > \text{lactic}$ . Alkali fails to show any coagulating effect. Both emulsions exhibited the same degree of stability. C. M. McCAY

A new protest against the methylene blue liver function test. KOKICHI NAKASHIMA. *Japan J. Gastroenterol.* **1**, 29-38(1929).—Clinical observations show that methylene blue has no unique characteristics in its reactions in liver tissue. It is worthless as a test of liver function since its rate of excretion by the liver is independent of the pathol. state of that organ. C. M. McCAY

Carbohydrate metabolism in pulmonary tuberculosis. S. RUSSO. *Boll. soc. ital. biol. sper.* **4**, 215-6(1929).—In nearly all 30 individuals with advanced tuberculosis the glucemic titer before breakfast was 0.038 to 0.07% higher than the normal (0.10%). In 80% of the cases the glucemic curve during fasting was different from that found in normal individuals; there was a gradual increase in the glucemic titer up to the 2nd hr. of fasting and then a lowering which approached the initial titer. The administration of 50-g. glucose before breakfast gave results which varied according to the clinical form of the disease. The results in general indicate that there is a disturbance of carbohydrate metabolism in tuberculosis. PETER MASUCCI

Studies on oxalic metabolism. II. The elimination of oxalic acid in phlorhizin diabetes. P. DELUCIA. *Boll. soc. ital. biol. sper.* **4**, 245-8(1929).—D. confirms his previous results that in phlorhizin diabetes there is an increase in the amt. of oxalic acid eliminated by dogs. III. The elimination of oxalic acid in human diabetes and its behavior following insulin therapy. P. DELUCIA AND F. VELARDI. *Ibid* 249-51.—The elimination of oxalic acid increases in diabetes. The administration of insulin diminishes the elimination of oxalic acid very markedly. The results were obtained on 2 diabetic cases. PETER MASUCCI

The Takata-Ara reaction for cephalorachidian fluids. M. VOLTERRA. *Boll. soc. ital. biol. sper.* **4**, 226-7(1929).—This reaction was tried on 70 fluids with satisfactory results. The test is useful in diagnosing syphilis of the progressive paralysis type, when it is not possible to make a Wassermann test. PETER MASUCCI

The prognostic value of cholesterolemia in pulmonary tuberculosis. J. PALACIO. *Prensa med. Argentina* **1929**, 28. *Rev. sud-americana endocrinol., inmunol., quimioterap.* **12**, 363-4(1929).—The cholesterol in the blood is low in evolutive forms; it is normal in latent forms and high in fibrous forms. A. E. MEYER

Changes in the serum cholesterol content in anaphylaxis. I. M. GOLDBERG AND V. N. NEKL'DOV. *Biochem. Z.* **208**, 285-7(1929).—The serum cholesterol rises markedly during the anaphylactic shock in sensitized rabbits. Injection of antigen into non-sensitized rabbits causes no change, or even a fall in the cholesterol of the serum. S. MORGULIS

The diminished diastase action of the urine in kidney diseases and in diabetes. FRITZ SCHMEREL. *Biochem. Z.* **208**, 415-27(1929).—The low diastase content of diabetic urine is not due entirely to the nature of its medium as can be shown in expts. in which opt. conditions of  $\text{pH}$ , salt or buffering are maintained. Studies on phlorhizinized animals as well as of patients suffering from nephritis and other kidney diseases indicate that the poor permeability of the kidney for diastase may partly explain the slight diastase activity of diabetic urines. No conclusion can be drawn from the urine diastase findings as to the enzyme concn. in the blood. S. MORGULIS

The variation of the blood sugar in cases of abdominal typhus. YOICHI ANAZAWA. *Sei-ka-shi Med. J.* **48**, No. 2, 99-101, Abstract sect., 5-6(1929).—After a very careful study of the blood sugar in cases of typhus fever with and without complications it appears that the disease has a greater influence on the concn. of this substance than medication or nutrition. M. H. SOULE

Analysis of a fluid from a cyst of the spleen. MLLR. S. GRILLON. *J. pharm. chim.* [8], 9, 23-5(1929).—In a woman, 41 yrs., operation on a hard tumor yielded 300 g. of a viscous creamy fluid, d. 1.124,  $\text{H}_2\text{O}$  75.73%, solids 24.27% contg. cholesterol 0.10, al-

bumins 8.25, urea 0.043, fat 2.28, undetd. 0.877, ash 12.72% consisting of Cl 0.43,  $P_2O_5$  5.90, CaO 6.59%. Reducing substances and biliary pigments were absent. S. W.

The  $p_H$  of tumors. ANNA GOLDFEDER. *Z. Krebsforsch.* 29, 134-46(1929).—The  $p_H$  of three inoculable animal tumors (Ehrlich's mouse sarcoma and carcinoma, Rous's chicken sarcoma) lay between 7.5 and 7.7. With necrosis the alky. increases. If large amts. of glucose are given the  $p_H$  of the tumors is reduced. H. G. WELLS

Roff's cancer reaction. L. M. CORREA. *Z. Krebsforsch.* 29, 112-33(1929).—A general discussion of the principles and utilization of this reaction, which is based on the fact that serum of animals with cancer decolorizes neutral red more than normal serum. It often fails to be exhibited in cancer cases, but is almost always negative with noncancer serum. It seems to depend on a physicochemical alteration of the serum that is associated with absorption of  $CO_2$ . H. G. WELLS

The sugar content of the blood in emotional states. KARL M. BOWMAN AND JACOB KASANIN. *Arch. Neurol. and Psychiatry* 21, 342-62(1929).—In a series of 148 cases of mental diseases of various kinds with different types of emotional states, the majority showed normal blood-sugar values (80-120 mg. dextrose per 100 cc blood), in contrast to results of former investigators. The distribution curve was normal. It appears that high blood-sugar values are found in cases showing fever and vague physical symptoms. High values (above 120) were found in 9 women displaying excitement. R. C. WILLSON

The calcium content of the blood in different periods of pregnancy, toxicoes and post-natal diseases. M. SERDYUKOV AND A. MOROSOVA. "Grauertmann," Moscow *Monatsschr. Geburtsh. u. Gynäkol.* 78, 237-48(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 47, 645.—The series was 216 cases. Normal nonpregnant women showed blood Ca values of 9.0-13.7 mg. %, av. 11.25 mg. %; in the first half of pregnancy, 9.44-13.04, av. 11.78. In the second half of pregnancy the serum Ca was 9.24-13.5, av. 11.46. During childbirth the value was subnormal, 9.96-11.5, av. 10.73; during puerperium, 9.5-12.5, av. 11.02. In the amniotic fluid, it was 5.56-9.44, av. 7.37. Contrary to other investigators, the authors found no decrease during the gestation toxicoes. In minor puerperal diseases Ca was unchanged or only slightly decreased, but in severe diseases of the septic or pyemic type there was a Ca decrease. R. C. WILLSON

Report of further study of the poisonous amines as the etiology of toxemias of late pregnancy. HERMAN W. JOHNSON, ROBERT A. JOHNSTON AND H. O. NICHOLAS. *Texas State J. Med.* 24, 636-9(1929).—*B. coli* infection is present in practically every case of late toxemia. Tyramine poisoning produces symptoms and circulatory disturbances similar to those of late toxemia. Enough amino acids are available in the ordinary infarct, if converted rapidly to amines, to cause alarming symptoms. *B. coli* infection may cause kidney dysfunction which results in an increase in blood amino acids which are converted into poisonous amines. In the presence of circulatory handicaps of the pregnant uterus these may cause placental insults which may increase the amines of the blood and if the liver is unable to detoxify them, symptoms of late toxemia result. R. C. WILLSON

Carbon dioxide content of cerebrospinal fluid in paresis. E. KLEMPERER AND M. WEISSMANN. *Z. ges. Neurol. u. Psychiat.* 119, 351-73(1929); *J. Am. Med. Assoc.* 92, 2148.—There is an increase in the cerebrospinal fluid in uncomplicated paresis; this is markedly decreased by malaria treatment. Shortly after the cure the alkalosis of the fluid increases still more, but a few months later returns to normal. Maniac patients with paresis, patients with severe taboparesis and others with severe circulatory and metabolic disturbances do not show the usual increase. R. C. WILLSON

Study of I in South Carolina (MITCHELL) 15.

## H—PHARMACOLOGY

A. N. RICHARDS

Action of intravenous injection of lactic acid on alkali reserve of blood. B. KRAYCHINSKII. *Russ. J. Physiol.* 11, 433-44(1928).—Intravenous injection of lactic acid causes a lowering of the alkali reserve from 10 to 40% of its original value. The degree of lowering depends, not only on the amt. injected, but also on the rate of injection. The alkali reserve returns to normal in the course of 2-4 hr. B. C. A.

Salabrose (tetraglucosan) in diabetes. E. KAUFMANN. *Z. ges. exptl. Med.* 60, 116-32 (1928).—Oral administration of tetraglucosan is usually followed in diabetic and in normal subjects by a rise in the blood sugar, which also follows intravenous injection. With rabbits, tetraglucosan has no effect on insulin hypoglycemia. The use of tetraglucosan in diabetes is discussed. After removal of dextrose by fermentation, the

substance may be detd. polarimetrically or colorimetrically by reduction of picric acid to picramic acid. The latter method is unsuitable for its detn. in urine. B. C. A.

**Action of synthalin.** H. STAUB. *Z. klin. Med.* 107, 607-58(1928); cf. C. A. 22, 4644.—Intravenous administration of synthalin causes in fasting rabbits a primary hyperglucemia and a slight secondary hypogluemia. Continued peroral administration also results in no marked reduction of blood sugar. The incidence of the toxic effect of synthalin is discussed. The liver- and muscle-glycogen is diminished, and the formation of lactic acid is increased. The action of synthalin in no way resembles that of insulin. B. C. A.

**The formation of edema. VII. The influence of colloids on the intermediate water exchange associated with disturbed thyroid function.** CHOMATSU SATO. *Tôhoku J. Exptl. Med.* 11, 489-503(1928); cf. C. A. 22, 4171.—Two % gum arabic in Ringer soln. transfused through surviving rabbit-leg preps. retarded the formation of edema in the case of preps. from normal, from a thyroid and from hyperthyroid rabbits, the amt. of retardation increasing in the order given. Using 2% foreign blood serum in Ringer soln. an acceleration of the formation of edema occurred with preps. from normal and athyroid rabbits; a retardation with preps. from hyperthyroid rabbits was noted. B. C. BRUNSTETTER

**The pancreas hormone and mineral metabolism. III. The influence of the pancreas hormone on the various constituents of thoracic duct lymph and the relation between changes of blood and lymph in normal and in diabetic dogs.** SOSHIRO TAKEUCHI. *Tôhoku J. Exptl. Med.* 11, 568-603(1928); cf. C. A. 23, 888.—Lymph samples were collected from fistulas in the thoracic ducts of normal dogs and of dogs made diabetic by pancreatic extirpation. The effect of subcutaneous insulin injections (2.0-6.5 clinical units per kg.) on the concn. of blood and lymph and on their inorg. constituents was studied. In both blood and lymph, inorg. P and K decreased; Cl increased; no definite changes occurred in Ca and Mg. The % dry wt. and % protein increased in the blood but decreased in the lymph. Numerous quant. details are given. B. C. BRUNSTETTER

**The hyperpneic action of ammonium chloride in cats.** TAISUKE SUZUKI. *Tôhoku J. Exptl. Med.* 12, 417-24(1929); cf. C. A. 17, 2327.—NH<sub>4</sub>Cl was subcutaneously injected (0.7 g. per kg.) into (1) normal cats; into cats splanchnecotomized (2) unilaterally and contralaterally suprarenalectomized; (3) bilaterally; and (4) unilaterally. The av. % increase in respiration frequency, where the frequency before injection is expressed as a % of the max. after injection was: (1) 550; (2) 284; (3) 232; (4) 339. B. C. B.

**The effect of urease, parenterally injected, in normal rabbits.** HIIDEICHI TAKEITA. *Tôhoku J. Exptl. Med.* 12, 433-44(1929).—Urease acts as a diuretic when injected intraperitoneally into normal rabbits. If urea is first injected intravenously, followed by intraperitoneal injection of urease, the former seems to decrease the resistance of the rabbit to the latter. Intravenous injection of 0.5 g. urease into rabbits causes weakness, then convulsions, followed by death. Soon after the beginning of convulsions, the blood NH<sub>3</sub> increases and a striking acidosis sets in. B. C. BRUNSTETTER

**The action of thyroxine upon the protein, water and mineral metabolism. A.** SCUITTENHELM AND B. EISLER. *Z. ges. exptl. Med.* 61, 239-77(1928).—Normal and diseased men, dogs and rabbits were used. The protein metabolism in dogs is only slightly affected so long as the dosage does not exceed a crit. value. The urea excretion is increased and NH<sub>3</sub> decreased. With large doses there is an acidosis with a sharp increase in NH<sub>3</sub> excretion. Thyroxine produces swelling and its marked effect on metabolism appears at the same time. There is an early negative water balance followed by a const.-wt. period, and then with cumulative action a further negative balance. With doses under 2 mg. there is an increased water output in rabbits without a negative N balance. Higher doses produce a negative N balance out of proportion to the water output. In man the protein metabolism is only slightly affected; it shows as a negative N balance and an increased excretion of NH<sub>3</sub>. A slight negative water balance was caused. During menstruation, the action of thyroxine was greater, the N losses being greatly increased. Thyroxine had no effect upon the course of menstruation. It had no effect upon the metabolism and blood picture in pernicious anemia. The protein metabolism in myxedema deviates from the normal in the reduced urea excretion. The mineral metabolism is considerably changed, particularly the S metabolism, a considerable part of the total S being excreted unoxidized. Thyroxine increases the metabolism and shifts it toward the normal. Hippuric acid synthesis is deranged in myxedema. From exogenous benzoic acid there is an incomplete hippuric acid synthesis, which is changed to the normal with thyroxine. Between the congenital and climacteric myxedemas there are only quant. differences. F. L. DUNN

**The question of peroral administration of insulin.** GUSTAV SAMEK. *Z. ges. exptl. Med.* **62**, 707-16(1928).—S. was unable to find any lowering of the blood sugar in dogs receiving insulin perorally alone, or when combined with 0.3-0.5 g. saponin, or with bile preps. F. L. DUNN

**Insulin substitutes. VIII. Antidiabetic substances in yeast and yeast nucleic acids.** E. KAUFMANN. *Z. ges. exptl. Med.* **62**, 739-44(1928).—Peroral feedings of yeast exts. lowered the blood sugar in rabbits, the ext. made with *N* HCl being the most effective. Intravenous injections produced a similar effect. The acid exts. of the fermented yeast contg. the nucleic acids showed a similar effect which was not destroyed by heating to 100°. K. suggests that no true enzyme is involved. In contrast to the results with various plant exts., no hyperglucemic phase was observed. F. L. DUNN

**The influence of calcium feeding upon the carbon : nitrogen ratio in the urine of rabbits.** A. BICKEL and D. MARSCHALKOWITZ. *Z. ges. exptl. Med.* **62**, 747-55(1928).—Using the method of Gomez for C in urine and Kjeldahl for N, B. and M. found that the C output is reduced when Ca is fed to rabbits. The N remained const. resulting in a decrease in the C:N ratio. The amount of Ca used was 0.011-0.024 g. Ca per kg. per day in the form of lactate or as kalzan. B. and M. suggest that the reduction is due to an increase in the rate of oxidation, and that this change should be taken into account in metabolic studies. F. L. DUNN

**Ethylene anesthesia.** H. P. FAIRLIE. *Brit. J. Anaesth.* **1928**, 154; *Quart. J. Pharm.* **1**, 476. H. L. D

**Pyrethrins from *Chrysanthemum cinerariæfolium* as anthelmintics.** J. CHEVALIER. *Bull. acad. med.* **99**, 416(1928); *Quart. J. Pharm.* **1**, 657. H. L. D

**Sulfarsenol as a preventive of puerperal infection.** P. DELMAS and BRÉMOND. *Bull. soc. d'obstét. gynécol.* **1928**, 433; *Quart. J. Pharm.* **1**, 667-8. H. L. D

**Nicotine-chloroform syncope.** A. TOURNADE and J. MALMÉJAC. *Compt. rend. soc. biol.* **99**, 156(1928); *Physiol. Abstracts* **13**, 606.—Excessive secretion of adrenaline is not the only factor in the mechanism of the syncope caused by injection of nicotine into a chloroformed dog. In 2 out of 23 decapsulated dogs a typical syncope was caused by injection of nicotine in CHCl<sub>3</sub> anesthesia. It is enough to show that nicotine without the assocn. of adrenaline can det. the condition. H. L. D

**Antimony poisoning from enameled vessels.** J. A. CHARLES. *Med. Officer* **40**, 59(1928); *Quart. J. Pharm.* **1**, 454.—C. describes an outbreak of sickness from so called "lemonade." The drink was made in enameled buckets from "fruit crystals." Examn. showed that the enamel on the vessels had been attacked by the tartaric acid in the beverage. The enamel contained 5% Sb. The beverage from the pails contained 0.013% of metallic Sb. H. L. D

**Organic arsenical compounds: Use in certain streptococcal infections.** L. COLEBROOK. *Med. Research Council, Special Rept. Series*, No. **119**; *Quart. J. Pharm.* **1**, 478.—A small group of tervalent arsenicals, comprising arspenamine and 2 of its derivs. the monomethylene sulfoxylate (N. A. B.), and the dimethylene bisulfite (sulfarsenol, metarsenobillon and kharsulfan) exhibit certain properties which differentiate them rather sharply from almost every other known compd. which it has been proposed to use for the chemotherapy of bacterial infections. No quinquevalent arsenical has been found to have these properties. When injected into the animal or human body these arsenicals confer upon the blood fluids the peculiar bactericidal qualities which characterize their simple solns.—and these acquired bactericidal qualities are retained by the blood for a considerable time. It seems probable that, owing to the slowness of excretion of these drugs, and also the remarkable slowness with which they enter into combination with the blood corpuscles and the fixed tissue-cells, a considerable fraction of the injected dose is retained for a time in soln. in the blood plasma. In common with other antiseptic agents these arsenicals are capable of destructive action upon human leucocytes, given a sufficient concn. and a long enough period of contact, but there is this important difference—whereas the ordinary antiseptics have a higher affinity for the leucocytes than for the microbes, and, by combining with the former, forfeit their microbicidal potential—these arsenicals have a higher affinity for *certain* microbes (the hemolytic streptococci and pneumococci, for example) than for the leucocytes. It becomes possible, therefore, by suitable dosage, to maintain such a concn. of these arsenicals in a patient's blood as to avoid injury to the leucocytes while conferring a measure of bactericidal potency upon the blood fluids. The compds. so far tested may be placed in the following order of increasing toxicity for human leucocytes: metarsenobillon, kharsulfan and sulfarsenol, approx. equal; stabilarsan; neoarsphenamine; and lastly, Ag arspenamine. H. L. D

**Antidiuretic effect of posterior pituitary lobe extracts.** S. L. GARGLE, D. R. GILLIGAN AND H. M. BLUMGART. *New England J. Med.* **198**, 169(1928); *Quart. J. Pharm.* **1**, 480.—The antidiuretic action of posterior lobe pituitary ext. is inherent in the pressor principle. H. L. D.

**Arsphenamine preparations and the reticulo-endothelial system.** F. JIMÉNEZ DE ASúa AND M. J. KUHN. *Rev. soc. Argentina biol.* **4**, 124-41(1928); *Physiol. Abstracts* **13**, 542.—Injection of arsphenamine compds. is followed by hypertrophy of the reticulo-endothelial cells of the spleen, liver, and lymphatic glands. Granules appear in the cytoplasm of these cells, more especially in the spleen. Biochem. modifications also occur since Ag preps. are more easily fixed by the reticulo-endothelial cells. H. L. D.

**Action of guanidine on the contraction of denervated muscle.** I. SCANNAGATTI. *Rivista patol. sper.* **3**, 181-97(1928); *Physiol. Abstracts* **13**, 575.—Denervated toad muscle is hypersensitive to guanidine during the first day. Subsequently it is less sensitive than normal, in that the simple twitch or tetanus is less altered in character. H. L. D.

**Ammonium chloride as a remedy in colibacilluria.** A. BÉCART AND GAHLINGER. *L'union pharm.* **69**, 196(1928); *Quart. J. Pharm.* **1**, 475-6. H. L. D.

**Poisoning following the use of hexamine and salicylic acid.** H. EDELMANN. *Zentr. Chir.* **1928**, 1230; *Quart. J. Pharm.* **1**, 636. H. L. D.

**The effect of thallium on rats during lactation.** J. VÁSÁRHELYI. *Magyar Orvosi Arch.* **30**, 84-8(1929).—The Tl given *per os* is secreted with the milk. The young animals fed with this milk show the characteristic symptoms of Tl poisoning (hairless skin), whereas no effect can be observed on the lactating animal. G. H. VON FUCHS

**Quantitative measurements of pepsin in gastric juice before and after histamine stimulation.** W. SCOTT POLLAND AND ARTHUR L. BLOOMFIELD. *J. Clin. Investigation* **7**, 57-74(1929).—In normal persons, the concn. of pepsin in the gastric juice falls markedly after stimulation by histamine and follows closely the curve of N concn. The total output of pepsin is usually increased. ARTHUR GROLLMAN

**Dyestuffs in chemotherapy.** G. MALCOLM DYSON. *Z. Farbenind.* **20**, 212-8(1929).—A review. F. C. HAHN

**Lactic acid production after the use of synthalin.** H. HIRSCH-KAUFFMANN AND A. WAGNER. *Klin. Wochschr.* **7**, 1866-7(1928).—The use of synthalin in small, non-toxic but active doses does not lead to an increased production of lactic acid. M. H.

**The relationship between the action of calcium and digitalis.** ERNST BILLIGHEIMER. *Klin. Wochschr.* **8**, 724-6(1929).—The physiol. action of an increased Ca concn. (produced by injecting  $\text{CaCl}_2$ ) and of digitalis appears to be identical. The effects are given in detail; but especial stress is laid upon the fact that both substances reduce the heart rate. The effect of a Ca injection is transitory (20-25 min.) and is identical with the time required for the excess Ca to disappear from the blood. It is significant in this connection that continuous digitalization leads to an increase in blood Ca. The action on the heart is most effective when Ca and digitalis are injected simultaneously. This treatment has been employed very successfully in pneumonia. The beneficial action is to be ascribed to the inflammation-reducing action of Ca and to the combined action of both substances on the vascular system. Extensive bibliography. MILTON HANKE

**Clinical experiences with acedicon.** F. BERTRAM AND W. STOLTENBERG. *Klin. Wochschr.* **8**, 883-6(1929).—Acedicon, acetyldimethyldihydrothebaine, is an analgetic that is effective when administered either orally or subcutaneously. The peroral dose is 0.005-0.02 g., the subcutaneous dose 0.005-0.01 g. As an analgetic 0.01 g. of acedicon is equiv. to 0.007 g. morphine-HCl. It is a very effective anti-cough prepn. It has no effect upon respiration, heart action, blood pressure, peristaltic movements or body temp. It does not lead to albuminuria even in nephritics, and it does not lead to an elevation of the blood sugar in diabetics. A tolerance is not developed in most cases and the drug appears not to be habit forming. MILTON HANKE

**Effect of various solutions and salts on the pulsation rate of isolated hearts from young chick embryos.** WARREN H. LEWIS. *Carnegie Inst. Washington Pub.* **394** (Contributions to Embryology **20**), 173-92(1929).—Hearts isolated from 72 hr. chick embryos were used. Dextrose apparently acted as a stimulant rather than as a food. Prolonged pulsation required the presence of  $\text{NaHCO}_3$ , KCl and  $\text{CaCl}_2$ . Dild. dextrose-free Locke soln. and 0.9% NaCl soln. first increased and then slowed the pulsation rate. Concd. dextrose-free Locke soln. slowed the rate and decreased the strength of the beat. Increase in the concn. of KCl slowed the heart; absence of KCl first accelerated, then slowed, and finally stopped the heart. Increase in the concn. of  $\text{CaCl}_2$  caused a marked reduction in pulsation rate at the end of several hrs. J. S. H.

**Magnesium : a solvent in nephrolithiasis and an aid in preventing salivary calculus formation.** BERNARD B. BADANES. *Dental Cosmos* 71, 251-5(1929).—Sol. Mg salts administered orally have a solvent action on  $\text{CaC}_2\text{O}_4$  calculi in the urinary tract; they also dissolve mucin and globulin. It is recommended that *tooth pastes* contain 0.5%  $\text{MgSO}_4$  and 0.5%  $\text{MgCl}_2$  in order to help dissolve salivary calculi which contain  $\text{CaC}_2\text{O}_4$ , mucin, and globulin. JOSEPH S. HEPBURN

**Effect of soap in dentifrices on the tissues of the oral cavity.** BERNARD B. BADANES. *Dental Cosmos* 71, 474-9(1929).—When a soap is used in a dentifrice, it dissolves the edges of the gums, and thus gives rise to recession of the gums. When both soap and  $\text{CaCO}_3$  are present, in the presence of the saliva white insol. Ca soaps are formed and deposit, e. g., in the interproximal spaces. JOSEPH S. HEPBURN

**Studies in local anesthetics: method for determining anesthetic efficiency by the use of goldfish.** H. T. DAILEY AND H. C. BENEDICT. *Dental Cosmos* 71, 704-7(1929).—Cocaine-HCl is 8.4 times as efficient as an anesthetic as procaine-HCl; of these 2 compds. procaine-HCl is far less toxic. The method is described. JOSEPH S. HEPBURN

**Ceanothyn as a hemostatic.** C. B. THARALDSEN. *J. Am. Inst. Homeopathy* 22, 428-35(1929).—Ceanothyn contains 1 mg. of the alkaloids of *Ceanothus Americanus* (the wild snowball or New Jersey tea) per cc. of hydro-alc. ext. These alkaloids (3 in number) possess hemostatic properties, due to their acceleration of the action of thromboplastin, but cannot produce intravenous clotting, and have no action on the heart, liver or kidneys. Oral administration of 2 to 4 fluid drachms produces, on the av., a decrease of 28% in clotting time; the max. effect occurs in 30 to 45 min. and may be maintained by doses of 2 fluid drachms at intervals of 30 min. JOSEPH S. HEPBURN

**Effect on tonus and reflexes of alcohol applied to the femoral nerve of the decerebrate cat.** J. M. D. OLMSTED AND JOSEPHINE BALL. *Univ. Calif. Pub. in Physiol.* 7, 43-56(1929).—Alc. (13%) was applied to the femoral nerve of the decerebrate cat, and isotonic records were made of the movement of the isolated or nearly isolated quadriceps muscle. Reflexes disappeared in the following order and prior to evidence of failure of response to motor nerve stimulation: (1) stretch and tonus and probably rebound contraction, (2) knee jerk, (3) crossed extension. Recovery occurred in the reverse order. Tonus could be inhibited so long as it could be shown to be present. JOSEPH S. HEPBURN

**Hematoporphyrin excretion in the urine in chronic lead poisoning.** SIGMUND HIRSCHHORN AND WALTER ROBITSCHKE. *Z. klin. Med.* 106, 664-70(1927).—In 6 cases from a total of 77 cases of chronic Pb poisoning, a layer of the urine 5 cm. in thickness gave the spectrum of acid hematoporphyrin. The hematoporphyrin had its origin in the hemoglobin of the erythrocytes. JOSEPH S. HEPBURN

**Salt action and diuresis.** ERNST BLOCH. *Z. klin. Med.* 106, 733-44(1927).—Abundant excretion of urine is accompanied by an increased  $p_{\text{H}}$  value. The excretion of Na and Cl ions is parallel; hence NaCl is being excreted. Intravenous injection of KCl increases the excretion of most ions and of  $\text{H}_2\text{O}$ . Intravenous injection of NaCl produces disturbances in the excretion of  $\text{SO}_4$  and  $\text{PO}_4$  anions. Intravenous injection of  $\text{Na}_2\text{SO}_4$  causes a marked increase in the urinary sulfates and decreases in both the vol. and the excretion of most ions. No definite relationship exists between the action of injected ions and their excretion. JOSEPH S. HEPBURN

**Further communication on insulin hypoglycemia and insulin shock in man.** H. O. KLEIN AND H. HOLZER. *Z. klin. Med.* 107, 94-112(1928); cf. C. A. 22, 816, 3458. In insulin hypoglycemia, the venous blood is bright red, almost as red as arterial blood, apparently due to a high oxyhemoglobin content. JOSEPH S. HEPBURN

**Fatty changes in the Kupfer cells in the liver of the guinea pig in phosphorus poisoning.** J. S. LAWRENCE AND M. M. HUFFMAN. *Arch. Path.* 7, 809-12(1929).—Administration of P in small quantities to guinea pigs produces an accumulation of fatty globules in the Kupfer cells as an early manifestation of P poisoning of the liver. H. F. H

**The effect of small doses of plasmochine on the viability of gametocytes of malaria as measured by mosquito infection experiments.** M. A. BARBER, W. H. W. KOMP AND B. M. NEWMAN. *U. S. Pub. Health Repts.* 44, 1409-20(1929).—Plasmochine in small doses has a definite effect on the viability of crescents as measured by mosquito infection tests. It is probable that the general use, in a population, of such small doses of plasmochine would be safe and effective in reducing the transmission of malaria. J. A. K

**Influence of oral administration of saponin upon intestinal absorption.** N. ENDO, T. MIZOGUCHI AND YET. K. NAITO. *Japan Med. World* 9, 35-8(1929).—Rabbits and mice being used the following substances were tested: potassium iodide, reduced iron magnesium sulfate, cholera bacilli, typhoid bacilli, rat-typhoid bacilli and cholera and typhoid immune sera in the presence of added saponins. It is concluded that when

various chemical substances are mixed with saponin they are more readily absorbed by the intestinal canal. When various bacilli or immune serums are mixed with saponin they become suitable for oral immunizing.

N. KOPELOFF

**The influence of calcium iodide on the heart and the vessels.** JERZY KAULBERSZ. *Méd. Doświadczalna i Społeczna* 9, 458–66 (467 French) (1929).—A very dil. soln. of  $\text{CaI}_2$  has no influence on the blood vessels; more concd. solns. cause a constriction. Small doses increase the systole; larger doses retard the rhythm of the heart. The blood pressure in rabbits does not change after intravenous injection of small amts., but increases after large doses. The usefulness of  $\text{CaI}_2$  in cases of increased blood pressure could not be proved experimentally.

JAROSLAV KUČERA

**The effects of phosphate buffers on intestinal movements, and their inter-relation with calcium.** TORALD SOLLMANN, W. F. VON OETTINGEN AND Y. ISHIKAWA. *Am. J. Physiol.* 87, 293–304 (1928).—The addn. of phosphate to Locke or Ringer soln. tended to reduce the  $\text{Ca-ion}$  concn. by pptn. of  $\text{Ca}$  phosphates and as a result to depress the contractions of excised intestines immersed therein. This danger can be minimized by using only freshly prepd. mixts., by adding the min. amt. of phosphate (preferably not more than 0.024%) in as dil. soln. as possible as  $\text{H}_2\text{PO}_4$  or  $\text{NaH}_2\text{PO}_4$  with subsequent neutralization with  $\text{NaHCO}_3$ .

J. F. LYMAN

**Some chemical changes in muscle produced by drugs.** H. N. ETS. *Am. J. Physiol.* 87, 399–405 (1928).—Pilocarpine injected into anesthetized dogs produced a decrease in the  $\text{Na}$ ,  $\text{K}$ ,  $\text{Ca}$  and  $\text{Mg}$  of the  $\text{CCl}_3\text{CO}_2\text{H}$  ext. of the wall of the small intestine. Atropine produced opposite changes. Adrenaline produced an increase in  $\text{Na}$  and  $\text{Ca}$  and a decrease in  $\text{K}$  and  $\text{Mg}$ .

J. F. LYMAN

**The toxicity of purified bile preparation.** E. U. STILL. *Am. J. Physiol.* 88, 729–36 (1929).—Bilirubin, glycocholic acid, cholic acid, choleic acid and desoxycholic acid were prepd. and tested for toxicity by their effects on respiration and on blood pressure in dogs and their fatal effects on frogs. Bilirubin was non-toxic. The bile acids were toxic in the following descending order: choleic acid, desoxycholic acid, glycocholic acid and cholic acid.

J. F. LYMAN

**Action of calcium ions on the frog heart.** A. J. CLARK, G. H. PERCIVAL AND C. P. STEWART. *J. Physiol.* 66, 346–55 (1928).—The effects produced on the frog heart by variations in the total  $\text{Ca}$  content of the perfusion fluid, or by the addn. of citrate, seem to be due to variations in  $\text{Ca}$  ions. The simplest hypothesis seems to be that the response of the heart is dependent on the presence in the surface membranes of  $\text{Ca}$  soaps or of  $\text{Ca}$  lipid complexes, which are highly labile and dissociate as soon as the ionic concn. of  $\text{Ca}$  in the perfusion fluid is reduced.

J. F. LYMAN

**A vaso-dilator action of acetates.** WALTER BAUER AND D. W. RICHARDS, JR. *J. Physiol.* 66, 371–8 (1928).—Acetate solns. in doses of 25 mg. or more, intravenously in dogs and cats, exerted a vaso-dilator effect. The action seems to be upon the smaller blood vessels and is independent of the central nervous system and is not affected by atropine.

J. F. LYMAN

**The action of insulin in normal persons.** LORNA KING, E. L. KENNAWAY AND ALFRED PINEY. *J. Physiol.* 66, 400–2 (1928).—Injection of insulin in a normal person 3 hr. after breakfast produced profuse sweating, muscular weakness and tremor and extreme hunger, accompanied by an absolute decrease in neutrophil leucocytes and an absolute increase in lymphocytes. Lack of available carbohydrate is probably responsible for the physiol. symptoms.

J. F. LYMAN

**The effect of sodium sulfate on the oxygen usage of the kidney.** A. R. FEE. *J. Physiol.* 67, 14–6 (1929); cf. *C. A.* 22, 3689.—There was no increase in the  $\text{O}_2$  consumption of the kidney after the intravenous injection of  $\text{Na}_2\text{SO}_4$  unless a marked increase in the renal blood flow and a diuresis occurred.

J. F. LYMAN

**The feeding of saccharin to mice. A study of the question of minimal toxic action.** K. B. LEHMANN. *Arch. Hyg.* 101, 39–47 (1929).—The administration of large amts. of saccharin to mice for three generations appeared to have no effect upon their growth, development, or ability to reproduce.

E. R. MAIN

**The effect of technically and hygienically important gases and vapors upon the organism. Brominated hydrocarbons of the aliphatic series.** ERHARD GLASER AND S. FRISCH. *Arch. Hyg.* 101, 48–64 (1929).—Subcutaneous injection showed that  $\text{C}_2\text{H}_5\text{Br}$  is 6 times,  $\text{C}_3\text{H}_7\text{Br}$  4 times and  $\text{MeBr}$  7 times as toxic as  $\text{EtBr}$ . The toxic action of the vapors of  $\text{C}_2\text{H}_5\text{Br}$  and  $\text{MeBr}$  is 8 times greater than that of  $\text{EtBr}$  vapor. The inhalation of  $\text{C}_2\text{H}_5\text{Br}$  vapor is without toxic result. Because of its greater volatility, the danger attending the use of  $\text{EtBr}$  is more than twice as great as that attending the use of the more toxic  $\text{C}_2\text{H}_5\text{Br}$ .  $\text{MeBr}$  is still more dangerous and the greatest caution should be observed in its use (cf. Glaser, *C. A.* 23, 1701). The inhalation of

subnarcotic doses of  $C_2H_4Br_2$  and MeBr may eventually result in death. The animal appear to tolerate larger concns. of the compds. for a short time better than lower concns. for longer periods. EtBr acts more rapidly, but the toxic effect of  $C_2H_4Br_2$  is more lasting. E. R. MAIN

**The status of alcohol and of prohibition liquor from the chemist's standpoint.** CHARLES D. HOWARD. *New England J. Med.* 200, 933-6(1929).—The small quantities of aldehydes, fusel oil or MeOH present in distd. alc. beverages probably produce no toxic effects. The reported harmful results are due, in most instances, to an over-dosage of EtOH or to the use of corn. products, such as radiator alc., canned heat, etc. E. R. MAIN

**Pharmacological studies on certain derivatives of pyrrole. IV. The action of  $\alpha$ -benzoylpyrrole in the frog.** ELENA BIGLIOLI. *Biochim. terap. sper.* 16, 47-58 (1929).— $\alpha$ -Benzoylpyrrole in the frog causes the abolition of spontaneous motor and reflex activity; when applied locally it suspends the activity of the nerve and muscle; it produces local anesthesia; it arrests the activity of the isolated heart; if the isolated heart is washed after the arrest of activity, the heart begins to pulsate again and the normal cardiac activity returns. In general, benzoylpyrrole suspends the functional activity of the tissues and its action is transitory; it has very marked local anesthetic action. PETER MASUCCI

**The toxicity of certain uranium salts.** MARIANO MESSINI. *Biochim. terap. sper.* 16, 120-4(1929).—The salts were injected intravenously into rabbits and their toxicity was:  $UO_2(NO_3)_2 > UO_2(SO_4) > UO_2(OAc)_2$ . There was a marked diminution of the toxicity in proportion to the diln. used. Phosphates did not act as antidotes. There was a noticeable difference in the 3 salts between the immediate m. l. d. (g. equiv. 0.0005-0.0013 for the sulfate) and the delayed m. l. d. (g. equiv. 0.00000023). P. M.

**The convulsant action of the barium ion.** MICHELE MITOLO. *Boll. soc. ital. biol. sper.* 4, 34-7(1929).—The purpose was to test the changes in the reflex excitability induced by Ba on the nerve centers and to study its central seat of action. The expts. were made on the Baglioni prep. which consisted of the isolated cerebrospinal axes to *Bufo vulgaris*, the sciatic nerves and the 2 posterior limbs.  $BaCl_2$  solns. (2.2 and 4.5%) were applied locally on circumscribed areas of the posterior intumescence of the cerebrospinal axes; the applications were made (1) on the ventral side and (2) on the dorsal side of the intumescence. M. concludes that the Ba ion is a convulsant poison of the central nervous system comparable in its action to strychnine and capable of provoking tetanic convulsions, as it acts selectively on the central sensori-coordinator mechanisms of the posterior horn of the spinal medulla (dorsal side of the posterior intumescence). PETER MASUCCI

**Studies on antagonism. II. Camphor and sodium salicylate.** A. CHIODO. *Boll. soc. ital. biol. sper.* 4, 122-5(1929); cf. *C. A.* 22, 3231. PETER MASUCCI

**The action of intravenous injections of acetic acid on the respiratory rhythm.** G. SUNZERI. *Boll. soc. ital. biol. sper.* 4, 126-8(1929).—The rapid injection of 1 cc. N AcOH per kg. body wt. into the external jugular vein of a dog gives rise to an intense dyspnea and to respiratory disturbances. The animal is more resistant if AcOH and AcONa are injected. If the solns. are injected into the femoral artery, the effects are the same quantitatively, but are less intense and do not last as long. P. M.

**The effects of quinine treatment or other medicaments in the prevention of experimental malaria.** D. OTTOLENGHI AND G. BROTZU. *Boll. soc. ital. biol. sper.* 4, 150-3(1929).—Quinine treatment does not kill the sporozoites inoculated by the mosquitoes when the treatment has already begun or has been started soon after. The infection remains latent and then when the treatment is suspended, the disease appears in its typical form. Better results were obtained with plasmochine. P. M.

**The potassium ion and the action of sodium perchlorate on striated muscles.** MARIANO MESSINI. *Boll. soc. ital. biol. sper.* 4, 185-8(1929).—The contraction of striated muscles by  $NaClO_4$  is attributed to a derangement of the equil. of K ions in the interior part of the muscle, and not to the pptn. of  $KClO_4$ . This salt is less sol., less dissoed., and, therefore, the activity of the  $K^+$  ion is diminished. The conditions of equil. in the muscle may be restored by the addn. of small amts. of KCl to the perfusion fluid. PETER MASUCCI

**Pharmacological studies on certain derivatives of pyrrole. II. Pyrrole.** A. RABBENO. *Boll. soc. ital. biol. sper.* 4, 192-4(1929); cf. *C. A.* 22, 2984.—Conclusions: The toxicity of pyrrole in the guinea pig is characterized by a descending type of paralysis and by muscle contracture. Applied locally, it arrests the activity of the muscle, nerve and the cutaneous sensor receptors; allowed to circulate in the heart and in the isolated central nervous system, it arrests the activity. The process is reversible.

Pyrrole has an action approaching that of a narcotic; in the isolated organ the concn. which abolishes the reflexes is 10 times less than that which arrests the heart. **III. The action of  $\alpha$ -propionylpyrrole and  $\alpha$ -butyrylpyrrole in the frog.** *Ibid* 195-8.—The pharmacol. points covered are: fundamental action, local anesthetic action, action on isolated heart and action on the isolated central nervous system. P. M.

**The action of certain organic and inorganic anions on blood vessels and other smooth muscle organs.** G. Russo. *Boll. soc. ital. biol. sper.* 4, 208-11(1929).—The  $\text{HCO}_3$ ,  $\text{SO}_4$ , lactate and  $\text{PO}_4$  ions do not have any appreciable action on the blood vessels when allowed to circulate by perfusion methods; the acetate ion has vasodilator and the citrate ion vasoconstrictor action. The  $\text{HCO}_3$  and lactate ions have no action on the frog stomach, while the  $\text{SO}_4$ , acetate,  $\text{PO}_4$  and citrate ions have a depressor action on the tone and in part on the automatic movements of the organ. P. M.

**The pharmacology of strychnine derivatives (ethylstrychnine).** M. AIAZZI-MANCINI. *Boll. soc. ital. biol. sper.* 4, 219-20(1929).—The pharmacol. properties of ethylstrychnine are enumerated. In general, this substance although much less toxic has the same fundamental properties as strychnine. P. M.

**The pharmacology of the autonomous system.** M. AIAZZI-MANCINI. *Boll. soc. ital. biol. sper.* 4, 224-5(1929).—The pharmacol. action of *p*-methylaninoethanolphenol-HCl (sympatol) was as follows: There was a marked positive inotropism on the heart of the guinea pig and rat. Its action on the blood pressure of the rabbit, cat and dog, with and without anesthetic, and with and without cutting the vagus, was similar to adrenaline but quantitatively less intense. Sympatol is much more resistant to oxidation and its action lasts longer than adrenaline. Unlike adrenaline it retains its physiol. action after ergotamine treatment. In doses of 2-3 mg., it increased the tone of the intestine of a rat without modifying the rhythm.  $1/10$  to  $2/10$  mg. doses arrest the contractions of the uterus and lower its tone. PETER MASUCCI

**Further studies on the action of urotropine on uterine contractions.** C. VERGESI. *Boll. soc. ital. biol. sper.* 4, 278-80(1929); cf. C. A. 22, 3230.—Urotropine administered intravenously offers to the obstetrical clinic an efficacious means of stimulating uterine contractions. V. made use of this clinically in 6 cases with satisfactory results. PETER MASUCCI

**The action of cocaine hydrochloride on a sensitive nerve (lingual nerve of the dog sensory path of the lingual-maxillary reflex).** J. RÉGNIER AND G. VALETTE. *Bull. sci. pharmacol.* 36, 284-91(1929).—A method is given for testing local anesthetics on a nerve able to respond to a single excitation. The method of Cardot and Laugier, *Compt. rend. soc. biol.* 86, 529(1922), is employed. A. E. MEYER

**The therapeutics of trypanosomiasis.** LUIS BAKUNIN. *Rev. sud-americana endocrinol., immunol., quimioterap.* 12, 10-4(1929).—Report on effects obtained with atoxyl, emetic tartar and trypanamide or trypanarsyl. A. E. MEYER

**The mode of action of the thyroid hormone.** RUDOLF WEIL AND MARTIN LANDSBERG. *Biochem. Z.* 207, 186-93(1929).—Thyroxine in a diln. of 1:400000 increases quantitatively tissue autolysis in neutral medium. On the basis of this observation an attempt is made to explain physicochemically the various metabolic effects of thyroxine. S. MORGULIS

**The influence of insulin and thyroxine on liver autolysis.** A. SIMON AND P. WEINER. *Biochem. Z.* 207, 319-31(1929).—Following large insulin doses the autolysis of the liver from starved and non-starved cats at  $p_H$  6.04-6.24 proceeds more slowly than in livers from control animals. This inhibiting action of the insulin cannot be found in *in vitro* expts., nor does thyroxine exert any action under these conditions. S. M.

**The effect of formaldehyde on dilute spleen extract solutions.** OTTO MÜLLNER. *Biochem. Z.* 208, 354-6(1929).—HCHO even in concns. of 0.5-0.2% exerts a strong injurious action on the diastase activity. This effect does not appear at once, and may require a day before its full action develops. S. MORGULIS

**The mode of action of the male sex hormone from substances obtained in the vegetable kingdom.** S. LOEWÉ, H. E. VOSS, F. LANGE AND E. SPOHR. *Endokrinologie* 1, 39-44(1928).—Tokokinines are hormones which are responsible for development of sexual characteristics, and are represented by the female hormone, the lykinine and the male, the androkinine. The presence of the latter could not be demonstrated until a special test was devised. The test consists in following the regenerative changes in certain organs in castrated animals under the influence of the androkinines; it serves both qual. and quant. purposes. Prepns. were made from the male flowers of *Salix caprea* which demonstrate the presence of these androkinines in the plant kingdom. The identity of the androkinines from animal and plant sources cannot be proved,

but certain properties and keeping qualities suggest their chem. identity. Likewise their action manifests strict sex specificity.

S. MORGULIS

**Influence of resorption velocity on the insulin action.** WALTER REDISCH AND B. M. BLOCH. *Endokrinologie* 1, 241-50(1928).—The findings of Bertram that the injection of a protein (caseosar) together with insulin considerably prolongs its action have been corroborated. It was furthermore demonstrated that the same effect could be produced by adding to the insulin a 5% gum acacia soln. so that the retarded action could not be attributed to the protein. Dialysis expts. also show that a gum-acacia-insulin mixt. dialyzes much more slowly through a membrane than pure insulin. S. M.

**The effect of adrenaline on the gaseous metabolism.** F. KLEIN AND R. WEISS. *Endokrinologie* 1, 264-71(1928).—Intravenous injection of adrenaline in doses of 0.001-0.003 mg. per min. has no effect on the heat production but raises the respiratory quotient of lightly or deeply anesthetized rabbits. Large adrenaline doses (0.8 mg.) increase the respiratory quotient of deeply narcotized rabbits, but the total metabolism is generally diminished. The metabolic effect of the adrenaline, both raising or lowering, is a complex phenomenon. Small "physiol." doses of adrenaline increase the metabolism of normal animals and humans. In anesthetized animals this increase in metabolism does not occur. The metabolic effect of large adrenaline doses depends upon the action of the mobilized carbohydrate. In starved animals or in deep narcosis the metabolism falls; in well nourished animals and in light anesthesia the metabolism rises; while under large adrenaline doses the lowering of the metabolism predominates over the metabolism-raising action of the carbohydrate plethora. S. MORGULIS

**The action of synthalin on the gaseous metabolism.** F. KLEIN AND R. WEISS. *Endokrinologie* 1, 321-2(1928).—Synthalin does not affect the gaseous metabolism in a manner comparable to the action of insulin. Non-toxic doses (1 mg. per kg.) do not increase the respiratory quotient. S. MORGULIS

**Experimental therapeutic studies on females with spontaneous cycle insufficiency.** S. LOEWY, H. E. VOSS AND E. PAAS. *Endokrinologie* 1, 323-37(1928).—To 9 sexually ripe female mice manifesting spontaneous insufficiency in the sexual cycle, anterior lobe of the hypophysis was transplanted and this had in 80% of the expts. a more or less definite effect on the development of heat. The hypophysis action depends upon the amt. of transplanted gland, 0.6-3.2 g. per kg. body wt. being either without influence or leading only to the proestrus stage; 6.3 g.-20.0 g. per kg., however, causes a more or less pronounced estrus. In no case did the effect of the anterior lobe of hypophysis last beyond the first estrus. Tyramine, histamine or synthetic cycloethanamine (hexamethyldipyrrollethanamine) neither in small nor in large doses, even when administered continually, have no favorable effect on the sexual insufficiency. S. MORGULIS

**Pharmacodynamics of chlorophyll.** EDUARD RENTZ. *Skand. Arch. Physiol.* 56, 36-117(1929).—Medium doses of chlorophyll increase the tone and increase also the height and frequency of the contraction of the rabbit intestine but large doses generally paralyze the motor function of the intestine followed by a transient improvement. The action of parasympathetic stimuli on the intestine is not noticeably affected by medium doses of chlorophyll while large doses inhibit or prevent their action. Atropinization generally weakens somewhat the chlorophyll effect. The adrenaline action is markedly prolonged while BaCl<sub>2</sub> produces the same strong effect even after large chlorophyll doses. On the isolated rabbit uterus medium chlorophyll doses have a mild motor and tonic effect; but even the largest doses always act like adrenaline. The action is reversible. The adrenaline effect is prolonged, but atropinization inhibits or stops the chlorophyll action. After large atropine doses chlorophyll in large amts. produces a fall in tone. The effect of BaCl<sub>2</sub> is unchanged. Chlorophyll increases the amplitude and diminishes somewhat the frequency of contraction of the isolated frog heart. The adrenaline action is not strengthened. Chlorophyll is equally active before and after the treatment of the heart with ergotamine, but the influence of acetylcholine is inhibited or prevented by large chlorophyll doses. Chlorophyll causes vasodilation, but it also greatly improves the adrenaline action, but has no effect on the influence of BaCl<sub>2</sub> on the vascular system. The rabbit aorta has an increased tonus under the influence of chlorophyll which also improves the adrenaline effect. Chlorophyll produces a slight improvement in the respiration of the rabbit, a slight rise in blood pressure, a dilatation of the kidney and intestinal vessels but has no influence on the vessels of the extremities. In large doses chlorophyll produces an opposite action. Blood pressure expts. with cats give the same results but the adrenaline effect is increased although chlorophyll acting alone on the kidney vessels causes a slight dilatation. It follows therefore that chlorophyll has a marked stimulating effect on muscle, mani-

fects a strong affinity for the vegetative nervous system, especially sensitizing the sympathetic motor nerve endings to adrenaline, but its action on the inhibitory portion of the sympathicus could be clearly observed only in the isolated rabbit intestine. Large chorophyll doses paralyze the vagus and to a lesser extent also the sympathetic.

S. MORGULIS

**Action of strophanthin on the formed elements of the blood, especially on thrombocytes and leucocytes.** PETER WEGGER. *Skand. Arch. Physiol.* 56, 291-301 (1929).—Injections of 0.08-0.15 mg. strophanthin per kg. of rabbit cause a strong and protracted thrombocytosis which does not disappear for about 30 days. In several instances the thrombocytosis was accompanied by a leucocytosis.

S. MORGULIS

**The effect of arsenic on the maturation of red blood cells.** RAPHAEL ISAACS. *Folia Haematol.*, I Abt., 37, 389-404 (1929).—The effect of toxic and non-toxic doses of  $As_2O_3$  and  $As_2O_5$  was studied on normal and tumor-bearing white mice by observing the percentage variation of 2 stages in the development of the red blood cells (granule red blood cell and the reticulocyte stage). Non-lethal doses of As caused a decrease in the percentage of both stages of young red blood cells apparently as long as the As was present in sufficient concn. in the body. After this, if no more As was given there was a tendency for the more immature red blood cells to increase in percentage. In acute poisoning with death within 24 hr. there was no characteristic marked change in the abs. or relative numbers of young red blood cells. In the tumor-bearing mice the depression in the no. of young red cells was not as marked, but a study of red cell formation showed that the bone marrow did not have as much reserve as in the normal mice and that more cells were in the younger stages. The effect of  $H_3AsO_4$  is similar to that of  $H_3AsO_3$ , but its action is less intense and somewhat delayed.

J. T. M.

**Carbon monoxide and veronal (poisoning).** GUYOR. *Ann. mèd. légale criminal. police sci.* 9, 119-21 (1929).—A case is described of attempted suicide by means of veronal and CO (illuminating gas).

A. PAPINEAU-COUTURE

**Therapeutic values of some rare element compounds.** ROSALIE M. PARR. *Trans. Illinois Acad. Sci.* 21, 194-7 (1928).—Preliminary report. P. discusses the use of Ge compds. for the treatment of anemia, and cites several cases where compds. of Ge have produced beneficial results.

L. L. QUILL

**Pharmacology of the crop (esophageal) muscles.** P. J. HANZLIK AND E. M. BUTT. *J. Pharmacol.* 33, 387-441 (1928); cf. *C. A.* 22, 4653.—The pharmacol. action of the following drugs on the intact crop muscles is described: autonomic drugs: apocodeine, arecoline, atropine, choline, ephedrine, adrenaline, ergotoxine, nicotine, phenylethanolamine, physostigmine, pilocarpine; local anesthetics: butyn, cocaine, procaine, saligenin; hypnotics and opiates: alc., Na barbital, NaBr, chloral, morphine, papaverine, chelidonine; proteinogenous agents and organ exts.: guanidine, histamine, peptone, pituitary ext., horse and beef serum, tyramine; muscular stimulant and depressant drugs: Ba, caffeine, nitroglycerin, quinine, quinidine,  $NaNO_3$ , sparteine; phys. agents, salts and ions:  $AcOH$ , agarized serum,  $CaCl_2$ , Ca lactate, camphor, cholesterol, colloidal iron, fuller's earth,  $MgSO_4$ .

C. RIEGEL

**The biologic study of two new pentavalent trypanocidal arsenical compounds: the monosodium salt of 2-p-arsono-anilino-ethanol (etharsanol) and 3-p-arsono-anilino-propanol (proparsanol).** W. K. STRATMAN AND A. S. LOEVENHART. *J. Pharmacol.* 33, 443-57 (1928).—Compds. were administered to mice, rats, guinea pigs and rabbits intravenously, intramuscularly, subcutaneously, intraperitoneally and orally. Clinical symptoms and results of histological examn. are described. The max. tolerated dose of etharsanol is 0.15-1.25 g. per kg., and the m. l. d. 0.25-1.4 g. per kg., depending on the animal used and the method of administration. The max. tolerated dose for proparsanol is 0.2-1.4 g., and the m. l. d. 0.3-1.75 g. per kg. Etharsanol is twice as toxic as tryparsamide, but has a low toxicity compared to other arsenical drugs.

C. RIEGEL

**The influence of chemical and other agents upon the toxicity and antigenic power of ricin.** II. The detoxification of ricin by means of various agencies. EMMETT B. CARMICHAEL. *J. Pharmacol.* 35, 193-221 (1929).—Ricin prepd. from castor bean press cake by the method of Osborne, Mendel and Harris agglutinates red cells and is toxic. The m. f. d. for mice, guinea pigs and rabbits was 0.02 mg. per kg. and for rats slightly more. Ricin lost its toxicity when treated (a) with oxidizing agents, (b) with ultra-violet light and (c) by boiling the aq. soln. Congo red diminished toxicity, the animals developing ulcers, but surviving the injection, whereas neutral red had no effect on the toxic properties of ricin. III. The production of immunity by means of ricin and detoxified ricin. *Ibid* 223-39.—Rabbits and guinea pigs were given injections of ricin detoxified by heating (coagulation). The doses given were sufficient (if not

detoxified) to kill 300 animals. When these animals were subsequently given a lethal dose of untreated ricin (0.02-0.026 mg. per kg.) 6 of 7 animals lived, indicating production of immunity to the toxin. Blood serum of these animals (taken before injection of untreated ricin), when mixed with untreated ricin and injected into other animals, furnished immunity also. Ricin treated with  $\text{KMnO}_4$  in the proportion of 35-70 mg. to 0.3 g. ricin detoxified the ricin. This treated ricin injected into rabbits developed in them an immunity to untreated ricin in amts. equiv. to 100-120 times the lethal dose. Serum from such animals when injected into mice along with untreated ricin used, and length of time of treatment, destroyed both toxic and antigenic principles. The expts. are taken to indicate that ricin has 2 biol. functions, one toxic and the other antigenic, each of which is dependent on a different group or part of the toxin. C. R.

The action of chlorine on men poisoned by toxic smokes. DUNCAN C. WALTON AND W. A. ELDRIDGE. *J. Pharmacol.* 35, 241-56(1929).—When Cl was bubbled through solns. of diphenylchloroarsine, diphenylcyanoarsine or diphenylaminochlorarsine, the As was oxidized to the pentavalent form. The resulting products were non-irritating when breathed by men, and gave no reaction when titrated with I. Men gassed with any of the 3 toxic gases were markedly benefitted if given Cl. C. RIEGEL.

The effect of salicylate administration on the acetone body content of the blood. HAROLD B. MYERS AND CHARLES FERGUSON. *J. Pharmacol.* 35, 313-19(1929).—The acetone and  $\beta$ -hydroxybutyric acid content of the blood in rabbits was not altered by administration of Na salicylate in either therapeutic or toxic doses. The acetone content of blood in 2 human subjects was not altered by salicylate administration. C. RIEGEL.

The action of some tertiary amines related to ephedrine. F. R. CURTIS. *J. Pharmacol.* 35, 321-32(1929).—C. investigated the action of the following tertiary amines on blood pressure of pithed cats, on strips of uterus immersed in a soln. contg them, and on the bronchii of cats with brain, medulla and most of the cervical spinal cord destroyed: (1) methylephedrine, (2) ethylephedrine, (3) ethanolephedrine, (4) *n*-propylephedrine, (5) isopropylephedrine, (6) butylephedrine and (7) diethylnorephedrine. Nos. 1, 2, 3 and 7 were equal in their power of raising blood pressure, but were all far less active than ephedrine. Nos. 4, 5 and 6 were less active than the other four. While small initial doses produce slight rise in blood pressure subsequent doses at first had no effect, and later produced a fall in blood pressure. An injection of ephedrine at the time of this fall caused a small and temporary rise, or even a definite fall. All 7 compds. caused contraction of strips of uterus (more powerful than for ephedrine). Where the action of the compds. on bronchii was detd. lung vol. was recorded. 1, 2 and 7 dilated the bronchii with the same efficiency as ephedrine. 3, 4, 5 and 6 had no effect in non-toxic doses. The results indicate that Nos. 1, 2 and 7 might be used in treatment of asthma in preference to ephedrine because of the lesser effect on circulation. C. RIEGEL.

The pharmacology and toxicology of some new organic mercury compounds. SEYMOUR J. COHEN. *J. Pharmacol.* 35, 343-50(1929).—Me, Et, Bu, tolyl, benzyl, Ph and naphthyl mercuric thioglycollic acids inhibit the growth of the tubercle bacillus in 1:500,000 diln. Aq. solns. of the first 3 compds. (more sol. than the others) were injected intraperitoneally into white rats and intravenously into rabbits. The m. l. d. (smallest amt. per kg. which killed in 24 hr.) in rats was 40, 30 and 30 mg., resp; m. l. d. in rabbits (smallest amt. which caused death regardless of time) was 20 mg. in each of 3 cases. When given to frogs, the drugs produced signs of depression of the central nervous system. In dogs moderate doses caused a fall in blood pressure of 10-30 mm. Hg. The paralysis of the hind legs produced by these compds. given in repeated small doses (the most striking effect) is not due (1) to the Hg ion, (2) to org. Hg ion or (3) to the thioglycollate ion. A similar paralysis was produced by methyl mercuric chloride (in NaOH). The paralysis may be caused by a particular type of organo-mercury combination with a hydrocarbon radical. C. RIEGEL.

The effect of methylguanidine upon the blood pressure of adrenalectomized dogs. RALPH H. MAJOR AND C. J. WEBER. *J. Pharmacol.* 35, 351-4(1929).—In 3 dogs injections of methylguanidine sulfate 10 min. after the adrenals were removed caused a pronounced rise in blood pressure. It is concluded that the pressor action of methylguanidine in the normal animal is not due to excessive activity of the adrenals. C. R.

Morphine habituation: Tolerance to the stimulant action of morphine. HARRY GOLD. *J. Pharmacol.* 35, 355-61(1929).—Cats were given daily doses of 5, 10 and 20 mg. per kg. of morphine sulfate intramuscularly for 9-30 days and symptoms of stimulation of higher nervous centers and of stimulation of the cord were noted. Habitua-

tion developed only slowly and gradually, especially with the 20 mg. dose. Symptoms of brain stimulation diminished more than those of cord stimulation, and with the 20 mg. dose the latter symptoms were not depressed throughout the period of expt. When the drug was withheld after a period of habituation, drowsiness and loss of appetite result, lasting several days. This could be relieved by injection of the drug.

C. RIEGEL

**The treatment of experimental tuberculosis with organic gold and copper compounds.** W. E. DIXON AND J. C. HOYLE. *J. Pharmacol.* 35, 409-15(1929).—Guinea pigs and rabbits with tubercle bacilli were given intravenously or subcutaneously, at intervals of 7-14 days, 0.23-3.0 cc. of 1% aq. solns. of Au or Cu salts, (Cu, 4 etu)  $\text{NO}_3$  and (Au, 2 etu)Cl,  $\text{H}_2\text{O}$ , where etu represents ethylenethiocarbamide. Although in rabbits the Au compd. delayed death, the results on the whole do not indicate beneficial results. All the animals after death showed progressive tuberculous lesions.

C. RIEGEL

**The relation of arsenicals to the glutathione content of animal tissue.** HERMAN BROWN AND JOHN A. KOLMER. *J. Pharmacol.* 35, 417-24(1929).—Dogs, rabbits, guinea pigs and albino rats were exsanguinated after treatment with arsphenamine or neoarsphenamine, and the glutathione contents of defibrinated blood and of tissues detd. Small repeated therapeutic doses of arsphenamine or neoarsphenamine had no effect on glutathione content. Single large doses caused a reduction in the amt. of reduced glutathione. Conclusion: While large doses diminished the amt. of reduced glutathione the toxic effects of these compds. administered therapeutically (pathological changes in liver and kidneys) cannot be attributed to direct action in tissue glutathione.

C. RIEGEL

**Studies in absorption and excretion of magnesium.** W. F. TAYLOR AND J. E. WINTER. *J. Pharmacol.* 35, 435-9(1929).—Two men excreted in the urine 9.48 and 11.26% of a dose of  $\text{MgCl}_2$  given by mouth. A dog excreted 7.55%. Blood serum Mg in dogs increased after giving  $\text{MgCl}_2$ , the increase after 1 g. amounting to 10.4 mg above the normal. No narcosis was observed. When dogs, in which fever had been produced by injection of a hay infusion, were given  $\text{MgCl}_2$  400 mg. per kg. the fall in temp. paralleled the rise in Mg in the blood. Four rabbits were given 800 mg.  $\text{MgCl}_2$  per kg. Two at the stage of light narcosis had a blood Mg of 7.03 mg. per 100 cc. and 11.3 mg., two in deep narcosis 18.2 and 21.1 mg. per 100 cc.

C. RIEGEL

**The action of the post-pituitary principles on the blood.** F. R. CURTIS AND J. W. PICKERING. *Lancet* 215, 695-6(1928).—The 2 fractions of post-pituitary ext.—vasopressin and oxytocin—sepd. in the Parke, Davis and Co., labs. were studied. Vasopressin increased the coagulation of the blood both in fasting animals and in those at the height of digestion. Oxytocin inhibited coagulation but after hemorrhage it increased it.

F. B. SEIBERT

**Iodized tincture of guaiacol in the treatment of synovial and serous affections.** JOHN MABERLY. *Lancet* 216, 437-8(1929).—In cases of pleurisy and synovitis of various types, tinctures of iodoguaiacol had a definite selective antiseptic and antiphlogistic action in these membranes.

F. B. SEIBERT

**Respiratory action of lobeline in the dog.** SAMSON WHITE AND F. R. CURTIS. *Lancet* 216, 439-40(1929).—Doses of 0.15-0.4 mg. per kg. body wt. of lobeline in the dog anesthetized with chloralose produce, as a rule, a marked initial stimulation of respiration. The period of hyperpnea in most of the observations is from 1 to 2.5 min. and the expired  $\text{CO}_2$  per min. may be 2-4 times the resting amts. The hyperpnea is, however, usually transitory.

F. B. SEIBERT

**The use of avertin for anesthesia.** JOSEPH BLOMFIELD AND F. E. SHIPWAY. *Lancet* 216, 546-9(1929).—Avertin,  $\text{CBr}_3\text{CH}_2\text{OH}$ , is a valuable anesthetic. Contraindications are few, but may be rectal, liver and kidney diseases.

F. B. SEIBERT

**Polycythemia vera treated with phenylhydrazine hydrochloride.** W. MACKAY. *Lancet* 216, 762-4(1929).—Phenylhydrazine given by mouth causes destruction of red cells. The bilirubin content of the blood serum increases and occasionally urobilin appears in the urine. It is able to call forth a leucocytosis.

F. B. SEIBERT

**Action of insulin upon gastric secretion.** SHOZO TAKIMOTO. *Hokkaido J. Med.* 6, 938-58(1928).—Insulin accelerates the gastric juice secretion of man and increases acidity and amt. of pepsin.

K. SOMEYA

**Influence of strychnine upon the glycogen consumption and the carbon dioxide production of the spinal cord.** BUNYA KOMORI. *Okayama J. Med.* 40, 1408-16(1928).—The glycogen content of the spinal cord of the frog is decreased by strychnine. The amt of  $\text{CO}_2$  production of the spinal cord is 0.012 mg. per min. on the av., showing an

increase of 9% was compared with the normal production 0.011 mg. per min.

K. SOMEYA

**Effect of phosphorus on nitrogenous substances in the bile.** KIZO SUGIU. *Okayama J. Med.* 40, 1481-506(1928).—When yellow P is given to a dog with a fistula in its gall-bladder the coagulable protein in the bile begins to increase in 4 days, and returns to the normal in 3-4 weeks. Urea begins to increase slightly in 4 days, and returns to the normal in 30 days. When glucose is given perorally and P is then administered, the effect is inappreciable for 2 mg. P per 2 kg. of the wt. of the animal, while with 3 mg. per 2 kg. there is a slight hindrance to the liver function. In hungry dogs, there is sometimes found a coagulable protein even before the P poisoning. After administration of P, there is a marked increase in the amt. of urea,  $\text{NH}_4\text{OH}$  and coagulable protein, which decreases on giving glucose. If adrenaline is injected into hungry dogs and P is then given there is a remarkable increase in the amt. of coagulable protein,  $\text{NH}_4\text{OH}$  and urea also increasing. If insulin is injected, the bile secretion is accelerated, while coagulable protein does not appear even after giving P.  $\text{NH}_4\text{OH}$  and urea slightly increase. The effect of phosphorus on amino acids in the bile. *Ibid* 2202-13.—In normal dogs, the quantity of amino acids in the bile is negligible; it increases on giving P. But if the liver glycogen is increased by giving glucose, or if insulin is injected subcutaneously, the amino acid formation after giving P decreases, the value approaching that of a normal dog. In hungry dogs, or in dogs that have been injected with adrenaline, the amino acid content increases after giving P, in proportion to the degree of hunger or to the quantity of adrenaline.

K. S.

**The fate of injected lactic acid and acetaldehyde.** TARO HACHIYA. *Tokyo Med. News* 1928, 1797-807.—In living bodies both lactic acid and  $\text{MeCHO}$  are transformed into sugar. The latter is also changed into lactic acid, but the conversion of lactic acid into  $\text{MeCHO}$  is difficult.

K. SOMEYA

**The antitoxic action of calcium chloride on sparteine sulfate.** P. L. VIOLE AND A. GIBERTON. *Compt. rend.* 188, 1181-2(1929).—The lethal dose of the sulfate of sparteine for guinea pigs was 10 mg. per 100 g. The antitoxic action of Ca was detd. *in vitro* and *in vivo*. In the former procedure a lethal dose of the sulfate of sparteine was dissolved in 5 cc. of a soln. of  $\text{CaCl}_2$  contg. 0.4 mg.  $\text{CaCl}_2$  per cc. and then injected under the abdominal skin. The animals survived indefinitely. For the *in vivo* tests the alkaloid was dissolved in 5 cc. of distd.  $\text{H}_2\text{O}$  and injected as before; immediately after the injection of the sparteine 2 cc. of an isotonic  $\text{CaCl}_2$  soln. was injected intracardially. The animals survived indefinitely. The Ca salt had no antitoxic action on diphtheria toxin.

M. H. SOULÉ

**Influence of a large quantity of iodine on the internal organs.** M. MINOWADA. *Acta Dermatol* (Kyoto) 11, 531-8(1928); *Ber. ges. Physiol. exper. Pharmacol.* 48, 450.

R. C. WILLSON

**The effect of smaller doses of histamine in stimulating human gastric secretion.** LOUIS M. GOMPERTZ AND WILLIAM COHEN. *Am. J. Med. Sci.* 177, 59-64(1929).—The previously employed doses of 0.5 mg. histamine seem unnecessary since doses as small as 0.25 mg. histamine-HCl are sufficient to demonstrate the action of histamine as a gastric secretory stimulant. With the smaller dose the objectionable systemic effects are averted.

R. C. WILLSON

**Clinical and experimental studies on calcium and cholesterol in relation to the thyroid-parathyroid apparatus.** PRESTON A. WADE. *Am. J. Med. Sci.* 177, 790-816(1929).—Doses of cod-liver oil of 20-50 cc. daily for 14-30 days before operation prolong the lives of thyroparathyroidectomized dogs. The Ca level falls as in control animals, but reaches lower levels. There is evidence of a relationship between the Ca and cholesterol content of thyroparathyroidectomized dogs which indicates a relationship in the metabolism of Ca and cholesterol. A rising cholesterol level in actual tetany was consistent with the occurrence of a decreasing Ca level. In toxic thyroid disease (human) the blood Ca was below normal. After operation the Ca rose above normal. The blood cholesterol level was raised in these cases before operation and rose only slightly thereafter.

R. C. WILLSON

**Increase in blood sugar following the ingestion of glycerol.** JULIUS FERBER AND SOPHIE RABINOWITSCH. *Am. J. Med. Sci.* 177, 827-32(1929).—Glycerol given to a human being on an empty stomach will produce hyperglucemia. The extent of the latter is in direct ratio to the disturbance of carbohydrate metabolism in the individual. In more progressive cases of diabetes glycerol may also produce a glucosuria. These findings indicate that in the human, glycerol is converted into glucose.

R. C. W.

**The anesthetic properties of carbon dioxide.** CHAUNCEY D. LEAKE AND RALPH M. WATERS. *Anesthesia and Analgesia* 8, 17-19(1929).—Anesthesia was produced

in rabbits and dogs with mixts. of 30–50% CO<sub>2</sub> and O. The muscles are relaxed and the reflexes disappear. Respiration is deeper than usual, but the rate is unchanged. Blood pressure is raised during induction, but is about normal during the period of anesthesia. Pulse rate is increased during induction and depressed during anesthesia.

R. C. WILLSON

**Effect of alcohol on the patellar tendon reflex time.** LEE EDWARDS TRAVIS AND JOHN M. DORSEY. *Arch. Neurol. and Psychiatry* 21, 613–24 (1929).

R. C. W.

**The pharmacotherapeutic action of colloidal magnesium hydroxide on toxic hepatitis and nephritis.** EMIL PRIBYL. *Biol. Spisy vysoké školy zverolék Brne* 6, 16 (1927); *Ber. ges. Physiol. expil. Pharmacol.* 48, 125.—Rabbits were poisoned with P, As and uranylacetate and an aq. emulsion of colloidal Mg(OH)<sub>2</sub> was given intravenously. The Mg(OH)<sub>2</sub> effected a general improvement in the animals, as was seen in the blood and urine conditions (rapid recession of the residual N and negative findings in the urine) and in the liver and kidney function. The therapeutic action of the Mg(OH)<sub>2</sub> is ascribed to the alky. of the prepn. and to the sp. action of the Mg ions on the injured tissue.

R. C. WILLSON

**The effects of glycocyamine and glycocyamidine on the blood pressure.** RALPH H. MAJOR AND C. J. WEBER. *Bull. Johns Hopkins Hosp.* 42, 207–11 (1928).—Injections of 18 mg. per kg. dog produced a marked fall in the blood pressure. Glycocyamine also reduces the hypertension produced by methylguanidine. Glycocyamidine produces similar results, although it is not quite so effective against the methylguanidine hypertension and the fall is of shorter duration.

R. C. WILLSON

**The influence of insulin on diabetic lipemia.** I. DONOMAE. *Folia endocrinol. japon.* 4, 45 (1928); *Ber. ges. Physiol. expil. Pharmacol.* 47, 774.—The cloudy serum before the treatment showed an increase in all the lipid fractions; it was greatest in the fatty acids, moderate in lecithin and relatively slight in cholesterol. After insulin treatment the lipid content was reduced; it was greatest and most rapid in the fatty acids, slight in the lecithin and no constant change could be detected in cholesterol.

R. C. W.

**The influence of endocrine preparations on the basal metabolism during hyperthyreosis. II. The influence of insulin.** T. HARA. *Folia endocrinol. japon.* 4, 433–52 (1928); *Ber. ges. Physiol. expil. Pharmacol.* 47, 753.—Insulin (Lilly) given subcutaneously in doses of 9–15 units per day decreased the increased basal metabolism in 6 cases, increased it in 4 and had no effect in 4. The max. effect appeared after 30–40 days. The respiratory quotient was increased in some cases. Body wt. increased in 11 of 15 cases. Cf. C. A. 23, 3506.

R. C. WILLSON

**The influence of endocrine preparations on the basal metabolism in hyperthyreosis. IV. The influence of Lugol solution and of combined therapy with iodine and inner-secretory preparations.** T. HARA. *Folia endocrinol. japon.* 4, 28–30 (1928); *Ber. ges. Physiol. expil. Pharmacol.* 48, 424; cf. preceding abstr.—In 7 cases of hyperthyreosis the decrease in basal metabolism caused by Lugol soln. (distd. H<sub>2</sub>O, 27.0 g.; I, 1.0 g.; KI, 15–20 drops daily) was greater than that following organotherapy. The effect is seen after 7 days (av.). After 11–16 days (av. 14) the Lugol medication begins to show toxic action. The basal metabolism increases again. In toxic adenoma (3 cases) the Lugol medication increased the basal metabolism from the first and aggravated the symptoms. The administration of thymus gland substance subdued in 2 of 3 cases the toxic effect of over-medication with Lugol's soln. After long-continued medication the basal metabolism increased again and was checked only by discontinuing the medication. Suprarenal substance and insulin also checked the increase provoked by the continued Lugol medication.

R. C. WILLSON

**The effects of novocaine on the blood.** FRANCESCO BELLELLI. *Folia med.* 14, 857–75 (1928); *Ber. ges. Physiol. expil. Pharmacol.* 47, 842.—In dogs, cocaine is 4 times as toxic as novocaine. Novocaine acts on the peripheral nerve endings, causing a general lack of sensitivity and kills through respiratory paralysis. It effects a pseudo-leucocytosis in the periphery because of vascular dilatation and stasis. At the same time there is an increase in neutrophils and monocytes and a decrease in lymphocytes and eosinophiles.

R. C. WILLSON

**Comparative studies on the toxicity of various local anesthetics upon the organism, the nerve fibers and the heart of frogs.** ISAO KONDO. *Folia pharmacol. japon.* 7, 17 (1928); *Ber. ges. Physiol. expil. Pharmacol.* 48, 130.—The relative toxicities of the prepn. studied, as compared to cocaine, are: cocaine 100, tropacocaine 60, novocaine 33, alypine 151 and  $\beta$ -eucaine 100. The relative values for the interruption of motor conduction are: cocaine 100, tropacocaine 100, novocaine 50, alypine 25 and  $\beta$ -eucaine

25. Action on the frog heart: cocaine 100, tropacocaine 100, novocaine 6 and alypine and  $\beta$ -eucaine 200. R. C. WILLSON

The influence of the intravenous, subcutaneous and intraperitoneal infusion of Ringer-Locke solution upon the arterial and venous blood pressure. HIDEO KAMON. *Folia pharmacol. japon.* 7, 18(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 48, 229.—Heated Ringer-Locke soln. was given to rabbits and produced the same conditions regardless of the temp. (13–16° and 51–55°). The effects appear later after subcutaneous injection than after intravenous or intraperitoneal administration. The arterial and venous blood pressures increase and just before death reach "a very considerable height." R. C. WILLSON

The influence of different drugs on the growth of pulmonary and ventricular tissue of the hen embryo in vitro. HIDEO KAMON. *Folia pharmacol. japon.* 7, 86–111 (1928); *Ber. ges. Physiol. exptl. Pharmacol.* 48, 292.—In appropriate concns., digitalin, saponin, morphine, cocaine, quinine, atropine, pilocarpine, KCN, Na arsenite and EtOH check the growth of the embryonal heart and lung tissue. Digitalin and Na arsenite in minimal amts. further growth. All these agents act more strongly on the heart than on the lung tissue, with the exception of saponin and EtOH in which no difference was observed. R. C. WILLSON

The peripheral action of picrotoxin. MASAYOSHI OGAWA. Higashiyama Hosp., Kyoto. *Folia pharmacol. japon.* 7, 326–34(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 47, 678. R. C. WILLSON

The action of orally administered drugs of the digitalis group on frogs. MASAYOSHI OGAWA. *Folia pharmacol. japon.* 7, 335–44(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 47, 676.—When introduced into the stomach the cardiac action of convallamarin is weaker than that of helleborein and strophanthin. The action of helleborein increases with increased concn. but that of strophanthin appears not to be dependent upon the concn. These 3 drugs in strong concns. effect a systolic cardiac stagnation, while weak concns. produce a semi or complete diastolic one. Digtoxin in 40% alc., produces a semi-systolic one, while digitalis infusum (1:10) always effects a diastolic stagnation. R. C. WILLSON

Biological research of sterility. III. Influence of drugs and medicines on spermatozoa. SH. UCHIGAKI. *Japon. J. Obstet.* 10, 19–40(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 48, 264.—The tested substances were either applied directly to the spermatozoa of white mice or administered to female mice and their sera applied to the spermatozoa. Spermatozoa treated with the serum of nicotine-poisoned animals live but a short time. Dilute alc. is indifferent; nicotine and caffeine even in dilns. of 1:1000 and 1:10,000 impede the movement of spermatozoa. Opium and morphine are non-toxic to spermatozoa but the sera of animals pretreated with these substances are toxic to them. Cocaine is toxic even in dilns. of 1:100,000. Pb and S shorten the duration of movement. Quinine is toxic to spermatozoa but the serum of animals pretreated with it is inactive. CO<sub>2</sub>, boric acid, lysol, HgCl<sub>2</sub> and H<sub>2</sub>O<sub>2</sub> shorten the duration of life of spermatozoa even in medically permitted doses. R. C. W

The excretion of lead by mine workers at Broken Hill. R. W. TANNAHILL. *Med. J. Australia* 1929, I, 201–5.—The excretion by men not exposed to Pb dust of the mines corresponded with that small amt. excreted by normal men in Sydney. The Pb excretion of men exposed to Pb dust varied widely in different individuals. Men continuously exposed showed higher excretion than others. A higher excretion of Pb follows short as well as long exposure. More Pb was found in the feces than in the urine. There is no relationship between the amt. found in the feces and that found in the urine. R. C. WILLSON

Lead excretion of workers at the smelters, Port Pirie. R. W. TANNAHILL. *Med. J. Australia* 1929, I, 205–8.—Pb excreted ranged from normal limits up to 1.04 mg. per l. in the urine. The general conclusions are the same as those from a study at Broken Hill (preceding abstract). R. C. WILLSON

The blood of workers exposed to lead. R. Y. MATHEW. *Med. J. Australia* 1929, I, 208–15.—Most const. and characteristic changes are found in the red cells in the form of anisocytosis, polychromasia and punctate basophilia. The presence of punctate basophilia is a definite indication of the absorption of Pb and the extent, type and degree of permanency of this factor give some indication as to the extent and degree of permanency of the bodily damage. R. C. WILLSON

The distribution of lead in the body after absorption. R. W. TANNAHILL. *Med. J. Australia* 1929, I, 216–7.—Pb seems to be absorbed through the respiratory tract, entering the systemic circulation from which it is carried throughout the body. Some reaches the liver and is excreted with bile into the intestines and removed from the

body by the feces. Others are removed from the blood into the kidney and excreted in the urine. The greatest amt. is taken up by the bones where it is ordinarily stored. However, it may under some conditions be released from the bones and cause a severe intoxication.

R. C. WILLSON

**The intravenous injection of phosphates: an experimental study with regard to diagnostic and therapeutic possibilities in chronic interstitial nephritis.** ADOLF BOLLIGER. *Med. J. Australia* 1929, I, 650-5.—Na phosphate solns. of varying  $p_H$  values (4.5-8.0) were injected into fasting, catheterized dogs and the urine and blood examd. In normal dogs the urea N and the  $CO_2$ -combining power of the plasma were always within normal limits. The inorg.  $PO_4$  of the plasma rose immediately after the injection, but fell to less than the normal value within 3 hr. In subjects which received as many as 54 injections over a period of 7 months the P elimination gradually decreased. In a dog with experimentally produced rapidly progressing nephritis, during a period of 2 months, the P excretion decreased rapidly, while the blood urea and the blood inorganic P rose steadily. In other nephritic animals the  $PO_4$  injections seemed to exert a beneficial therapeutic action toward the nephritis, particularly the nutritional condition.

R. C. WILLSON

**Vinca rosea: its effect on the blood-sugar level of normal rabbits.** DOUGLAS H. K. LEE AND W. R. M. DREW. *Med. J. Australia* 1929, I, 699-701.—No definite evidence was found that an infusion or ext. of *Vinca rosea* leaves, fed orally to normal rabbits, produces a fall in the blood-sugar level, although large quantities were given. There is a natural daily variation in the blood sugar of normal rabbits and the animals are slow to adapt themselves to the exptl. conditions, so that such expts. must be continued for long periods of time.

R. C. WILLSON

**The action of some diuretics and other drugs on the glomeruli.** MASANORI OKADA. *Okayama-Igakku-Zasshi* 40, 717-25(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 48, 284; cf. *C. A.* 23, 2500.—A tendency toward diuresis (enlarged diams., increase in glomeruli and copious addn. of blood) followed the administration of the following drugs to the exposed kidney: caffeine (0.2-1.0% soln. in drops or 0.05-1.0 cc. 1% soln. injected), caffeine-Na benzoate (same concns.), diuretin (0.1-1.0%), creatine (0.2%), guanidine (0.1%),  $NaNO_2$  (0.8%),  $NaNO_3$  (0.1%),  $Na_2HPO_4$  (2.4%),  $CaCl_2$  (1.0%),  $Ca(NO_3)_2$  (1.5%),  $Ca_3(PO_4)_2$  (2.1%),  $MgCl_2$  (1.5%) and  $MgSO_4$  (4.5%). The same effect was produced by  $1/10$  or  $1/100$  M hydroquinone, phloroglucinol and pyrogallol. No action followed the use of theocine, glucose, NaBr, NaI,  $Na_2SO_4$  and  $NaHCO_3$ . An effect directly opposite to that first reported followed the use of guanidine (0.3-0.8%) and all the K salts: AcOK (0.1-0.5%), KBr (1.5%),  $KNO_3$  (1.2%), KCl (0.9%), KI (1.4%),  $K_2CO_3$  (1.2%),  $KClO_3$  (1.2%),  $K_2SO_4$  (1.5%) and  $KClO$  (0.9%).

R. C. WILLSON

**Experimental studies of diuretin hyperglucemia.** NOBUYOSI SUGIMOTO. *Okayama Igakku-Zasshi* 39, 719-42(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 47, 838.—The degree of diuretin hyperglucemia depends upon the size of the dose and the mode of application: intravenous injections have the strongest action in rabbits, then subcutaneous and intraperitoneal in order. Insulin subcutaneously inhibits the diuretin hyperglucemia, diuretin the insulin hypoglucemia. Atropine (1 mg. per kg.) suppresses the diuretin hyperglucemia.

R. C. WILLSON

**Studies on the regulation of blood coagulation from the pharmacological point of view. III. The influence of some parasympathetic poisons on the blood coagulation.** HISASHI TANAKA. *Okayama Igakku-Zasshi* 40, 1103-13(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 48, 136; cf. *C. A.* 23, 3750.—Pilocarpine intravenously (0.001-0.01 g. per kg. rabbit) slows the coagulation time of the blood, increases fibrinogen and anti-thrombin and decreases thrombin; a preliminary treatment with atropine acts antagonistically. Acetylcholine (0.001-0.003) acts the same as pilocarpine. Atropine intravenously (0.0003-0.001) accelerates the coagulation time, while larger doses (0.03-0.05) stop it.

R. C. WILLSON

**Determination of the strength of the action of senega saponin.** STAN. PETLACH. *Spisy Lekárske Fakulty Masarykovy Univ.* 5, 145-57(1927); *Ber. ges. Physiol. exptl. Pharmacol.* 47, 844.—The action of senega root depends on its saponin content which was detd. by its capacity to hemolyze the erythrocytes of guinea pigs. The limit of hemolyzing concn. was detd. and the hemolytic index calcd.

R. C. WILLSON

**The conduct of aromatic amines in the organism.** H. WEBER AND C. HEIDEPRIEM. *Zentr. Gewerbehyg.* 5, 269-72(1928); *Ber. ges. Physiol. exptl. Pharmacol.* 48, 451.—The proportionate elimination and the toxicological effects of  $\alpha$ -naphthylamine, dimethylaniline and benzidine were studied. Subcutaneously injected  $\alpha$ -naphthylamine and dimethylaniline are eliminated partly unchanged and partly as sulfuric and glucuronic acids coupled hydroxylation products, in which the former is paired

with glucuronic acid, the latter with  $H_2SO_4$ . Toxicologically small doses of  $\alpha$ -naphthylamine produced no symptoms. Dimethylaniline produced general symptoms, methemoglobinemia, increase of the hemoglobin and erythrocyte count and an irritation of the bladder mucous membrane. Benzidine is eliminated partly unchanged but hydroxylation products also appeared. Its toxic effects are indefinite.

R. C. WILLSON

The identity of the action of calcium and adrenaline on the isolated frog heart. S. ZIGANOV. *Zhur. expl. Biol. Med.* 10, 35-46(1928); *Ber. ges. Physiol. expl. Pharmacol.* 47, 604; cf. *C. A.* 23, 3027.—With isotonic Black Sea water as a perfusion fluid, adrenaline accelerates the pulse of the isolated normal frog heart and decreases the work of a contraction. The duration of a complete cardiac contraction (systole and diastole) is shortened. Ca in concns. of 0.02-0.2% produces a slowing of the cardiac contraction and disorders of the rhythm. It reduces the total conduction capacity of the heart and increases the work of a contraction.

The constitution of some dichlorophenetidines [for use in pharmacology] (BARGELEINI) 10. Quinazolines. II. Synthesis of 6-ethoxy-3-(4-ethoxyphenyl)-3,4-dihydroquinazoline [an anesthetic] (MAFFEI) 10.

## 12—FOODS

F. C. BLANCK AND H. A. LEPPER

The composition of the most important vegetable foodstuffs of the Dutch East Indies. C. VAN ROSSEM. *Mededeel. Algem. Proefsta. Landbouw.* (Buitenzorg) No. 24, 76(1927) (with a summary in English); *Intern. Rev. Agr.* [N. S.], 19, No. 5, 465-6. Analyses are given of the principal foodstuffs of vegetable origin in the Dutch East Indies: *Andropogon sorghum*, *Arachis hypogaea*, *Coix lacrima*, *Glycine Max* (*G. soja*), *Oryza sativa*, *Phaseolus radiatus*, *Sesamum orientale*, *Vigna sinensis*, *Voandzeia subterranea*, *Zea mays*, *Canna edulis*, *Coleus tuberosus*, *Dioscorea* sp. div., *Ipomaea batatas*, and *Manihot utilissima*. A table is given indicating the physiol. heat from combustion and also a table of the analyses of the most important European foodstuffs for comparison.

H. L. D

The coloring of foodstuffs. L. WHINYATES. *Can. Chem. Met.* 13, 163-4(1929).—Probably well over 95% of the color used in foodstuffs is synthetic. Three main conditions govern the selection of food colors: (1) the laws where the products are consumed; (2) the colors must be harmless to both user and consumer; and (3) they must be stable in the material to be colored. Argentina is the only important country prohibiting synthetic colors. Great Britain and Canada give specific limits to As, Cu, Pb and Zn. The U. S. regulations are the most stringent now in force, and Canadian, Australian and New Zealand regulations are based on these. Canada has a list of 12 permitted colors of which 10 are on the U. S. list. In Canada the Dept. of Agriculture and the Dept. of Health are responsible for the collecting and listing of samples. The conditions affecting the manuf. of food colors are discussed. Some form of international discussion for the framing of uniform regulations is recommended. E. G. R. A

The contamination of foodstuffs when exposed for sale. G. E. BODY. *J. Royal Inst.* 49, 507-9(1929); *U. S. Pub. Health Eng. Abstracts E-840c*, 27.—Bacon, pork, cake, sweets, bread, cheese, cooked meats and dried fish were examd. bacteriologically and bio-chemically. Of 27 samples 16 showed the presence of *B. coli*. C. R. F.

Metals in our food. F. B. FLINN AND J. M. INOUE. *J. Am. Med. Assoc.* 90, 1010-3(1928); *Bull. Hyg.* 3, 733(1928).—A general discussion of the possible effects of metals taken up from cooking utensils. The authors discuss and study the effect of Cu, Sn, Ni, Zn and Al. Ten rats were used for each metal, being given an average daily dose of 2 mg. Of Cu, Sn and Ni 98.5-99% was excreted in feces; Al, 70% in feces and 30% in urine; Zn is equally divided between the two. There was practically no accumulation in the body. Metal salts ingested with food combine with protein except in excessive amounts and in hyperacidity. The authors' general opinion is that there is no evidence of chronic poisoning from metallic utensils, especially Al.

GEORGE R. GREENBANK

The use of diastatic extracts in bread making. IVAN A. EFFRONT AND ALBERT R. BORDN. *Chimie & industrie Special No.*, 648-9(Feb., 1929).—The use of small quantities of sugar in bread making may be of appreciable advantage when using low-grade flours (with low content of directly fermentable substances) or with yeasts that

are low in glycogen. Substitution of amylolytic enzymes, such as "super-diastase Y" (manufd. by the Société Rapide, Seclin, Nord), is highly advantageous; these enzymes produce the required sugar progressively during the course of the bread making, working more uniformly and rapidly and permitting of increasing the speed of rising with certainty and of regulating the consistency of the crumb and the height of the bread. A. PAPINEAU-COUTURE

The differentiation of wheat and rye flour breads. M. WAGENAAR. *Z. Untersuch. Lebensm.* 57, 37-45(1929).—Microscopic differentiation of the starches and cell elements of wheat and rye flour is made. Polarized light and aniline stains facilitate the sepn. of the 2 grains. In using polarized light, the most characteristic structure is the cross section, followed in order of importance by plant hairs and the epiderm. C. R. F.

Colorimetric determination of ergot in flour. F. S. OKOLOV. *Z. Untersuch. Lebensm.* 57, 63-71(1929).—For rye flour, 10 g. is dried for 1 hr. at 110°, shaken with a mixt. of 500 cc.  $\text{CHCl}_3$  and 60 cc.  $\text{EtOH}$  (sp. gr. 1.415-1.420), and the floating portion is filtered off after 1 hr., dried and shaken with 30 cc. of  $\text{Et}_2\text{O}$  and 1 cc. of  $\text{H}_2\text{SO}_4$  (1 to 4). The next day the glutinous ppt. is filtered off, the flask and paper are washed with  $\text{Et}_2\text{O}$  until 40 cc. of filtrate is obtained and 2 cc. of a satd. soln. of  $\text{NaHCO}_3$  added. After the mixt. has been shaken, the colored aq. layer is compared with standards in a *Walpole colorimeter*. The 2 standards are prepd. as follows: (1) A soln. of 0.1 g. of carmine in a mixt. of 5 cc. of concd.  $\text{NH}_4\text{OH}$  and 95 cc. of  $\text{H}_2\text{O}$ . Portions of 0.05-0.5 cc. are dild. to 10 cc., preserved with 2 drops of  $\text{CHOH}$ , and stored in the dark in stoppered bottles. (2) A soln. of 0.05 cc. of methyl orange in 100 cc. of  $\text{H}_2\text{O}$ , of which 0.2 to 0.5 cc. portions are dild. to 50 cc. after the addn. of 2 cc. of 0.1 N  $\text{NaOH}$  soln. The % of ergot is given by the no. of cc. of the carmine soln. which exactly matches. The methyl orange soln. is used only as a compensator for yellow color. For wheat flour, a 20 g. wheat sample is shaken with 50 cc. of  $\text{Et}_2\text{O}$  and 5 cc. of 1 to 4  $\text{H}_2\text{SO}_4$ , filtered after 1 day, the filtrate dild. to 60 cc. and the procedure for rye flour is followed. The method is independent of the age or type of sample. If less than 3% of ergot was present, the max. exptl. error was 0.2%. C. R. FELLERS

Determination of ergot in flour by a serological method. F. S. OKOLOV AND I. G. AKIMOV. *Z. Untersuch. Lebensm.* 57, 72-6(1929).—From 1 to 5 cc. of an ext. of ergot was injected intravenously into rabbits for antigen prepn. The ext. was purified by removal of  $\text{H}_2\text{O}$ -sol. poisons such as alkaloids and amines by the following treatment: The powd., dried and defatted ergot was twice extd. for 24 hr., dried, mixed with physiol. salt soln. contg. 0.5% of  $\text{NaOH}$  soln. and  $\text{CHCl}_3$ . After 24 hr. the mixt. was neutralized with a 10% soln. of  $\text{H}_3\text{PO}_4$  and filtered. In a 2 months' immunization period, a titer value for the serum of 1:20,000 was obtained. The precipitin ring test was then carried out in an agglutination tube with 2 cc. of serum and 0.5 cc. of a filtered soln. prepd. by extg. 20 g. of the sample with 100 cc. of physiol. salt soln. for 24 hr. An ergot content of 0.1-0.5% gave well-defined rings after incubation at 37° for 25 min.; 0.05% showed more diffuse rings which were intensified after 35 min. at room temp.; while 0.02% gave an opalescence, and ergot-free flour gave no reaction. Specificity tests on 11 weeds gave indecisive results which, however, are not considered to detract from the value of the method. C. R. FELLERS

Aluminum baking powders. G. SCHAEFFER AND G. FONTES. *Bull. soc. hyg. aliment.* 16, 1-24, 49-79(1928); *Bull. Hyg.* 3, 731(1928).—Bread and pastry made with alum and phosphate baking powders do not form insol. compds. upon baking but are readily sol. in the  $\text{HCl}$  of gastric juice. Evacuation of the stomachs of dogs fed on bread contg. these powders shows soly. The Al of the spleen is increased. The fertility of mice fed on this bread is reduced. This is shown to be due to atrophy of the ovary produced by Al. GEORGE R. GREENBANK

Luminescence of a genuine Dutch lard in ultra-violet light. A. VAN DRUTEN. *Z. Untersuch. Lebensm.* 57, 60-2(1929).—Lard from pigs slaughtered in the autumn of 1928 gave a bright blue to blue-violet fluorescence in ultra-violet light at 60°. This is contrary to the findings of van Raalte (*C. A.* 23, 1002). The intensity was increased after bleaching with fuller's earth and 0.25% of norite, but was decreased after heating at 140°. With solid lard, the fluorescence appeared on the surface. C. R. FELLERS

Research on marzipan. J. PRITZKER AND ROBERT JUNGKUNZ. *Z. Untersuch. Lebensm.* 57, 85-90(1929).—Chem. and phys. detns. are reported on various almond-sugar combinations known as marzipan. C. R. FELLERS

Estimation of vanillin in vanilla pods and vanilla sugar. R. EDER AND E. SCHLUMPF. *Pharm. Act. Helv.* 3, 65(1928); *Quart. J. Pharmacy* 1, 612.—The method depends upon the formation of a ppt. on mixing aq. solns. of vanillin and semioxamazide. A 3 to 4 g. sample of the vanilla fruit is taken and an aq. ext. prepd. by extrn. under

reflux 6 to 7 times with 15-20 cc. of water. After filtration and washing, the aq. ext. is shaken 6 to 7 times with much ether, the ethereal ext. dried with  $\text{Na}_2\text{SO}_4$ , and the ether recovered by careful distn. and finally spontaneous evapn. The residue is dissolved in 10 cc. of hot water and filtered through cotton wool into an Erlenmeyer flask. The residue is washed twice with 5 cc. of hot water and a soln. of 0.1 g. of semioxamazide in 10 cc. of hot water added to the cool vanillin soln. through the same filter. The mixt. is shaken for a few min. and left to stand for 12 hr. The ppt. is carefully collected in a weighed glass Gooch crucible and the flask rinsed with 30 cc. of cold water. The crucible and contents are dried to const. wt. at  $105^\circ$  and weighed. The amt. of vanillin present is given by multiplying the wt. of semioxamazide of vanillin by 0.6413 g. and adding 0.003 g. to correct for the soly. of the semioxamazide. When applied to vanillin sugar, 3 g. of this substance is dissolved in 20 cc. of warm water, the semioxamazide soln. added and the process is then conducted as above. The results are more accurate and the method does not possess the disadvantages of colorimetric detns.

H. L. D.

**Determination of sugar and dry matter in root crops.** A. ZADE. *Fortschritte Landw.* 3, 207-10(1928).—Roots are taken at random from each plot to make 100 or 200 per treatment, and sampled in the field by a special contrivance. The mixed sample is preserved with toluene in a flask that may be sealed with paraffin, and at any convenient time up to 14 days this material may be pulverized and analyzed. According to the values given, the greatest change in dry matter is 0.4%, and in sugar 0.6% after a fortnight. The method has been used for 3 years, and is recommended for groups of expts.

B. C. A.

**Utilization of oil-mill residues; the manufacture of edible aleurone meals.** ÉMILE ANDRÉ. *Bull. soc. encour. ind. nat.* 1929, 347-59.—General article on the utilization of valuable, but often wasted, pulp and waste materials from such oleaginous materials as olives, flaxseed, peanuts, sunflower, and sesame.

C. R. FELLERS

**Dairy products among the ancients.** RENÉ PIQUE. *Chimie & industrie Special No.*, 656-68(Feb., 1929).—Historical, with bibliography of 119 references. A. P.-C

**Dr. N. Gerber's acidbutyrometry as a scientific research method for milk.** G. KOESTLER AND W. LOERTSCHER. *Z. Untersuch. Lebensm.* 57, 48-59(1929).—Fat analyses in milk were made by the Gottlieb-Roese, Schmid-Bondzynski and Gerber acidbutyrometric methods. In general, the results agreed very well. The following acidbutyrometer correction scale was obtained as a result of the work. No correction is necessary when the fat content is 0-1.5%; subtract 0.05% between 1.51 and 2.50%; subtract 0.1% between 2.51 and 3.50%; subtract 0.15% between 3.51 and 4.50%; and 0.20% between 4.51 and 5.50%. Duplicate detns. always checked within 0.05% fat. Wider use of Gerber's instrument is advocated.

C. R. FELLERS

**Advantages of filtration over mechanical purification of milk by centrifuging.** H. STASSANO AND A. P. ROLLET. *Chimie & industrie Special No.*, 652-5(Feb., 1929).—It is claimed, with exptl. evidence to support the contention, that centrifuging tends slightly to increase the bacterial content of raw milk.

A. PAPINEAU-COUTURE

**Constants of sterilized milk fats and their mixtures with cacao butter.** HEINRICH FINKE. *Z. Untersuch. Lebensm.* 57, 9-13(1929).—Phys. and chem. consts. of the fats of whole and skimmed milk powder, condensed milk and cacao butter were studied. Similarly, mixts. of butterfat and cacao butter were studied with a view of using the results in the detection of foreign fats in cacao butter. In general, the consts. of the mixts. lie between those of pure butter and pure cacao fat. The data are inconclusive but the investigation is being continued.

C. R. FELLERS

**A contribution to the physical chemistry of milk.** W. GRIMMER AND H. BENDUSKI. *Milchwirtschaft. Forsch.* 7, 76-99(1928).—In the souring of milk the  $p_H$  runs parallel to the acid value for a time but later the  $p_H$  changes much more rapidly than the titratable acidity. The  $p_H$  is an exponential function of the titratable acidity,  $y = c \cdot a^x$ , in which  $y = p_H$ ;  $c = 0.370$  (const.);  $a = 1.325$  (const.);  $x$  = titratable acidity. The refractive index of the  $\text{CaCl}_2$  serum follows one of three rules: (1) The refraction decreases with acid concn.; (2) the refractive index changes rapidly at first, then less rapidly as acidity increases; (3) the refractive index decreases slowly at first and then rapidly as the acidity increases. The refractive index changes more rapidly with increase in  $p_H$  than with increase in titratable acidity.

GEORGE R. GREENBANK

**The fluorescence of milk and milk products in filtered ultra-violet light.** O. GERNGROSS AND M. SCHULZ. *Milchwirtschaft. Forsch.* 6, 567-74(1928).—Fresh milks of the cow, ewe and goat show a strong gold fluorescence; human and dog milks fluoresce to a far less degree. The milks of the lioness, mare and ass show a blue fluorescence. The fluorescent substance is resistant to oxidation but is changed by alkali above  $p_H$  10.

On neutralizing to  $p_H$  6 it reappears. It remains for a month in  $CH_2O$ -preserved milk. Direct sunlight changes it over to a white in a short time. G. R. G.

**The determination of the chlorine content of milk.** R. NESENI. *Z. Fleisch- u. Milchhyg.* 38, 343-4(1928).—The Cl content of milk is used to det. diseased condition of the udder. N. finds present methods of det. of Cl as inaccurate. He recommends the following: mix 5 cc. milk with an equal vol. of 0.1 N  $AgNO_3$  and twice the amt. of halogen-free  $HNO_3$ , boil, add 10% sol.  $KMnO_4$  until the soln. is clear, boil until oxidation is complete, dil. to twice the vol., add a small quantity of  $FeAlSO_4$  and titrate excess Ag with 0.1 N  $NH_4CNS$ . GEORGE R. GREENBANK

**Simple methods of determining the hydrogen-ion concentration of milk.** G. SCHWARZ. *Milchwirtschaft. Forsch.* 6, 458-63(1928).—S. compares the  $p_H$  detd. colorimetrically on milk sera prepd. by pptn. of the protein (1) by satn. with NaCl and (2) addn. of  $CH_3OH$  (92-95%) with that given by the quinhydrone electrode on raw, high- and low-temp. pasteurized milk, skim milk, buttermilk and cream. The alc. serum gives a  $p_H$  more nearly that of the electrometric method. The acidity of each sample studied is given. GEORGE R. GREENBANK

**The change from the colostic to the fresh milk period in cow milk.** GEORGE SCHULZE. *Milchwirtschaft. Forsch.* 6, 445-57(1928).—The curves of lactose and refractive index vs. time after calving intersect on the 14th day; this S. considers the end of the colostic period. After this time there is very little change until the end of the lactation period when the refractive index increases slightly. From the 264th to the 271st day after calving the lactose drops 1.2%. GEORGE R. GREENBANK

**Bacterial counts of pasteurized milk.** G. K. BOWES. *Pub. Health* 41, 364-7(1928); *U. S. Pub. Health Eng. Abstracts* E-840c, 26.—Pasteurization reduced the count on farmers' milk from 82.42 to 99.9% with an av. of 98.66%. In pasteurizing plants where the av. count exceeds 10,000 or where individual counts exceed 20,000, the handling and pretreatment of the raw milk should be carefully scrutinized. C. R. F.

**Advantages of rotary pumps for circulating milk, beer and fruit juices in pasteurizing apparatus.** H. STASSANO AND A. P. ROLLET. *Chimie & industrie Special No.*, 650-1(Feb., 1929); cf. *C. A.* 18, 3234.—One of the important advantages of the closed system of pasteurization is that it retains practically the whole of the  $CO_2$  content of the original liquid and prevents aeration. This advantage is lost to a considerable extent when circulation is effected by means of a plunger pump instead of a rotary pump. A. PAPINEAU-COUTURE

**Investigations on the milk and cheeses of Hungarian ewes.** A. FALTIN. *Kisérlet. Közlemények (Bull. Hung. Agron. Sta.)* 30, No. 2, 125-46(1927) (résumé in German); *Intern. Rev. Agr. [N. S.]*, 19, 386.—The milk of Hungarian and Fries-Racka ewes, resp., averaged  $d_{15}$  1.0368, 1.0362; refraction of serum 17.5°, 41.3, 40.2; dry matter, 20.45, 18.73%; fat, 8.57, 7.29%; fat-free dry ext., 11.98, 11.46%; ash, 0.94, 0.93%. The dry matter and the fat minima are found at the beginning and the maxima at the end of the lactation period. Throughout the lactation period the percentage of fat-free dry ext. remains nearly constant, while the refraction of the serum varies considerably. F. also examd. 31 samples of "Gomolya" (a half-worked cheese) which serves for the preparation of "Brinza" (a soft cheese ready to eat) and 31 samples of "Brinza." Gomolya has an av. water content of 44.07%, and a fat content of 51.45% calcd. on the dry matter. The  $n$  of the fat calcd. at 40° is on the av. 42.8°. Brinza has an av. water content of 40.27% and fat content of 50.35% calcd. on the dry matter. H. L. D.

**Mottling in colored cheese.** G. F. V. MORGAN. *New Zealand J. Agr.* 38, 259-60(1929).—Mottling in cheddar cheese seems to be due to the expresse of the white fatty whey after pressing, rather than during the last stage of cheddaring. This type of whey is rich in fat, albumin and lactose and is an excellent medium for bacterial growth, which accounts for the fact that decompn. frequently begins in the mottled areas. The mottled condition is not the result of bacterial action. K. D. JACOB

**A bottle test for detecting certain butter defects.** W. S. SUTTON. *Agr. Gaz. N. S. Wales* 40, 244-8(1929).—To det. whether butter will develop a "decomposed" odor during storage place about 30 g. of butter in a sterile 200-cc. Erlenmeyer flask, partially submerge in a water bath at 40-50° and agitate until all the butter is melted. Then, for the cotton-wool plug in the flask substitute a sterile cork. Incubate the flask at room temp. (approx. 15-20°) and exam. for odor at the end of 1 and 7 days. Expts. with a no. of samples of butter showed that this test confirms and supplements the results obtained by the bacterial plate count method. Normally, no odor developed when the butter contained less than 100,000 bacteria per g. and odor developed when there were more than 500,000 bacteria per g. In specific instances "decomposed" odors developed in butter contg. less than 100,000 bacteria per g. Butters, graded

as "choicest," which are likely to develop biol. flavors at a later stage, produce odors when submitted to the bottle test.

The butter refractometer. FR. BOLM. *Z. Untersuch. Lebensm.* 57, 91-2(1929).—Temp. corrections for the range 30-80° are tabulated.

Egg-yolk margarine. J. ANGERHAUSEN AND G. SCHULZE. *Pharm. Zentralhalle* 70, 389-92(1929).—The detection of egg yolk in margarine via Fendler is possible only, if, after incorporation with the margarine, it is subjected to temps. not higher than 60°. In an exptl. study of the production of margarine combined with "heliozithin" (a concd. protein-free egg yolk ext.) it is demonstrated that a product of this character cannot rightly be termed "egg yolk margarine," but rather a margarine with heliozithin addn Cf. *C. A.* 23, 2222.

Osmotic activity in eggs of different breeds of the common fowl. F. E. RICE AND D. L. YOUNG. *Poultry Sci.* 7, 116-8(1928); *Expt. Sta. Record* 59, 569.—In an effort to det. the cause of "watery" whites in storage eggs, studies were made of the phys. properties, especially the osmotic activity, of the eggs of 4 breeds of poultry. Numerous investigators have reported that the chem. compn. of eggs of various breeds is quite uniform, and analyses in connection with this study have borne out these conclusions. Refractive index, which is a measure of total solids, and f. p., which is proportional to the osmotic pressure, were detd. in the yolks and whites of the eggs, but the differences found were not significant. The authors conclude that any difference in appearance of the eggs of different breeds could not be attributed to osmotic activity.

Experiments with heat-precipitable horse-flesh albumins as precipitinogens. CH. SCHWEIZER. *Mitt. Lebensm. Hyg.* 20, 69-76(1929); cf. *C. A.* 22, 4163.—The method of Rosenberg for differentiating precipitable albumins in heated meats must be applied with caution. Because of the development of a non-specific turbidity, it does not seem workable with precipitins prepd. by heat-coagulable horse-flesh albumins in detecting cooked horse flesh.

The occurrence of lead in the egg of the domestic hen. WILFRED B. S. BISHOP. *Med. J. Australia* 1929, I, 96-9; cf. *C. A.* 22, 4611.—The Pb content of eggs from different fowls varies widely; that from different eggs from the same fowl varies but within narrow limits.

Canned vegetable troubles arising from sugar. W. HAMILTON GORDON. *Food Manuf.* 4, 171(1929).—This is a brief discussion of the relation of flat sour bacteria, thermophilic anaerobes, and sulfide spoilage bacteria found in sugar to troubles arising therefrom.

Hygienic value of chicory. L. DUCAMP. *Ann. hyg. publ. ind. sociale* 6, 160-8 (1928); *Bull. hyg.* 3, 733(1928).—Analyses show the nature and proportion of the constituents both sol. and insol. The ash contains 25-34% K<sub>2</sub>O. There is no foundation for the suggestion that the K causes heart trouble. It has a laxative value and there appears to be no harmful effects on drinking the infusion.

Maturity of apples in relation to long storage. Some experiments with the iodine test. M. DAVEY. *New Zealand J. Agr.* 38, 172-6(1929).—Some varieties of apples which appeared to be mature when judged by the color of the skin were found to be decidedly immature when tested for starch with I<sub>2</sub> soln. Different varieties of apples seem to vary widely in this respect. Apples from the same tree, having similar external appearance and picked at the same time, frequently showed a wide range of maturity as indicated by the I<sub>2</sub> test. By means of the I<sub>2</sub> test, it was found that when ripening begins, conversion of the starch to sugar is quite rapid, frequently being complete in 8 days. The investigation is being continued to det. the best stage of maturity at which to pick apples in order to minimize the danger of the development of bitter-pit during storage.

Rate of drying of Corinthian grapes. N. C. ROUSSOPOULOS AND G. M. MEYMARIS. *Ann. sci. agron.* 45, 442-52(1928).—It was found experimentally that within the limits of effective measures, the degree of drying of grapes treated with alk. solns was, for any given time period, proportional to their water content, or, in other words, the drying followed the laws of true exosmosis. Treatment with alk. carbonates accelerated the drying by increasing the area of exosmosis. The probable value of  $K^1/K$ , calcd. from the law of exosmosis, can be used as a measure of the efficacy of any agent as an accelerator in drying.

The detection of imitation canned peas. O. LÜNING AND E. BEYER. *Z. Untersuch. Lebensm.* 57, 76-85(1929).—The detection of mature peas soaked to simulate freshly canned immature peas is best carried out by a detn. of total N, insol. N, starch and water content. Freshly canned green peas contained 83.6% H<sub>2</sub>O while soaked

ripe peas of the same varieties contained 73.0%. The protein is approx. 5% higher in the green pea than in the mature soaked pea (dry basis). Insol. N and starch are also higher in the mature peas. C. R. FELLERS

Treatment of frozen potatoes by salt water. ARTHUR CADORET. *Compt. rend. acad. agr. France* 15, 682-3(1929).—Frozen potatoes which had commenced to soften were either soaked 12 hrs. in 10% salt water and dried in lime or dried in warm air. In both cases the results were successful. The tubers thawed normally, hardened without blackening and were in a perfect state of conservation. E. F. SNYDER

"Dry-rot" of swedes. T. WHITEHEAD and W. A. PRITCHARD. *Welsh J. Agr.* 5, 159-75(1929).—No relation could be established between the use of various fertilizer salts and the intensity of the attack by the dry-rot fungus, *Phoma lingam*, on swedes. Flowers of S. powd. lime and formalin were not effective in preventing development of the disease when applied to swedes prior to storage in clamps. Slightly better, but still unsatisfactory results were obtained by dusting the swedes with ground limestone. Formalin damaged the rinds of the bulbs, while S and powd. lime made the bulbs very dirty. K. D. JACOB

The coloring matters of *Carthamus* in bromatology. VICTOR ASTRADA. *Rev. farm.* (Buenos Aires) [2], 2, 159-60, 208-10(1929).—The flowers of *Carthamus* or false saffron have the following compn.:  $H_2O$  9.10, N-contg. substances 17.50, rosin 42.50, cellulose 13.0, fat 3.90, starch 2.90, ash 11.10%. The yellow principle is sol. in  $H_2O$ ; 0.2 g. of the flower gives color to 1 l. It is insol. in  $Et_2O$ ,  $CHCl_3$ ,  $C_6H_6$ , petroleum ether,  $AmOH$  and abs.  $EtOH$ . Prep.: To a 2.5% soln. in  $H_2O$   $AcOH$  and  $Pb$  acetate are added. After being filtered, the ppt. is dissolved in dil.  $H_2SO_4$ , filtered, neutralized with  $NaOH$  and pptd. with 80%  $EtOH$ . The substance is supposed to be a deriv. of quinoxaline. Another yellow substance is contained in the cell membrane of the petals. It is sol. in alkali. A. E. MEYER

The clarification and filtration of fruit juices. M. R. DAUGHTERS. *Canning Age* 8, 503-5(1927); *Expt. Sta. Record* 59, 713.—Successful clarification and filtration of fruit juices and exts. are said to depend upon the use of solubilizing enzymes for the conversion of starch and other undesired substances present in such material into permanently sol. compds., a chem. soln. of mixed enzymes adapted to this purpose, made by extg. suitable cultures of certain molds and having diastatic, proteolytic, milk-coagulating, and lipatic properties, being described. Diagrams and graphs illustrate the type of app. used and the progress of filtration with respect to time for pectin ext. and for sweet apple cider. H. L. D.

Composition of the fruits of *Asimina triloba* Dunal. GUSTAVE RIVIERE and GEORGES PICHARD. *J. soc. hort. France* [4], 28, 160(1927); *Intern. Rev. Science & Practice of Agr.* [N. S.], 18, 594T.—The following is the analysis of the fruits of *Asimina* picked in the botanical gardens of Tours, where this species of the Anonaceae family grows in the open soil. The pulp of the fruit is soft and pasty. Its perfume, the amt. of sugar it contains and its slight acidity make it very palatable. The fruit is an elongated berry, yellowish and rather like a small banana. It is a native of North America. Its chemical composition follows: wt. of a single fruit 22.39 g., d. 1.030, pulp 21.79 g., small fruit stones 0.60 g., total sugar 4.27 g., acidity expressed as  $H_2SO_4$  0.15 g., dry matter 21.80 g., ash 0.60 g. H. L. D.

The preparation of some perfumes and flavoring extracts from furfural and its derivatives. Esters of  $\beta$ -furylacrylic acid. HENRY GILMAN and GEORGE F. WRIGHT. *Iowa State Coll. J. Sci.* 3, 109-12(1929).—The following esters of furylacrylic acid were prepd.: (1) methyl, (2) ethyl, (3) propyl, (4) isopropyl, (5) butyl, (6) amyl, (7) benzyl, (8) furfuryl. Various methods were used in the preps. The yields varied from 20% to 90%. All hydrolyzed easily. The physiol. effects of the esters were not detd. The odors and tastes were as follows: (1) acetophenone odor, raisin taste; (2) excellent constituent for maple, walnut and coffee; (3) fatty odor, tastes like dried apple peels; (4) resembles *Me cinnamate*, reminds one of caraway; (5) like amyl or isobutyl salicylate; (6) sour sharp odor like last stages of rose, apple and slight raisin taste; (7) odor like benzyl benzoate, taste characteristic of raisin; (8) very slight odor. F. E. B.

The artificial drying of fodder. GEORGES RAY. *Chimie & industrie* Special No., 676-81(Feb., 1929).—A brief review of the various processes suggested and tried out by different investigators, with a discussion of their applicability in France. A. PAPINEAU-COUTURE

The utilization of fresh apple residues for cattle food. G. WARCOLLIER. *Rev. zootech.* 6, No. 9, 185-8(1927); *Intern. Rev. Agr.* [N. S.], 19, 472.—The residues after the crushing of apples vary in compn. chiefly according to the process used for extracting the juice. Results of analysis of 3 samples of residues of different origin are, resp.,

water, 80.20, 77.12, 80.12; nitrogenous matters, 0.73, 1.09, 1.03; fatty matters, 0.69, 0.87, 0.76; sugars (expressed as glucose), 6.43, 2.67, 0.37; N-free extract (sugars deducted), 8.39, 12.51, 10.92; crude cellulose, 2.88, 4.47, 6.00; mineral matters, 0.68, 0.67, 0.80; food value per 100 kg. expressed as starch, 12.00, 11.50, 8.40. The nutritive ratio of the fresh residue often lies between 1:20 and 1:25. In richness and in nutritive ratio the fresh residue fairly closely resembles mangels and fresh sugar beet pulp; it may hence be used in conjunction with other more concentrated food in the rations of adult animals for whom the nutritive ratio ought to vary from 1:5 to 1:12 according to the type of animal and the purpose for which they are kept. Ten kg. of residue is equal to 3 kg. of good hay. The residue will be mixed 8 to 12 hours before use with fragments of straw, chaff and chopped hay or straw, and concentrates fairly rich in protein will be added to the ration. H. L. D.

Detection of saponins in foods (KOFER) 17. Study of I in South Carolina [in feedstuffs] (MITCHELL) 15. The effect of nitrates upon corrosion in tin cans (CULPEPPER, MOON) 9. The mineral content of grain (GREAVES, HIRST) 11E. Apparatus for the determination of density of solids (BARTHOLOME) 1. Electrical precipitation apparatus, etc., preparing "smoked salt" for treating foods (U. S. pat. 1,719,353) 4. Alkali perphosphates [for baking powders] (Brit. pat. 300,946) 18.

MOULTON, CHARLES R.: *Meat Through the Microscope; Applications of Chemistry and the Biological Sciences to Some Problems of the Meat Packing Industry*. Chicago: Univ. of Chicago Press. 528 pp.

RENNES, J.: *Le lait loyal et les laits hors du commerce*. Paris: Le François. 202 pp. F. 20.

**Preserving food.** STABAVITE SYNDICATE, LTD. Fr. 655,688, June 13, 1928. Food is covered with a gum such as gum tragacanth capable of swelling in the presence of water without becoming sticky. Antiseptics or preservatives such as an alkali nitrate or bisulfite are then added to the gum.

**Preserving foods.** A. M. KOBOLKE. Brit. 300,529, Aug. 9, 1927. Insects or other "pests" in foods and the like are destroyed in a sealed kiln from which air is evacuated and replaced by CO which is then in turn evacuated and replaced by CS<sub>2</sub> or other suitable fumigant. An app. is described.

**Packing sheets for foods.** FABRIQUE DE FEUILLES D'ÉTAIN BERTHOUD S. A. Fr. 655,147, June 1, 1928. Packing sheets for foods such as cheese are made of metal, preferably Sn, covered on one or both sides with a substance such as white gum lac which is not affected by org. acids.

**Mixing food ingredients or other materials.** FREDERICK L. CRADDOCK. U. S. 1,719,800, July 2. Mech. features.

**Apparatus for dehydrating food products.** ELLARD L. YOUNGER (to Younger Dehydrator Co.). U. S. 1,718,845, June 25. Structural features.

**Treatment of flour with heated air.** E. A. FISHER and C. R. JONES. Brit. 300,291, June 10, 1927. Flour is treated with a current of air of regulated humidity and of such temp. that the temp. of the flour will be raised within a period of 3 hrs. or less to about 55-80° without reducing the moisture content of the flour materially below 10%.

**Heat treatment of flour to improve its quality.** E. A. FISHER and C. R. JONES. Brit. 300,537, June 10, 1927. Flour in suspension is treated with heated and humidified air at a temp. of about 55-80°; intermediate milling products may be similarly treated. An app. is described.

**"Flour improver."** NAAMLÖÖZE VENNOOTSCHAP NOURY & VAN DER LANDE'S HANDELMAATSCHAPPIJ and J. A. L. VAN DER LANDE. Brit. 300,568, May 12, 1927. Flour, wheat or an intermediate milling product is heated to 35-90° in the presence of a small proportion of acid to subject the gluten to a partial coagulation so that 95-30% of it remains retainable in a washing test. The product, in the proportion of about 0.5-2.0%, may be added to untreated flour. O is preferably excluded and moisture retained during the heating.

**"Flour improver."** NAAMLÖÖZE VENNOOTSCHAP NOURY & VAN DER LANDE'S HANDELMAATSCHAPPIJ and J. A. L. VAN DER LANDE. Brit. 300,515, May 12, 1927. Wheat, flour or an intermediate milling product is heated to 70-90° until a considerable portion of the gluten becomes non-retainable in a washing test. A small proportion of the product may be added to ordinary flour.

**Packaged evaporated milk.** GEORGE A. FISHER. U. S. 1,719,760, July 2. A

can is filled to at least 97.27% its capacity with evapd. milk, sealed and then subjected to a sterilizing temp. while agitating.

**Heated drum and scraper apparatus suitable for drying milk.** BOHUMIL BOUDA and GEORGE G. SKELTON (to Collis Co.). U. S. 1,717,491, June 18. Structural features.

**Apparatus for drying milk on a belt conveyor.** K. W. PFEFFERKORN. Brit. 300,655, Nov. 17, 1927.

**Apparatus for sterilizing milk and sealing it in cans.** BORDEN CO. Brit. 301,220, Dec. 19, 1927.

**Removing bleaching chemicals from fruit.** SAUL BLUMENTHAL. U. S. 1,717,869, June 18. SO<sub>2</sub> used for bleaching is removed from fruits such as raisins, apples, pears or cherries by submerging the fruit in a soln. of KClO<sub>3</sub>, agitating and draining and then washing with fresh water.

**Preparing citrus fruits for market.** HENRY B. SLATER (to W. B. Clancy, W. A. Johnson and Geo. A. Sarau, trustees). U. S. 1,719,567, July 2. The fruit is treated with alk. and fungicidal solns., dried, and the oil which has been leached from the fruit is replaced with a non-volatile mineral oil.

**Preparing citrus fruits for canning.** ALEXANDER W. STOTT (to Hills Bros. Co.). U. S. 1,719,631, July 2. An app. is described suitable for treating fruits such as grapefruit with a soln. by spraying and immersion.

**Vitamins.** CASPAR SCHMITT. Fr. 655,181, June 2, 1928. A material rich in vitamins for addn. to foods is obtained from cotton seed by removing the oil and reducing the sarcocarp to a very fine powder and macerating in water or aq. liquid.

**Drying grain, hops, etc.** T. E. DAVIES. Brit. 300,758, Oct. 15, 1927. Drying and slight bleaching is effected by the use of gas obtained by burning water gas or semi-water gas in air. An app. is described suitable for forming and burning the gas.

### 13—GENERAL INDUSTRIAL CHEMISTRY

HARLAN S. MINER

**Newer diaphragm materials for chemical technology.** HEINRICH PINCESS. *Chem. Ztg.* 53, 437-8(1929).—Notes are given on the use of cement (DRP 381,811), cellulose (DRP 421, 120), glass or SiO<sub>2</sub> threads (DRP 442,965), and hard rubber (DRP 423,079), with special praise for the last-named material.

W. C. EBAUGH

**The American chemical industry.** A. H. SWIFT. *U. S. Bur. of Foreign and Domestic Com. Trade Promotion Series No. 78*, 114 pp.(1929).—Production and trade of the current century are summarized.

E. H.

**The use of porous stone for purification and introduction of gases, especially air, into liquids.** P. MEYER DI PIERRE. *Chem.-Tech. Rundschau* 44, 698(1929).—Gases are usually purified by the Cottrell-Möller process, by washing with water or steam, or by filtration through cloths or metal web. The latter may be satisfactorily replaced by less sensitive porous filter stones. These are obtainable with varying pore sizes for which have been detd. the rates of filtration of air at 50, 100, 150, 200 and 250 mm. pressure. Such stone can also be used to disperse gas being introduced into a liquid.

E. PICKERING

**Complete clarification of liquids by means of centrifugals with filter drums.** A. SCHMÜCKING AND K. DIEHL. *Chem. Fabrik* 1929, 287-8, 298-300.—The Krupp centrifugal combined with a filter cloth is described and operating data are given.

J. H. M.

**Conception of hardness and its practical interest in the study of materials, especially lime, cement and brick.** EDMOND MARCOTTE. *Rev. matériaux construction trav. publics* 1929, 126-30, 171-4, 211-4.—The detn. of a single phys. or mech. property is sufficient for evaluating the others. A Brinell hardness is convenient for the purpose and from it tensile and compressive strengths can readily be calcd., provided the parameters have been detd. by a sufficient no. of preliminary expts.

F. O. ANDEREGG

**Estimation of the distribution of particle sizes in dust-forming substances, especially of cement.** H. W. GONELL. *Zement* 17, 1786-91, 1819-23, 1848-52(1928).—Sedimentation and air elutriation methods of sepg. fine particles are described and discussed. Air elutriation gave the most satisfactory analysis of particles 0-60  $\mu$  in diam.

H. F. KRIEGE

**The theory of fine grinding. IX. Connection between the statistical diameter and the statistical volume of irregularly shaped particles of crushed sand.** GEOFFREY MARTIN AND EDGAR A. BOWES. *Trans. Ceram. Soc.* 27, 247-58(1928).—Five carefully graded air-elutriated samples of quartz sand were chosen with a wide range in av. particle size. By actual count these particles varied in no. from 2188 to 116,520 per g. For particles of irregular shape but similar shape if  $d$  be their statistical diams. and  $V$  the corresponding statistical volume, then  $V/d^3 = \text{const. } B$ , which is called the vol. const. of the powder. This const. was found to vary irregularly between the narrow limits of 0.275-0.284, with an av. of 0.2772 for the 5 sizes studied. Therefore the vol. const. of the crushed particles is sensibly the same, and the av. shape remains the same whether the particles are large or small. **X. The connection between the statistical diameter of crushed sand particles and their statistical surface.** *Ibid* 259-84.—Crushed sand was divided into 19 samples by air elutriation. Microscopic measurements were made to det. the lineal dimensions and the number of particles per g. The range included particles of 0.00333-0.08325 cm. mean diam. If  $S$  be the statistical surface of particles of statistical diam.  $d$ , then  $S/d^2 = \text{surface const. } A$ . This const. was found to vary from approx. 2.0 to 2.49, the higher value belonging to the coarser samples. The fact that this const. is less than that for a sphere (3.1416) is due to the flattened form of the crushed quartz particles, thus exposing the 2 greatest dimensions to measurement. Since the change in surface const. is small, it follows that the av. shape of particles remains the same both in the coarse and the fine grades. **XI. Calculations relating to diameters, surfaces, and weights of homogeneous grades of crushed quartz sand.** GEOFFREY MARTIN. *Ibid* 285-9.—The chief numerical data relating to 20 homogeneous grades of quartz particles, ranging in size from 31,000,000 to 1240 per g., are given. Methods of calcg. the vols., surfaces and wts. of powders of different size are presented.

H. F. KRIEGE

**Gas purification.** HERBERT A. GOLLMAR (to Koppers Co.). U. S. 1,719,177, July 2. Acidic impurities are removed from gas by washing it with a soln. of an alk. earth compd. of a metal of the Sn group of qual. analysis such as  $\text{CaHAs}_2\text{O}$  or  $\text{MgHAs}_2\text{O}$ . Cf. *C. A.* 23, 455.

**Gas purification.** HERBERT A. GOLLMAR (to Koppers Co.). U. S. 1,719,762, July 2. Impurities comprising S compds. are removed from gas by the action of a thio-As compd. such as a partially sulfided soln. of Na arsenite. Cf. *C. A.* 23, 455.

**Gas purification.** DAVID L. JACOBSON (to Koppers Co.). U. S. 1,719,180, July 2. Impurities including S compds. are removed by washing the gas with a soln. of an alkali and a compd. of As, such as a Na arsenite soln.

**Purifying gases.** C. J. HANSEN. *Brit.* 301,061, Nov. 24, 1927. In a process such as that described in *Brit.* 299,302 (*C. A.* 23, 3332) for removing  $\text{NH}_3$  and  $\text{H}_2\text{S}$  from gases, the gases are subjected to a preliminary washing with the spent liquor,

contg. Fe sulfide, from the main scrubbing operation. Various details of procedure are described.

**Purifying gases.** GASTON A. DURR. Fr. 655,123, Oct. 19, 1927. A filter for removing dust, tar and other impurities from gases coming from industrial app. or chem. reactions is composed of a layer of asbestos in the form of fibers or cloth.

**Purifying gases.** I. G. FARBERIND. A.-G. Fr. 656,395, June 23, 1928. Wetting agents such as a sulfonic acid or a sulfonate are added to the liquid used for washing a gas. Thus, 1 to 2 g. per l. of Na benzylnaphthalenesulfonate is added to the water used for washing blast-furnace gases.

**Purifying gases.** SOC. INTERNATIONALES DES PROCÉDÉS PRUDHOMME-HOUDRY. Fr. 655,135, Oct. 20, 1927. Gases coming from heat treatment or distn. of bituminous substances are passed through a preheater to heat them to the optimum temp. for purification before entering the purifiers.

**Gaseous reactions.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 655,725, Mar. 12, 1928. Inert gases, such as A in the production of  $\text{NH}_3$  from N and H, or  $\text{CH}_4$  in the hydrogenation of coal, are removed by washing the gases with paraffin under pressure.

**Separation of gases by liquefaction.** GES. FÜR LINDE'S EISMASCHINEN A. G. Fr. 655,660, June 12, 1928. Details are given.

**Preventing absorption of gases by liquids.** PAUL LECHLER. Fr. 656,447, June 25, 1928. See Brit. 295,319 (C. A. 23, 2228).

**Liquefaction of nitrous vapors.** I. G. FARBERIND. A.-G. Fr. 655,578, June 11, 1928. In a process of liquefying nitrous vapors the vapor tension of the liquid N oxides is lowered by the addn. of  $\text{HNO}_3$ . The  $\text{HNO}_3$  may be added to the gaseous mixt.

**Eliminating acetylene.** LOUIS TOCCO. Fr. 656,365, Nov. 8, 1927.  $\text{C}_2\text{H}_2$  is removed from gaseous mixts. such as coke-oven gases to be liquefied for the sepn. of H and N to produce  $\text{NH}_3$  by washing the gases with acetone.

**Detection of gases, vapors or smoke.** MAX BUCHHOLZ. Fr. 655,160, June 2, 1928. The presence of decompn. gases, vapors or smoke is detected and their densities are measured, by utilizing the variation of heat absorptive power or permeability to heat rays, when such substances come in the path of heat rays from a source of heat.

**Separating carbon dioxide from gas mixtures.** WERSCHEN-WEISSENFELSER BRAUNKOHLN.-A.-G. Ger. 477,159, Feb. 17, 1927. The sepn. is effected with an alkali carbonate soln. which is used until bicarbonate is pptd. The bicarbonate is sepd. from the lye and heated, and the carbonate so obtained is redissolved in the lye. The method is particularly applicable to fuel distn. gases.

**Discharging solids, liquids and gases simultaneously from high-pressure reaction vessels.** BRAUNKOHLN.-PRODUKTE A.-G. Ger. 477,038, May 23, 1924. The reaction vessel is connected to a vessel in which a lower pressure is maintained through a tapering valve of sufficient cross section to ensure passage of the solid. The method may be applied in the manuf. of oil from coal, in the cracking of tars and oils rich in asphalt, and in hydrogenating fats.

**Reduction and oxidation.** FREDY W. RAUTH. Fr. 655,846, June 2, 1928. Reductions and oxidations are carried out by means of H and O in the nascent state in an alternating high-frequency elec. or magnetic or elec. and magnetic field. Fluids of different elec. conductibilities may be introduced into the field; one of the fluids may be a salt or acid or basic soln. which do or do not take part in the reaction. In the case of reduction, finely divided metals such as Fe or Al may be added to the system.

**Comminuting solid substances.** WALTER OSTERMANN (to Industrial Spray Drying Corp.). U. S. 1,718,184, June 18. The material to be comminuted is formed into a fine liquid dispersion in a colloid mill and this dispersion is then atomized and subjected to spray desiccation. A colloid mill and assoc. drying app. are described.

**Separating sediment from liquids.** CARL H. NORDELL. U. S. 1,718,871, June 25. An app. is described.

**Sterilizing, etc.** GEORG A. KRAUSE. Fr. 656,309, June 20, 1928. See Brit. 293,385 (C. A. 23, 1702).

**Refrigeration.** LOUIS A. BENOIST and GARDNER T. VORHEES. U. S. 1,719,818, July 2. A "low-temp. latent heat of fusion substance" such as a brine is frozen by conducting heat from it to a refrigerant fluid and a "high-temp. latent heat of fusion substance" such as a brine of different sp. gr. is frozen by conducting heat from it to the low-temp. substance. Air is cooled by conducting heat from it to the high-temp. substance and water is frozen by conducting heat from it to the low-temp. substance. An app. is described.

**Refrigerating.** IVAR AMUNDSEN. Ger. 477,037, Apr. 9, 1926. See Brit. 266,683 (C. A. 22, 650).

**Refrigerating system.** SAMUEL RUBEN. U. S. 1,717,584, June 18. Gases are electrolytically liberated from a liquid such as KCl soln. in a closed vessel; one of the gases, such as Cl, is condensed and liquefied, heat is absorbed from a body adjacent the liquefied gas by vaporizing the gas and chemically combining it with another of the liberated gases, such as H, and the product of such chem. combination is absorbed by and combined with the liquid from which the gases were liberated. An arrangement of app. is described.

**Refrigerating system of the compression type.** WILLIS H. CARRIER (to Carrier Engineering Corp.). U. S. 1,718,683, June 25.

**Refrigerating apparatus of the compression type.** MATSON C. TERRY (to Westinghouse Elec. & Mfg. Co.). U. S. 1,719,634, July 2.

**Refrigerating system of the absorption type.** ELIAS WIRTH-FREY (to Sulzer frères Soc. Anon.). U. S. 1,718,283, June 25. Structural features.

**Refrigerating system of the gas compression type.** HERMAN SCHARNAGEL (to Harry W. Dyer). U. S. 1,717,895, June 18. Air may be used as the refrigerating medium.

**Refrigerating system of the absorption type.** BLUFORD W. BROCKETT (to Edmund E. Allyne). U. S. 1,719,208, July 2. An app. is described.

**Refrigerating system of the continuous-cycle absorption type.** PLANTEN-MUNTERS REFRIGERATING SYSTEM AKTIEBOLAG (to Electrolux, Ltd.). Brit. 301,323, Nov. 25, 1927.

**Refrigerating system of the compression type suitable for use with sulfur dioxide.** L. V. MYERS (to Wayne Co.). Brit. 300,621, Nov. 17, 1927.

**Refrigerating apparatus of the intermittent absorption type.** CYRUS H. HAPGOOD. U. S. 1,718,690, June 25. Structural features.

**Refrigerating apparatus of the intermittently operating absorption type.** JULIUS BAYER. U. S. 1,717,909, June 18.

**Refrigerating apparatus of the absorption type.** A. LENNING (to Electrolux, Ltd.). Brit. 300,589, Nov. 15, 1927.

**Refrigerating plant.** GASWERKSBAU UND MASCHINEN FABRIKS-A.-G., FRANZ MANOSCHEK. Fr. 655,329, May 8, 1928.

**Air filter (containing filtering and heat-insulating material) for refrigerating chambers, etc.** ROBERT SPEIDEL. U. S. 1,717,470, June 18. Structural features.

**Air-purifying canister for respirators.** R. H. DAVIS, R. W. G. DAVIS and C. G. ROSLING. Brit. 301,532, Aug. 31, 1927. A canister contg. material for the catalytic oxidation of CO and drying material such as  $\text{CaCl}_2$  is provided with an audible signal device to indicate exhaustion of the layers. This may be operated by a string impregnated with  $\text{ZnCl}_2$  which is affected by moisture on exhaustion of the  $\text{CaCl}_2$ . Other features of similar character are also described.

**Insulating and other compositions from cashew-nut shell liquid.** M. T. HARVEY (to Harvel Corp.). Brit. 300,654, Nov. 17, 1927. To produce a drying product, cashew-nut shell liquid may be heated either alone or in the presence of metals or metal compds such as Cu, Pb, Mn, Pb oxide, Cu carbonate or oleate or cuprous  $\text{NH}_4$  carbonate or while blown with air. Other oils, resins, gums, driers, solvents, etc., may be added for producing insulating or molding compns., varnishes, etc. Cf. C. A. 23, 1000.

**Insulating coatings on aluminum, etc.** L. McCULLOCH (to Metropolitan-Vickers Electrical Co., Ltd.). Brit. 300,912, Nov. 19, 1927. Al or Al alloys such as parts of elec. app. are immersed in an aq. soln. contg. in suspension an alk. earth oxide such as CaO or SrO and an alk. earth metal salt such as  $\text{CaSO}_4$ ,  $\text{Ca}(\text{NO}_3)_2$  or  $\text{CaCl}_2$  or the corresponding Sr salts to form a film on the metal which is then dried and baked at about  $200^\circ$ . An insulating varnish may subsequently be applied.

## 14—WATER, SEWAGE AND SANITATION

C. H. BADGER

**Hydrochemistry of the upper Kama and its tributaries.** A. TRIFONOV. *Bull.*

*inst. recherches biol. univ. Perm* 5, 147-56(1927) (German résumé); *Biol. Abstracts* 2, 440.—A study of the water of the Kama River between Perm and the mouth of the Wischera and at the mouths of 7 of its tributaries supports the theory of the universal occurrence of chem. heterogeneity in the cross section of a flowing stream. The  $p_H$  varied between 7.2 and 8.2 at different points along the river, depending chiefly on the balance between acid and salts in the bicarbonate buffer system. In the water flowing in from the western tributaries there were found small quantities of anions of strong acids, but larger quantities of the anions of weak acids; the reverse was true of the eastern tributaries. The difference was attributed to difference in geological structure of the areas drained. The alkali reserve of the main river, however, was remarkably const. in the stretch investigated between the 3rd and 11th of Aug. H. L. D.

Volumetric determination of sulfate in water by the barium chromate method. G. NACHTIGALL AND F. RAEDER. *Arch. Hyg.* 100, 31(1928); *U. S. Pub. Health Eng. Abstracts* E-789a, 56.—Org. substances interfere with the  $SO_4$  detn. by the  $BaCrO_4$  method. Complete oxidation of org. matter in the water sample by the use of  $H_2O_2$  is recommended to obviate this error. C. R. FELLERS

The differentiation of organic substances in water. K. KEISER. *Tech. Gemeindeblatt* 31, 81(1928); *U. S. Pub. Health Eng. Abstracts* E-815a, 72.—A comparison was made between the O demand by Kubel's method and the Cl demand by Froboese's method of a no. of natural waters and aq. exts. The quotient ( $O_2$  demand in mg./l.)  $\div$  (Cl demand in mg./l.) is shown to be a valuable criterion in detg. the quality of a water. For raw river water, this quotient is normally 1:3 and is not much affected by substances of vegetable nature. The presence of substances of animal origin, however, increases the value of the Cl no. many times. The coagulation of water with alum seps. more of the substances which are attacked by O than those which are attacked by Cl. In lab. expts. casein was almost completely removed by coagulation, peptone to a lesser extent and urea scarcely at all. In the process of filtration the Cl demand of a water is reduced by about 25%. Sand filtration, therefore, plays a very important part in the biol. decompn. of substances remaining in water after coagulation. C. R. F.

Calculation of the electric conductivity of water. J. H. LINSCHOTEN. *Chem. Weekblad* 26, 198-202(1929).—Two graphical methods are described, by means of which the electrical conductivity of potable water at 18° is obtained without calcs. The complete diagrams are given in the original paper. ALBERT L. HENNE

The technic of water sterilization by chlorine and its compounds. F. DIENERT. *Ann. hyg. publ. ind. sociale* 1929, 65-87; cf. *C. A.* 22, 3008; 23, 2517.—A critical discussion. G. TOENNIES

Chlorine consumption in water. BESEMAN. *Water Yearbook for Sanit. Chem. and Eng.* 1928, 64-77; *U. S. Pub. Health Eng. Abstracts* E-789a, 50.—Cl consumption in water is caused by org. and inorg. substances;  $p_H$  values do not affect Cl consumption. Light intensity plays a role and it is best to add Cl in the dark. It is immaterial whether a Cl soln. or a  $NaOCl$  soln. is used. Differences in temp. affect Cl absorption, so that in practice the Cl dosage should be changed with the temp. of the water. A detention period of 5 min. is sufficient since practically no difference was observed between 5 and 60 min. contact periods. Residual Cl requires more Cl and it is recommended, in practice, to use the Olszewski method, i. e., just sufficient Cl. C. R. FELLERS

The theory of water chlorination. E. RUNOV. *Centr. Bakt. Parasitenk.*, II Abt., 77, 21-38(1929).—In the chlorination of water with the usual doses not more than 2% of the available Cl is used in the oxidation of bacteria, the larger part being consumed by dead org. matter and salts. The amt. of Cl used by the bacteria cannot be detd. directly in the usual dosage but only by extrapolation from larger doses. The in-

fluence of different electrolytes depends not only on their concn. but on the dose of Cl. For small doses of Cl, the catalytic effects of the following salts increase in the order given:  $\text{NH}_4$ , Ca, Mg, K. For large doses of Cl the order of increase is practically reversed: Ca(K), Mg, K(Ca),  $\text{NH}_4$ . No special action could be traced to any anion.

JOHN T. MYERS

Chemical treatment at Kansas City, Mo. GEO. F. GILKISON. *Munic. News and Water Works* 76, No 1, 31(1929); *U. S. Pub. Health Eng. Abstracts* E-789d, 63-4.—The Missouri River is highly polluted with a turbidity ranging from 15 to 18,000 p. p. m. The chem. treatment consists of presedimentation, followed by coagulation with alum and lime and sterilization with liquid Cl. Approx. 90% of the suspended matter is removed by pre-sedimentation. Alum and lime are added as the water passes from the second settling basin and enters the mixing chamber with a retention period of 1 min. The water then enters the coagulation basins and is pumped to the distribution station. Sedimentation and coagulation alone gave an av. removal of 99.68% of the turbidity. The plant manufactures all of the 5 million lb. of alum required annually at a cost of \$16.22 per ton.

C. R. FELLERS

Experimental plants in water treatment. H. N. JENKS. *Water Works Eng.* 82, 721-2, 751(1929).

E. I. S.

Chemical and mechanical treatment plant at Winston-Salem, N. C. W. J. THRASHER. *J. North Carolina Sect. Am. Water Works Assoc.* 5, 175-90(1927); *U. S. Pub. Health Eng. Abstracts* E-789, 28.—The successive steps are coarse bar screens manually raked; fine screens of self-cleaning, revolving drum, Dorr type; elec. control lime application; mixing tank with conical bottom; 3 electrolyzers (rate capacity 3 million gal. per day each); sedimentation in a single large rectangular Dorr clarifier with detention of about 2 hr.; a 50-ft circular Dorr thickener where  $\text{CaO}$  is added for conditioning; and following this to 2 vacuum-drum-type sludge filters. The raw sewage, about 4.8 million gal. per day, is a mixt. of domestic and industrial waste often highly colored by dyes from textile and finishing plants and stale through long trunk line sewer travel to the plant. The effluent having an  $\text{O}_2$  demand content of 4 to 5 p. p. m. is discharged to Salem Creek in a diln. of about 1 to 1, where it travels 6 miles to a stream twice the size and thence to the Yadkin River, a stream of 1200 sec. feet, 11 miles below the plant. The reduction of total org. solids is 72.6%, total bacteria 99.5%, *B. coli* 99.9%, reduction in  $\text{O}_2$  consumed from 144 to 42 p. p. m. and increase of dissolved  $\text{O}_2$  from 0.4 to 3.7 p. p. m. Numerous tables are appended.

The neutralization ("Impfung") of cooling water; a method of preventing scale in surface condensers and various equipment in which water is warmed. W. KÄSTEN. *Chem. Fabrik* 1929, 269-70.— $\text{HCl}$  is added partly to neutralize  $\text{CaCO}_3$  and  $\text{MgCO}_3$ . A cut of the mixer is shown. Cf. Ger. Pat. Nos. 29,747 and 331,292.

J. H. M.

Experiences with fish-pond sewage disposal. ED. MERKEL. *Water Yearbook for Sanit. Chem. and Eng.* 1928, 228-42; *U. S. Pub. Health Eng. Abstracts* E-789, 26.—At Zerkabelshof the sewage is pretreated in a "Dyrvidag" system consisting of a sedimentation basin connected with a digestion tank; the settled sewage flows through the digestion compartment. The 2-acre fish pond receives the sewage from 1500 persons. Only 50% purification occurs in the pond. It is concluded that to be satisfactory (1) a high diln. of the effluent is necessary especially in dry weather; (2) the diln. water should be rich in Ca and (3) acid water is detrimental.

C. R. FELLERS

Discharge of filtered sewage into an otherwise unpolluted stream. HARRISON P. EDDY. *Am. J. Pub. Health* 19, 641-6(1929).—This case is illuminating as to the results which may follow the discharge of effluents from sewage-treatment plants into streams where the natural flow available for diln. compared with the vol. of effluent is small. Two lessons are taught: (1) Well-purified effluents require substantial diln. (2) Extensive easements may be necessary where adequate diln. is not available.

J. A. KENNEDY

Permanganate consumption, chlorine number and chloramine number in water and sewage analysis. F. EGGER. *Water Yearbook for Sanit. Chem. and Eng.* 1928, 56-84; *U. S. Pub. Health Eng. Abstracts* E-815, 8.—With  $\text{NaOCl}$  other values are obtained than with chloramines. The 2 methods should be kept sep. It is proposed

to designate the value obtained with hypochlorite as Cl no. and that found with chloramine as chloramine no. Chloramines attack urine and albuminoids less than hypochlorite, so that the use of chloramines is of less value since feces-polluted water requires more of the latter. The Cl nos. are greatly affected by residual Cl, whereas detns. made by the permanganate method are less affected and consequently of greater value. The 2 methods cannot be compared directly. C. R. FELLERS

A demonstration of color reaction in the test for free chlorine as applied to sewage. C. M. NICHOLS. *Proc. 13th Ann. Meeting, N. J. Sewage Works Assoc.* 1928, 1-2; *U. S. Pub. Health Eng. Abstracts E-789c*, 42.—In order to study the time factor as related to the application of Cl to a sewage-works effluent, N. allowed definite time intervals before testing for free Cl. Samples dosed with 10 p. p. m. of Cl and allowed to stand for 30 min. did not show any free Cl by the KI, AcOH and starch test. A suggested min. contact period for allowing the Cl to act is 15 min. Where pre-chlorination is practiced, it is unnecessary to have Cl present in the tank effluent but usually at some point in the flow chambers of the tanks. C. R. FELLERS

The purification of sewage containing large amounts of dyestuffs by the activated sludge process. A. PRITZKOW and JORDAN. *Wasser u. Gas* 18, 553 (1928); *Wasser u. Abwasser* 24, 219; cf. C. A. 23, 2231.—The complete removal of dyes is effected only by repeated filtration through clinker beds. Lab. expts. indicated that sewage contg. dyestuffs was rendered innocuous by treatment with the activated sludge process. C. R. FELLERS

Sewage treatment Duisburg a. Rh. W. SEEGERT. *Gesundh. Ing.* 52, 258-61, 324-9 (1929).—A description. WAYNE L. DENMAN

Innovations in sewage treatment for the city of Leipzig. MIEDER. *Gesundh. Ing.* 52, 353-61, 392-7 (1929).—Mechanical processes have replaced hand labor to a large extent. WAYNE L. DENMAN

Improvement of sludge digestion in the treatment plant at Halle. HEILMANN and W. J. MULLER. *Gesundh. Ing.* 52, 268-70, 342-4 (1929).—The treatment plant is of the Emscher type and is operated at almost full capacity. Artificial heating increases the efficiency. WAYNE L. DENMAN

Regulation of sludge digestion with lime. H. BACH. *Water Yearbook for Sanit. Chem. and Eng.* 1928, 242-60; *U. S. Pub. Health Eng. Abstracts E-789*, 26.—Using lab. expts. and a controlled  $p_H$ , B. found CaO increased the gas production from fresh sewage solids from 120 l. in 130 days to 200 l. in 80 days. Reaction control is vital in successful sludge disposal plant operation. C. R. FELLERS

Gas production from sewage sludge. HEILMANN. *Water Yearbook for Sanit. Chem. and Eng.* 1928, 228-42; *U. S. Pub. Health Eng. Abstracts E-789*, 26; cf. C. A. 23, 2776.—The compn. of the gases produced at Stuttgart are  $CH_4$  73.5%,  $CO_2$  14,  $H_2$  4.8,  $N_2$  4.7; in Halle:  $CH_4$  77.5,  $CO_2$  17.8,  $N_2$  4.6. The gas in Stuttgart is sold for 7 pf. per cu. m. and at Halle for 4 pf. In Halle the gas production per capita, 3 yr. av., was 116 cu. ft. C. R. FELLERS

Odor control of chlorination. R. F. GOUDY. *Calif. Sewage Works J.* 1, 87-101 (1928); *U. S. Pub. Health Eng. Abstracts E-840*, 58.—The Orange Co. cities, totaling a population of about 70,000, are linked together by an outfall sewer system. This sewage is pumped through an 18 in. main, 2 miles in length, and the detention period in this force main varies from 10 to 20 hr., averaging about 12 hr. Two chlorinators were installed, one of them located just ahead of the force main and the other one located about  $2\frac{1}{2}$  miles below the junction of the force main and the gravity sewer. The results show reduction of  $H_2S$  by chlorination. By destroying the sulfate-splitting organisms before  $H_2S$  was produced in large quantities, and then continuing to inhibit their growth by means of the second chlorinator, the same work was accomplished as if a much larger dose of Cl had been added at the end of the force main. This fact shows the importance of giving proper study to the location of chlorinators on such work, in order that the control may be accomplished economically. C. R. FELLERS

The reconstruction of the Schwerin sewage plant on the OMS principle. RAMSBECK. *Tech. Gemeindeblatt* 31, 62 (1928); *U. S. Pub. Health Eng. Abstracts E-815b*, 48.—The sewage disposal plant at Schwerin, which was built in 1908, contained 6 Emscher tanks. Trouble was experienced with these, because of the deposition of solid matter on the sloping walls of the settling portion and to the collection of a large amt of scum on the restricted surface of the digestion portion. This scum, unless removed daily, prevented the escape of gas, which found its way through the slots into the settling tank and caused putrefaction and odors. In 1925-26, the tanks were reconstructed on the OMS principle, with settling channels lying under the surface of the water and provided with removable covers. The advantage of this arrangement

lies in the limited cross section of the channel which causes the incoming sewage to scour the inside of the settling portion and prevents the deposition thereon of suspended solids. Further, a large surface area is provided for the digestion portion which permits of free escape of gases. Scum in the incoming sewage can pass directly into the settling portion through slots provided in the top of the settling channel. The digestion process is assisted by an arrangement by which the sludge can be flushed with water and the collection of salts, which interfere with the activity of the anaerobic bacteria, is avoided. An investigation of the plant has shown that the removal of suspended matter and digestion of sludge are very complete.

C. R. FELLERS

**The treatment plant of Chemnitz.** H. ROCH. *Gesundh. Ing.* 52, 369-77 (1929).—Sewage to the extent of 35.3 million cu. m. is digested each year.

W. L. D.

**Sewage treatment works in England, Scotland and the United States with special consideration of the activated sludge installations and their importance for the removal of Berlin's sewage irrigation fields.** F. LANGBEIN. *Gesundh. Ing.* 52, 281-4, 405-11 (1929).—A summary of sewage treatment in many of the principal English and American cities with numerous photographs of equipment, etc. Activated-sludge processes are superior and will displace irrigation of sewage on to fields.

WAYNE L. DENMAN

**Operating results of domestic treatment plants in Nuremberg.** J. V. HANFSTENGEL AND ED. MERKEL. *Gesundh. Ing.* 52, 270-3, 424-6 (1929).—Mechanical treatment plants for individual houses are no longer in favor. Most installations now contain several chambers, usually 4, and employ sludge digestion.

WAYNE L. DENMAN

**The Dunbar sewage filter.** E. W. STEEL AND P. J. A. ZELLER. *Texas Eng. Expt. Sta., Bull.* 37, 5-15 (1928); *U. S. Pub. Health Eng. Abstracts E-840*, 58.—A small exptl. Dunbar filter bed 4 ft. deep, having 4 layers of material grading from 3 to 6 in. at the bottom to  $\frac{1}{2}$  to  $\frac{1}{8}$  in. at the top, was operated for a yr. as continuously as the necessary resting and drying periods permitted. The sewage treated was stronger than the av. domestic sewage which had been settled in Imhoff tanks. The quality of the effluent varied with the rate of dosing and to a lesser extent with the character of the applied sewage. At rates up to 2.0 m. g. d. per acre, an 85% reduction in biochem.  $O_2$  demand may be expected. The optimum rate of 1.3 m. g. d. per acre was the highest for good nitrification and high dissolved  $O_2$  in the effluent. Between 1.3 and 2.0 m. g. d. per acre a clear effluent is produced, but nitrification is incomplete and dissolved  $O_2$  is absent. Clogging of the bed, indicated by sewage standing to a depth of 3 to 4 in., occurs after application of 8.0 m. g. of settled sewage per acre (about 6 days' run at optimum rate). Resting is necessary only to allow drying and removal of solids caught upon the surface. In dry weather 36 hr. rest is sufficient. A uniformly good quality of effluent may be expected even with the careless operation anticipated in small cities.

C. R. FELLERS

**Profitable garbage disposal in a town of 1400.** W. L. DOUGLAS. *Am. City* 40, 86-7 (1929); *U. S. Pub. Health Eng. Abstracts E-815c*, 11.—A Beccari type of garbage disposal plant at Dunedin, Fla., composed of 5 cells of 50 tons per month each, is economically operated. Three lb. of  $CaO$  is added to each 100 lb. of garbage to counteract the acids principally due to citrus fruits. At the end of 5 days' digestion, the temp. has reached about  $145^\circ$  and when this temp. begins to decline, the air ports are opened and  $O_2$  is admitted, thus permitting the aerobic bacteria to continue the destruction of the garbage. At the end of 30 days, the garbage is practically dry, contg. about 10% moisture. About 15 to 20% of the original bulk remains. Better results were subsequently secured by the use of 5 to 6 lb. of  $CaO$  per 100 lb. of garbage during the fall when citrus fruits constituted a large bulk of the garbage. About 40 days was required for the drying. The humus had a value of \$20.00 to \$30.00 per ton as fertilizer.

C. R. FELLERS

**The "Mammut" thickener.** STEEN. *Deut. Zuckerind.* 52, 275 (1928); *U. S. Pub. Health Eng. Abstracts E-815b*, 49.—The app. is a tank for the continuous sepn. of sludge from beet transport and washing waters. The tank is circular, and has a W-shaped diametrical cross section, which gives a large surface area for a given vol. The water to be clarified enters the app. centrally and flows radially outward toward the periphery of the tank where it runs into an annular trough and is discharged. The sludge which falls onto the sloping sides of the tank arrives at the bottom in a well mixed condition and is easily pumped. It is removed through a pipe which reaches to the bottom of the tank and which is mounted on a staging which continually revolves about the center of the app. The sludge is collected in a central chamber from which it is discharged to the drying beds. For a plant dealing with 1200 tons of beets per day and discharging about 2200 gallons of transport and wash water per min., a tank of about 74 ft. outside and 19.5 ft. inside diameter is suggested. This would provide a

water surface area of about 3970 sq. ft. About 264,000 gal. of sludge, with a dry solid content of about 400 tons, would be obtained per day in this plant. C. R. F.

**Atmospheric pollution.** J. S. OWENS. *Domestic Eng.* 47, 219-25(1927); *U. S. Pub. Health Eng. Abstracts E-815a*, 6; cf. *C. A.* 22, 2651, 3289.—The av. wt. of soot deposited per sq. mile in London is 300 tons, with a max. at the center of the city of 476 tons. The ratio of domestic and factory soot is best detd. by estg. the % of tar present. Tar forms 25% of domestic soot and but 1% of factory soot. By using the *Owens dust counter*, an av. of 5000 particles per cc. was found in London in winter while 80,000 per cc. were present in a dense smoke fog. The abolition of CO<sub>2</sub> and other obsolete ventilation standards is urged. C. R. FELLERS

**The present position of the hygiene of the atmosphere.** W. LIESEGANG. *Klin. Wochschr.* 7, 463-5(1928); *U. S. Pub. Health Eng. Abstracts E-815*, 3; cf. *C. A.* 22, 4759.—The use of tar is advocated for keeping down street dust. There is no definite proof that smoke has any influence on health. CO in amts. present in Berlin has a pronounced effect on the health of city-dwellers. C. R. FELLERS

**Index of comfort in the ventilation of theaters in Sydney, New South Wales.** C. BADHAM, C. F. ASSHETON and H. E. RAYNOR. Rept. Director-General Pub. Health, N. S. Wales. *Studies in Ind. Hyg.* No. 10, 49-72(1926); *U. S. Pub. Health Eng. Abstracts E-815*, 3.—The ideas of the English school, as contrasted with those of the American group of workers who favor the effective temp. as an index of comfort, are discussed. The effective temp. charts of American workers as an index of comfort in the theaters of Sydney are unsatisfactory. A dry katathermometer cooling time of not less than 6.1 at 60° F. and not less than 4.8 at 70° F. is recommended. In order to control the CO<sub>2</sub> content of the air, an air supply varying from 15 to 30 cu. ft. per person per min. is advised. Based on the recommendations as to air movement, it has been computed that an air change of from 6 to 12 times per hr. is required. C. R. F.

**Public health engineering—scope and policy.** R. S. WESTON, EARLE WATERMAN, W. F. WELLS, V. M. EHLERS and ABEL WOLMAN. *Am. J. Pub. Health* 19, 677-8 (1929).—A comm. rept. "Public health engineering may be defined, briefly, as the practice of those engineering arts which affect public health, or, more elaborately, as the application of the laws of science, including those of physics, chemistry and biology, to the betterment of man's environment." J. A. KENNEDY

**Disposal of wastes by the fermentation process.** ARTHUR BONIFACE. *Proc. 9th Ann. Conference Intern. Assoc. Street Sanit. Officials* 11-2; *U. S. Pub. Health Eng. Abstracts E-815a*, 8(1929); cf. *C. A.* 21, 145.—The Scarsdale, N. Y., 8-cell unit, concrete, fermentation disposal plant as originally built was patterned after the Florence, Italy, plant. The cells were charged to capacity with org. matter, securely closed, then left undisturbed for periods varying from 45 to 60 days, at the end of which time the residue produced was removed and placed in sheds to dry, later being removed and eventually used as fertilizer. Upon removal from the fermentation chambers the humus emitted decidedly objectionable odors and was otherwise very unsatisfactory. The plant was reconstructed to provide for drainage from the cells, and aeration through port holes placed near the floor. A gas vent was inserted through the roof to emit the evolving gases. The cells were charged from the top and discharged from the sides. An air-washing chamber with pump arrangement was connected to the gas vent at the roof to spray the discharged gases with KMnO<sub>4</sub> in order to keep down odor nuisance. Before the cells are filled, the garbage is spread out and treated with Ca(OH)<sub>2</sub> in the proportion of about 1.5% by wt. to effect neutralization, followed by a 10% soln. of (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> to start anaerobic action. The garbage is then dumped into the cells, the cells are closed and allowed to ferment for 30 days. The humus produced is 12 to 16% by wt. of the original charge and high in fertilizing value. Plants have the advantage of low initial cost, low operating and maintenance costs, no noxious odors, destruction of pathogenic organisms and revenue-producing possibilities. C. R. FELLERS

**Sugar-beet waste disposal.** E. NOLTE. *Water Yearbook for Sanit. Chem. and Eng.* 1928, 272-80; *U. S. Pub. Health Eng. Abstracts E-789*, 26.—The waste is settled and digested in a series of lagoons and the effluent is run over filter beds. Sedimentation is accomplished in small lagoons and the effluent when dild. 1 to 10 with river water had no further O demand. The fungus *Sphaerotilus* grows very abundantly in sugar waste waters even after much dild. C. R. FELLERS

**The use of gasoline as a larvicide in wells and similar collections of water used for drinking or domestic purposes.** C. S. RYLES and B. C. MAJUMDER. *Maylayan Med. J.* 2, 144 (1927); *U. S. Pub. Health Eng. Abstracts E-789*, 17.—In preliminary lab. expts., small quantities of gasoline, when dropped on a water surface, stupefied *Culex* larvae, but killed many of the *Anopheles* larvae. Stirring increased the efficacy of the gasoline.

In the lab 2 drams to 95 sq. in. surface produced unfailing results. All signs of the gasoline had gone in 1 hr. and all larvae were dead. Expts. were made on wells and tanks with and without vegetation. Vegetation was killed by the gasoline as were all kinds of mosquito larvae with rapidity and certainty when the application was made at a rate of 24 oz. per 80 sq. ft. at a cost of 15c. Stirring is recommended, but a spray may be used instead. After 3 hrs. no trace of the gasoline is detectable by smell, taste or chem. examn. It is suggested that wells be treated in the evening; by morning the water would show no trace of the application. C. R. FELLERS

The action of toxic substances on adult mosquitoes. A. B. LISCHETTI. *Rev. soc. ent. argent.* (Buenos Aires) 1, No. 2, 29-32(1926); *U. S. Pub. Health Eng. Abstracts* E-789, 17.—Mosquitoes are readily attracted for short distances by honey as bait. Females ate the honey-bait smeared on gauze around caged guinea pigs. Poisoned females were unable to lay eggs. Various poisons such as KCN, K arsenite,  $HgCl_2$ ,  $H_3BO_3$  and K arsenate were used. Of these, K arsenite was most efficacious. KCN, though the most active for a time, soon lost its activity. C. R. FELLERS

Exhaust gases of motor vehicles. W. LIESEGANG. *Gesundh. Ing.* 52, 385-91 (1929).—Many samples of air collected from tunnels, garages, streets, etc., have been found to contain appreciable quantities of CO. A complete bibliography is attached. WAYNE L. DENMAN

An open-air swimming pool supplied by underground water at Neumensten in Holstein. D. JUNGLOW. *Tech. Gemeindeblatt* 30, 315(1928); *U. S. Pub. Health Eng. Abstracts* E-815, 3.—A supply of 350 gals. per bather is thought adequate. In Aug., 1927, the total bacterial count averaged 128 per cc. with 0-3 *B. coli* per cc. C. R. F

Remarks on Junglow's paper. G. NACHTIGALL. *Tech. Gemeindeblatt* 31, 39 (1928); *U. S. Pub. Health Eng. Abstracts* E-815, 3; cf. preceding abstract.—For swimming pool purification at Hamburg the water is continually circulated, treated with alum, passed through 2 filters in series and chlorinated. A small quantity of  $NH_3$  added along with the Cl increases the sterilizing action of the Cl and prevents objectionable odors. *B. coli* is never detected after this treatment. C. R. FELLERS

The effect of small doses of plasmochine on the viability of gametocytes of malarina as measured by mosquito infection experiments (BARBER, *et al.*) 11H. Apparatus for aerating sewage (U. S. pat. 1,717,713) 1.

Treating water or sewage. G. ORNSTEIN. Brit. 300,898, Nov. 19, 1927. A metal salt is formed at the place of use from the basic metal by the action of Cl or HCl in the presence of  $H_2O$  and the resulting soln. is delivered to the liquid to be treated with or without simultaneous addn. of Cl. An arrangement of app. is described.

Treating "Town refuse." A. J. TERWAGNE. Brit. 301,427, Nov. 29, 1927. After drying, refuse is heated to produce combustible gases and C. App. and various details of procedure are described.

Filter construction for use in softening water with zeolites. HARRY M. MARSH and ROBERT STIRLING (to W. J. Westaway Co., Ltd.). U. S. 1,718,244, June 25.

Filtration apparatus adapted for softening water with "permutite." CARL HUF-SCHMIDT. U. S. 1,719,548, July 2. Structural features.

Apparatus for sterilizing water by heating. J. SLATER & Co. (Engineers), LTD., and J. C. ROBINSON. Brit. 300,718, Aug. 27, 1927. Structural features.

Preventing scale deposition in water preheaters. JULIUS ALSBERG (to Superheater Co.). U. S. 1,717,905, June 18. The cold feed water is treated with colloidal chestnut ext.

Base-exchanging material. THOMAS P. HILDITCH and HAROLD J. WHEATON (to American Doucil Co.). U. S. 1,717,777, June 18. A soln. of alkali metal silicate is mixed with a soln. of a neutral alkali metal salt such as  $NaClO_3$ ,  $Na_2HPO_4$  or  $Na_2SO_4$  to produce a gel and the gel is dried to obtain a product which is suitable for softening water.

Mixing apparatus for treating feed-water with emulsions or reagents. FILTRATORS, LTD., and V. SAKS. Brit. 300,664, May 18, 1927.

Furnace for burning sewage sludge, etc. F. VON SPRINGBORN. Brit. 301,295, Jan. 19, 1928. Structural features.

Tank and associated apparatus for collecting sludge such as that from sewage. WM. L. D'OLIER and W. G. PRUCHEN. U. S. 1,717,764, June 18. Structural features.

Apparatus for treating sewage by the "activated sludge" method. KARL IMHOFF. U. S. 1,717,780, June 18. Structural details.

**Apparatus (with a spiral rotatable steam coil) for rendering animal offal and similar materials.** RICHARD L. O'MEARA (to Mechanical Mfg. Co.). U. S. 1,717,465, June 18. Structural features.

**Disinfecting garbage in cans with *p*-dichlorobenzene, etc.** ALEXANDER LOWY. U. S. 1,719,185-6, July 2. A special construction of receptacles is described.

## 15—SOILS, FERTILIZERS AND AGRICULTURAL CHEMISTRY

J. J. SKINNER

**Collection and analysis of soil samples from (African) colonies.** MAURICE MARCHAND. *Rev. botan. appl. agr. colon.* 8, 25-32(1928).—Mech. and chem. analyses of 16 soils are given. M. S. ANDERSON

**Soils of the Punjab.** P. E. LANDER, RAMJI NARAIN AND MEHTA M. LAL. *Mem. Dept. Agr. India*, Chem. Ser. 10, 25-142(1929).—The characteristics of the various types of soil occurring in the Punjab are discussed. Numerous chem. and phys. analyses of the surface and subsoils are tabulated. K. D. JACOB

**Salty soils in Central Otago.** A. D. COLLINS. *New Zealand J. Agr.* 38, 250-3 (1929).—Analyses of surface scrapings from salty soil areas in the Central Otago district of N. Z. showed the presence of sol. Mg salts, principally the sulfate, in quantities that would probably be toxic to plants. Considerable quantities of H<sub>2</sub>O-sol. K and Na, apparently combined principally as the chlorides, were also present. K. D. J.

**Soil types of France.** V. AGAFONOV. *Proc. Intern. Soc. Soil Sci.* (Suppl.) 1, 67-89(1928).—The soils of France are classified: (1) podsolized soils; (2) red and yellow soils and (3) azonal soils (loess and volcanic soils). Samples were studied microscopically and chemically, the latter involving total analysis and estn. of plant nutrients by detn. of constituents sol. in boiling 10% HCl. The podsolized soils, which cover the greater part of France, may be divided into 2 zones by drawing a line in a general northeast southwest direction between Mezières, Chalons Poitiers and then in a southerly direction. The soils to the east of this line are much less podsolized than those to the west. The former are classified as brown soils (Ramann). The red, yellow and gray soils of southern France cannot be classified on the basis of climate, geological material having been of greater influence in their development. The soils of Normandy and those near Paris, Laon and Toulouse are yellow loess soils; those of the central plateau are volcanic. I. A. DENISON

**Some data about alkali soils of Russia.** D. J. VILENSKY. *Proc. Intern. Soc. Soil Sci.* (Suppl.) 1, 50-65(1928).—The genesis, compn. and phys. characteristics of the saline and alkali soils of southwest Russia are considered in the light of the theories of K. Gdroidz. Conclusion: Leaching of saline soils without application of other methods of improvement leads to deterioration since leaching transforms saline soils into alkali soils. I. A. DENISON

**The absorbent power of soils.** J. CLARENS. *Ann. sci. agron.* 46, 166-7(1929).—C. disagrees with the conclusions of Demolon, Burgevin and Barbier (preceding abstract) that the fixation of K<sub>2</sub>O and NH<sub>3</sub> by clay soils is due to adsorption and that it follows Freudlich's adsorption equation. These authors reply to Clarens' criticisms and offer further corroboration of their theory from the literature. K. S. MARKLEY

**Bituminous soil.** B. AARNIO. *Proc. Intern. Soc. Soil Sci.* (Suppl.) 1, 92-5(1928).—Bituminous soil is formed under peat beds by the infiltration of org. substances into the mineral stratum above which the peat lies. Bituminous soils invariably contain wax. Analysis shows that such soils are rich in Al<sub>2</sub>O<sub>3</sub> and poor in SiO<sub>2</sub>. Humic solns., which penetrate the mineral strata, ppt. Al<sub>2</sub>O<sub>3</sub>, while SiO<sub>2</sub> is carried away in colloidal soln. The formation of bituminous soils is everywhere the same, but the beds of Hungary are characterized by very great thickness. I. A. DENISON

**Soil profiles of Spitzbergen.** K. O. BJÖRLYKKE. *Proc. Intern. Soc. Soil Sci.* (Suppl.) 1, 96-107(1928).—Chem. and mech. analyses and  $p_H$  detns. are given for several soil profiles in Spitzbergen. Only slight differences are noted in the compn. of samples taken at different depths except in those cases where much org. matter is present. I. A. DENISON

**Graphical representation of the buffering power of soils.** W. U. BEHRENS. *Fortschritte Landw.* 3, 299(1928).—Polemical. The author holds that buffering power is best characterized by a series of titration measurements plotted with  $p_H$  values for abscissas and "buffering,"  $dS/dp_H$ , for ordinates. Limitations of single- and double-value detns. are pointed out. B. C. A.

The interchange between phosphoric acid and arsenic acid in soils. C. ANTONIANI AND G. FONIO. *Atti accad. Lincei* [6], 9, 344-50(1929).—Soils were treated with a soln. of  $\text{Na}_2\text{HPO}_4$  (400 cc. of 0.087% soln.) and then treated with successive portions (300 cc. each) of  $\text{H}_2\text{AsO}_4$ ; the mg. mols. of arsenate absorbed, as well as of phosphate displaced, was noted. Evidently, the soil is not satd. at first, so a large amount of arsenate is absorbed; this is independent of the exchange with phosphate. Therefore, phosphate in soil is susceptible to displacement by arsenate ions from dil.  $\text{H}_2\text{AsO}_4$ .

Beet soils. JACQUES DE VILMORIN. *Chimie & industrie* Special No., 669-70 (Feb., 1929).—Experience has shown that even under conditions which otherwise might not be very favorable, and more particularly when there is an appreciable deficiency in  $\text{CaO}$ , satisfactory sugar-beet yields can be expected if the sub-soil is deep and of proper texture.

The causes of variation of soil reaction in relation to the sugar beet. DECoux. *Sucr. belge* 48, 309-13, 332-7(1929).—The general causes for the acidification of soils are reviewed. In studying the action of fertilizers on soil reaction, 17 types of fertilizers are used on 4 types of soils. The  $p_{\text{H}}$  values of the fertilizers alone are detd. by shaking a known wt. with 500 cc.  $\text{H}_2\text{O}$  for 24 hrs. and using the filtrate for the colorimetric method. A known wt. of soil is now shaken for 24 hrs. with a fertilizer and water suspension similar to the above: the  $p_{\text{H}}$  of the filtrate is again detd. The results are tabulated. The amt. of fertilizer used is comparable to that of field practice. The author reviews the transformations that these fertilizers undergo in the soil. F. C.-C.

Determining the maximum molecular moisture-holding capacity of soils by centrifuging and the characterization of the mechanical properties of soils by this determination. A. F. LEBREDEV. *Pochvovedenie (Pédologie)* 23, No. 1-2, 49-69(1928) (In English).—With the aid of a centrifuge designed by L., rotating 50,000 revolutions per min., detns. were made on the force necessary to remove gravitational water from different types of soil. It was also shown that the film water cannot be removed even with a force equal to 70,000 gravity. From data on the mol. moisture-holding capacity of various sized particles L. concludes that this capacity is an additive function, and the detn. of it may serve as a basis for the characterization of the mech. compn. of the soil, without, however, giving the actual mech. compn. of the soils. A classification of different soils based on the mol. moisture-holding capacity checks very well with the classification based on actual mech. analyses. Drawings and descriptions of the centrifuge are given.

Notes on the constitution and culture value of soils of various formations in Madagascar. BONNEFOY. *Rev. botan. appl. agr. colon.* 8, 161-75, 185-99, 209-24(1928). Partial analyses of numerous soil samples from various provinces of Madagascar are given. Most of the soils are laterites and show low contents of the plant food elements. The N content serves as a rough index of the fertility of these laterites. As a rule, soils contg. less than 0.1% N are not cultivated. The use of mineral fertilizers is suggested for soil improvement. It is thought that N will be sufficiently fixed from the air if sufficient quantities of the other elements are present.

Influence of calcium phosphate on the yield and nutritive values of Paddy fields. F. ANNOTEL. *Rev. botan. appl. agr. colon.* 8, 397-403(1928).—Chem. analyses of rice grown on 16 fields both with and without Ca phosphate showed a marked increase in protein content of the grain resulting from the fertilization. Variations in other constituents were less consistent. Extensive chem. analyses are given.

The use of gypsum on salt soils. L. TRABUT. *Bull. agr. Algérie* [3], 33, No. 1, 1-8(1927); *Intern. Rev. Science & Practice of Agr.* [N. S.], 18, 261-2T.—General information is here given regarding cultivation on salt soil, and the action of certain salts in neutralizing the harmful effects of Na and Mg chlorates and of  $\text{Na}_2\text{CO}_3$ .  $\text{CaSO}_4$  is considered valuable as counteracting those salts which are harmful to cultivation. In the presence of  $\text{CaSO}_4$  (gypsum), the concn. of harmful salts which the roots can stand is considerably increased. If the salt lies above a calcareous soil it forms  $\text{Na}_2\text{CO}_3$  by reaction of the  $\text{NaCl}$  on the  $\text{CaCO}_3$ , and this has a markedly sterilizing effect through the combination of the Na with a weak acid; the soil becomes black and impermeable, and forms the well known, black salt soil. Thus the value of  $\text{CaSO}_4$  for plant growth on salt soil is thoroughly established.

Liming of soils. VINCENT AND HERVIAUX. *Ann. sci. agron.* 45, 335-57(1928).—Lab. and culture expts. are presented which agree in demonstrating that preliminary, partial or total satn. (of acidic constituents) of colloidal soils permits a more complete assimilation of  $\text{K}_2\text{O}$  by plants, not only of the  $\text{K}_2\text{O}$  added in the form of fertilizer but also of the  $\text{K}_2\text{O}$  adsorbed by the soil. Instead of satg. the colloids by the use of large

amts. of  $K_2O$ , lime may be used; this is not only more economical but is necessary in the case of non-calcareous soils. The use of large amts. of  $K_2O$  is not only uneconomical from the standpoint of the  $K_2O$  consumed but, in addition, results in strong decalcification, necessitating more frequent liming. Liming is recommended as indicated by acidity measurement, limiting the amt. of lime to the predetd. requirements, thus conserving the humus of the soil and assuring max. assimilation of the applied  $K_2O$  salts.

K. S. MARELEY

**Relationship of sulfur content of soils and plants.** F. HENGL AND P. RECKENDORFER. *Fortschritte Landw.* 3, 598(1928).—In considering smoke injury it is essential to know how far the S content of a plant may be affected by that of the soil, especially when sulfate has been added in fertilizers. Crop plants were fertilized with fertilizers contg. chloride and sulfate; at the time of flowering, the respective Cl or sulfate content of plants so treated was considerably above that of the controls, but when the plants were ripe the differences were less, sulfate content in particular being little affected. In field observations no relationship was found, except in extreme cases, between sulfate content of soils and plants; further, natural variations in the S content of plants were greater than increases due to smoke gases.

B. C. A

**Synthetic ammonia in the fertilizer industry.** J. W. TURRENTINE. *J. Chem. Education* 6, 894-8(1929).—Proposals and future developments are discussed.

E. F. SNYDER

**Concentrated fertilizers. Problems for the chemist and agronomist.** A. B. BEAUMONT. *J. Chem. Education* 6, 899-905(1929).—Some of the outstanding problems and opportunities now at hand are discussed.

E. F. SNYDER

**Phosphoric acid in agriculture: Some of its occurrences in agricultural materials, its functions, and evidences of its importance.** FRANK E. CORRIE. *Fertilizer, Feeding Stuffs and Farm Supplies J.* 14, 405-6, 409(1929).

K. D. JACOB

**Inspection of agricultural lime products.** H. D. HASKINS AND M. W. GOODWIN. *Mass. Agr. Expt. Sta., Control Series Bull.* 20, 1-7(1928).—Analysis of 27 samples of com. lime products showed a variation in  $CaO$  content from 30.68 to 66.27% and in  $MgO$  from 0.98 to 33.18%. Any lime material which will pass a 20-mesh sieve is assumed to be available in the soil within a 5 yr. period. On those products which will not wholly pass a 20-mesh sieve, it is assumed that the oxides in that portion which is coarser than 20-mesh will be only 50% effective during the same period.

C. R. F.

**Comparison of Rhenania phosphate with superphosphate and basic slag [as fertilizers].** DENSCH. *Fortschritte Landw.* 3, 356(1928).—In a year's pot and field expts. with several acid soils, superphosphate tended to give the largest increases in yield; there was nothing to choose between Rhenania phosphate and basic slag. The former is accordingly classed as a "high-value" fertilizer.

B. C. A.

**Potash and nitrogen fertilization of potatoes.** H. WIESSMANN AND E. SCHRAMM. *Fortschritte Landw.* 3, 625(1928).—From 11 field expts. in different districts it appeared that (except on one soil which did not respond to N) the total yield of starch was little increased by potash manuring unless N was also added. Further N caused larger increases in starch yield than did further potash. Starch content, as distinct from yield, was highest without potash or N, and lowest with the heaviest applications. Potash (40% salts) depressed starch content, whether or not N was applied, and the depressing effect of potash was greater than that of N.

B. C. A.

**Electrolytic or electroactive fertilizers.** E. BURBAN. *Ann. sci. agron.* 45, 362-72(1928).—B. divides fertilizers into four classes, viz. (1) those insol. in  $H_2O$ ; (2) those sol. in  $H_2O$  but only slightly dissoc.; (3) those sol. in  $H_2O$  and moderately dissoc.; (4) those sol. in  $H_2O$  and highly dissoc. A discussion follows of the action of fertilizers in soil soln. and in contact with soil colloids, as plant nutrients and as herbicides from the viewpoint of their soly., degree of dissocn. and ionic mobility.

K. S. M.

**Fertilizer requirements of the plum lands of the Agenais region (France).** G. GUITTONNEAU, J. KEILLING AND M. BÉJAMBES. *Ann. sci. agron.* 46, 133-65(1929); cf. C. A. 23, 1711.—The limiting factor in the fertility of these soils is the lack of assimilable phosphoric acid. The need for assimilable potash is less certain. Soil analyses do not lead to any precise conclusions regarding their need for sulfur.

K. S. M.

**Influence on adsorption phenomena on certain reactions which can come into play in the fixation of fertilizers by soil.** RENÉ DUBRISAY. *Chimie & industrie Special No.*, 671-5(Feb., 1929).—See C. A. 22, 2633.

A. PAFINEAU-COUTURE

**Evaluation of the root-soluble soil nutrients phosphoric acid and potassium.** GERLACH. *Z. Pflanzenernähr. Düngung* 7B, 579-84(1928).—Differences in the limiting values of root-sol. nutrients as expressed by Neubauer and by Roemer are discussed. In field trials far fewer soils exhibited deficiencies of K or phosphate than when examd.

by the Neubauer and Roemer methods. The different exptl. conditions of the 3 methods of soil examn. are largely responsible for the divergent results obtained.

B. C. A.

**Root solubility of phosphoric acid contained in superphosphate, neutral phosphate, reform phosphate and Algiers phosphate.** C. DREYSPRING, C. KRÜGEL AND R. PANTKEE. *Superphosphate* 2, 61-9, 81-9(1929).—The absorption by barley of the  $P_2O_5$  in superphosphate, reform phosphate, neutral phosphate and ground Algerian phosphate rock was detd. by means of the Neubauer method, equal quantities of total  $P_2O_5$  being used in each case. The quantities of  $P_2O_5$  absorbed by the barley seedlings in 18 days with applications of  $P_2O_5$  varying from 5 to 80 mg. per pot were superphosphate 4.2 to 53.3, neutral phosphate 3.2 to 39.1, reform phosphate 1.4 to 10.7 and Algerian phosphate rock 1.2 to 2.4 mg. In all cases there was a very close relation between the percentages of  $P_2O_5$  absorbed by the seedlings and the percentages of total  $P_2O_5$  sol. in  $H_2O$  and in  $NH_4$  citrate in the original phosphates.

K. D. JACOB

**The value of blast-furnace slag as fertilizer.** CURT WEISE. *Arch. Eisenhüttenw.* 2, 283-6(1928).—Ground blast-furnace slag is used with advantage as a substitute for limestone. The crop increases of the slag over those of limestone are ascribed to the accessory constituents of the slag, viz. Fe, S, Mn, colloidal  $SiO_2$ , etc.

R. D. B.

**Nitrogen fertilization.** F. MÜNTER. *Z. Pflanzenernähr. Füngung* 7B, 553-79(1928).—Results of numerous field trials extending over a number of years are utilized to elucidate the most advantageous use of nitrogenous fertilizers for various soils, crops and climatic conditions. The importance of the soil reaction in this connection is emphasized.

B. C. A.

**The effect of fertilizer treatments upon the quantity and quality of pasture vegetation.** I. Mineral treatments. B. A. BROWN. *J. Am. Soc. Agron.* 21, 673-8(1929).—In most instances little, if any, benefit has resulted from adding potash to P and lime. However, on lighter soils, which at present probably should not be used for permanent pasture anyway, it may be profitable to apply potash. II. Nitrogen treatments. HENRY DORSEY. *Ibid* 679-86. —The early expts. on the use of N alone or with minerals has cast much doubt upon its real value. The use of cheaper minerals has induced clover and other legume growth. This growth has, in turn, been followed by a heavy grass growth, due, no doubt, to the accumulated N fixed by the bacteria in the clover and other legume nodules.

E. F. SNYDER

**Some effects of fertilizers on the production of lucerne root nodules.** W. D. REID. *New Zealand J. Agr.* 38, 103-8(1929).—Lab. tests in agar media and in soil showed that when superphosphate is mixed with inoculated lucerne seed before sowing, a large percentage of the nodule bacteria is killed, but ground rock phosphate and basic slag do not have any deleterious effect. As regards germination, the seed seems to be adversely affected by superphosphate, but not by rock phosphate and basic slag. In both cases, mixts. of equal wts. of superphosphate and lime give results between those obtained with superphosphate alone, and with rock phosphate and basic slag.

K. D. JACOB

**Crabs in paddy fields.** K. VENKATARAMAN. Madras Agr. Dept., *Yearbook for* 1927, 23-33(1928).—An org. fertilizer contg.  $P_2O_5$  0.31,  $K_2O$  0.45 and N 0.20% was prepd. from land crabs by allowing them to rot for 10 weeks in a pit covered with a layer of soil.

K. D. JACOB

**The chemical composition of grass from plots fertilized and grazed intensively.** J. G. ARCHIBALD AND P. R. NELSON. *J. Am. Soc. Agron.* 21, 686-700(1929).—The fertilizer treatment decreased considerably the % of dry matter in the grass and decreased slightly the % of crude fiber and Ca in the dry matter. The % of N, P and ether ext. was increased, the N markedly so. Acre production of all constituents was increased, N being nearly doubled, while P and ether ext. were increased by about one-half. The fertilizer treatment increased the nutritive value of the dry matter of the grass. Seasonal fluctuations in the content of the several constituents detd. were not smoothed out to any great degree by the fertilizer treatment, except with Ca, which showed quite a uniform rate of increase in the fertilized plots as the season advanced. Fluctuations in acre production, however, were somewhat reduced by the system, except N and ether ext., which showed much the same seasonal variations on the fertilized and on the check plots. With one exception, the peak of production on all plots of all constituents occurred in June. Min. production occurred in May in all cases. Grass kept in the vegetative stage by grazing may be quite different in chem. composition from what it was in the spring.

E. F. SNYDER

**Role of pasture in the mineral nutrition of farm animals.** L. A. MAYNARD. *J. Agron.* 21, 700-8(1929).—Irrespective of the question as to whether it is

practicable to increase the mineral content of pasture grass where it is deficient, it is important from the standpoint of animal husbandry that future pasture investigations should give increased consideration to the question of their mineral content.

E. F. SNYDER

**Ecological factors determining the pasture flora in the Northeastern United States.** H. P. COOPER, J. K. WILSON AND J. H. BARRON. *J. Am. Soc. Agron.* 21, 607-27 (1929).—It has been observed that there is not a close correlation between the H-ion concn. of the soil and the growth of pasture plants. It is believed that the quantity and quality of the exchangeable cations in the soil complex may be more important than the  $pH$  value of the soil in detg. its adaptability for the growth of certain plants. Recent work on cation exchange in soil colloids shows that there is a correlation between the exchangeability of the various cations and the standard electrode potentials of the metallic materials. Relatively more cations are removed by extrn. with  $N/1$   $NH_4Cl$  than by electro dialysis. This difference is probably partially due to the relative solubilities of the hydroxides of the various metals in water and in the presence of  $NH_4$  salts. The  $NO_3$  and  $H_2PO_4$  anions are sensitive to visible light radiation. The sensitivity of compds. to visible light may be an important factor in nutrient media. It is probable that there is a closer correlation between the growth of plants and the ratio of colloidal material to the available reactive metals which have relatively high standard electrode potentials than there is between the actual % of these materials in the soils and plant growth. There is a correlation between the chem. compn. of the ash of pasture plants and the available soil constituents. Pasture plants grown on poor acid soils usually contain smaller quantities of material with relatively high standard electrode potentials than plants grown on productive soils. The plants grown on the poor acid soils often contain relatively large amts. of Si and other hard elements with relatively low standard electrode potentials, such as Al, Mn and Fe. It is believed the presence of the hard elements influences the palatability of the pasture plants. The plants grown on the fertile soils usually contain relatively large amts. of the soft elements, such as P, K and Ca, and are usually palatable. The width of the N:C ratio of the org. matter on and in the soils is correlated with the relative amts. of cationic and anionic N available for plant growth. Soils with high nitrifying power apparently produce a better quality of pasture than soils with low nitrifying power. The response of plants and animals to some of the relatively weak ions, such as Mg, Mn, Cu, Fe, Ni, Co, I and others, definitely suggests that the presence of compds. of these weak ions may be very important in the nutrition of both plants and animals.

E. F. SNYDER

**The nutritive value of pasture grass as influenced by management.** T. W. FAGAN. *Welsh J. Agr.* 5, 99-109 (1929).—Close grazing and frequent cutting are important factors. Data showing the effect of various factors on the chem. compn. of pasture grass are given.

K. D. JACOB

**The Wormbold system under Welsh conditions.** J. J. GRIFFITH AND R. PHILLIPS. *Welsh J. Agr.* 5, 83-98 (1929); cf. preceding abstr.—Monthly chem. analyses of the dry matter and ash of closely grazed pasture grass are tabulated for the period, April to October. In general, the protein content was highest in October and lowest in May and June. The  $Et_2O$  ext. diminished fairly regularly until August, but showed a tendency to increase slightly during the autumn. The  $P_2O_5$  content of the ash was decidedly lower in June than at any other time of the season. Nitro-chalk was distinctly superior to  $(NH_4)_2SO_4$  as a N fertilizer for pastures as regards the color and the bulk of the herbage produced by the first applications, but in subsequent applications there was no noticeable difference in the effects of the 2 fertilizers. The investigations are being continued.

K. D. JACOB

**Comparative returns in feed units from crop rotation and pasture.** J. W. WHITE. *J. Am. Soc. Agron.* 21, 589-93 (1929).—The pasture as a general av. has produced 10.9% greater wt. of air-dry matter, 7.4% more total digestible nutrients, and 189% more digestible crude protein than was produced in the grain rotation. Potash has caused an increase of 29% of nutrients on the pasture compared to 43% in case of the grain rotation. N, however, has increased the nutrients in the pasture land 37% and in the rotation system only 6%. The P K N treatment has given 9% increase in nutrients on pasture in excess of the reinforced manure. However, the manure treatment has been 9% more effective than P K N in grain rotation. Even though sol. N has caused an increase of 37% over P K in growth of pasture grasses, its effectiveness would no doubt have been much greater had it been applied annually or even semi-annually. The expts. have demonstrated rather conclusively that fertilizer investments on grazing lands may yield equal or superior returns, in terms of digestible nutrients, to similar investments on rotated crops.

E. F. SNYDER

**Study of iodine in South Carolina.** J. H. MITCHELL. *Clemson Agr. Coll. Science* 69, 650-1(1929).—"The relationship of the mineral content of feeding stuffs grown in South Carolina and of the mineral content of the soils upon which they were grown" is being studied. The iodine content of the soil from 6 different sections of the state, of 36 feedstuffs and vegetables, and of 8 rivers is reported. There is a striking increase from 142-684 to 765-3021 parts per billion in the iodine content of the soil from the surface to 18 in. below the surface.

W. D. LANGLEY

**Lime-deficient areas in King-Country.** C. M. WRIGHT. *New Zealand J. Agr.* 38, 260-6(1929).—Preliminary expts. indicated that so-called "dopiness" in sheep, a disease which is apparently caused by a deficiency of Ca in the vegetation from certain areas in King-Country, N. Z., may be prevented by applying Ca, in the form of *ground limestone* or *gypsum*, to the pastures.

K. D. JACOB

**Cure of iron starvation (bush sickness) in stock.** B. C. ASRON. *New Zealand J. Agr.* 38, 232-7(1929); cf. *C. A.* 22, 3241.—Fe starvation in stock occurs in N. Z. in the light volcanic-loam and pumice-sand districts and is caused by a deficiency of Fe in the vegetation. The disease is prevented by fertilizing the soil with *basic slag*, which contains an appreciable amt. of Fe, or by addn. of sol. Fe salts, such as Fe-NH<sub>4</sub> citrate, to the animals' rations. Recent expts. with finely ground *spathic iron ore* have shown that this material gives good results, without the danger of overdosing, when mixed directly with the rations.

K. D. JACOB

**The composition of some commercial insecticides, fungicides, bactericides, rodenticides and weed killers.** H. J. FISHER AND E. M. BAILEY. *Conn. Agr. Expt. Sta., Bull.* 300, 207-368(1929).—A very full compilation in 33 tables of analytical data compiled from all available sources.

C. R. FELLERS

**Liquid hydrocyanic acid. Its use in citrus fumigation.** A. A. RAMSAY. *Agr. Gaz. N. S. Wales* 40, 55-7(1929).—Cyanide fumigation of citrus trees with liquid HCN has the advantage over the pot system in that the use and transportation of cumbersome equipment are eliminated. The pot system possesses the advantage of simplicity and ease of operation by laborers of ordinary intelligence. More uniform fumigation of the entire tree is obtained by the pot system, while the gas from liquid HCN is most effective at the bottom of the tree and least effective at the top.

K. D. JACOB

**Some observations upon wetting power.** E. L. GREEN. *J. Phys. Chem.* 33, 921-35(1929).—As a part of the study of oil-spray materials an extension of the data of previous investigators has been undertaken. The modifications of surfaces by small quantities of contamination are known and, for this reason, the consideration of the wetting of solid surfaces by liquids such as mixts., solns., dispersions and emulsions must be approached with caution. It must be considered that there must be another fluid already in contact with, and perhaps very strongly absorbed upon, the surface of the solid. That fluid consists of the gases of the atm., and the fact that it is gaseous and not liquid brings about quant. rather than qual. differences in its behavior toward surfaces. It would seem that emphasis upon the necessity of a plane surface as a foundation for angle of contact measurements is superfluous. Nevertheless, several investigators have proceeded to det. the angle of contact of liquids with surfaces, such that even remote accuracy in the orientation of the tangent that is to represent the solid plane surface is out of the question. Such are segmented and otherwise convoluted larvae, more mature insects, leaves with ribs, and stems with nodes and scars. Furthermore, they have not allowed for the effects of hairs and other outgrowths that modify these surfaces. It was intended to relate these measurements to glass so that glass might be used as a reference surface, if it could be shown that parallel variations occurred on tree tissue and glass. This was abandoned for reasons cited. Two cuts of the app. used are pictured.

E. F. SNYDER

The origin of chernozem and of the South Russian steppe (TANFIL'EV) 8.

**Fertilizer.** ANGUS MACLACHLAN (to American By-Product Machinery Co) U. S. 1,718,297, June 25. Material high in casein such as poultry manure is acidified and evapd. to dryness. An app. is described.

**Fertilizer.** A. B. KENSINGTON. *Brit.* 301,105, Aug. 25, 1927. Poultry manure is mixed with absorbent material such as peat moss and dried so as to permit free escape of moisture. An acid or acid salt may be added to neutralize NH<sub>3</sub>. An app. is described.

**Fertilizer.** F. G. LILJENROTH (to Kunstdünger-Patent-Verwertungs-A.-G.) *Brit.* 301,486, Dec. 1, 1927. HNO<sub>3</sub> is caused to react with the CaCO<sub>3</sub> obtained when CaSO<sub>4</sub> is treated with NH<sub>3</sub> and CO<sub>2</sub> (a portion of the (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> formed in this reaction

being left in admixt. with the  $\text{CaCO}_3$ ).  $\text{CaSO}_4$  may be sepd. from the resulting soln. before it is evapd.

**Fertilizer.** STOCKHOLMS SUPERFOSFAT FABRIKS AKTIEBOLAG. Brit. 301,387, Nov. 28, 1927. A mixed fertilizer is prepd. by subjecting a mixt. of a K salt,  $\text{H}_2\text{PO}_4$  and another acid such as  $\text{HNO}_3$  or  $\text{H}_2\text{SO}_4$  in thin layers to the action of gaseous  $\text{NH}_3$  (suitably in a worm-conveyor app., in countercurrent).

**Fertilizers.** I. G. FARBENIND. A.-G. Brit. 300,329, Aug. 24, 1927. Urea is mixed with Al phosphate or Fe phosphate or both, with or without addn. of other fertilizing substances.

**Fertilizer.** I. G. FARBENIND. A.-G. Brit. 300,402, Dec. 3, 1927. The double salt  $\text{NH}_4\text{K}$  sulfate is formed by treating solid  $\text{KHSO}_4$  with gaseous  $\text{NH}_3$  at ordinary temp. A revolving tube furnace may be used and the temp. raised to  $50^\circ$  to complete the reaction. Details for prepg. the  $\text{KHSO}_4$  from  $\text{KCl}$  and  $\text{H}_2\text{SO}_4$  are given.

**Fertilizers.** IMPERIAL CHEMICAL INDUSTRIES, LTD. Fr. 655,360, May 10, 1927. A mixed fertilizer contains superphosphate, a nitrate (Na or Al) and an alkali sulfate.

**Calcium phosphate fertilizers.** J. A. POND. Brit. 300,965, Nov. 21, 1927. A fertilizer comprising a substantial quantity of mono-Ca phosphate, some di-Ca phosphate and a relatively small quantity of unattacked tri-Ca phosphate is obtained by treating ground tri-Ca phosphate with  $\text{H}_2\text{SO}_4$  (suitably of a sp. gr. of about 1.36–1.55) in 10–20% less than the proportion required for complete formation of the mono-Ca phosphate and heating the material to about  $135^\circ$ .

**Preparing fertilizer from organic refuse by fermentation.** L. BOGGIANO-PICO. Brit. 300,607, Nov. 16, 1927. An app. is described.

**Insecticides.** I. G. FARBENIND. A.-G. Fr. 655,852, June 5, 1928. Insecticides or fungicides contain inert substances such as clay, talc, kaolin,  $\text{SiO}_2$  gel,  $\text{Al}_2\text{O}_3$  or charcoal, with org. Hg compds. such as Hg nitrophenol.

**Insecticides and fungicides.** M. LACROIX and H. BREYER. Brit. 300,439, Feb. 13, 1928. Naphthalene, sublimed S and  $\text{BaSO}_4$  are intimately mixed, Cu nitrate and tar oil are stirred in and the mixt. is made into a homogeneous paste with Na silicate; formic acid and K silicate are then added, followed by addn. of fine sawdust which has been boiled in water. The product may be used on plants or in the soil.

**Insecticides formed with ammonium fluosilicate and soluble soaps.** W. H. GROOMBRIDGE and A. J. DICKINSON, LTD. Brit. 301,186, Nov. 10, 1927.

**Insecticides containing derris root or its constituents.** ZAIDAN HOJIN RIKAGAKU KENKYUJO. Brit. 300,606, Nov. 16, 1927.

**Copper oxychloride.** SOC. ELETTRICA ED ELETTROCHIMICA DEL CAFFARO. Fr. 655,157, June 2, 1928. A compd.,  $3\text{CuO} \cdot \text{CuOCl}_2 \cdot 4\text{H}_2\text{O}$ , useful for combating diseases of plants is prepd. by the reaction of  $\text{CuCl}_2$  on alk. earth carbonates in the presence of water and preferably at  $40\text{--}50^\circ$ .

**Stimulating plants or seeds.** JOHANNES HUNDHAUSEN. Ger. 477,401, May 3, 1927. Plants or seeds are stimulated with aq. solns. of glycerophosphates. Thus, seeds may be soaked in a glycerophosphate soln., or the soln. may be introduced into the plant or into its flowers, etc.

**Mordants for seeds.** I. G. FARBENIND. A.-G. Fr. 655,790, Mar. 14, 1928. Colloidal org. As compds. such as  $\text{C}_6\text{H}_5\text{AsO}$  with or without fungicides or bactericides are used as mordants for seeds.

**Preparing cotton seed for planting.** VENUS U. CLOER. U. S. 1,718,332, June 25. A mass of seed in dry condition in an enclosed space is subjected to the action of halogen acid gas under pressure; after removal from the acid atm. the seed is heated to about  $82\text{--}99^\circ$  and agitated to remove the lint. An app. is described. The acid treatment serves to facilitate sepn. of heart seed from lighter seed.

## 16—THE FERMENTATION INDUSTRIES

C. N. FREY

**Theoretical and technical advances in the study of alcoholic fermentation.** FREDERICK CHALLENGER. *Ind. Chemist* 5, 239–42(1929). E. H.

**Analysis of hops.** W. WOLLMER. *Wochschr. Brau.* 46, 121–4(1929).—Full details are given for the detn. of total resins, humulone and soft resins in hops. A. S.

**Analysis of the bitter substances of hops.** W. WINDISCH, P. KOLBACH and M. WINTER. *Wochschr. Brau.* 46, 101–6, 111–17, 124–31(1929).—Humulone decomposes on aging under the action of moisture, heat and oxidation into soft and hard resins.

Special precautions for overcoming the interference of these substances in the detn. of humulone are given. Electrometric titration was of no value in estg. the hop resins.

A. SCHULTZ

**Artificial acidification of mashes and worts.** F. EMSLANDER. *Wochschr. Brau.* **46**, 157-9(1929).—Artificial acidification of mashes and worts may greatly improve the stability of the beer but often produces an "empty" and astringent flavor. The higher the litmus acidity, which comprises the salt-forming proteins, in proportion to the total acidity (with phenolphthalein) the fuller is the flavor of the beer. A. S.

**Determination of moisture in barley and malt.** F. WINDISCH. *Wochschr. Brau.* **46**, 96-8(1929).—Various methods of detg. moisture in org. substances are more or less inaccurate and only give relative values. The dielec. const. method gave the most accurate results. The app. is simple, consisting of a measuring device attached to a condenser and the time for a measurement is only 1 min.

A. SCHULTZ

**Phosphatases in malt.** H. LÜERS AND L. MALSCH. *Wochschr. Brau.* **46**, 143 G, 153-7(1929).—About 90% of the phosphoric acid in barley is in org. combination. This is set free by phosphatases in the sprouting and mashing processes. The opt temps. and  $p_H$  values for the max. activities of these enzymes are: glycerophosphatase, 36°  $p_H$ , 5.2; nucleotidase, 49°, 5.6; phytase, 48°, 5.2-5.3; and saccharophosphatase, 41.5, 6.0. There is an 8-11-fold increase of phosphatases during germination of the barley. During kilning these are weakened and especially phytase and glycerophosphatase. The malting conditions most favorable for the production of these enzymes are slow germination and low temps. on the malting floor.

A. SCHULTZ

**Proteolytic enzymes in green malt.** C. K. MILL AND K. LINDERSTRØM-LANG. *Compt. rend. trav. lab. Carlsberg* **17**, No. 10, 1-14(1929).—Results are explained on the assumption that there are at least 2 proteolytic enzymes in green malt. One is a protease acting on gelatin, edestin and egg-albumin peptone; this protease has an optimum  $p_H$  of 4.3 when acting on edestin at 40°. The other is a peptidase, which breaks up leucylglycine, the optimum  $p_H$  being 7.6-7.9 at 40°. This peptidase is greatly inhibited by phosphates and is easily decompd. when the malt ext. is allowed to stand at ordinary temp. at its natural reaction ( $p_H$  5.9). The exts. were usually prepd by grinding 200-500 g. green malt, autolyzing for 2 hrs. at 30° with  $\frac{3}{4}$  its weight of  $H_2O$  and allowing to stand overnight at 1°. The enzyme soln. was thereupon drawn off and allowed to stand at the same temp., some toluene being added. Under these conditions the activity of the peptidase, which was the most unstable, remained more or less unaltered for 7-8 days.

R. P. WALTON

**Titration by stages.** P. KOHLBACH. *Wochschr. Brau.* **46**, 91-6(1929). In this critical discussion on titrating a wort or beer in stages K. recommends replacing the old range of 7.07 to 9.18  $p_H$  by the range 4.27 to 7.07, which is covered in practical brewing and fermentation.

A. SCHULTZ

**Alterations of the hemicellulose-splitting enzyme during the germination and kilning process.** H. LÜERS AND L. MALSCH. *Wochschr. Brau.* **46**, 163-4(1929).—The enzyme, cytase, plays an important part in dissolving the cell walls during malting. The activity of the cytase in barley diminishes somewhat during steeping but increases rapidly during germination to about 2.5 times that of the original barley. It is mostly destroyed again in kilning so that its value in the finished malt is lower than in the barley.

A. SCHULTZ

**The preparation of diastase.** FERDINAND WINKLER AND FRANZ KÖCK. *Chem.-Ztg.* **53**, 457(1929).—Green malt is crushed in a mortar and treated with chlorinated org. compds. Some warm water and glycerol are added to the crushed malt. The mixt. is percolated, the percolate centrifuged and the upper aq. layer drawn off. This layer is purified by several filtrations and pptd. with alc. The ppt. is dried and constitutes a prepn. analogous to the prepn. found in commerce. It is shown, however, that the filtrate still contains considerable quantities of diastatic substances, which can be obtained by working the liquid in a vacuum. This method involving a preliminary pptn. with alc. is not considered as suitable as a method in which the purified percolate is mixed with acetone. By this latter method a ppt. gradually forms in the course of 24 hr., which is centrifuged off. The remaining liquid is evapd. at a temp. not exceeding 40°. The whitish yellow to yellow substance thus obtained is reported to be more active than the usual com. prepn.

R. P. WALTON

**Lactic acid: its importance in judging the qualities of grapes and its determination by the Möslinger method.** J. SCHINDLER AND V. HULAČ. *Chem. Listy* **23**, 73-7(1929).—A natural formation of lactic acid in grapes is a factor for improving the wines in northern climates especially during unfavorable years. In the southern countries where grape juices are only slightly acid, the formation of lactic acid indicates a decrease

in the quality. The content of lactic acid must be considered together with the non-liquid acids and extd. residues; wines with a high lactic acid content must be judged carefully. The quantity of lactic acid detd. is multiplied by 0.83 and to this is added the sum of non-liquid acids yielding the total acids present. The analytical results of 19 wines show that the Möslinger analyses run several tenths of a g. higher than those of the Kunz method. The Möslinger method is simpler and more rapid; it is recommended for the control of wine quality.

FRANK MARESH

**Activation of yeast by pressure fermentation.** SCHUSTER. *Wochschr. Brau.* 46, 99(1929).—Yeast race R successively fermented under pressure showed a stronger fermentation, had larger cells with fewer granulations and settled less readily in its wort than the normal yeast. This activated yeast is believed to show a greater resistance against infection.

A. SCHULTZ

**Use of closed fermentation vats.** F. WINDISCH. *Wochschr. Brau.* 46, 106–7 (1929).—Fermentation vats should be closed, even though the gas is not collected, because of the protection against infection and of the invigorating action on the yeast.

A. SCHULTZ

**Divinylglycol considered as the agent of the bitter flavor in the "bitterness" disease of wines.** F. VOISENET. *Compt. rend.* 188, 1271–3(1929); cf. *C. A.* 23, 3537.—The bitter product isolated from Bourgogne wine suffering from the "bitterness" disease is  $C_6H_{10}O_2$ , b.  $198^\circ$ , vapor d. 3.72,  $d_{15} 1.0148$ , sol. in  $H_2O$ , EtOH and  $Et_2O$ , oxidizes in the air with formation of acrolein. The properties correspond with those of divinylglycol. Its formation from acrolein by reductases contained in the yeast is considered likely.

G. TOENNIES

The equation of alcoholic fermentation (HARDEN, HENLEY) 11A. Phosphoric esters in alcoholic fermentation. I. The sequence of formation of phosphoric esters and  $CO_2$  in fermentation of dried yeast (BOYLAND) 11A. Advantages of rotary pumps for circulating beer in pasteurizing apparatus (STASSANO, ROLLET) 12. Drying grain, hops, etc (Brit. pat. 300,758) 12. Preparing fertilizer from organic refuse by fermentation (Brit. pat. 300,607) 15.

**Lactic acid and alcohol.** PAUL LINDNER. Fr. 656,432, June 25, 1928. Cane sugar, glucose, or fructose is fermented with the bacterium found in the *Agave americana*, for the production of lactic acid and alc. The cultures may be grown in milk to which one of the above sugars has been added.

**Low-alcohol beverage of the beer type.** HERMAN HEUSER (to United States Process Corp.). U. S. 1,717,685, June 18. A portion of a batch of beer is dealcoholized; another portion is condensed and the condensed portion is subjected to yeast fermentation and is added to the dealcoholized portion in such proportion as to keep the alc. content within the legal limit.

**Low-alcohol beverage from beer.** VALENTINE GILBERT. U. S. 1,717,920, June 18. Excess alc. above that legally permissible is converted into HOAc or lactic acid (suitably by bacterial action) and excess acid is then neutralized with  $NaHCO_3$ .

**Clarifying beer.** BERTRAND SIMON. Fr. 655,288, Feb. 28, 1928. Perforated horizontal plates of Al arranged in stacks are placed in the bottom of the casks to increase the surface of deposition for the yeast.

**Yeast.** LUCIEN LAVEDAN. U. S. 1,718,910, June 25.  $CO_2$  from an external source is introduced during yeast propagation to assist in regulating the process. Various details of procedure are described.

## 17—PHARMACEUTICAL CHEMISTRY

W. O. EMERY

**Evaluation of Peru balsam.** A. TSCHIRCH, H. ROSENTHAL AND G. FRIEDLÄNDER. *Pharm. Acta Helv.* 3, 85–8(1928).—The analytical characteristics of Peru balsam are described. The material has  $d_{15} 1.145$ – $1.167$ , and gives a clear mixt. with 1 vol. of 90% alc. but turbidity on addn. of a further 7 vols. of alc.; 3 g. of balsam give a clear mixt. with 1 g. of  $CS_2$ , and yield a brown resin on addn. of 9 g. of  $CS_2$ . The characters of the portions sol. or insol. in ether and light petroleum are described. These and other analytical tests are preferred to detns. of the acid and sapon. values of the crude product.

B. C. A.

**Lemon oil.** J. PRITZKER AND R. JUNGKUNZ. *Pharm. Acta Helv.* 3, 79–83(1928).—

Fresh or suitably preserved lemon oil has  $n_D^{20}$  70–76; values above 77 indicate that the oil is old and altered, unless it is free from terpenes. Old lemon oil changes color and deposits a brown mass; with HCl,  $d_4^{1.19}$ , the acid layer becomes dark brown or black, and the oil layer brownish. A residue on steam distillation of over 4% is abnormal. The normal Eibner-Hue value is 0.6–1.2.

B. C. A.

A new sensitive reaction for the ergot alkaloids, ergotamine, ergotoxine and ergotinine, and its adaptation to the examination and colorimetric determination of ergot preparations. H. W. VAN URK. *Pharm. Weekblad* 66, 473–81(1929).—The violet color reaction between ergot alkaloids and  $p$ -Me<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CHO in the presence of H<sub>2</sub>SO<sub>4</sub> has certain advantages over the usual AcOH test and is sufficiently delicate to warrant extensive use. As a ring reaction it is capable of detecting 0.01 mg. of alkaloid per cc. With ergot exts. where the color of the soln. would interfere, the alkaloids are extd. by adding NH<sub>4</sub>OH and shaking with Et<sub>2</sub>O. The test may then be performed directly with the Et<sub>2</sub>O ext. or after evapn. of the solvent. For the detn., 1 cc. of the tincture or dild. ext. is made alk. with NH<sub>4</sub>OH and shaken with 5 cc. Et<sub>2</sub>O. Sep. portions of 2.5, 1.0, 0.5, 0.25 and 0.1 cc. of the Et<sub>2</sub>O ext. are evapd., each residue is dissolved in 1 cc. EtOH, 1% soln. of  $p$ -Me<sub>2</sub>NC<sub>6</sub>H<sub>4</sub>CHO in EtOH added, and then H<sub>2</sub>SO<sub>4</sub> allowed to flow to the bottom and form a color ring. After 1–2 hrs. standing, the tube showing the faintest pos. reaction is considered to represent 0.01 mg. of alkaloid, and the concn. of the original soln. calcd. on the basis of aliquots taken.

A. W. DOX

Estimation of chloral. C. BRUGES. *Bull. soc. pharm. Bordeaux* 66, 12–7(1928). Various known procedures are discussed. In all of them an error is introduced by the action of NaOH on the CHCl<sub>3</sub> formed, to produce NaCl. By detn. of this NaCl the quantity of CHCl<sub>3</sub> consumed by the NaOH can be calcd. and thus an accurate detn. of chloral is possible.

A. G. DUMÉZ

Identification of yohimbine by microcrystallography. GEORGES DENIGÈS. *Bull. soc. pharm. Bordeaux* 66, 123–7; *Mikrochem.* 6, 113–5(1928).—Dil. the residue (yohimbine-HCl or the free base), in a drop of ammonia on a glass slide, add a drop of 2% or 3% AgNO<sub>3</sub> soln. Mix and add a few drops of NaOH soln. The mixt. turns brown. After 5 or 6 mins. cover the prepn. with cover-glass. Place under strong magnification of microscope and observe crystalline scattered groups in the form of spirals, isolated or assembled in a mosaic manner, of a yellowish brown color. It is yohimbine (illustrated by figure). To identify the only salt of the alkaloid, yohimbine-HCl (illustrated by figure), dissolve 0.1 or 0.2 mg. of the residue in a drop of water made ammoniacal, evap. by heating until crystals of yohimbine are obtained. Dissolve the product on a slide with a few drops of 10% HCl. Evap. as before and secure rhombic scales of the salt. If a mixt. of sodium ammonium silver nitrate is added to the second residue, crystals of yohimbine will be obtained again. Two longer methods also are described.

A. G. DUMÉZ

Preparation of pure emodin. C. ROULIEF AND R. DUBREUIL. *Bull. soc. pharm. Bordeaux* 66, 145–52(1928).—A proposed method is: Treat a convenient quantity of alder buckthorn with 5 times its weight of 97% alc. Add 1 g. of pure HCl and heat at 75° for half an hr. Cool, strain by expression, and filter the alc. liquor. Distil, avoiding overheating and complete in a vacuum oven. Powder the dry ext. in a mortar and exhaust with benzine. Then place it in a desiccator in a current of dry air. Take up the dried ext. thus obtained in ammonia (5 parts per 100) and ppt. by an excess of HCl in the presence of ether. Exhaust with ether until the latter is colored a yellowish red. Distil the ethereal liquors and complete the concn. in a round-bottomed porcelain container. Harden the brownish residue by freezing, place in the air for 48 hrs. and take up in ammonia (5 parts per 100), discarding the insol. residue. Ppt. the filtrate by using HCl, sep. the mother liquors by centrifugalization, and wash twice with distd. water. Repeat the process of acidification, centrifugalization, etc., and dry the ppt. over H<sub>2</sub>SO<sub>4</sub>.

A. G. DUMÉZ

Pine tar of the Codex. R. MASSY. *Bull. soc. pharm. Bordeaux* 66, 152–4(1928). Vegetable tar is defined as follows: It is a pyrogenous product obtained from trunks and roots of several species of pines and residues coming from their exploitation. Official vegetable tar (pine tar) of the Codex, known also as "Norway tar," has the following characteristics: semifluid; granular; brownish black in mass, and transparent brownish red in thin layer; strong and persistent odor; acid reaction; liquefiable by heat and combustible with smoky flame; insol. in water, sol. in alc., ether, fixed and volatile oils. Other vegetable tars have practically the same properties regardless of the woods from which they are derived. Therefore, M. thinks the Codex should give other tests to distinguish official tar from the others. He states that an excessive quantity of defective material or added adulterants could not be detected readily in official tar be-

cause of lack of tests. He also mentions that a purified vegetable tar is prepd. from the official product, and suggests that the Codex abolish its present method of prepg. official pine tar (vegetable tar).

A. G. DuMez

**Extraction of strychnine and brucine for their determination.** E. DUFRILHO. *Bull. soc. pharm. Bordeaux* 66, 133-9(1928).—A critical explanation is given of the present methods of extg. and detg. strychnine and brucine. Errors in the processes are due to: (1) insufficient exhaustion of the plant, (2) contamination of alkaloids by impurities and (3) detn. of the strychnine and brucine content together in most cases, instead of separately. A proposed method of extn., purification and estn. of the 2 alkaloids is: (a) *Extraction*—Dry 10 g. of a strychnine-bearing drug in No. 30 powder at 60-70°. Det. the moisture. Mix 5 g. of the powd. drug with half its vol. of pumice stone. Moisten with 5 cc. of a mixt. of acetic alc. (99 cc. 70% alc. and 1 cc. glacial acetic acid) and place in the tube of a Soxhlet app. (type described) having a plug of glass wool at the bottom and on the surface of the drug. Place 95 cc. of the acetic alc. in the Pyrex flask and ext. for at least 4 hrs., or until exhaustion is complete. Heat the extd. liquid in the flask on a water bath until a sirupy ext. is obtained. Test for its acidity with litmus; if neg., acidify with a few drops of acetic acid. (b) *Purification*—shake the sirupy ext. in a stoppered flask with 15-20 cc. of ether until emulsification takes place. Let stand, then reject the supernatant ether from the sirupy ext. Repeat until a drop of ether placed on parchment paper leaves no stain. Complete evapn. of the ether by plunging the flask into boiling water away from the flame. (c) *Estimation*—Chill the sirupy ext. in a flask, pour into it 50 g. of ether, 25 g. of chloroform and ammonia until alk. Stopper the flask and agitate for 5 min. Let stand for 1 hr., remove 60 g. of the ether-chloroform mixt. (corresponding to 4 g. of the powd. drug) into a tared, wide, flattened container. Evap. on a water bath. Take up the residue in 10 cc. of ether, evap. and dry in an oven at 100° to const. weight. The product represents the total quantity of pure alkaloids. Weigh, then proceed with the volumetric detn. of strychnine and brucine separately as mentioned before. Advantages of the proposed method are: simplicity, time-saving, perfect control, complete exhaustion, and pure state of alkaloids obtained.

A. G. DuMez

**Apropos the next edition of the Codex.** A. MANSEAU. *Bull. soc. pharm. Bordeaux* 66, 23-4(1928).—M. mentions that many medicaments which are official in the Codex are described too briefly, with the result that pharmacists and students are required to seek information regarding them in other books of chemistry and pharmacy. Examples are: Ca glycerophosphate, ichthyol, barbituric acid derivs., etc. An official commission has been appointed and given the privilege of contributing to the new addition of the Codex any necessary addns. or modifications in the interest of pharmacy. The French pharmaceutical societies are not organized thoroughly to collaborate with the commission. The harmony existing among German pharmaceutical societies which aid in editing the German Codex is cited.

A. G. DuMez

**Alteration of dermatol.** RENÉ GUYOT. *Bull. soc. pharm. Bordeaux* 66, 18-23 (1928).—A summary of the physical properties of dermatol is given, and reasons for its alteration under certain conditions are discussed. The results of Dupuy on the alteration of dermatol are mentioned. The alteration was thought to be due to: (1) impurities in the process of manuf. (methods of Causse and Fischer are given); (2) incomplete washings; and (3) addn. of adulterants. Each of these supposed reasons is discussed. The real cause for alteration is the oxidation of the phenolic functions of the gallate with the production of a violet-colored pigment, known in the industry as galloflavin. This product was prepd. by the action of ultra-violet radiations on dermatol in a dark chamber. Other attempts to reproduce the violet colorations were made with successful results. Conclusion: Dermatol is not absolutely unalterable in the air. A. G. D.

**Alterations by light, heat and agitation of the heavy petroleum oils refined for therapeutic use.** P. BRUÈRE. *Bull. soc. pharm. Bordeaux* 1928, 142-4; *J. pharm. chim.* [8], 9, 26-7(1929).—Actually the products known under the names of liquid paraffin, paraffin oil, liquid vaseline and vaseline oil are obtained by sepn., refining and mixing heavy petroleum oil, and all the names cited above should be considered as synonyms. There are found on the market only those mixts. imposed by the needs of commerce and they are defined by their d. and viscosity. The d. of an official product must be between 0.875 and 0.885, and the limits for the absolute viscosity are from 0.3 to 0.6 at 35° (Baumé viscometer with Et<sub>2</sub>O). These oils can undergo many changes: (1) change by light (photolysis); whence the necessity of keeping liquid

in the same way as photolysis and thermolysis. These changes can easily be detected by Hardy's test: Deposit, with a drawn out stirring-rod having the tip terminating in a bulb, one drop of the product to be tested on a large surface of very clean distd. water which is at rest; two different results may be observed: (a) The droplet takes a lenticular shape and remains in one place; the product is well refined and well preserved. (b) The droplet spreads more or less rapidly; the oil is altered either by light or bad refining, or has deteriorated as a result of agitation. A. G. DuMEZ.

**Composition of spirit of ether.** A. SCHAMELHOUT. *J. pharm. Belg.* 10, 129-31 (1928).—Whether "Aether cum Spiritu" of the Netherland Pharmacopeia could be dispensed for "Spiritus Aethereus" prescribed by a foreign physician is discussed as to names and synonyms and compn. as found in twelve pharmacopeias. The name "Spiritus Aethereus" is given by three pharmacopeias and is of the same compn., 25 parts of ether to 75 parts of alcohol; while "Aether cum Spiritu" contains equal parts by wt. of ether and alc.; others, however, of the same name are of different compn., and others of the same compn. have different names. In all, 6 formulas are stated, ranging from 20 to 50 parts of ether in 100 parts of the spirit of ether. A. G. D.

**Yage.** L. MICHELIS. *J. pharm. Belg.* 10, 247-8 (1928).—Perrot and Hamet, after a histological study, state that yage does not belong to the Apocynaceae or Asclepiadaceae, but that it approaches *Banisteria hassleriana* and *Schizoptera* in the structure of its stems and leaves. M. reviews other literature, giving bibliographic references. Four plates are shown of the drug. Some of the specimens obtained from Colombia were found to contain the alkaloid yageine isolated by Degand. A. G. DuMEZ.

**Silver salt of mercury oxycyanide.** E. HAIRS. *J. pharm. Belg.* 10, 267-8 (1928).—The detection of  $\text{HgCl}_2$  in the oxycyanide by the test as given by the German and Belgian pharmacopeias is misleading. The test adds 1 cc. of  $\text{HNO}_3$  and 2 drops of a 5%  $\text{AgNO}_3$  soln. to a 5% soln. of the mercuric oxycyanide, when no precipitate should form. In the case of the normal cyanide, contg. a trace of the chloride, a ppt. will form; whereas with the oxycyanide, as much as 10% chloride will not form a ppt. Furthermore, a soln. of the oxycyanide will dissolve the ppt. formed by adding a soln. of  $\text{AgNO}_3$  to one of  $\text{HgCl}_2$ . By increasing the amount of  $\text{AgNO}_3$  in the test to 25 drops, a ppt. of fine needles and prismatic crystals was obtained. An analysis of the compd. corresponded to the formula of Woehler, namely  $\text{Hg}(\text{CN})_2 \cdot \text{AgNO}_3 \cdot 2\text{H}_2\text{O}$ . The same compd. was obtained by using the normal cyanide. H. mentions the possibility of using this compd. therapeutically. A. G. DuMEZ.

**Phytochemical study of Polygonum aviculare.** FELIX DAELS. *J. pharm. Belg.* 10, 353-5 (1928).—An attempt was made to det. some of the constituents responsible for the use of *Polygonum aviculare* as a remedy for diabetes. An alc. ext. treated with  $\text{CHCl}_3$  and 10%  $\text{H}_2\text{SO}_4$  gave: In the aq. soln., reducing sugars, identified as dextrose, and some tannin; in the  $\text{CHCl}_3$  soln., the Bornträger reaction, traces of hydroxymethyl-anthraquinone; and in the residue, tannin and some anthraquinone. An ethereal ext. showed 2.5% of fat in the dry drug. An aq. ext. after being first exhausted with MeOH, contained mucilages, tannin, chlorides and silicates; it was also capable of reducing Fehling soln. The aq. soln., clarified and inverted, was capable of considerable reduction. A 20% infusion, comparable to an administerable product, contained a trace of volatile oil and a volatile alkaloid somewhat similar to nicotine or conine. An aq. ext., first treated with MeOH and followed with alc. KOH, although black and hygroscopic, indicated nothing in addition to the above. Traces of tannin and anthraquinone were found in every ext. The results obtained indicate that the drug contains a glucotannin, anthraquinones, essential oil, invertible sugars, and probably a trace of a volatile alkaloid. Tannins are responsible for the relief of the diabetic thirst, and the anthraquinones for the laxative properties. A. G. D.

**Analysis of saffron.** N. WATTIEZ. *J. pharm. Belg.* 10, 371-5 (1928).—The work was originally started to det. biochemically, the amount of added sugar present as adulterant. The adulteration is accomplished by dipping the drug in a suitable sugar solution and then allowing it to dry in air. The resulting drug is slightly drier and more brittle, but the original color and odor persist. When the drug is powdered this adulteration is beyond detection. The resulting reduced ash is raised by the addition of minerals, as sodium sulfate. Some previously used adulterants are also included. Several methods are given for the detn. of added sucrose in saffron, which is simply a detn. of the reducing matter before and after acid inversion, in a 1-2% aq. ext. of the drug. The acid used in the inversion affects other hydrolyzable matter as glucosides present in the drug. Results vary, depending on the length of time allowed for inversion. The test is limited practically, by the use of variable strengths of acid for inversion. The biochem. method is based upon the fact that sucrose is acted upon by invertase,

and the glucosides by emulsin. The drug is extd. 3 times with hot 70% alc., the alcohol removed by distn., the residue dissolved in water and filtered and the soln. (2%) treated with invertase and then emulsin. The alc. stabilized ext. thus prepd. shows negligible retention of sugar by clarifying with ammoniacal acetate, and gives amounts of added sucrose by means of invertase fairly accurately. Comparison of the stabilized extract with an aq. ext. which had stood for 5 days showed fermenting action in the water ext., identical action of invertase and the same total reducing sugars after action of emulsin in both exts. The biochem. method indicates the presence in saffron of 1-1.5% of an unknown sugar, hydrolyzable by invertase, the resulting sugar being l-rotatory; of a glucoside, hydrolyzable by emulsin; and of an enzyme capable of hydrolyzing the glucoside present in the drug. Chemical analysis of the drug showed moisture 17.2, ash 4.72, N 2.30, reducing matter before acid inversion 24.25 and after inversion 25.90%.

A. G. DuMEZ

**Solubility of spirit of turpentine in alcohol.** G. RONCHESNE. *J. pharm. Belg.* 10, 391-2(1928).—The Belgian Pharm. requires that the spirit should dissolve in 12 parts of alc., in contrast to the French Codex, which requires it to dissolve in 7 parts of 90% alc. The turpentine and alc. were measured with calibrated burets and the mixing was carried out in a tall, glass-stoppered, graduated cylinder. To 12 cc. of 94% alc., sufficient spirit of turpentine is added until the mixt. has a slight turbidity, and the addn. of another 0.5 cc. of alc. produces a clear soln. This soln., after some min. becomes cloudy, but the addn. of another 0.5 cc. of alc. makes it clear; this occurs twice more; hence the addn. of another cc. of alc. A lowering in temp. also causes a turbidity, which is corrected by a final 0.5 cc. of alc. Thus, one part of turpentine dissolves in 2.75 parts of 94% alc. Adding the turpentine to the alc. produces similar results. Spirit of turpentine dissolves in 3 parts of 94% alc.

A. G. DuMEZ

**Composition of fruits of *Swartzia madagascarensis*.** P. DEGAND. *J. pharm. Belg.* 10, 427-9(1928).—The fruits are pods, 7-15 cm. long, containing two kinds of seeds: one, blackish, 7 mm. long; the other, which is olive-green, being smoother and larger. The seeds were extd. with alc. acidulated with tartaric acid, the alc. was removed, the ext. treated with water, the aq. soln. treated with acid and alkali and then extd. with ethereal solvents according to the method of Dragendorff. The acid and alk. media gave similar results: petroleum extraction, negative; benzene or chloroform, gave a slight resinous residue sol. in dil. HCl, but negative to Bouchardat or Mayer's reagents, and a slight coloration to Froehde's reagent. The pods contained 6.72% moisture and (on the dry pods) ash 2.79, crude fiber 18.3, albuminous matter 6.23, and ethereal ext. 1.02%; phosphates, Ca, silica, iron and alkali metals were present in the ash. No alkaloids were found in the pods. The pulverized drug moistened with NaOH turned a dark red, indicating anthraquinones; the same was shown with all the exts. obtained in the other detns.; acid, however, restored its original olive-green color.

A. G. DuMEZ

**Determination of colloidal bismuth.** F. DE MYTTENARRE. *J. pharm. Belg.* 10, 443-5(1928).—The analysis of colloidal bismuth preps. used in syphilitic and dermatologic work shows the presence of variable amounts of bismuth ranging from zero to 0.017% in manufactured ampoules. On account of the inconsistency of the prepn. or the instability of the colloid, as is sometimes shown by a black deposit on the walls of the container, or a flocculent bismuth precipitate, controlled products should be used in anti-venereal prophylaxis, or all colloidal preps. which contain these deposits should be rejected. Bi was detd. by the method of Malengreau and Delrue (C. A. 19, 529) and that of Bouillenne and Dumont, which consists of treating the product with HNO<sub>3</sub> and H<sub>2</sub>SO<sub>4</sub>, evapg. to dryness, incinerating, dissolving the ash in a little HNO<sub>3</sub> and making up to vol. Graduated quantities of this soln. are added to 10 cc. of water, and 3 or 4 drops of 10% KI soln. and then 2 drops of a 1% NaHSO<sub>3</sub> soln. are added. The yellow color appearing in 5 min. is compared with the color of a similar series of standards. For Belgian preps., the standard used contained 1:1000 of BiONO<sub>3</sub>, which had been previously dissolved in a little HNO<sub>3</sub>. The soly. of the iodide formed is equiv. to 1.2 mg. of bismuth per 100 cc. of soln.

A. G. DuMEZ

**Sixth supplement of the French Pharmacopeia.** A. SCHAMELHOUT. *J. pharm. Belg.* 10, 513-5, 529-33, 545-7(1928).—Gauzes are recognized as absorbent, dressing, and "tangepts." Tests are given for absorbent power, loss of wt. at 100°, reaction to litmus, water-sol. matter, and ash. Gauze bandages are made like the compresses but are heavier and are covered with a starch base. "Tangepts" differ in that the cotton strands are of different types and are better suited for giving strength. *Arsphenamine* is official under its chem. name; the supplement mentions six other synonyms and trade names. The tests and properties given are similar to those of the U. S. P.

Three soly. tests for differentiating it from neoarsphenamine are included. In one, however, an error is shown in the calcn. of the amount of NaOH necessary for neutralization of the salt. Arsenic is detd. in the same manner as in the U. S. P., except that the supplement does not provide for the addn. of oxalic acid to neutralize the excess of permanganate present after oxidation. S is detd. after destruction of the org. matter by oxidation with  $\text{HNO}_3$  and Br and weighing as  $\text{BaSO}_4$ . The effect of the drug injected into the rabbit and mouse detcs. its toxicity. Rabbits are kept under observation for 7 days after injection, when they should be alive, show no great loss in wt., or develop diarrhea within one hr. after being injected. The dose is 6 cc. of a 2% soln. per kg. body wt. of the rabbit, weighing 1000–1500 g. Similar details are given for the mouse; 8 out of 10 should remain alive after a three-day period. The dose is 0.2 cc. of a 1:300 soln. per g. body wt. of the mouse. The manner of preservation and therapeutic dosage of the drug are practically the same as given in the U. S. P. *Neoarsphenamine* is recognized as sodium diaminodihydroxyarsenobenzenesulfoxylate, which fails to indicate that the drug is a methylene deriv. The formula, however, is not given; statements lead to the opinion that it is not a pure chemical but a mixt. depending upon the method of manuf. Tests are given for proof of As and of the methylene deriv. as formaldehyde. The assays for As and S are the same as for arsphenamine, limiting As to not less than 19%, and S not over 12%. This high allowance of S will permit adulteration of the product, since a disubstituted salt contains less than 12% of S. The dose for the rabbit is 250 mg. per kg. body wt. After 7 days 3 of 4 rabbits should be alive. With the mouse, inject two series of ten each, giving one set 0.5 cc. of a 0.75% soln., and the other set, a like quantity of a 0.85% soln. After 4 days, 7 mice of the first set and 6 of the second should be alive. Other precautions to be observed as to loss in wt., occurrence of diarrhea and feeding of animals are the same as those given for arsphenamine.

Study of alkaloids of *Picalima klaineana*. L. MICHIELS. *J. pharm. Belg.* 10, 561(1928).—A review of the literature.

*Meriandra bengalensis* and its essential oil. S. DEZANI. *Boll. inform. econ. (Rome)* 15, No. 1–2, 72(1927); *Intern. Rev. Science & Practice of Agr.* [N. S.] 18, 477T. *Meriandra bengalensis* Benth, is a shrub of the Labiate family, sub-family Stachyoidae Meriandreae, a native of Abyssinia, which also grows wild over an extensive area in Eritrea, between Adi Caje, Az Taclesan and Adi Ugri. The leaves contain enough ordinary camphor to warrant its industrial exploitation. They also contain eight-celled glands rich in essential oil and these glands are found also, though in smaller numbers, on the twigs and the calyx of the flowers. Submitted to aqueous steam distillation they yield first a yellowish oil and afterwards crystals of ordinary camphor. The oil on cooling forms a butyric mass, which on the separation of stearopten and after purification by repeated crystallizations is found to consist of ordinary camphor.

H. L. D.

Experimental culture of peppermint in Poland. Study of the oil. W. J. STRAŻEWICZ. *Brochure* 24 pp., Warsaw, 1928; *Quart. J. Pharmacy* 1, 641–2.—Peppermint, *Mentha piperita* (L.) Huds., var. *officinalis* Sole, forma *rubescens* Camus, has been cultivated and collected in 1926 and 1927 at the medicinal-plant garden of the Uniwersité Stefan Batory, at Vilno (Wilna). Eleven of the samples of distd. oil showed the following characters:  $-d_{15} = 0.9033$  to  $0.9171$ ;  $\alpha_D^{25} = -23.04$  to  $-31.66$ , esterified menthol 6.25 to 14.0, free menthol 37.77 to 59.98, total menthol 48.17 to 68.18%. Judged by their compn., these oils are of medium quality. A batch of inflorescences of black peppermint gave a superior yield of oil of higher sp. gr. 0.9238, and dextrorotatory,  $\alpha_D^{25} = +13.9$ , rich in esterified menthol, less rich in total and in free menthol. Increase of insolation and temp. during the vegetable period diminishes the proportion of esters in the oil. Steam distillation yields in 20 to 25 min. 0.75 of the oil and the whole in 1 hour. As distn. proceeds, the d., rotation and proportion of menthol esters increase in succeeding fractions of the oil, while the proportion of free menthol diminishes. The yield and compn. of the oil vary with the rapidity and temp. of the distn. The infection of peppermint by *Puccinia menthae* Gers. diminishes the harvest, but has no effect upon the yield and quality of the oil. The use of superphosphates as a fertilizer is efficacious against the disease and increases the harvest. The drug, gathered before flowering, contains a larger proportion of leaves than of stems; if harvested when in full flower, the stem and leaf are present in about equal amts., the inflorescence forming about 0.1 of the whole. When the fresh plant is dried, it loses the greater part of its moisture in the first 15 or 20 hours. Temporary storage of peppermint in well-filled sacks, in a shaded and well-aired depot, does not alter either the content or the quality of the oil.

H. L. D.

**Diuretic mercury compounds of the cyclic series.** S. SCHMIDL. *Bull. gen. therap.* 178, 451(1927); *Quart. J. Pharmacy* 1, 475-6.—Hg salts of the aromatic series, in which the metal is attached to an allyl group, provoke diuresis, after the parenteral injection of their aq. solns., the intensity of which bears no relation to the amt. of Hg present in the mol. Their therapeutic activity is, therefore, distinct from their toxicity. The complex mercuric hydroxyl compd. with salicylallylaminoacetic acid, rendered sol. in water with  $\text{NH}_4\text{Cl}$ , appears to be the most valuable of these. Its action is intense and rapid, and its toxicity is low. It occasions profuse diuresis in the normal subject as well as in cases of disease. Its use is indicated in all cases where a prompt and powerful diuretic effect is desirable. The same contraindications apply to its use as in the case of antisiphilitic mercurial treatment. It must not be injected when a rise of temp. is evident. It may be used to emphasize the action of theobromine, but it does not appear to augment the action of digitalin or of ouabain. The optimal dose is in the region of 1.2 cc. of a 10% soln., which should not be repeated at a less interval than 4 days. The injection should be made intramuscularly. These are as rapid in action as those given intravenously, and more lasting. This route, too, is easier in edematous cases. The diuresis provoked is purely chloro-aq. The amt. of urea is diminished, but ultimately returns to its original figure. H. L. D.

**Determination of alkaloids in Sabadilla seeds.** JÖNSON. *Farm. Revy.* 1928, 184; *Quart. J. Pharmacy* 1, 608.—The following modification of the method of the Swiss pharmacopeia is recommended. Ten g. of the seed, in No. 30 powder, is shaken thoroughly for 10 minutes with a mixt. of 100 g. of ether and 10 g. of  $\text{NH}_3$  soln. As soon as the mixt. has become clear, the ethereal soln. is transferred to a sepg. funnel and shaken twice with 1 cc. of  $N\text{NH}_3$  soln. Fifty g. of the ethereal soln. is weighed out, the ether distd. off, and the residue evapd. with a further 5 cc. of ether. The residue is dissolved in 5 cc. of  $N/10\text{HCl}$ , 50 cc. of  $\text{H}_2\text{O}$  is added, followed by a sufficient amt. of ether and 5 drops of iodoeosin soln., and the excess of acid is titrated back with  $N/10$  alkali. If after shaking out the alkaloid the mixt. should show no sign of becoming clear, it is recommended that the liquid be poured off from the powder and shaken with 5 cc. of water. The dark-colored lower layer is rejected and the ethereal soln. washed with 2 portions of 1 or 2 cc. of  $N\text{NH}_3$ . H. L. D.

**Spanish essential oils.** ERNEST S. GUENTHER. *Am. Perfumer* 24, 160-2(1929).—A survey has been made of the Spanish essential-oil industry, notably in the production and character of spike oil. The chem. and phys. properties of some 8 different provincial samples are listed, in connection with the methods of distn. followed, the yields, cost price and adulteration of the oil. W. O. E.

**Beauty creams.** FRED WINTER. *Am. Perfumer* 24, 165-6, 232, 234(1929).—An attempt is made to enumerate certain details and useful precautions designed to guard the manufr. against defects in his products. In this connection, the theory of the manuf. of beauty creams and raw materials involved are discussed, such as the neutral glycerides, beeswax, lanolin, cacao butter, stearin, petrolatum, spermaceti, kerosene, paraffin, glycerol and water. W. O. E.

**Copper compound of diethylbarbituric acid.** N. V. ROMANOVA. *Arch. Pharm.* 267, 370-2(1929).—Veronal soln. treated with  $\text{Cu}(\text{OAc})_2$  soln. gives a blue ppt.,  $\text{OC.CEt}_2\text{CO.NH.CO.NCuOAc}$ .  $\text{CuSO}_4$  soln. also forms a blue ppt. W. O. E.

**Bolivian drugs.** O. KELLER AND FRANZ GOTTAUF. *Arch. Pharm.* 267, 373-90 (1929).—Among the drugs used locally in Bolivia are I, Chuchuhuasca; II, Yuquilla; III, Anocaperi; IV, Ayahuasca; V, Chacrana; VI, Mamiri; VII, Palo Balsamo Peru; and VIII, Barbaco. The essential ingredients of I are a fatty oil, phytosterol, resin tannin and caoutchouc; II, an alkaloid (1.5% from 100 g. powd. drug), yellow and amorphous, sol. in  $\text{H}_2\text{O}$ ,  $\text{EtOH}$ ,  $\text{MeOH}$ ,  $\text{AcMe}$ , insol. in  $\text{Et}_2\text{O}$ ,  $\text{CHCl}_3$  and  $\text{EtOAc}$ , yellow-brown with concd.  $\text{H}_2\text{SO}_4$ , red-violet with  $\text{Br-H}_2\text{O}$ ; III, fatty oil, resins, piperine or a nearly related alkaloid; IV, tannin, fat and alkaloid,  $\text{C}_{15}\text{H}_{13}\text{N}_2\text{O}$  (nitrate,  $\text{C}_{15}\text{H}_{13}\text{N}_2\text{O} \cdot \text{HNO}_3$ ) nearly related to banisterine or harmine; V, fat, phytosterol, resins, free pyrocatechol, saponin (3.4%) ( $\text{C}_{41}\text{H}_{70}\text{O}_{20}$ ), glucose, rhamnose, pentose and tannin. The condition of the other three drugs did not permit of examn. W. O. E.

**Bolivian drugs.** TH. HERZOG. *Arch. Pharm.* 267, 390-400(1929).—A botanical-pharmacognostic study of ayahuasca, chacrana and anocaperi. W. O. E.

**Macedonian opium.** A. VRGOČ. *Arch. Pharm.* 267, 352-70(1929).—A comprehensive study of the cultivation, production and diseases of opium in connection with the economic factors incident thereto. The article is illustrated. W. O. E.

**Determination of nitrate nitrogen in tobacco.** HUBERT B. VICKERY AND GEORGE W. PUCHER. *Ind. Eng. Chem., Anal. Ed.* 1, 121-3(1929).—A modification of the Jones

method for detg. nitrate N is described which is especially adapted for the investigation of tobacco or its exts. The method consists in the preliminary quant. removal of nicotine by steam distn. of a suspension of the tobacco in an alk. soln. Nicotine may be detd. in this distillate and nitrate in the residue by reduction with acid and reduced Fe. It is necessary to conduct a blank detn. omitting the reducing agent, but the relative magnitude of this blank is small and not highly variable. Data are given showing the wide variability of the proportion of nitrate N in tobacco and its dependence on the type of nitrogenous fertilizer employed in growing the plant. W. O. E.

**Chemical characterization of drugs. VII. Microsublimation in the D. A. B. 6.** L. ROSENTHALER. *Apoth. Ztg.* 44, 744-6(1929).—While the present edition of the Ger. Pharm. provides for microsublimation as a new procedure, L. concludes from a series of expts. with various crude drugs that its adoption by the Pharm. is unwise. W. O. E.

**Indian Ephedra species. Their extraction and assay.** S. KRISHNA AND T. P. GHOSE. *J. Soc. Chem. Ind.* 48, 67-70T(1929).—Five different species of *Ephedra* are known to occur in India, *E. gerardiana*, *E. nebrodensis*, *E. intermedia*, *E. pachyclada* and *E. foliata*, the last of which contains no ephedrine, while *E. intermedia* contains 0.1 to 0.3, and *E. gerardiana* 0.4 to 1.25%. That the altitude has no connection with the alkaloid content is clearly apparent from data now available. The present study shows that the greater the annual rainfall the smaller is the alkaloid content. A sample of *E. gerardiana* grown at an altitude of 12,000 ft., with annual rainfall about 100 in., contained about 0.10% ephedrine, while another sample from an altitude of 10,000 ft. and av. rainfall of about 3 in. had 1.23% alk. Tables are presented showing these marked variations, also the distributions and diagnostic characters of the 3 main species of Indian *Ephedra*. Exptl. studies show the methods of extn. and assay followed, likewise a procedure for large-scale operation. The influence of different solvents on natural and synthetic ephedrine (ephedrine) has been studied. W. O. E.

**Vanadic acid as reagent in pharmacy.** FRITZ WISCHO. *Pharm. Monatsh.* 10, 88-9(1929).—The use of  $V_2O_5$  as reagent, notably for aloin and certain alkaloids, is discussed. Expts. also are described looking to the substitution of *titanic acid* for vanadic. W. O. E.

**Detection of saponins in drugs and foods.** L. KOFLER. *Pharm. Monatsh.* 10, 97(1929).—A discussion of the Fischer and Nevelsky capillary (blood gelatin) test, which permits detection of saponin in drug sections. W. O. E.

**Mercurial salves and cosmetic creams.** P. SCHÜTZ. *Pharm. Ztg.* 74, 784-5(1929).—While mercurial salves and creams for cosmetic purposes are prohibited under the German law, certain preps. appear from time to time which contain salts of Hg, Bi and Zn. Several brands are cited in connection with their formulas. W. O. E.

**Estimation of the optical activity in the D. A. B. 6.** E. SCHROFF. *Pharm. Ztg.* 74, 785-6(1929).—The optical values of some 13 solid substances and 20 essential oils are specified in the Ger. Pharm. In the present paper the  $[\alpha]_D^{20}$  has been detd. for about 50 different compds. and substances, either alone or in definite concns. of appropriate solvents. W. O. E.

**Salve bases for ophthalmological purposes.** C. STICH. *Pharm. Ztg.* 74, 800-1(1929).—Not all brands of com. petrolatum are suited to ophthalmological application, and even the best is alone inadequate. A 10% addn. of lanolin and  $H_2O$  is suggested. Photographic reproductions of the cornea treated with noviform salve are given. W. O. E.

**Chloramine-T.** R. A. FELDHOFF. *Pharm. Ztg.* 74, 756-7(1929).—A review of the properties of and method of manufg. the D. A. B. 6 prep. known as "Chloramin-p-Toluolchloramidnatrium." W. O. E.

**Keeping qualities of certain pharmaceutical preparations.** H. ESCHENBRENNER. *Pharm. Ztg.* 74, 742-4(1929).—Emphasis is placed on the necessity of rendering certain pharmaceutical preps., notably pills, more stable through addn. of appropriate antiseptics. W. O. E.

**The German Pharmacopeia. VI.** ANON. *Am. J. Pharm.* 101, 425-41(1929).—A translation of the General Rules of the German Pharm. VI, 1928. W. G. G.

**Observations on the potency of Indian digitalis.** R. N. CHOPRA AND PREMANKUR DE. *Indian Med. Gaz.* 64, 312-14(1929).—The potency of Indian-grown leaf compares favorably with that imported. Proper storage is an important factor. F. G. G.

**Acid number of ergot.** I. PÁL LIPTÁK. *Magyar Gyógyszerésztud. Társaság közlönete (ber. ungar. pharm. Ges.)* 2, 211-6(1926); *Chem. Zentr.* 1928, I, 1562-3; cf. C. A. 22, 137.—The acid no. increased with the age of the sample. In 5 tests there was a

decrease in strength with increasing acid content. II. *Ibid* 3, 426–30(1927); *Chem. Zentr.* 1928, I, 1563.—Numerous tests were made on ergot for acid no., strength and alkaloid content. If the acid no. was above 2, the strength decreased and the drug did not correspond to pharmaceutical requirements. FRANCIS P. GRIFFITHS

Jasmine aldehyde and other interesting compounds of the perfume industry. OTTO GERHARDT. *Metallbörse* 18, 2752, 2866(1928).—A review. F. C. H.

Standardization of thyroid preparations. J. R. MORCH. *J. Physiol.* 67, 221–41 (1929).—See *C. A.* 23, 1923. J. F. LYMAN

Inorganic constituents of diuretic drugs. K. KONO. *J. Pharm. Soc. Japan* 48, 1098–102(1928).—K. made quant. analyses of the aq. ext. of *Achyranthes bidentata*, Blume, root (I), *Akebia quinata*, D. C., stems (II), *Catalpa ovata*, G. Don., seeds (III) and pods (IV), and *Ephedra sinica* or *E. equisetina*, stems (V) as follows (results given in above order): drug in aq. ext. 59.16, 10.22, 11.81, 9.12, and 21.23%; ash in drug, 7.95, 8.23, 16.26, 13.96, and 15.65%; ash insol. in dil. acids, 0.197, 1.279, 0.248, 0.006 and 0.211%; Fe, 0.453, 0.011, 0.011, 0.005, 0.124%; Al, —, 0.015, —, —, —; Mn, —, trace, —, —, —; Ca, 0.048, 0.057, 0.072, 0.029, 0.033%; Mg, 0.079, 0.049, 0.097, 0.019, 0.178%; K, 1.115, 0.254, 0.444, 0.344, 0.985%; Na, 0.476, 0.140, 0.037, 0.045, 0.081%;  $P_2O_5$ , 0.543, 0.109, 0.566, 0.031, 0.307%. F. I. NAKAMURA

Stabilization of medicinal plants and pharmaceutical preparations by the action of some hydrocarbons. IONESCO-MATIU AND H. VARCOVICI. Univ. de Jassy. *Chimie & industrie Special No.*, 498–503(Feb., 1929).—The stabilizing effects of  $CH_4$ ,  $C_2H_2$ ,  $EtCl$  and  $CCl_4$  on hyoscyamus and belladonna leaves, exts. and tinctures below 50° were investigated. Tinctures and exts. of both hyoscyamus and belladonna, whether prepd. from fresh or dried leaves, all showed appreciable decrease in alkaloid content after a period of 1 yr., the loss in every case being greater with untreated than with treated materials. The most pronounced effect was produced by  $C_2H_2$ . As the loss in alkaloids can be attributed to their hydrolysis and decompn., the stabilizing treatment is considered to retard the decomp. or hydrolyzing reactions. A. P.-C.

Examination of barbituric medicinals. E. V. CHRISTENSEN. *Arch. Pharm. Chem.* 33, 216–28(1929).—*Liq. barbamin* DAK was carefully made up for expts. in control tests of the somnifen type of drugs. There are 4 of these in Denmark: The DAK prepn. (I), somnifen (LaRoach?) (II), Soporol (III) and Guttanal (IV). All are made up of mixts. of barbituric acid derivs.,  $Et_2NH$ , flavoring matter and alc.-glycerol. In I there are the  $Et_2$ ,  $Pr_2$  and  $(C_3H_7)_2$  derivs., 9.9, 4.6, 5.2%, resp., and 4.5% of  $Et_2NH$ . To det. the derivs. weigh 2 cc. sample and mix it with 2 cc. 4 N  $H_2SO_4$ . Shake this with several 10-cc. portions of  $CHCl_3$ . Filter the  $CHCl_3$  layers through cotton and distil off the  $CHCl_3$ . Weigh the residue as barbituric derivs. The av. barbituric recovery for I was 99.7%. The residue was repeatedly taken up in alc. and evapd. to remove volatile esters but there was no change in wt. In  $Et_2O$  extns. there is a change by this treatment. The aq. layer plus cotton filter washings was made strongly alk. and distd. for  $Et_2NH$  detn. just as in detn. of  $NH_3$ . Attempts to det. the individual derivs. were not altogether satisfactory. Diallyl- and allylisopropylbarbituric acids in isolated prepn. gave true values on addition of Br or I and titrating excess but for II and III the values seemed high, probably because of some halogen substitution. Fractional crystn. gave 39%  $Pr_2$  deriv. (m. 147.5°) for IV. Allylisopropylbarbituric acid fractions were more difficult, for II m. 141.5°, and for III m. 143°. The  $Et_2$  derivs. could not be fractionated in this way to a purity giving reasonable melting points. A. R. R.

Making and evaluating decoctions. GUSTAF SÖDERBERG AND WALDEMAR HÖK. *Svensk Farm. Tids.* 33, 49–55, 72–8, 101–6, 139–45, 153–6(1929).—Decoctions of *cortex cinchonae*, *cortex condurango* and *radix senegal* were made according to procedures in Succ. Pharm. editions VIII, IX and X. They gave a progressively better yield except that the IX edition method was not as efficient as VIII for senegal. Tin vessels were somewhat better than porcelain. The ext. dry wt. is a fair measure of drug value. The  $CHCl_3$  no. is good for judging condurango. The drug can also be assayed by a minimetric method in which a series of 0.1 to 1.0 cc. decoction is boiled in satd. NaCl solu. and dild. with water. The disappearance of opalescence is noted. A. R. ROSE

A proposed physiological standard for pituitarium U. S. P. Wm. T. McCLOSKEY AND J. C. MUNCH. *J. Am. Pharm. Assoc.* 18, 31–4(1929).—Eight samples of commercial pituitarium, representing current output, were obtained directly from the manufacturers. Exts. were made by the U. S. P. method and were assayed by the Dale and Laidlaw procedure (*C. A.* 7, 156), with some modifications. A wide variation in the activity of the samples was found. The strength varied from 1.5 to 75% of the activity of the official powder. Most of the powders ranged from 30 to 50% of the standard. It is recommended that manufacturers be required to market a product

for commercial purposes that shows an activity of 50% of the standard U. S. P. powder.

**Studies on the determination of camphor in camphor liniment.** L. E. WARREN, CHARLES F. POE, GOLDNER LIPSEY AND CLARENCE L. VAUGHN. *J. Am. Pharm. Assoc.* 18, 580-6 (1929).—The U. S. P.-X method for detg. camphor in camphor liniment gives low results, because of oxidation of the oil. The error may amount to 1% or more. Various kinds of dishes and different methods of heating were tried but none proved satisfactory. A more satisfactory method was developed which uses a vacuum oven. Details are reserved for a second paper.

**Bioassay of aconite and its preparations. I. Lethal dose of aconite to rats.** J. C. MUNCH AND G. S. GITTINGER. *J. Am. Pharm. Assoc.* 18, 17-24 (1929).—There is wide individual variation in susceptibility of rats to aconitine administered subcutaneously and intraperitoneally, the most resistant animals requiring more than twice the amt. to kill over the most susceptible ones. The rat is capable of detoxicating a fatal dose of aconitine in 3-4 days. The fatal dose of aconitine (killing 2 out of 3), when injected subcutaneously into white rats by the U. S. P. method, is 0.175 mg./kg. Wild rats are equally or somewhat less susceptible. Injected peritoneally the fatal dose is 0.1 mg./kg. Subcutaneous injections appear more reliable than intraperitoneal injections. Great variations in susceptibility of individual rats make it necessary to use a number of test animals. Surviving rats may be used again in 4 days. On the assumption that there was a const. rate of detoxication of aconitine in terms of mg./kg per hr., white rats detoxicated 0.0047 mg. after subcutaneous injection, and 0.0015 mg. after intraperitoneal injection. For the preliminary assay of aconitine, and presumably aconite preps., readily available white rats may be used to conserve the more expensive guinea pigs.

L. E. WARREN

Mg: a solvent in nephrolithiasis and an aid in preventing salivary calculus formation (BADANES) 11H. The method of formation and the detection of alkaloids in the young tobacco plant (CHAZE) 11D. ARNOLD, KARL: *Repetitorium der Chemie. Namentlich zum Gebr. f. Mediziner u. Pharmazeuten.* 17th ed., revised by Karl W. Rosenmund. Leipzig: Leopold Voss. 393 pp. Linen, M. 14.80.

HATCHER, ROBERT A., et al.: *Useful Drugs; A List of Drugs Selected to Supply the Demand for a Less Extensive Materia Medica with a Brief Discussion of Their Actions, Uses and Dosage.* 7th ed., revised. Chicago: Am. Med. Assocn. 172 pp.

HORATIUS, THEODOR: *Die Fabrikation der Äther und Grundessenzen.* 4th ed., revised and edited by Wolfgang Gaber. Venna: A. Hartleben. 291 pp. M. 6.50, bound, M. 7.50.

**Iodized oils.** FIRMA E. MERCK (Erich Kornick, inventor). Ger. 469,233, April 4, 1926. Stable iodized oils are prepd. from oils having a high I value by acting on the unsatd. oil with the exact quantity of I compd. necessary for satn., and then splitting off the loosely bound I by a suitable agent. Thus, 3 parts of poppy-seed oil is allowed to stand with 3 parts of gaseous HI for one day, and with 4 parts of HI for another day. The brown product is decolorized by shaking with bisulfite soln., neutralized, washed, dried and filtered, a light brown oil with a 40% I content being formed. Other examples are given.

**Synthetic drugs.** I. G. FARBENIND. A.-G. Brit. 300,695, Aug. 18, 1927. Products producing contraction of the blood vessels and exciting labor pains are obtained by treating resorcinol monomethyl ether with a soln. of Na in alc. and heating with diethylaminoethyl chloride, or  $\alpha$ -dimethylamino- $\beta$ -methyl- $\gamma$ -chlorobutane, in the presence of an alk. substance.

**Medicinal serums.** LUDWIG FEJES and BRUNO BÖTTCHER (to Elektro-Osmose A.-G. (Graf Schwerin Ges.)). U. S. 1,718,282, June 25. A protective or curative serum such as a diphtheria serum is treated with an excess of a sulfate such as  $(\text{NH}_4)_2\text{SO}_4$  to salt out and ppt. the globulins, the ppt. is treated with water and Ba acetate.

thus pptg.  $\text{BaSO}_4$ , and the  $\text{BaSO}_4$  is sepd. from the globulin soln. and the latter is subjected to electroösmosis, and the treatment is continued until at the isoelec. point of  $p_H$  6.4 the euglobulins have become deposited, and the deposit is sepd. from the aq. soln. of pseudoglobulin.

**Therapeutic compound.** CHEMISCHE FABRIK VORM. SANDOZ. Fr. 655,301, Apr. 2, 1928. Isobutylallylbarbituric acid is combined with 1-phenyl-2,3-dimethyl-4-dimethylamino-5-pyrazolone in a solvent such as  $\text{C}_6\text{H}_6$ . The new compd. ppts. as a yellow cryst. powder, m.  $83-85^\circ$ .

**Therapeutic compounds of cadmium, lead, palladium, copper or gold.** G. T. MORGAN AND F. H. BURSTALL. Brit. 300,330, Aug. 25, 1927. Complex compds. are obtained by treating ethylthiourea with a salt of one of the specified metals.

**Therapeutic arsenobenzenes.** A. ALBERT. Brit. 300,716, Aug. 26, 1927. Hypophosphorus acid or one of its salts is used with  $\text{SO}_2$  or one of its salts in an acid medium in effecting the reduction of compds. such as the semicarbazone of 3-aldehyde-1-phenoxyacetic acid-6-arsonic acid, a mixt. of the semicarbazones of 3-hydroxy-1-benzaldehyde-4-arsonic acid and of 3-aldehyde-1-phenoxyacetic acid-6-arsonic acid, the semicarbazone of 1-benzaldehyde-3-hydroxy-4-arsonic acid, the semicarbazone of 1-acetophenone-3-hydroxy-4-arsonic acid or 3-aminobenzene-4-hydroxy-1-arsonic acid. The semicarbazone of 3-aldehyde-1-phenoxyacetic acid-6-arsonic acid is made by the action of chloroacetic acid on the semicarbazone of 3-hydroxy-1-benzaldehyde-4-arsonic acid.

**Therapeutic organic arsenic compounds.** A. D. MACALLUM. Brit. 300,286, May 4, 1927. 3-Amino-4-hydroxy-5-iodophenylarsonic acid is prepd. by reducing a cold alk. soln. of 3-nitro-4-hydroxy-5-iodophenylarsonic acid with excess of freshly pptd. titanous or ferrous oxide or with Na hyposulfite; its Zn and Pb salts are described. Treatment of the product, with or without isolation, with  $\text{Ac}_2\text{O}$ , forms 3-acetamido-4-hydroxy-5-iodophenylarsonic acid, which by reduction gives 3,3'-diacetamido-4,4'-dihydroxy-5,5'-diiodoarsenobenzene. 3-Acetamino-4-hydroxy-5-iodophenylarsenious oxide is formed when the arseno compd. is treated with I and the resulting arsine diiodide then hydrolyzed with aq.  $\text{NaHCO}_3$ .

**Organic arsenic compounds containing iodine.** A. D. MACALLUM. Brit. 300,538, May 4, 1927. 3,3'-Dinitro-4,4'-dihydroxy-5,5'-diiodoarsenobenzene is made by treating a MeOH soln. of 3-nitro-4-hydroxy-5-iodophenylarsonic acid with  $\text{H}_3\text{PO}_2$  at  $55-60^\circ$ . 3-Nitro-4-hydroxy-5-iodophenylarsenious oxide is produced when the arseno compd. is treated with I and the resulting arsine diiodide then hydrolyzed with aq. alkali bicarbonate. The products may be used as *parasitocides*.

**Organic mercury compounds.** TASCH LABORATORY, LTD. Brit. 301,023, Nov. 23, 1927. 1-Phenyl-2,3-dimethyl-4-sulfamino-5-pyrazolone is treated with Hg salts to produce compds. contg. 1 atom Hg to 4 mols. of the pyrazolone, which may be used as *therapeutic agents*.

**Solanaceae alkaloid salts.** WALTER SCHOELLER and HERBERT SCHOTTE (to Chemische Fabrik auf Actien, vorm. E. Schering). U. S. 1,717,585, June 18. A soln. is prepd. of equimol. proportions of 2 different Solanaceae alkaloids such as scopolamine and hyoscyamine and a polybasic acid such as camphoric or tartaric acid in a volatile solvent such as alc. and the solvent is allowed to evap. at low temp.

**Glucosides from squill.** CHEMISCHE FABRIK VORM. SANDOZ. Brit. 300,726, Sept. 1, 1927. The cardioactive glucoside of squill is sepd. in the presence of aq. media, into 2 components by fractional soln., fractional pptn. or fractional extrn. from aq. media by use of org. solvents. Numerous details are given.

**Theobromine.** GERARD C. A. VAN DORP (to Naamlooze Vennootschap Societeit voor chemische Industrie "Katwijk"). U. S. 1,718,093, June 18. See Brit. 287,507 (C. A. 23, 483).

**Thymol and menthol.** SCHERING-KAHLBAUM A.-G. Brit. 301,087, Nov. 24, 1927. Hydroxymenthyl is heated with H and a hydrogenating catalyst (which may be assoc. with a porous catalyst) to split off water and effect addn. of 2 or 8 at. proportions of H. Cf. C. A. 23, 611.

**Quinoline-indole compounds.** I. G. FARBENIND. A.-G. Brit. 300,279, Nov. 11, 1927. Quinoline-indole compds. in which the indole nucleus is connected at its 2,3-position with the aromatic part of the quinoline nucleus are prepd. by converting a benzamidoquinoline into a carbazole or by subjecting an aminocarbazole to the quinoline synthesis. The products may be used as *therapeutic agents* or as *intermediates for the manuf. of other pharmaceutical compds. or dyes*.

**Antiseptic solution containing ethylene iodide.** WM. A. STEPHENS. U. S. 1,719,523, July 2. I crystals and alc. are vaporized and the combined vapors are condensed.

**Detergent.** FARRINGTON DANIELS. U. S. 1,719,595, July 2. A detergent sub-

stantially free from soaps and suitable for use on the skin comprises  $\text{Na}_3\text{PO}_4$  or other alk. phosphate together with a fatty oil such as cottonseed oil and palm oil.

**Perfumes.** VIANOVA G. M. B. H. FÜR CHEM. IND. Fr. 656,445, June 25, 1928. Ethereal oils or perfumes are extd. from substances contg. them by means of liquid  $\text{CO}_2$ .

**Perfumes.** I. G. FARBENIND. A.-G. Fr. 655,958, June, 15, 1928. Aldehyde or keto groups are introduced into aromatic diisopropyl compds., or aromatic aldehydes or ketones which contain no or only one isopropyl group are transformed into diisopropyl compds., or an aldehyde or keto and a second isopropyl group are introduced simultaneously into a mono-isopropylaryl compd. Examples are given of the prepn. of diisopropylbenzaldehyde,  $b_{12-13}$  147–153°, by passing  $\text{CO}$  into boiling diisopropylbenzene contg.  $\text{AlCl}_3$  and  $\text{CuCl}$ , or from 4-isopropylbenzaldehyde and isopropyl chloride in the presence of  $\text{CS}_2$  and  $\text{AlCl}_3$ . The prepn. of diisopropylmethylbenzaldehyde,  $b_9$  148–150°, diisopropylmethylbenzaldehyde,  $b_9$  150–155°, diisopropyl-*ar*-tetrahydronaphthaldehyde,  $b_9$  182–185°, diisopropylacetophenone,  $b_{13}$  145–150°, is also described. The compds. may be condensed with acetone or  $\text{AcH}$ , oxidized to the corresponding acid or reduced to the corresponding alc.

## 18—ACIDS, ALKALIES, SALTS AND SUNDRIES

E. M. SYMMES

**Improvements in the manufacture of sulfuric acid by the lead-chamber process.** R. MORITZ. *Chimie & industrie Special No.*, 466–71 (Feb., 1929).—A review of recent progress, dealing with roasting pyrites, concn. before the Glover tower, lead chambers, cooling, continuous decantation and feeding of niter.

**The synthesis of ammonia in the glow discharge.** A. KEITH BREWER AND J. W. WESTHAVER. *J. Phys. Chem.* 33, 883–95 (1929).—The synthesis of  $\text{NH}_3$  from a 3:1  $\text{H}_2$ - $\text{N}_2$  mixt. in the glow discharge has been investigated by a static system between 4 mm. and 0.1 mm. pressure. The rate of synthesis is found to be proportional to the current passing through the discharge tube, and is independent of the total gas pressure over the range studied. The presence of a magnetic field at right angles to the elec. field materially increases the rate of synthesis, whereas a parallel field has no effect. The formation of  $\text{NH}_3$  is shown to be entirely a gas-phase reaction. The data are interpreted as indicating that the reaction is initiated by the positive ions formed in the discharge, the rate of synthesis being proportional to the rate of formation of ions present, and hence to the current. A new electrochem. law for discharge tubes is suggested.

P. H. EMMETT

**Theory of the ammonia-soda process.** N. I. KIRICHENKO. *Ukrainskii Khim Zhur.* 3, *Tech. Pt.* 141–79 (1928).—When  $\text{CO}_2$  is passed into an  $\text{NH}_3$  soln. at first no carbonate forms; only carbamate is produced. After reaching a definite concn. the carbamate gradually hydrolyzes to  $\text{NH}_4\text{HCO}_3$ . This reacts with  $\text{NaCl}$  to ppt.  $\text{NaHCO}_3$ . The greater the  $\text{NH}_3$  concn. in the soln., the  $\text{CO}_2$  content remaining the same, the greater the carbamate formation and the higher the ratio carbamate to bicarbonate at the moment of equil.  $\text{NH}_3$  thus affects the equil and the presence of large quantities of  $\text{NH}_3$  affects adversely the transformation of carbamate to  $\text{NH}_4\text{HCO}_3$  and  $\text{NaHCO}_3$  pptn. The more  $\text{CO}_2$  present the more rapidly formed and the larger the ppt. when the solns. are mixed with a definite quantity of  $\text{NaCl}$ . The fundamental conditions causing  $\text{NaHCO}_3$  pptn. are the presence in the soln. of  $\text{NaHCO}_3$  greater in amt. than satn. and the presence of active  $\text{OH}$  ions in quantity sufficient for formation of  $\text{NaHCO}_3$  and for "neutralization" of the  $\text{H}$  ions of  $\text{NH}_4\text{Cl}$ , the latter compd. increasing with growth of the ppt. The presence of  $\text{NaHCO}_3$  in quantity greater than satn., is entirely due to the presence of  $\text{NH}_4\text{HCO}_3$  in no more than the equiv. quantity. Until this limit of satn. of the  $\text{NH}_3$  soln. by  $\text{CO}_2$  is reached no pptn. is expected. For each mol. of carbamate transformed into bicarbonate a mol. of  $\text{NH}_3$  is set free. The latter finally increases so that further transformation to  $\text{NH}_4\text{HCO}_3$  becomes impossible and pptn. stops. Complete transformation of carbamate to bicarbonate cannot be attained even by intensifying the  $\text{CO}_2$  current. When equil. is reached the soln. always contains some free  $\text{NH}_3$ . The above reactions are simultaneous. The thermic aspect of the above reactions is considered and an improved method of carbamate detn. in soln. based on Fenton's method (*Proc. Roy. Soc.* 49, 386 (1886)) is given. B. N.

**Synthesis of cyanamide by combination of carbon and calcium nitride.** KADLEC-FLECK. *Compt. rend.* 188, 561–3 (1929).—Mixts. of  $\text{Ca}_3\text{N}_2$  and  $\text{C}$  were heated at temps.

of 800–1100° and were found to react according to the equation  $\text{CaCN}_2 + 5\text{C} \longrightarrow \text{CaCN}_2 + 2\text{CaC}_2$ . E. G. VANDEN BOSCHE

**Atmospheric nitrogen processes in Spain.** RAMON DE IZAGUIRRE. *Ing. y construcción* (Madrid) No. 59, 536–41 (1927); *Intern. Rev. Agr.* [N. S.], 19, 714–6.—Two factories have been at work some years at Flix (Tarragona) and at La Felguera (Asturias) using the Claude process. At Flix H is obtained as a by-product of NaCl electrolysis. It is very pure and can be used without further treatment. At La Felguera H from coke ovens is used, purified and compressed to 30 atmospheres by 3 separate compressions and finally further purified in scrubber towers contg. various substances such as  $\text{NH}_3$  to hold up  $\text{CO}_2$ ,  $\text{H}_2\text{S}$ , etc.,  $\text{H}_2\text{O}$  to retain the  $\text{NH}_3$  carried over from the preceding tower and finally a soln. of NaOH to stop traces of  $\text{CO}_2$ . The gas is then dried by passing into 4 containers holding solid NaOH. A tiered distn. column regenerates the carbonated  $\text{NH}_3$  soln. The gas at the beginning of the process contains:  $\text{CO}_2$  3.5,  $\text{H}_2\text{S}$  1.5,  $\text{C}_2\text{H}_6$  2.5, O 1.0, CO 6.5, H 40.0,  $\text{CH}_4$  26.0,  $\text{C}_2\text{H}_4$  1.5, N 17.5,  $\text{C}_4\text{H}_8$  0.02,  $\text{NH}_3$  traces. At La Felguera 60–70,000 cu. m. of coke-oven gas is treated, yielding 30,000 cu. m. of  $\text{H}_2$ . N is obtained by burning H in air by a special burner; the  $\text{H}_2\text{O}$  of combustion is condensed by refrigerating. The H actually turned to account in this operation is only 6–10% of that used. The  $\text{N}_2 + 3\text{H}_2$  mixt., always contg. 1% CO, is compressed to 900–1000 atm. in a series of 8 cascade hyper-compressors, which give successively 2.5–10–25–60–125–300–600–1000 atms. Catalysis takes place in a special tube of Cr-, Ni- or W-steel, in the presence of a specially activated Fe oxide. About 40% of the  $\text{N}_2 + 3\text{H}_2$  mixt. introduced into the catalyst tube is combined. A series of these catalysts is used, in the first 2 of which, mounted in parallel, 40 cu. m. are combined per every 100 cu. m.; in the second 24 cu. m.; in the third 14.4 cu. m.; and in the fourth, 8.6 cu. m.; 13% remains uncombined. The factory produces 5 tons of chem. pure, anhyd.  $\text{NH}_3$ . Power consumption is 1.4 kw. hrs. per kg.  $\text{NH}_3$ . The La Felguera factory has also a  $\text{H}_2\text{SO}_4$  plant using Huelva pyrites in Herreshoff furnaces. Pb towers with Gaillard turbines for spraying  $\text{H}_2\text{O}$  are used. This system is greatly superior to the Pb-chamber system. There is also a 10-ton Frank-Caro  $\text{HNO}_3$  plant. H. L. D.

**Processes for making pure alumina.** F. C. CHRAMBACH. *Metallbörse* 19, 985, 1041–2 (1929).—A review. W. C. EBAUGH

**Preparation of alumina from volcanic ash as a source of aluminum.** ISAMU SEKI. *Repts. Imp. Ind. Research Inst. Osaka, Japan* 10, No. 2, 22 pp. (1929).—Japan lacks bauxite as a source of Al. Many attempts have been made in the past to prep.  $\text{Al}_2\text{O}_3$ . S. makes  $\text{Al}_2\text{O}_3$  from volcanic ash contg. 15–30%  $\text{Al}_2\text{O}_3$ . Volcanic ash is pulverized after being dried at 130°, heated at 400–700° for 2 hrs. in an elec. oven, and treated with  $\text{H}_2\text{SO}_4$ . The soly. of  $\text{Al}_2\text{O}_3$  is highest (99.5%) when the acid concn. is 30°. Bé, and treatment about 30 min.  $\text{Al}_2(\text{SO}_4)_3$  is best sepd. from  $\text{CaSO}_4$  when the d. of the soln. is about 1.47. Fe is best removed from the  $\text{Al}_2(\text{SO}_4)_3$  soln. by a ferrocyanide soln., but other methods may be used. Under such conditions the product obtained contains  $\text{Al}_2\text{O}_3$  99.08,  $\text{H}_2\text{SiO}_4$  0.86 and  $\text{Fe}(\text{OH})_3$  0.06. F. I. NAKAMURA

**The stock of ferrous sulfide of the world.** STEINAR FOSLIE. *Tids. Kemi og Bergvesen* 8, 30–32, 48–51 (1928).—A statistical survey. A. D.

**Selenium and its use in the arts.** A. KUFFERATH. *Chem.-tech. Rundschau* 44, 438 (1929).—The application of Se to the production of light-sensitive cells is well known. Addn. of 0.01–0.05% Ag to the Se increases the sensitivity of the cell to red and yellow light and makes it sensitive to Röntgen rays. Se is used in rubber vulcanization, in manuf. of ruby glass, its compds. in photographic toning baths and to decolorize Fe-contg. glass, and compds. of Se with eosin and fluorescein have been used unsuccessfully in treatment of malignant tumors. Se is obtained chiefly as a by-product of  $\text{H}_2\text{SO}_4$  manuf. and from anode slimes in Cu refineries. E. PICKERING

**The marketing of antimony.** J. W. FURNESS. U. S. Bur. of Foreign and Domestic Commerce, *Trade Information Bull.*, No. 624, 29 pp. (1929). E. I. S.

**Russian magnesite.** B. BIRUKOV. *Tovind.-Ztg.* 53, 928–30 (1929). F. O. A.

**The extraction of iodine from sea-weeds (red Phyllophora) of the Black Sea.** N. D. AVERKIEV. *Farm. Zhur.* 1928, 176–9.—The sea-weed red *Phyllophora*, found abundantly in the Sevastopol-Dunai-Odessa region, has a very high I content as compared with the sea-weeds of the Pacific Ocean, Scotland, Normandy and the White Sea. During the war a special I-recovery plant was installed in Ekaterinoslav, and from 1915 to 1918 1000 kg. of I was produced. This work was completely interrupted during the civil war. In 1917 an expedition investigated the possibilities of I production on a large scale and submitted a plan for the monthly production of 2100 kg. of I at a cost of about \$7.50 per kg. E. BIELOUSS

**The carbon monoxide process.** R. NITZSCHMANN. *Metallbörse* 19, 1070–2.

(1929).—Equations and tables based upon the primary reactions  $C + O_2 = CO_2 + 97,640$  cal. and  $C + CO_2 = 2 CO - 38,360$  cal. W. C. EBAUGH

The testing of casein for industrial purposes. W. L. DAVIES. *Ind. Chemist* 5, 202-4 (1929); cf. *C. A.* 23, 1478.—Small amts. of ash, fat, acidity, sugars and adulterants limit the use of casein. Com. casein is made by 4 processes: (a) acid casein, (b) rennet casein, (c) buttermilk casein, and (d) natural-sour casein. These processes are briefly described and the impurities each product is likely to contain stated. Casein should be tested for: (a) fineness, (b) color, (c) smell, (d) moisture, (e) fat, (f) ash, (g) sugar, (h) N, (i) acidity, (j) Ca and P. Each of these is described and also the special tests (a) borax suitability test and (b) wax or strength test. Av. analyses of caseins made by the various processes listed above are given. A short list of references is included. E. G. R. ARDAGH

The chemistry of fire-quenching appliances. ANT. STEINHILBER. *Chem. Listy* 23, 86-90 (1929).—A discussion. FRANK MARESH

Preservation of plant and animal materials by chemical means. CURT DREWS *Chem. Tech. Rundschau* 44, 439 (1929).—Review of patent literature relating to means for preserving blossoms and other plant parts and the fixation of animal tissues. E. PICKERING

Comparison of the Zennström and other processes for the production of paper pulp and by-products from maritime pine and other resinous woods [recovery of  $(NH_4)_2SO_4$ ] (RIVIÈRE) 23. Insulating compositions from cashew-nut shell liquid (Brit. pat. 300,654) 13. Apparatus suitable for making  $CS_2$  or for other chemical reactions (U. S. pat. 1,719,509) 1.

Purifying mineral acids. KALI-CHEMIE A.-G. (Friedrich Rüsberg, Fritz Müller and Albert Wehrung, inventors). Ger. 477,100, Sept. 7, 1921. The liquid or vaporized acids are treated with active C.

Hydrochloric acid and ammonia from ammonium chloride. JACOB KESSLER U. S. 1,718,420, June 25. Solid  $NH_4Cl$  is vaporized and the vapors are passed at an elevated temp. through  $NH_4HSO_4$  fused in a closed chamber or retort of refractory material resistant to the chemicals employed in the process; HCl is collected and a rapid current of  $CO_2$ -free air is passed above the reaction mass to drive out residual HCl. Superheated steam is subsequently passed through the residual bisulfate mass, to obtain  $NH_3$ . An app. is described.

Sulfuric acid. HUGO PETERSEN. Ger. 477,266, May 27, 1925. A concg. app. is arranged between the roasting furnace and the denitration app. so that the acid from the denitration app. is concd. by the hot gases from the roasting furnace. Acid of above 60° Bé. may be so obtained. Cf. *C. A.* 22, 1218.

Recovering sulfuric acid. FIRMA CARL STILL. Ger. 477,267, Sept. 21, 1926 See Brit. 277,619 (*C. A.* 22, 2656).

Nitric acid. CHEMICAL CONSTRUCTION CO. Fr. 656,108, June 19, 1928.  $HNO_3$  is concd. by passing it along with a dehydrating agent such as  $H_2SO_4$  through a series of retorts or chambers in cascade, the vapors of  $HNO_3$  passing in opposite direction to the flow of liquid. External heating means is described.

Nitric and sulfuric acids. I. G. FARBENIND. A.-G. Brit. 301,232, Jan. 16, 1928 Mixts. contg.  $NH_3$  and volatile S compds. such as are obtained by heating the  $NH_4$  sulfite produced in washing illuminating gas or by mixing  $NH_3$  with gases obtained by burning S or from ore desulfurization are treated to produce both  $HNO_3$  and  $H_2SO_4$ , after preliminary purification to remove catalyst poisons. Various details and examples of catalytic treatments and of the app. used are given. Cf. *C. A.* 23, 2537.

Hydrocyanic acid. A. R. FRANK and N. CARO. — Brit. 301,093, Nov. 24, 1927 In prep. HCN as described in Brit. 282,379 (*C. A.* 22, 3743) the compds. of alk. earth metals are replaced by Zn compds. Small proportions of metals such as Cu or Ag or their compds. also may be added and the contact substances may be made into compact pieces with waterglass or other binder.

Hydrocyanic acid. I. G. FARBENIND. A.-G. Brit. 300,369, Oct. 13, 1927.  $NH_3$  and CO are passed over a catalyst consisting of a carbide of Fe, Ni or Co, which may be mixed with Mo, Mn, W, Ce, Ti or Cu or their compds., preferably at a temp. of about 450°. The resultant gases may be cooled to sep.  $NH_4CN$  or may be absorbed in caustic alkali soln. Cf. *C. A.* 23, 3779.

Phosphoric acid. PIERRE JOLIBOIS AND LES MINES DOMANIALES DES POTASSES D'ALSACE, and SOC. ANON. DES MINES DE KALI SAINTE-THÉRÈSE. Fr. 655,299, Mar. 29, 1928.  $H_3PO_4$  is obtained by heating  $Ca_3(PO_4)_2$  in the presence of a catalyst such

as charcoal and passing through it CO and Cl or a substance contg. Cl, and treating the  $\text{POCl}_3$  with water to form  $\text{H}_3\text{PO}_4$  and HCl.

**Titanic acid.** I. G. FARBENIND. A.-G. Fr. 655,701, June 13, 1928. A white titanic acid is obtained by carrying out the hydrolysis of the ore with  $\text{H}_2\text{SO}_4$  in the presence of HF or sol. fluorides. Cf. C. A. 23, 3779.

**Catalytic oxidation of ammonia, etc.** F. JOST. Brit. 300,562, Nov. 14, 1927. Exothermic gas reactions such as oxidation of  $\text{NH}_3$  are controlled by removing heat from the reaction through the catalyst body which may be hollow and cooled on one side while the reaction takes place on the other side.

**Purifying sodium hydroxide and similar solutions.** LEONARDO CERINI. U. S. 1,719,754, July 2. In dialytic purification, a diaphragm of mercerized woven fabric is used. Cf. C. A. 23, 2538.

**Alkali and alkaline earth metal nitrates.** KALI-INDUSTRIE A.-G., C. T. THORSSELL and A. KRISTENSSON. Brit. 300,632, Nov. 18, 1927. A nitrate and nitrite soln. such as is obtained by causing a soln. or suspension of alkali or alk. earth hydroxide or carbonate to trickle over the absorption towers of a  $\text{HNO}_3$  plant is freed from nitrite as by treatment with  $\text{HNO}_3$  and steam and then cooled (suitably to about  $0^\circ$ ) to deposit part of the nitrate in solid form.

**Alkali ammonium phosphates.** STOCKHOLMS SUPERFOSFAT FABRIKS AKTIEBOLAG. Brit. 300,903, Nov. 19, 1927. The reaction product of phosphatic materials and acid is treated with alkali sulfate to remove Ca as  $\text{CaSO}_4$  and the resulting soln. is treated with an excess of  $\text{NH}_3$  while cooling the soln. (suitably to  $0^\circ$ ) to effect pptn. of the desired product and leave a mother liquor contg. mainly  $\text{NH}_3$  and suitable for reuse.

**Alkali perphosphates.** S. HUSAIN and J. R. PARTINGTON. Brit. 300,946, Aug. 20, 1927. Pseudo-perphosphates (which may be used for bleaching, disinfecting or in baking powders, etc.) are prepd. by treating a sol. orthophosphate (preferably anhyd.) with a peroxide in the presence of water or a dil. aq. soln. of  $\text{H}_2\text{O}_2$  and evapg. the resulting soln. under reduced pressure at room temp. and over a desiccating agent such as fused  $\text{CaCl}_2$  to obtain a solid product.

**Alkali metal silicates.** BIRGER F. HALVORSEN (to Norsk Hydro-Elektrisk Kvaestofaktieselskab). U. S. 1,718,292, June 25. Alkali metal compds. (such as a nitrate or nitrite) contg. N and O are mixed with silicic acid hydrate and heated to above  $250^\circ$  but below the m. p. of the mass.

**Calcium alkali phosphates.** A. MESSERSCHMITT. Brit. 300,961, Nov. 21, 1927. Citrate-sol. Ca alkali phosphates, e. g., a product corresponding to the formula  $2\text{CaO} \cdot \text{K}_2\text{O} \cdot \text{P}_2\text{O}_5$ , are obtained by sintering together, without fusion, raw phosphates or phosphate mixts., basic or acid substances such as alk. earth oxides, alumina, silica, Fe oxide, etc., clay or other silicates or alkali-contg. minerals, an alkali sulfate or substances contg. it such as K Mg sulfate or crude Stassfurt salts, and a reducing agent such as C or iron pyrites sufficient to effect partial reduction of the sulfate. Various details are given.

**Crystallizing ammonium nitrate, etc.** APPAREILS ET EVAPORATEURS KESTNER. Brit. 301,496, Dec. 2, 1927.  $\text{NH}_4\text{NO}_3$  or other substances which crystallize exothermically are crystd. by strongly agitating their hot satd. solns. while exposed to a current of air to carry off evapd. moisture. An app. is described.

**Citrate-soluble phosphates.** RHENANIA-KUNHEIM VEREIN CHEMISCHER FABRIKEN A.-G. (to Kali-Chemie A.-G.). Brit. 301,022, Nov. 23, 1927. Production of citrate-sol. phosphates by calcining crude phosphates with alkali carbonates or salts or Mg compds. or mixts. of these with silica, with or without use of steam, is effected in 2 stages, the first stage being at a temp. below the fusion point of the original mixt. and being continued until most of the F has been driven out, and the second stage being at a higher temp. but also without fusion.

**Potassium ammonium phosphates.** SOC. DE PRODUITS CHIMIQUES DES TERRES RARES. Brit. 300,919, Nov. 19, 1927, Fr. 657,307, Nov. 19, 1927.  $\text{K NH}_4$  phosphates (which may include a salt of the formula  $\text{NH}_4\text{K}(\text{H}_2\text{PO}_4)_2$ ) are made by reaction between  $\text{H}_3\text{PO}_4$ , KCl and  $\text{NH}_3$ .

**Oxidizing salts.** I. G. FARBENIND. A.-G. Fr. 655,818, May 11, 1928. Metallic salts such as  $\text{FeSO}_4$  (bivalent) are converted to a higher degree of oxidation (tervalent) by treating them in aq. soln. at temps. above  $100^\circ$  with O gas under pressure.

**Purifying zinc sulfate solutions.** THE RHODESIA BROKEN HILL DEVELOPMENT CO., LTD. Ger. 477,290, Sept. 9, 1926. Ni is removed from neutral or feebly acid solns. of  $\text{ZnSO}_4$  by means of powd. Zn in the presence of compds. of As and Cu. The pptn. is hindered by the presence of  $\text{SiO}_2$ ,  $\text{Al}_2\text{O}_3$  and org. substances, and accordingly care is taken to avoid the presence of such substances during the pptn. and preferably also during the sepn. of the ppt. The process may be carried out in app. lined with Pb.

**Calcium hypochlorite.** ANTHONY GEORGE and MAURICE C. TAYLOR (to Mathieson Alkali Works). U. S. 1,718,284, June 25. A slurry contg. lime and an alkali metal compd. is chlorinated to form  $\text{Ca}(\text{OCl})_2$  and alkali metal chloride and the latter is sepd. as a ppt. U. S. 1,718,285 (Anthony George) relates to similar processes. U. S. 1,718,286 (Jesse A. Guyer and Maurice C. Taylor) specifies chlorinating a soln. of caustic alkali and reacting on the product with  $\text{CaCl}_2$ . U. S. 1,718,287 (Robert B. McMullin and Anthony George) specifies chlorinating a mixt. of caustic alkali and lime in water while using an excess of lime over that chemically equiv. to the caustic alkali. Cf. following abstr. and C. A. 23, 3058.

**Calcium hypochlorite.** THE MATHIESON ALKALI WORKS. Ger. 477,386, May 24, 1927.  $\text{Ca}(\text{OCl})_2$  substantially free from  $\text{CaCl}_2$  and  $\text{Ca}(\text{OH})_2$  is prepd. by chlorinating milk of lime until pptn. of  $\text{Ca}(\text{OCl})_2$  begins, then adding caustic alkali, and chlorinating again. The addn. of caustic alkali to the chlorinated milk of lime produces  $\text{NaOCl}$  and ppts.  $\text{Ca}(\text{OH})_2$ , which is converted in the further chlorination to  $\text{Ca}(\text{OCl})_2$  and  $\text{CaCl}_2$ . The  $\text{CaCl}_2$  then undergoes double decompn. with the  $\text{NaOCl}$ . An example is given. Cf. preceding abstr. and C. A. 23, 3058.

**Potassium carbamate and carbonate.** KALI-INDUSTRIE A.-G., C. T. THORSSELL, and A. KRISTENSSON. Brit. 300,629, Nov. 18, 1927. K carbamate is prepd. by reaction between a K salt such as  $\text{KCl}$  and  $\text{NH}_4$  carbamate in the presence of liquid  $\text{NH}_3$ . K carbamate remains as a solid while  $\text{NH}_4\text{Cl}$  goes into soln.  $\text{K}_2\text{CO}_3$  or  $\text{KHCO}_3$  may be formed from the carbamate.

**Calcium cyanamide.** HERBERT WITTEK. Ger. 477,225, Aug. 14, 1925. A perforated container for the carbide is arranged in a furnace to which N is supplied, the arrangement being such that the N is constrained to pass through the mass of carbide.

**Calcium cyanogen compound.** I. G. FARBENIND. A.-G. Brit. 300,348, Sept. 19, 1927. A compd. of the formula  $\text{Ca}(\text{CN})_2 \cdot 2\text{NH}_3$  which is relatively stable in the presence of water and when heated yields Ca cyanide is formed by allowing a mixt. of  $\text{HCN}$  and  $\text{NH}_3$  to act upon  $\text{CaO}$  or  $\text{Ca}(\text{OH})_2$  or sol. Ca salts in the presence of water or org. solvents or suspension media such as alc., ether, benzene or pyridine, or by passing  $\text{NH}_3$  through a concd. soln. of Ca cyanide or by passing  $\text{HCN}$  and  $\text{NH}_3$  over powd. lime.

**Phosphates.** SOC. DES PHOSPHATES TUNISIENS. Fr. 655,616, June 11, 1928. A chart is given showing the relative conditions of sp. gr. and ratio of titration with phenolphthalein and methyl orange for the production from  $\text{Na}_2\text{HPO}_4$  of a neutral  $\text{Na}_3\text{PO}_4$  in contrast to the alk. phosphate of commerce. Fr. 655,617 describes the prepn. of neutral  $\text{Na}_3\text{PO}_4$  by prepg. a soln. of  $\text{Na}_2\text{HPO}_4$  and adding  $\text{NaOH}$  soln. until a ratio of 0.432:0.451 is obtained between the titration with phenolphthalein and methyl orange. The sp. gr. of the soln. should be kept above 1.30.

**Leaching solid raw materials with acid.** F. G. LILJENROTH (to Kunstdünger Patent-Verwertungs-A.-G.). Brit. 301,306, Nov. 26, 1927. In the treatment of raw phosphate or impure  $\text{CaCO}_3$  with  $\text{HNO}_3$  to obtain  $\text{Ca}(\text{NO}_3)_2$  solns., or of bauxite or other Al-bearing material to produce  $\text{Al}_2(\text{SO}_4)_3$  solns., or of raw phosphate with  $\text{H}_2\text{SO}_4$  to produce  $\text{H}_3\text{PO}_4$  or phosphates, liquid obtained from washing the residues is used for prepg. leaching acid as by absorption of nitrous gases,  $\text{SO}_3$ ,  $\text{SO}_2$  and O, or gaseous  $\text{HCl}$ .

**Sulfates of sodium and potassium.** CHEMIEVERFAHREN GES. Brit. 300,630, Nov. 18, 1927. Double decompn. is effected between  $\text{MgSO}_4$  and  $\text{NaCl}$  or  $\text{KCl}$  in a soln. of  $\text{NH}_4\text{Cl}$  in aq.  $\text{NH}_3$ . The sulfate remains in solid form and the  $\text{MgCl}_2$  goes into soln.

**Granulating sodium sulfide and similar substances.** KALI-CHEMIE A.-G. Brit. 301,384, Nov. 28, 1927. See Ger. 476,218 (C. A. 23, 3781).

**Sodium silicate solution.** CHARLES D. WOOD (to Grasselli Chemical Co.). U. S. 1,719,038, July 2. Successive batches of a mixt. of "Na silicate glass" and water are agitated under superatm. steam pressure in a closed rotary cylinder to effect soln. and the resultant soln. is delivered from the cylinder by force of the pressure into a storage vessel.

**Calcium sulfate, etc.** I. G. FARBENIND. A.-G. Brit. 301,210, Dec. 5, 1927. Reaction of  $\text{H}_2\text{SO}_4$  or of sulfates on Ca compds. is effected in the presence of metaphosphoric acid or its salts;  $\text{CaSO}_4$  is obtained in a granular and readily filterable condition.  $\text{KNO}_3$  may be formed by reaction of  $\text{K}_2\text{SO}_4$  on  $\text{Ca}(\text{NO}_3)_2$  in the presence of metaphosphoric acid. The treatment of phosphate rock with  $\text{H}_2\text{SO}_4$  or  $\text{NaHSO}_4$  is also described.

**Zirconium sulfite and oxide.** RHENANIA-KUNHEIM VEREIN CHEMISCHER FABRIKEN A.-G. (to Kali-Chemie A.-G.). Brit. 300,271, Nov. 11, 1927. Solns. obtained by the action of  $\text{HCl}$  on the product produced by heating Zr ores with  $\text{CaO}$  and C are

treated with  $\text{SO}_2$  or a sulfite or bisulfite to ppt. basic Zr sulfite, which is converted into oxide by heating.

**Metal carbonyl compounds.** I. G. FARBERIND. A.-G. Brit. 301,099, June 25, 1927. Mixts. of metals which form carbonyls such as Fe, Ni, Co, Mo, etc., are sepd. by forming the mixed carbonyls, sepg. the carbonyls by fractional distn. or otherwise, and decomp. the sepd. carbonyls. Cf. C. A. 23, 3547.

**Nitrosyl chloride.** GUY B. TAYLOR (to E. I. duPont de Nemours & Co.). U. S. 1,717,951, June 18.  $\text{NO}_2$  is caused to react with an aq. soln. of KCl, the H halide concn. of which is less than that corresponding to a H halide vapor pressure of 1 mm. Hg.

**Atomizing sulfur.** ARTHUR J. CROWLEY and CHARLES S. HALEY (to Humboldt Sulphur Co.). U. S. 1,718,334, June 25. In atomizing S, e. g., for the purpose of finely subdividing it, the S is atomized by a nozzle adjacent the surface of a mass of molten S which serves as a supply for the atomization and also as a source of heat to prevent congealing of the S being atomized. An app. is described.

**Heat-exchange apparatus suitable for use in catalysis of sulfur dioxide to produce sulfur trioxide.** HANS O. C. ISENBERG (to General Chemical Co.). U. S. 1,719,610, July 2. Structural features.

**Silica gel.** I. G. FARBERIND. A.-G. (Richard May and Siegmund Munch, inventors). Ger. 477,101, Mar. 19, 1925. The manuf. of silica gel by the interaction of an alkali silicate soln. and an acid is conducted in 2 stages, in the 1st of which an alk. gel is pptd. and in the 2nd of which the gel is treated with gaseous  $\text{CO}_2$  or  $\text{SO}_2$ , the gel being broken into pieces between the 2 stages. Gaseous  $\text{CO}_2$  or  $\text{SO}_2$  may be used also in the 1st stage.

**Oxide of iron and sulfur.** COMSTOCK & WESCOTT, INC. Fr. 655,829, May 22, 1928. Fe ores, particularly sulfide ores, are chlorinated at about  $375^\circ$  to give  $\text{FeCl}_3$ , which is further chlorinated after removal of diluent gases to  $\text{FeCl}_3$ . This is roasted with air at  $700\text{--}800^\circ$  to give  $\text{Fe}_2\text{O}_3$  and Cl. A small quantity of producer gas may be added to coarsen the oxide produced. Part of the recovered Cl may be passed through molten S to form  $\text{S}_2\text{Cl}_2$ , which is used to chlorinate sulfide ores and part is used to chlorinate the  $\text{FeCl}_3$ . The S formed is recovered. Cl is used in both stages with oxide ores.

**Active carbon.** A.-G. FÜR STICKSTOFFDÜNGER. Brit. 301,330, Nov. 26, 1927. Active C is obtained by sieving or other suitable sorting of ashes from the combustion of coal, lignite, wood or peat and purifying the material. Ashes deposited in flues are especially suitable.

**Active carbon.** I. G. FARBERIND. A.-G. Brit. 301,313. Active C is rendered non-corrosive to iron and other metal app. by treatment with an electrolyte, the anions of which are non-injurious or are easily removable. Nitrate of Fe or Zn, free acids, etc., may be used. C may be prepd. suitable for medicinal purposes, for use in refining glycerol, etc.

**Active carbon.** KALI-CHEMIE A.-G. AND FRIEDRICH RÜSBERG. Ger. 477,372, Feb. 8, 1922. Active C prepd. from lignite and the like by carbonizing in the presence of KOH or  $\text{K}_2\text{CO}_3$ , extg. with water, and washing with acid is freed from ash by washing with an alkali soln. followed, if desired, by a further washing with acid.

**Active charcoal.** AENNE SCHREINER. Fr. 656,193, June 21, 1928. See Brit. 202,566 (C. A. 23, 1481).

**Activation of charcoal.** CHARLES J. V. FÉRY. Fr. 655,092, Oct. 15, 1927. Charcoal activated for elec. uses is prepd. by treating sawdust with NaOH or KOH to remove matter from the pores, drying and impregnating with dil.  $\text{H}_2\text{SO}_4$ ,  $\text{Pb}(\text{NO}_3)_2$  and calcining after drying, or after treatment with NaOH or KOH the sawdust is washed with water, impregnated with a soln. of  $\text{ZnSO}_4$  or  $\text{Zn}(\text{NO}_3)_2$  and calcined at a temp. higher than the distn. point of Zn.

**Carbon black.** LOUIS SIMPSON. Can. 290,539, June 18, 1929. Washed, dried and pulverized albertite is mixed with heated air and sprayed into a restricted space and subjected to successive currents of gas or air at varying temp., whereby the volatile gases in the mixt. are carried off and carbon black deposited.

**Plant construction for production of carbon black by decomposition of hydrocarbon gas.** ROY H. UHLINGER (to Thermoatomic Carbon Co.). U. S. 1,718,720, June 25.

**Lampblack, etc.** COMPAGNIE LORRAINE DE CHARBONS POUR L'ÉLECTRICITÉ. Brit. 300,610, Nov. 16, 1927, Fr. 656,765, Nov. 16, 1927. C blacks are rendered less dusty, while retaining their pulverulent condition, by adding up to 10% of tarry materials such as pine tar or natural asphalt. The product may be used as a filler with rubber or in prep. inks or paints.

**Phosphorus pentasulfide.** P. DUTOIT. Brit. 301,500, Dec. 1, 1927. See Swiss 131,096 (C. A. 23, 3781).

**Storing solid carbon dioxide.** J. W. MARTIN. Brit. 300,985, Nov. 22, 1927.

Solid blocks of  $\text{CO}_2$  are enclosed within paper bags or other wrappers and packed within a storage box.

**Gas comprising hydrogen and carbon monoxide.** I. G. FARBENIND. A.-G. Brit. 300,328, Aug. 24, 1927. An app. is described for burning hydrocarbons with just sufficient O to produce CO and H at temps. above  $1000^\circ$  without use of steam or catalysts.

**Carbon disulfide.** I. G. FARBENIND. A.-G. Brit. 300,579, Nov. 15, 1927. App. for volatilizing S and superheating the vapors is heated separately from the main retorts in which the S vapors react with C. Various structural features are described.

**Dissolving and separating hafnium and zirconium compounds.** ANTON E. VAN ARKEL and JAN H. DE BOER (to Naamlooze Vennootschap Philips' Gloeilampenfabrieken). U. S. 1,718,616, June 25. Hf and Zr phosphates are dissolved with oxalic acid and then fractionally pptd. (suitably with HCl). Cf. C. A. 22, 484.

**Hydrogen.** F. GÜLKER. Brit. 301,499, Dec. 1, 1927. See Fr. 647,257 (C. A. 23, 2539).

**Recovery of metals and metal compounds by chlorination and use of ammoniacal solutions.** I. G. FARBENIND. A.-G. Brit. 301,342, Aug. 24, 1927. Various details are specified for selective reaction and sepn. of metals such as Ag, Ni, Co, Cu and Zn in the presence of compds. of other metals such as Ca, Al and Mg.

**Artificial board.** CLARENCE C. VOGT (to Armstrong Cork Co.). U. S. 1,718,011, June 18. Plant material such as corn stalks is cooked and the fibers are sepd. so as to produce a fibrous mass contg. the natural binder of the plant fibers, suitable phenolic material is added to the mass, it is shaped into board form and the board is baked to form a water-repellent phenolic condensation product binder from the natural binder. U. S. 1,718,012 (C. C. VOGT and ERNEST J. PIEPER) specifies a generally similar process in which a toughening agent such as stearin pitch, wax tailings or asphalt is also added previous to shaping and baking.

**Material for artificial dentures.** SIDNEY W. WILDING (to Amalgamated Dental Co. Ltd.). U. S. 1,718,019, June 18. A translucent gum facing is provided with a backing of a phenol-aldehyde condensation product capable of being indurated by heat admixed with a pigment such as  $\text{ZnO}$ ,  $\text{BaSO}_4$  or Sn oxide, to give the backing the required color and opacity to impart a natural appearance to the gum facing.

**Artificial stone for grinding and polishing.** ERNST P. MARS (to Tribune Co.) U. S. 1,718,827, June 25. A mixt. of tripoli powder 40, rotten stone 8, sugar 2  $\text{PbO}$  80, and glycerol 29 parts may be molded and used for polishing Cu cylinders used in intaglio printing.

**Plastic composition.** ROBERT M. WITTHYCOMBE. Ger. 477,239, June 15, 1926. See Brit. 277,107 (C. A. 22, 2446).

**Plastic materials.** JOSEPH C. PATRICK and NATHAN M. MNOOKIN. Fr. 656,114, June 19, 1928. Plastic substances are prepd. by reaction of olefin halides with sol or insol. polysulfides. In examples,  $\text{Na}_2\text{S}_9\text{H}_2\text{O}$  is dissolved in water and boiled with the addn of S to give principally  $\text{Na}_2\text{S}_4$ , ethylene dichloride is added and the mixt. heated, giving a product resembling soft rubber. A similar product is obtained from  $\text{CaS}_4$  and chlorinated olefins from the cracking of petroleum. Harder products are obtained if lower sulfides such as  $\text{Na}_2\text{S}_2$  or  $\text{Na}_2\text{S}_3$  are used.

**Dispersion agents.** I. G. FARBENIND. A.-G. Swiss 126,575, Oct. 26, 1926. A dispersion agent is made from a non-gaseous fuel, e. g., coal, tar, mineral oils, by treating with H under pressure and at a high temp., followed by dehydrogenation, demethylation or other splitting reaction. The products are used for prepn. of lacquers, rubber solns., paste-like products, e. g., shoe polish, and emulsions for the textile industry.

**Photomechanical printing surfaces.** R. A. GLASER (to Postergraph, Inc.). Brit. 301,031, Nov. 23, 1927. In producing printing surfaces, especially those of large size, a half-tone neg. or transparency is copied or enlarged by projection directly on to a plate sensitized with dichromated gelatin or albumin, suitably on Zn (which may have an underlying coating of hardened gelatin or albumin). After exposure, the plate is flowed with developing ink contg. asphalt which is allowed to dry before development. The asphalt penetrates to the metal where the exposure has taken place, and on development the light-sensitive coating is entirely dissolved away leaving a grayish image of asphalt on the metal. The plate is powdered with soapstone, cleaned with tannic acid and resin and may be further treated with asphalt and touched up before inking for the press.

**Printing from wood surfaces.** JACOB K. SNYDER (to A. C. Horn Co.). U. S. 1,717,945, June 18. The surface of walnut is treated with  $\text{ZnCl}_2$  to place the grain in relief, the softened grain is brushed out and the  $\text{ZnCl}_2$  is neutralized (suitably with NaOH) a precipitant is applied as is also a metallic stearate such as Al stearate and a

binder such as a resin or oil. The surface is then used for printing. U. S. 1,717,946 relates to a generally similar method of treating oak in which caustic soda is used in the preliminary etching treatment. U. S. 1,717,947 relates to similar treatment of mahogany with use of HOAc as etching material. A metallic salt such as  $\text{AgNO}_3$  or  $\text{K}_2\text{Cr}_2\text{O}_7$  may be used for hardening the wood following neutralization of the etching soln.

**Sound records.** J. R. CRAIG. Brit. 300,829, Jan. 16, 1928. Perforated sheets of thin metal such as Al, or of paper, cardboard or asphaltic compn., etc., are coated with thermoplastic material such as a cellulose ester or resinous compn. for producing laminated records. Various details are given.

**Friction material for brake linings, etc.** BRITISH THOMSON-HOUSTON CO., LTD., H. W. H. WARREN AND R. NEWBOUND. Brit. 300,309, Aug. 12, 1927. A filter of metal and asbestos such as a woven brass wire and asbestos cloth is bonded with a condensation product such as may be formed from phthalic anhydride and glycerol which may be plasticized with oleic acid or a similar substance.

**Stereoscopic anaglyphs.** KALLÉ & Co. A.-G. Brit. 301,490, Dec. 1, 1927. The diazo layer for a blue print may comprise fluoborate of 1-ethylamino-2-methyl-4-diazobenzene, 1-amino-8-naphthol-3,6-disulfonic acid and tartaric acid and that for an orange print 1-diazo-2-naphthol-4-sulfonic acid, 1-phenyl-3-methyl-5-pyrazolone and HCl.

**Tarnish-resisting silverware.** DANIEL GRAY, RICHARD O. BAILEY and WM. S. MURRAY (to Oneida Community, Ltd.). U. S. 1,719,365, July 2. Silverware is exposed to Hg in an oven maintained at a temp. suitable for the vaporization of Hg and absorption of the Hg by the ware.

**Shoe-filling composition.** I. G. FARBERIND. A.-G. Brit. 300,924, Nov. 19, 1927. A filling material such as cork cuttings is used with a binder comprising a mixt. of rubber and a cellulose ester or ether and various solvent and modifying materials.

**Condensation products of urea and formaldehyde.** ALPHONSE GAMS and GUSTAV WIDMER (to Soc. anon. pour l'ind. chim. A. Bâle). U. S. 1,718,901, June 25. An initial condensation product sol. in water, made from urea 1 and  $\text{CH}_2\text{O}$  at least 2 mol. proportions, is treated with sufficient urea to bring the proportion of urea to not less than 1.05 mols. to 2 mols. of  $\text{CH}_2\text{O}$  and reaction is effected to form a final insol. product.

**Detergent.** C. H. BISHOP and I. G. JENKINS. Brit. 300,362, Oct. 1, 1927. A cleansing compn. suitable for use in small proportion with boiling water is prepd. by boiling together lime 2 lb., soda 2 lb., borax 2 oz. and water 2 gal., settling and filtering.

**Ice substitutes for skating rinks.** F. E. MÜLLER. Brit. 301,172, Oct. 22, 1927. Equal parts of calcined  $\text{Na}_2\text{CO}_3$  and crystd.  $\text{Na}_2\text{CO}_3$  are mixed with each other and less than half as much of a mixt. of calcined and crystd.  $\text{Na}_2\text{SO}_4$  is added and water is added subsequently. A small proportion of "tragacanth" also may be added and the surface may be treated with castor oil or glycerol.

**Wall finish.** WALTER B. ALLEN (to Craftex Co.). U. S. 1,718,936, July 2. A paint-like soln. comprising an absorbent base such as clay or kaolin and a protein binder such as a casein compn. is applied and over this there is applied a permeating soln. contg. a waterproofing material such as Chinese vegetable wax absorbable by the base and an ingredient such as  $\text{CH}_2\text{O}$  which is reactive with the protein binder to increase its hardness and water-resisting properties.

**Sack for chemical products.** SOC. D'ÉLECTROCHIMIE DE BRIGNOUD (ÉTABLISSEMENTS FREDET-KUHLMANN). Fr. 656,350, Nov. 7, 1927. Sacks which can increase in size with swelling of the material they contain are made with pleats, the walls of which are kept together with fixing means of suitable resistance.

**Coating surfaces.** FABRICE R. HERVÉ, MAXIME HERVÉ and ANDRÉ HERVÉ. Ger. 477,315, June 8, 1926. See Brit. 253,889 (C. A. 21, 2540).

**Shaft furnace for burning lime.** COMPAGNIE DES FORGES DE CHATILLON, COMMENTRY, NEUVES-MAISONS. Fr. 655,748, Oct. 25, 1927.

**Containers for ether.** E. MALLINCKRODT (to Mallinckrodt Chemical Works). Brit. 300,641, Nov. 17, 1927. See U. S. 1,697,320 (C. A. 23, 1230).

**Gaskets for use in double seams of metal cans.** BERTON S. CLARK (to American Can Co.). U. S. 1,717,664, June 18. Gaskets are formed of an emulsified rubber soln., fibrous material such as wood fiber and  $\text{ZnCl}_2$ .

# 19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON, C. H. KERR

**Progress of glassmaking in the States.** W. E. S. TURNER. *Glass Ind.* 10, 131-5 (1929). H. F. KRIEGE

**The navy and the glass industry.** G. K. SPENCER. *Glass Ind.* 10, 37(1929).—Various naval uses of glass are discussed, special reference being made to the high quality of gage glass. H. F. KRIEGE

**Chemistry of glass.** W. C. TAYLOR. *Glass Ind.* 9, 248-50(1928).—The principal kinds of glass in general and special use are discussed. Certain lines for fruitful research in glass chemistry are suggested. H. F. KRIEGE

**Some properties of glasses containing zinc oxide.** S. ENGLISH, W. E. S. TURNER AND FRANCIS WINKS. *J. Soc. Glass Tech.* 12, 287-96T(1928).—Glasses of the type  $6\text{SiO}_2 \cdot (2-x) \text{Na}_2\text{O} \cdot x\text{ZnO}$  are discussed. The substitution of  $\text{Na}_2\text{O}$  by  $\text{ZnO}$  brings about a steady increase in  $d$ , from 2.45 to 2.54 for the range of  $\text{ZnO}$  from 1.29 to 11.13%. The annealing temp. is affected very little with  $\text{ZnO}$  addns. below 10%. The thermal expansion is affected more. The optical properties coincide closely with those of glasses in which  $\text{CaO}$  is substituted similarly. H. F. KRIEGE

**Factors affecting the composition of common glassware.** J. B. KRAK. *Glass Ind.* 10, 107-9(1929).—The compn. of common glasses depends chiefly on the qualities desired—namely durability, luster and resistance to thermal and mech. shock. Economic factors such as melting temps. and devitrification ranges help to det. the compn. of the glass selected. H. F. KRIEGE

**Testing of fuel oil as practiced in a well-known glass factory.** W. RONALD LESTER. *Glass Ind.* 10, 163-4(1929).—Standard government and A. S. T. M. methods are followed for the various tests. H. F. KRIEGE

**The weathering of glass. III. Relation between the weathering of glass and the relative humidity.** KOZO TABATA. *J. Soc. Chem. Ind., Japan* 31, 224-5(1928), Suppl. binding 31, 60B; cf. *C. A.* 22, 2038.—When the relative humidity is below 70%,  $\text{Na}_2\text{O} \cdot 2\text{SiO}_2$  tends to dry, whereas a soln. of  $\text{K}_2\text{O} \cdot 2\text{SiO}_2$  remains in sirupy state until about 50% relative humidity is attained. The action of weathering proceeds vigorously when relative humidity exceeds 85% and it is very slow at 70%. S. KONDO

**The devitrification of glass. V. Devitrification of flint glasses and their constitution.** KOZO TABATA. *J. Soc. Chem. Ind., Japan* 31, 225-8(1928), Suppl. binding 31, 60-1.—The phenomena of surface devitrification along assumed boundary lines of devitrification of flint glasses,  $\text{R}_2\text{O} \cdot x\text{PbO} \cdot y\text{SiO}_2$ , were carefully observed. The crystals produced are  $\text{SiO}_2$  and the degree of devitrification varies with the relative contents of the components. Flint glasses, except those very rich in  $\text{PbO}$ , are a mutual soln. of  $\text{R}_2\text{O} \cdot 2\text{SiO}_2$ ,  $\text{PbO} \cdot 2\text{SiO}_2$  and  $\text{SiO}_2$ . Each mol. of  $\text{Na}_2\text{O} \cdot 2\text{SiO}_2$ ,  $\text{K}_2\text{O} \cdot 2\text{SiO}_2$  and  $\text{PbO} \cdot 2\text{SiO}_2$  dissolves 0.25, 4.25 and 0.5 mol. of  $\text{SiO}_2$ , resp. VI. A preliminary experiment on the determination of the heating conditions for flint glasses. *Ibid* 228-33, Suppl. binding, 61-4B.—Samples taken from Marconi M. T. 4 bulb glass were heated at 600°, 625°, 650°, 675°, 700°, 750°, 800°, 850° and 900° for 30 to 120 min. The results are shown with photographs. Radiotron U. V. 199 and Cymotron 201A glasses also were used for the expts. The most vigorous spontaneous crystn. of Marconi M. T. 4 glass occurs at about 700°. The crystal growth is rapid at temps. between 650° and 700°. The form of crystals changes at temps. over 750°. At temps. over 950° the rate of crystal solution is greater than that of crystal production. The content of  $\text{PbO}$  seems to have no great influence on the temp. at which the rate of spontaneous crystn. is greatest. The crystals produced are always  $\text{SiO}_2$  in spite of marked difference in the compns. of the glasses.

**VII. Devitrification of  $\text{R}_2\text{O}-\text{CaO}-\text{SiO}_2$ .** *Ibid* 349-56, Suppl. binding, 82-3B.—The phenomena of devitrification of  $\text{R}_2\text{O} \cdot 0.5\text{CaO} \cdot y\text{SiO}_2$  and  $\text{R}_2\text{O} \cdot 0.8\text{CaO} \cdot y\text{SiO}_2$  have been studied. The conditions of heating for the most vigorous surface devitrification have been detd. The glasses consist of  $\text{R}_2\text{O} \cdot 2\text{SiO}_2$ ,  $\text{CaO} \cdot \text{SiO}_2$  and  $\text{SiO}_2$ ; 1 mol.  $\text{CaO} \cdot \text{SiO}_2$  dissolves 0.25 mol. of  $\text{SiO}_2$  in the state of glassy mass. In treating the phenomena of devitrification of glass, it is better to observe the phenomena of the surface devitrification.

**VIII. Devitrification of  $\text{R}_2\text{O}-\text{BaO}-\text{SiO}_2$ .** *Ibid* 356-61, Suppl. binding, 83-4B.—Expts. have been made of the devitrification of  $\text{R}_2\text{O} \cdot 0.5\text{BaO} \cdot y\text{SiO}_2$  and  $\text{R}_2\text{O} \cdot 0.75\text{BaO} \cdot y\text{SiO}_2$ . The compds. contained in the glasses are  $\text{R}_2\text{O} \cdot 2\text{SiO}_2$ ,  $\text{BaO} \cdot \text{SiO}_2$  and  $\text{SiO}_2$ . The amt. of silica dissolved per mol. of  $\text{BaO} \cdot \text{SiO}_2$  is 0.5 mol. IX. Devitrification of  $\text{R}_2\text{O}-\text{ZnO}-\text{SiO}_2$ . *Ibid* 361-5, Suppl. binding, 84B. The method of surface devitrification has been ap-

plied to  $R_2O \cdot 0.5-2.0ZnO \cdot ySiO_2$ . Constituents of the glasses are  $R_2O \cdot 2SiO_2$ ,  $ZnO \cdot 2SiO_2$  and  $SiO_2$ . No  $SiO_2$  is dissolved by  $ZnO \cdot 2SiO_2$ . X. Devitrification of  $R_2O \cdot MgO \cdot SiO_2$ . *Ibid* 365-8, Suppl. binding, 84B.—The surface devitrification of  $R_2O \cdot 0.5-2MgO \cdot ySiO_2$  has been studied. The glasses consist of  $R_2O \cdot 2SiO_2$ ,  $MgO \cdot 2SiO_2$  and  $SiO_2$ . No  $SiO_2$  is dissolved by  $MgO \cdot 2SiO_2$ . XI. The heating conditions. *Ibid* 369-71, Suppl. binding, 85B.—In the previous expts., the devitrification was observed at the max. rate of crystn. of  $SiO_2$  in the glass. The phenomenon takes place most markedly at sharp edges and is accelerated by surface contraction. The temps. at which the rate of crystn. of  $\beta$ -quartz occurs can be detd. by heating samples for about 60-120 min., during this period the sharpest edges round up slowly. Samples should contain a certain excess of silica. The crystn. of silicates should not occur to such an extent that crystallization of silica is hindered; and also weathered samples should not be used. XII. Devitrification of glasses containing boric anhydride. *Ibid* 372-3. Suppl. binding, 86-7B. Expts. have been made of devitrification of glasses composed of  $R_2O \cdot 0.8-2.0RO \cdot 0.25-0.5B_2O_3 \cdot 3.25-10.5SiO_2$ . The crystals produced by appropriate heat treatment are  $SiO_2$ . B compds. present in the glasses are  $RBO_2$ . The reactivity of  $Na_2O$  toward  $B_2O_3$  may exceed that of  $K_2O$ . S KONDO

**Experiments on coating and welding of glass.** SANGORO MURAKAMI. *J. Japan Ceram. Assoc.* 36, 303-11(1928).—In coating a glass on another, that with larger coeff. of expansion is cracked. In tubes, the cracks have net-like shapes on the inside and are lengthwise straight lines on the outside. Difference in coeff. of expansion should be less than  $60 \times 10^{-8}$  for safe coating. The glass with the larger coeff. should be used on the outside. In welding, the 2 glasses should show a diff. in elongation of less than 50% in the pull test. A flexible tube with spiral cracks can be obtained by coating a glass on both sides of another with smaller coeff. of expansion or by coating thickly a glass on another with smaller coeff. of expansion. S. KONDO

**Soda-zinc glasses.** KITSUZO FUWA, SUKEHARU SAKAI, MASABUMI SATO and FUJIO SUZUKI. *J. Japan Ceram. Assoc.* 36, 135-53, 243-64(1928).—Expts. were made on the influence of chem. compn. of glasses  $0.5-2Na_2O \cdot 0-6ZnO \cdot 6SiO_2$  upon their melting, weathering, devitrification, workability, effect of reheating, coeff. of expansion, elongation, thermal endurance and resistance to chemicals. Glasses within the range  $1.0Na_2O \cdot 0.25ZnO \cdot 0.75Na_2O \cdot 1.75ZnO \cdot 1.0Na_2O \cdot 0.4 \cdot 0ZnO \cdot 1.75Na_2O \cdot 0.5 \cdot 0ZnO \cdot 2.0Na_2O \cdot 2.5ZnO \cdot 1.75Na_2O \cdot 0.75ZnO$  were workable, being free from devitrification, weathering and difficulty of melting. Thermal expansion of the glasses was measured; the constns. given by Winkelmann-Schott and English-Turner are discussed. The former agree better with facts than the latter except for  $(2-x)Na_2O \cdot xZnO \cdot 6SiO_2$ . The constns. given by Winkelmann and Schott, by English and Turner and by the present authors, resp., are for  $SiO_2$   $0.8 \times 10^{-7}$ ,  $0.15 \times 10^{-7}$ ,  $0.722 \times 10^{-7}$ ; for  $Na_2O$   $10.0 \times 10^{-7}$ ,  $12.96 \times 10^{-7}$ ,  $10.65 \times 10^{-7}$ ; for  $Al_2O_3$   $5.0 \times 10^{-7}$ ,  $0.52 \times 10^{-7}$ ,  $0.45 \times 10^{-7}$ ; for  $ZnO$   $1.8 \times 10^{-7}$ ,  $2.1 \times 10^{-7}$ ,  $1.74 \times 10^{-7}$ . In the pull test, the rate of elongation of  $yNa_2O \cdot xZnO \cdot 6SiO_2$  increases with increase of  $x$ . The increase in the rate tends to be weakened with increase of  $y$ . The lowest temps. at which tubes of a fixed size have been cracked when they were dropped into cold water were measured. In general, the zinc glasses endure better than lime or lead glasses and the endurance is not much influenced by the variation in  $x$  as long as  $y$  is small, while it is reduced by the increase in  $x$  when  $y$  becomes large. The formula of Winkelmann-Schott was not valid for the specimens. The glasses are very resistant to water so long as  $x$  is not small. The resistance is not much influenced by the proportion of  $x$  and  $y$ . Glasses  $0.75Na_2O \cdot 1.0-2.0ZnO \cdot 6SiO_2$  are most resistant. The resistance to HCl is much influenced by the variation in  $x$  and  $y$ .  $1.0Na_2O \cdot 1.25ZnO \cdot 6SiO_2$  was most insol. The glasses are not highly resistant to NaOH soln. The variation in the resistance is small except in the glasses with small  $y$  or with certain ranges of  $x$ . The soly. in  $Na_2CO_3$  soln. is not small but not so large as in NaOH. S. KONDO

**Frosting glass by etching.** MINEICHI MASUDA. *J. Japan Ceram. Assoc.* 36, 183-92(1928).—Exptl. work is described which leads to the conclusion that among various theories of frosting phenomenon only the protection theory is correct. A soda-lead and a soda-line bulb glass were etched with a soln. composed of  $NH_4F$  12, HF 8 and water 12 parts. The frosted surfaces showed no double refraction. No difference in refractive index was observable between the cryst. and the unetched parts. The powder of the frosted glasses gave no pattern in x-ray spectra. Grains constituting a white film on the frosted surface of a transparent quartz glass did not act on polarized light and had  $n_D$  1.370.  $(NH_4)_2SiF_6$  prepd. for the sake of comparison had the same index, i. e., 1.370. The white film and the  $(NH_4)_2SiF_6$  gave x-ray spectra. S. KONDO

**The manufacture of laminated safety glass.** JOSEPH ROSSMAN. *Glass Ind.* 10, 1-6, 28-34, 57-64, 88-90(1929).—A history of the development of laminated glass and a

discussion of the U. S. patents relating to the solvents, org. films and machinery used in the manuf. of transparent, reinforced, non-shatterable glass. H. F. KRIEGE

"Selenium red" as a ceramic color. J. H. POLGREAN. *Trans. Ceram. Soc.* 28, 87-90 (1929).—It is possible to produce Se red powder by careful calcination with fluxes. Its color is lost at temps. above that of the enamel kiln. H. F. KRIEGE

Effect of substituting high-silica sand for some grades in lime-bonded silica bricks. W. HUGILL AND W. J. REES. *Trans. Ceram. Soc.* 28, 62-4 (1929); cf. *C. A.* 22, 1661. —Satisfactory characteristics were developed in bricks made of a high-SiO<sub>2</sub> sand in place of quartzite. H. F. KRIEGE

Some experiences with the use of temperature-measuring installations for the burning of clay tubes. WALTER JAEKEL. *Sprechsaal* 61, 943-4 (1928). C. H. L.

Further note on the crystalline break-up of kaolin. J. F. HYSLOP AND H. P. ROOKSBY. *Trans. Ceram. Soc.* 27, 299-302 (1928); cf. *C. A.* 22, 4746. —Examn. by x-ray shows that (a) the breakdown of the kaolin lattice occurs at 550° with the formation of the cryst. phase  $\alpha$  (4Al<sub>2</sub>O<sub>3</sub>·3SiO<sub>2</sub>); (b) the 870° crit. pt. is associated with the breakdown of a silicate lattice ( $\alpha$ ) and with the appearance of  $\gamma$  Al<sub>2</sub>O<sub>3</sub> and sillimanite; (c) the  $\gamma$  Al<sub>2</sub>O<sub>3</sub> without evidence of  $\alpha$  Al<sub>2</sub>O<sub>3</sub> persists beyond 870° but over 1060° it decreases and finally disappears. Thus the 870° point is not associated with an Al<sub>2</sub>O<sub>3</sub> change and indicates the existence of sillimanite under 1060°. Above this temp. mullite is formed. H. F. KRIEGE

Kilns and kiln firing. I. Introduction and general summary. S. R. HIND. *Trans. Ceram. Soc.* 28, 26-52 (1929).—Kilns for building brick and tile, sanitary ware, refractories and pottery are discussed. H. F. KRIEGE

The melting behavior of china glaze of the system: SiO<sub>2</sub>-B<sub>2</sub>O<sub>3</sub>-Al<sub>2</sub>O<sub>3</sub>-Na<sub>2</sub>O-CaO-PbO. E. LEONHARDT AND E. ZSCHIMMER. *Sprechsaal* 61, 763-7, 785-7, 805-7, 843-7, 961-5, 977-80, 997-1001, 1019-22 (1928).—The deformation points of Seger cones 022 to 010a were detd. for heating rates of 2° and 6° per min. Heating rate has a great influence. Cones between 012a and 1 soften at a higher temp. with slow heating than with rapid heating, because compds. which melt at a higher temp. form on the surface of the cones. The deformation temp. of Seger cones cannot be definitely established. C. H. LORIG

Smoky glazes, glittering ornamentations, metallic colors. JOSEF WOLF. *Sprech-*

*sual* 61, 883-6, 905-7(1928).—A comprehensive review of literature on smoky glazes is given. In prep. mixes for glittering ornamentalations sulfides of Cu, Ag, Bi and Fe are used. They are mixed with ocher or kaolin in a ratio of 1:3 or 1:5. Metallic coloring materials are prep'd. by mixing metallic salts with a resinous soln. of NaOH. C. H. L.

The electric furnaces for the firing of majolica and the glazed ornaments. G. MILANI. *Corriere ceram.* 10, 43-5(1929). G. SCHWOCH

Brilliant gold. F. CHEMNITUS. *Sprechsaal* 61, 748-50, 767-9(1928).—The theory and practice of brilliant gold prep'n. is discussed. It is prep'd. from solns. of Au, Rh, Ir, Bi, Cr, rosin and asphalt. C. H. LORIG

Refractories for the pottery industry. II. Saggars. W. EMERY. *Trans. Ceram. Soc.* 27, 169-219(1928). H. F. KRIEGER

Refractory material used as mortar for laying up refractories. D. A. MOULTON. *Trans. Ceram. Soc.* 27, 329-33(1928).—High-temp. cements can be made from pulverized burnt fireclay of good refractory qualities mixed with 3-6% of bentonite or aquacrylite. The fusion range of the grog is decreased from cone 30-31 to cone 27 with 10% addn. of the colloidal material. The mortar reaches its final set in 4-5 hr. and attains a good structural strength. H. F. KRIEGER

Kilns for burning refractories. WHITFIELD, GIBBONS, WILLIAMSON, TARRANT AND TAUDEVIN. *Refractories J.* 4, 202-44(1929).—A series of papers presented on the various tunnel kilns used in burning refractories. Those discussed were the Robertson, the Dressler, the Woodall-Duckham, the Williamson and the E. I. C. T. tunnel kilns. M. A. EDDY

Solid-fuel laboratory furnace to determine the refractoriness of refractory materials, etc. A. N. SISOEY. *Sprechsaal* 61, 807-8(1928).—A high-temp. lab. furnace burns retort coke. Temps. above 1600° can be obtained. C. H. LORIG

How to reduce furnace refractory costs. J. L. GRAUEL. *Ind. Power* 16, No. 6, 67-8, 122-8(1929).—Installation of SiC refractory furnace linings increased life of the bridge wall at a large paper mill 4 times. By air-cooling the wall, preheated air was furnished for combustion, bringing about further saving in fuel. E. I. S.

Apparatus for making glass sheets or plates by rolling. J. H. LEMAIRE. *Brit.* 301,083, Nov. 25, 1927. Structural features.

Checker-work and associated construction of a furnace for heating glass-melting

tanks. ROBERT P. CALLARD (to Libbey-Owens Sheet Glass Co.). U. S. 1,718,331, June 25.

Apparatus for forming blown glassware. SOC. ANON. D'ÉTUDES ET DE CONSTRUCTIONS D'APPAREILS MECANQUES POUR LA VERRERIE. Brit. 300,638, Nov. 18, 1927.

Drawing glass tubing. P. BLUM (to P. A. Favre). Brit. 300,646, Nov. 17, 1927. Mech. features.

Rotary inclined horizontal furnace for melting glass batch ingredients together. G. ZOTOS. Brit. 300,576, Nov. 15, 1927.

Drying system for use with annular kilns for ceramic ware, etc. OTTO BUSCH. U. S. 1,718,190, June 18. Structural features.

Hollow articles of fused silica. I. G. FARBERIND. A.-G. Brit. 301,117, Aug. 26, 1927. A mass of fused quartz is inflated against the wall of the furnace after removal of the heating elements. An elec. furnace construction and various details of operation are described.

Pottery-kiln construction. F. BENNION, H. J. PLANT and J. B. CLARKE. Brit. 301,270, April 26, 1928. The kiln lining consists of fireclay boxes filled with diatomite or other suitable non-conductor of heat. Various other structural features are described.

Regenerative tunnel kiln for ceramic materials. FRIEDRICH SIEMENS A.-G. and HUGO KNOBLAUCH. Ger. 477,260, Sept. 17, 1924.

Molded refractory material. G. KNUDSEN, V. M. GOLDSCHMIDT and R. KNUDSEN. Brit. 301,547, Sept. 3, 1927. Powd. or granular olivine rock is treated to effect a recrystn and cementation together of the grains, as by heating in the presence of small quantities of substances such as silicates, borates, chlorides, nitrates and phosphates of alkali metals, nitrates, borates, chlorides and phosphates of Sn, Mn, Fe and alk. earths and silicates, phosphates and borates of tervalent and quadrivalent metals. Various examples and details are given.

Aluminous abrasive. RAYMOND R. RIDGWAY and JOHN B. GLAZE (to Norton Co.). U. S. 1,719,131, July 2. A product which may be used as an abrasive or refractory comprises cryst. alumina grains of high purity in assocn. with reduction products of alumina and with Al sulfide (the sulfide not exceeding 3% of the mass). The material undergoes disintegration when subjected to hydrating conditions.

Reclaiming abrasive materials from bonded scrap, etc. SAMUEL F. WALTON (to Exolon Co.). U. S. 1,718,264, June 25. The scrap is heated and then suddenly cooled to render the bonding material relatively friable and then milled to reduce the bond to a separable condition.

Opacifying pigments. CHARLES J. KINZIE (to Titanium Alloy Mfg. Co.). U. S. 1,719,432, July 2. In making composite colored opacifying pigments for vitreous enamels, a charge comprising a Zr compd such as  $ZrO_2$ , a fluxing agent such as K feldspar,  $NaNO_3$ , borax,  $H_2BO_3$ , ZnO and cryolite and a homogeneously distributed coloring material such as Co oxide is heated to  $950^\circ$  for 3 hr. and the resulting mass is cooled.

Apparatus for molding ceramic insulators under air pressure. STEWART L. MOORE, JR. (to Locke Insulator Corp.). U. S. 1,717,996, June 18. Structural features.

## 20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Recent developments in the chemistry of cement manufacture. HANS KUEHL. *Pit and Quarry* 18, 84-6(1929). E. H.

The strength of cement and its fineness. A. DAHLGREN. *Rev. matériaux construction trav. publics* 1929, 175.—Two cements having residues of 0.7 and 6% on the sieve 4900 meshes per sq. cm. are found to have almost the same tensile strength. The compressive strength of the finer is slightly higher at early ages but about the same at 28 days. The conclusion is reached, and confirmed by a short treatment with HCl, that the best results are obtained with a cement having a residue of about 15%.

F. O. ANDEREGG

Serving a 14,000 kva load for cement mills. E. G. FLOCK and M. A. HYDE, JR. *Elec. World* 94, 62-5(1929).—4 illus. C. G. F.

Twenty-five years of special cements. C. PRUSSING. *Zement* 17, 1496-500 (1928). H. F. KRIEGER

Storage of cement. VIKTOR BÄHRNER. *Zement* 17, 1556-9(1928).—Twelve brands of Swedish cement were examnd. for fineness, setting time, compressive and tens-

ile strength after storage in the original paper bags for periods up to 6 months. No decrease in quality was found after 1 month's storage. Thereafter a reduction in the fineness and strength resulted with increasing time of storage.

H. F. KRIEGE

**Distribution of particles of cements.** Kozo Fujii. *J. Japan Ceram. Assoc.* 36, 46-57(1928).—Fineness of five cements was detd. successively by means of sieves with 4900, 6400 and 10,000 meshes per sq. cm., an air analyzer and an elutriation app. with EtOH. In general, the % wt. of each fraction increased with decrease in size. The wt.-size curves have a min. at diam. of 4-6 $\mu$ , a max. at 8-10 $\mu$  and another max. at 0-2 $\mu$  or 2-4 $\mu$ . The total surface area of 100 g. of each cement is given. The whole cement and that fraction consisting of particles smaller than 18 $\mu$  in diam., resp., contained SiO<sub>2</sub>, 21.10, 20.42; Al<sub>2</sub>O<sub>3</sub>, 6.01, 6.21; Fe<sub>2</sub>O<sub>3</sub>, 2.29, 2.17; CaO, 63.90, 61.60; MgO, 1.03, 0.91; SO<sub>3</sub>, 1.53, 1.85; loss on ignition, 3.01, 6.50; and showed hydraulic modulus, 2.11, 2.14; SiO<sub>2</sub>/Al<sub>2</sub>O<sub>3</sub>, 3.05, 3.29; and SiO<sub>2</sub>/Fe<sub>2</sub>O<sub>3</sub>, 2.29, 2.44.

S. KONDO

**Early-strength of cement.** I. S. NAGAI. *J. Japan Ceram. Assoc.* 36, 1-11(1928).—Various Japanese portland cements have been compared with 2 imported high early-strength cements, d., sieve, tensile and compression tests being made. It is concluded that 80-90% of the tensile strength is developed in 18-24 hrs. in most of the cements; the increase in compressive strength is much slower; most of the Japanese cements have high early compressive strength, but are inferior to the imported cements in tensile strength; a 2-day test is more rational than a 3-day test.

B. C. A.

**The early strength of cement.** II. SHOICHIRO NAGAI. *J. Japan Ceram. Assoc.* 36, 193-207(1928); cf. preceding abstr.—The early strengths of an alumina cement (Lumnite), a blast-furnace cement made by the Steel Works of the Imperial Government and two domestic early-high-strength port. cements are compared. III. *Ibid* 537-45.—N. gives results obtained in expts. on the early strengths of Velo cement, special cement, Supercement and two Japanese port. cements of high-silica type. IV. *Ibid* 577-87.—Chem. analyses are given of the cements which were used in the comparison tests of the early strength and described in the previous report. Two port. cements were sifted with a No. 300 sieve (about 13,960 meshes/sq. cm.) and the strengths of the coarser part, the original sample and the finer part are compared. The sifting caused no material change in their compn. Loss in strength due to aging was detd. by keeping a sample of cement in a closed vessel connected with a source of CO<sub>2</sub> satd. with moisture for 2 weeks. Aging decreased the tensile strength at one day from 23.3 to 3.9, and at 28 days from 30.9 to 26.2; it decreased the compressive strength at 1 day from 160 to 19, and at 28 days from 522 to 367.

S. KONDO

**Moduli of portland cement.** HESS. *Zement* 18, 36-9(1929).—The discussion deals with the value of three- and four-component systems in understanding the compn. of cement.

H. F. KRIEGE

**Some new moduli and indices relating to main hydraulic components of portland cements.** I. SHOICHIRO NAGAI. *J. Soc. Chem. Ind. (Japan)* 32, 236-42(1929), Suppl. binding 32, 73B.—There is no close relation between strengths and hydraulic modulus  $\text{CaO}/(\text{SiO}_2 + \text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3)$ , silica modulus  $\text{SiO}_2/(\text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3)$ , index of activity  $\text{SiO}_2/\text{Al}_2\text{O}_3$ , iron modulus  $\text{Al}_2\text{O}_3/\text{Fe}_2\text{O}_3$ , etc. In the lime factor  $\text{CaO}/(2.8\text{SiO}_2 + 1.1\text{Al}_2\text{O}_3)$ , cementation index  $(2.8\text{SiO}_2 + 1.1\text{Al}_2\text{O}_3 + 0.7\text{Fe}_2\text{O}_3)/(\text{CaO} + 1.4\text{MgO})$ , index of acidity  $2.8\text{SiO}_2/(1.1\text{Al}_2\text{O}_3 + 0.7\text{Fe}_2\text{O}_3)$ , etc., the manner of combinations of the main hydraulic component is considered, but they never express useful relations between them and strengths of mortars. II. *Ibid* 243-9, Suppl. binding 73-5B.—N. has proposed some new moduli and indices relating to main hydraulic components of cements and has calcd. their values for many Japanese and foreign port. cements. Some of these newly proposed moduli and indices are: Lime-silica ratio or lime-silica combining ratio =  $\text{CaO} - (1.65\text{Al}_2\text{O}_3 + 0.70\text{Fe}_2\text{O}_3 + 0.70\text{SO}_3 + \text{Free CaO})$ ; lime-silica molar ratio  $m =$

$$1.07 \times \frac{\text{SiO}_2 - 0.80 \times \text{insol. residue}}{\text{CaO} - (1.65\text{Al}_2\text{O}_3 + 0.70\text{Fe}_2\text{O}_3 + 0.70\text{Fe}_2\text{O}_3 + 0.70\text{SO}_3 + \text{Free CaO})} \quad \text{molar}$$

$$\text{ratio of tricalcium silicate to dicalcium silicate} = \frac{\text{molar \% of } 3\text{CaO SiO}_2}{\text{molar \% of } 2\text{CaO SiO}_2} - m - 2.00$$

Eight means of recent Japanese port. cements and five early-high-strength port. cements are plotted on a diagram of ternary system  $\text{CaO-SiO}_2\text{-Al}_2\text{O}_3$ , and merits and demerits of many cements of low-silica and high-silica types of Japanese and foreign port. cements are discussed. Three components CaO, SiO<sub>2</sub> and Al<sub>2</sub>O<sub>3</sub> were calcd. as follows: (1)  $\text{CaO} = \text{Total CaO} - (0.70\text{SO}_3 + \text{Free CaO})$ ; (2)  $\text{SiO}_2 = \text{Total SiO}_2 - 0.80 \times \text{insol. residue}$ ; (3)  $\text{Al}_2\text{O}_3 = \text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3$ .

S. KONDO

**Studies on mixed portland cements.** I. SHOICHIRO NAGAI. *J. Soc. Chem.*

*Ind. (Japan)* 32, 343-9(1929), Suppl. binding 32, 101-3B.—There are two sorts of mixed port. cements made in Japan, namely blast-furnace cement and Soliditit. The blast-furnace cement has recently made remarkable progress in the strength of 1:3 mortar, while the Soliditit has made no progress and is far inferior. N. modified the process of making Soliditit by adding one more admixture of siliceous nature. This new mixed port. cement has been named "Neo-Soliditit" and has just been patented (Jap. Pat. No. 80,692). The Neo-Soliditit is a remarkably early-high-strength cement and is comparable to superior foreign early-high-strength port. cement. S. KONDO

Graphical method of calculating cement raw mixture. KOZO FUJII. *J. Japan Ceram. Assoc.* 36, 369-81(1928).—When for raw materials, a hydraulic modulus, a silica modulus and an iron modulus are given, approx. proportion of the raw materials can readily be obtained by graphical method. However, the result must be checked by a mathematical method if accurate proportion is required. By the graphical method the adaptability of a given raw material can be detd. quickly. S. KONDO

Test on Japanese cement. V. SHOICHIRO NAGAI. *J. Japan Ceram. Assoc.* 36, 104-13(1928).—Cements made in Japan in 1927 were finer and produced mortars of slightly higher tensile and compressive strengths than those tested in 1924 and 1926. VI. *Ibid* 265-75.—The following figures give the % compn. of (1) av. of 12 Japanese port. cements, (2) Velo cement, (3) blast-furnace cement and (4) Soliditit, resp.: Loss on ignition, 1.02, 2.59, 0.74, 1.67; insol. residue, 0.25, 2.56, 0.78, 12.80; SiO<sub>2</sub>, 21.87, 20.37, 26.53, 31.51; Al<sub>2</sub>O<sub>3</sub>, 5.58, 6.75, 8.24, 7.26; Fe<sub>2</sub>O<sub>3</sub>, 3.12, 2.43, 3.14, 2.66; MnO, —, —, 1.00, —; CaO, 65.60, 63.57, 54.86, 51.59; MgO, 1.28, 1.17, 1.34, 1.77; SO<sub>3</sub>, 1.30, 2.78, 1.28, 1.70; sulfide sulfur, —, —, 0.65, —; alkalis, —, —, 2.12, 1.80. Recent Japanese port. cements show less long-time strengths as a result of increase in fineness. The relation between their chem. compn. and strengths is discussed. VII. *Ibid* 440-8.—The results of long-time strength tests, chem. analyses, and various indices or ratios between constituents of cements, manufd. in the autumn of 1927 are given. Av. of 12 Japanese port. cements, ferroconcrete, and Luminite, resp., showed loss on ignition, 1.05, 2.39, 2.94; insol. residue, 0.38, 0.48, 2.86; SiO<sub>2</sub>, 21.52, 21.36, 8.03; Al<sub>2</sub>O<sub>3</sub>, 5.17, 5.50, 38.92; Fe<sub>2</sub>O<sub>3</sub>, 3.64, 2.65, 6.82; CaO, 65.55, 65.00, 38.06; MgO, 1.37, 1.18, 0.96; SO<sub>3</sub>, 1.21, 1.66, 0.68%. VIII. *Ibid* 475-83.—The results are given of strength tests on 19 Japanese port. cements, a blast-furnace cement and a Soliditit, all collected at Tokio and Osaka markets in April, 1928, Velo cement (Denmark), special cement (Germany) and Super-cement (England). S. KONDO

The abrasion of cement and cement meal during the mechanical analysis and the most durable time of sieving. FÖRDERREUTHER and HAEGGERMANN. *Zement* 17, 1596-1600, 1627-31(1928).—The best sieve analysis is not necessarily the one giving the least residues per screen. Since abrasion is most serious with the coarser sizes the time for the hand sieving is reduced considerably for the coarser material. H. F. KRIEBE

Action of acid on cement mortar. SHOICHIRO NAGAI. *J. Japan Ceram. Assoc.* 36, 382-94(1928).—The effects of H<sub>2</sub>SO<sub>4</sub> and HCl on the tensile strengths of 1:3 mortars of a port. cement, a blast-furnace cement and a Soliditit have been studied. The action of 0.1 N H<sub>2</sub>SO<sub>4</sub> is fairly strong. HCl acts more severely. S. KONDO

Studies on modulus of rupture of cement mortars. II. SHOICHIRO NAGAI. *J. Soc. Chem. Ind. (Japan)* 31, 1153-8(1928), Suppl. binding, 31, 274-5B.—Tensile strength, modulus of rupture and compressive strength of 1:3 mortar of each cement were nearly the same for three standard sands, if compared at the same hardening age. The coeff. of modulus of rupture to tensile strength was Ca 2.05 for every standard sand mortar. Thus, the Japanese new standard sand is nearly equal to the German and American standards. Form of test piece had little or no influence on the modulus of rupture. S. KONDO

Bending strength of cement mortars. I. SHOICHIRO NAGAI. *J. Soc. Chem. Ind., (Japan)* 32, 431-7(1929), Suppl. binding, 32, 131-3B.—The results of the expts. on the bending strength or transverse strength of cement mortars for seven port. cements and a Soliditit cement, lately made in Japan, and an American high-alumina cement (Lumnite) are described. S. KONDO

Strength formula of cement mortars. I. SHOICHIRO NAGAI. *J. Soc. Chem. Ind. (Japan)* 31, 1159-66(1928), Suppl. binding, 31, 276B.—Unwin's rational formula  $y = a + b(x - 1)^n$ , in which  $a$  is the strength at one week,  $y$  is the strength at  $x$  weeks,  $b$  is a const. of cement, and  $n$  is 1,  $1/2$ ,  $1/3$ , etc., can never be applicable to the early-high-strength port. cements. II. *Ibid* 1268-73, Suppl. binding 301B.—N. modified the parabolic equation between strength and curing age to a linear equation:  $S = A + B \log d$ , where  $S$  is the strength at  $d$  days, and  $A$  and  $B$  are const. for each cement. By applying many results of tests at many curing ages and calcg. by the method of least

squares, consts.  $A$  and  $B$  were obtained for tensile and compressive strengths of each cement. A linear relation between  $B$  and activity index or silica modulus has been observed.  $B = (S - A)/\log d$ ; activity index =  $\text{SiO}_2/\text{Al}_2\text{O}_3$ ; silica modulus =  $\text{SiO}_2/(\text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3)$ . S. KONDO

Relation between composition of cement and strength of cement mortar on combined hardening. I. SHOICHIRO NAGAI. *J. Soc. Chem. Ind. (Japan)* 31, 821-7 (1928), Suppl. binding 31, 200B.—The increase in strength of cement mortar on combined hardening over that on common hardening was compared with the activity index ( $\text{SiO}_2/\text{Al}_2\text{O}_3$ ), the silica or silicate modulus ( $\text{SiO}_2/(\text{Al}_2\text{O}_3 + \text{Fe}_2\text{O}_3)$ ), or the iron or flux modulus ( $\text{Fe}_2\text{O}_3/\text{Al}_2\text{O}_3$ ); a close relation was observed between these ratios and strength. II. *Ibid* 941-8, Suppl. binding 225-6B.—In studying the lime-silica combining ratio

$$\left[ \frac{\text{CaO} - (1.65\text{Al}_2\text{O}_3 + 0.70\text{Fe}_2\text{O}_3 + 0.70\text{SO}_3 + \text{Free CaO})}{\text{SiO} - 0.80(\text{insol. residue})} \right], \text{ free lime was detd. by}$$

the method proposed by Lerch and Bogue (*C. A.* 20, 2737) and the factor 0.80 of insol. residue of port. cement is the silica content obtained by analysis of the insol. residue of some port. cements. This ratio is in linear relation with the increase of strength of cement mortar on combined hardening (1 day in wet air, 6 days in water and 21 days in air) to that on common hardening (1 day in wet air and 27 days in water). The Ca silicates ratio and silicate lime ratios are calcd. as follows:  $a = \text{CaO} - (1.65\text{Al}_2\text{O}_3 + 0.70\text{Fe}_2\text{O}_3 + 0.70\text{SO}_3 + \text{free CaO})$ ;  $b = \% \text{ of CaO forming } 2\text{CaO} \cdot \text{SiO}_2 = 2[2.80(\text{SiO}_2 - 0.80 \text{ insol. residue}) - a]$ ;  $c = \% \text{ of CaO forming } 3\text{CaO} \cdot \text{SiO}_2 = a - b$ ;  $d = \% \text{ of } 2\text{CaO} \cdot \text{SiO}_2 = 1.54b$ ;  $e = \% \text{ of } 3\text{CaO} \cdot \text{SiO}_2 = 1.36c$ . Ca silicates ratio =  $e/d = 3\text{CaO} \cdot \text{SiO}_2/2\text{CaO} \cdot \text{SiO}_2$ . Silicate lime ratio =  $c/b$ . These ratios are also in close relation with the increase of strength of combined hardening to that on common hardening. III. *Ibid* 32, 74-80 (1929), Suppl. binding 32, 29B.—The strengths of cement mortars on long combined hardening tests and those on long water hardening or air curing have been compared. On long combined hardening (1 day in wet air, 6 days in water and then in air to 26 weeks), the strength of low-silica cements became const. after 4 or 8 weeks as did those on long water hardening. So the difference of strengths at same ages of these two hardening tests is nearly const. at any curing ages after 8 weeks. But in the case of the high-silica type of cements, the difference of strengths between these long combined and water hardening tests decreased gradually, because of the increase of strength on water hardening. On long air hardening, the strengths are very small compared with those on water hardening or combined curing. The strengths of low-silica cements on long air hardening became const. after 4 or 8 weeks, but in the high-silica cements, the strength increased slowly. IV. *Ibid* 325-31, Suppl. binding, 98-9B.—Tensile and compressive strengths are given for blast-furnace cements and Solidit cement. The increase of strength on combined hardening over that of common curing is smaller in the blast-furnace cements than in the Solidit cements. The effects of admixture upon the strength of mortars in combined hardening have been studied. Acid mixtures, as puzzolana, Keisanhakudo (silica earth), kieselguhr, etc., increased the strength of mortars of cements of low-silica type both in water and combined hardening, while they had little effect on high- $\text{SiO}_2$  cements. V. *Ibid* 355-60, Suppl. binding, 106-8B.—Ordinary combined hardening (1 day in moist atm., 6 days in water and then cured in air to 8, 13 or 26 weeks from the molding), special combined hardening (1 day in moist atm., 27 days in water and then cured in air to 8, 13 or 26 weeks from the molding), and repeated combined hardening (1 day in moist atm., 6 days in water, 21 days in air and again in water to 8, 13 or 26 weeks from the molding) produce a remarkable increase of strength in low-silica cements, while there is little increase or a decrease in high-silica cements. Further, remarkable differences between these low-silica and high-silica cements have been observed in the results of strength tests of 1:4 and 1:5 mortars. S. KONDO

Influence of hardening temperature on the mortar strength of aluminous cement. A. F. ROSCHER LUND. *Zement* 17, 1690-2, 1725-9 (1928); cf. *C. A.* 22, 2042.—A definite reduction in strength is noted with increasing temps. of curing. H. F. KRIEGE

Influence of additions of different modifications of calcium sulfate on the mechanical properties of portland cement. PETER P. BUDNIKOV AND V. M. LESHOEY. *Zement* 17, 1526-9 (1928).—See *C. A.* 23, 2263. H. F. KRIEGE

Compressive strength, transverse strength, shrinkage and swelling, resistance to wear, imperviousness, and resistance to chemical attack of cement mortars and concrete, especially with different gradations of aggregate and with different water content of the mortars. OTTO GRAF. *Zement* 17, 1480-70, 1500-6, 1530-5, 1632-6, 1661-5, 1692-8 (1928).—Detg. the wt. per cu. ft. or the voidage of sand is not as safe a criterion for quality as is the screen analysis, provided the importance of variations in the gradation is understood. The relation between the water : cement ratios and the

transverse strength is fairly regular. The quality of concrete in compressive and transverse strength is in direct relation to the mortar quality. The gradation of the coarse aggregate within the limits studied is of less importance. Dry curing of concrete depressed the transverse strength and increased the compressive strength. Rewetting dried concrete increased its strength. The relation of compressive to transverse strength for mortar ranged from 3 to 12, for concrete 5-12. The shrinkage of mortars during the first drying out was proportional to the water : cement ratio of the batches. The shrinkage of 1:6 mortars was about half that of 1:3 mortars having the same water : cement ratio. The vol. changes of mortar were definitely increased by additions of  $\text{CaCl}_2$ . The resistance to wear under a sand blast decreased with increasing amounts of fine material in the mortar. The  $\text{H}_2\text{O}$  content is of greater effect on the wear resistance with lean than with rich mortars. The gradation of the sand has a pronounced effect on the imperviousness of the mortar to  $\text{H}_2\text{O}$  under pressure, sand gradation No. 5 being the best. Tamped concrete is more impervious parallel to the direction of tamping than at right angles to it. The resistance to chemical attack is affected by the gradation of the cement as well as of the sand, and by the curing history before the test. H. F. KRIEGE

Types of storage of cement test pieces and their strength relationship. JOSEPH KERTH. *Zement* 18, 94-7(1929). H. F. KRIEGE

The action of the caustic alkali constituents in the condensation water of cement on aluminum, protective coatings and organisms with remarks regarding the factor of soaking of cement test specimens. F. HUNDESHAGEN. *Zement* 18, 6-11(1929).—The alk. of the  $\text{H}_2\text{O}$  formed by the "sweating" of new cement or concrete is sufficient to corrode Al and some protective coatings as well as to destroy small plants and animals. It is suggested that the soaking of test specimens during curing dissolves sufficient alkali to alter the cement. H. F. KRIEGE

Composition of insoluble residue of various cements. SHOICHIRO NAGAI. *J. Soc. Chem. Ind. (Japan)* 32, 438-43(1929), Suppl. binding 32, 133-4B.—Insol. residues of many port. cements were analyzed. The principal constituents of the insol. residue are silica (av. 80%), alumina and alkalies. Thus, the insol. residue consists chiefly of alkali aluminosilicate and quartz. S. KONDO

Recent progress in the art of cement manufacture. KOZO FUJII. *J. Soc. Chem. Ind., (Japan)* 31, 660-9(1928). S. KONDO

Preliminary investigation of the Eckel process for the production of iron slag cement. H. C. MABEE. Canada Dept. of Mines, Mines Branch, *Rept. No.* 695, 162-3(1929).—Tests on high-grade ilmenite from Quebec contg.  $\text{TiO}_2$  35-40%,  $\text{Fe}_2\text{O}_3$  50-55%,  $\text{SiO}_2$  5% and low  $\text{CaO}$  and  $\text{Al}_2\text{O}_3$  showed that Ca titanate may be formed at high temps. and as slag may be sepd. from the metallic Fe. In order to produce cement the acid and boric ratios must be carefully adjusted. ALDEN H. EMERY

Laboratory work in the service of construction engineers and architects. E. PROBST AND A. HUMMEL. *Zement* 17, 1601-5(1928).—The importance of the proper distribution of sizes of aggregates, especially the fine aggregate, is stressed. H. F. K.

The ternary system lime-carbon dioxide-silica. An investigation of the manner of hardening of lime mortar. GUSTAV F. HÜTTIG AND EMIL ROSENKRANZ. *Z. Elektrochem.* 35, 308-14(1929); cf. *C. A.* 22, 4728.—Hardening of lime mortar occurs in 2 stages, drying and carbonation. The first may take only a few hrs. Analyses of mortars up to 2500 yrs. old shows that carbonation is not complete even in that time. The presence of  $\text{MgO}$  results in less absorption of  $\text{CO}_2$ . Thermodynamically  $\text{CaSiO}_3$  would be decompd. by  $\text{CO}_2$  up to  $140^\circ$ ; above that the reverse would occur. Liberation of  $\text{CO}_2$  from  $\text{CaCO}_3$  by active forms of  $\text{SiO}_2$  occurred at  $873^\circ$  but not at room temp. Quartz did not show appreciable action on  $\text{CaCO}_3$  at  $800^\circ$ . X-ray examn. showed  $\text{CaCO}_3$  but no  $\text{CaSiO}_3$  in mortars 580 and 970 years old. Tables of analyses of 5 mortars aged 430 to 970 years are given. Talc did not form  $\text{MgCO}_3$  at 80 lb.  $\text{CO}_2$  pressure in 6 hr. at  $200-400^\circ$ . FOSTER DEE SNELL

Heat measurements and water imperviousness in concrete. RUD. G. GÖSCHWITZ. *Zement* 17, 1723-5(1928).—The description of the app. for these physical measurements is given. H. F. KRIEGE

The thermal conductivity of concrete. A. HUMMEL. *Baug.* 9 [29], 528(1928). *Building Science Abstracts* [N. S.], 1, 252-3.—H., referring to a paper by Kleinlogel (*Beton u. Eisen* 27, 38) on monolithic concrete chimney stacks, points out that the coefficient of thermal conductivity of concrete is not a constant. Its value varies from 0.5 to 2.00 and is influenced by the moisture content, type of aggregate and the proportions in which the constituents of the concrete are present. It thus depends largely on the history of the specimen. The lower value should be used in calculating the stresses due to temperature gradients. H. L. D.

**Simple determination of the water requirement of poured concrete.** A. GUTTMANN. *Zement* 17, 1794-5(1928).—The consistency required for practical purposes is detd. with a piece of chute mounted on pipe frame so that its angle of inclination may be adjusted to any desired degree. A charge of 3 l. of the wet batch to be tested is emptied into the top of the 15-m. chute and is caught below to be measured. When the material adhering to the chute is 0.7-1.0 l. the batch has desirable consistency and H<sub>2</sub>O content.

H. F. KRIEGER

**The tensile strength of cement mortar and concrete.** H. OLSEN. *Beton u. Eisen* 28, 204-9, 218-20(1929).—The effects of the amount of mixing water, storage, addition of rock powder and relation between mortar strengths and concrete strengths are given.

F. O. ANDEREGG

**Relation between mortar strength and concrete strength.** H. BURCHARTZ. *Zement* 18, 2-6(1929).—In earth-moist batches 1 and 3 vols. of coarse aggregate added to each mortar did not reduce the 28-day compressive strength. Five vols. reduced the strength 18-30%. In plastic mixes reduction in strength occurred in all cases in proportion to decrease of the cement content and to the increasing H<sub>2</sub>O-cement ratio. The strengths were in no apparent relation to the densities of the specimens.

H. F. K.

**Increase in strength of concrete and mortar with age.** F. KLOKNER. *Intern. Congress Testing Materials* 1927, II, 75-84.—The strength of concrete or mortar  $K = a + b \log D$ , where  $a$  and  $b$  are consts. and  $D$  is the age.

F. O. A.

**Solution of the caustic, especially the alkali, constituents of concrete test specimens, during the usual storage under water.** F. HUNDESHAGEN. *Zement* 18, 34-6(1929).—Sufficient soln. of the alk. constituents occurs to warrant some consideration, especially with cements high in alkali.

H. F. KRIEGER

**Protection of metal work and reinforced concrete against locomotive fumes.** M. SURLÉAU. *Intern. Congress Testing Materials* 1927, II, 625-40.—The deterioration in metal work (rails, sleepers, bridges, hoods, signal bridges and steel depots), in reinforced concrete and in tunnel masonry is described and attributed to sulfuric acid from SO<sub>2</sub> in the gases, to the changes in temp. and to the blasting effect of the gases and cinders. Metal work may be protected by a coating of reinforced concrete, by cement applied with a spray gun, by spray metallizing, by false ceilings, by use of copper steel or homogeneous steel and by ventilation. Reinforced concrete may be protected by brickwork, cement applied under pressure, fibrocement, or false work of reinforced concrete. Engine hoods are best constructed of reinforced concrete, fibrocement or wood covered with the latter. Painting is useful only on slightly exposed surfaces. Stagnation of fumes and deposits of soot are especially to be avoided.

PAUL J. CULHANE

**The apparatus of an ultra-modern plaster factory.** J. PROUTEAU. *Rev. matériaux construction trav. publics* 1929, 201-5.

F. O. ANDEREGG

**The effect of adding trass on the properties of gypsum.** A. STROPOV. *Tonind. Ztg.* 53, 927-8(1929).—The addition of trass lengthens the working time for gypsum and improves the 7-day tensile strength to a certain point, beyond which it drops rapidly.

F. O. ANDEREGG

**Asphaltic pavements. Characteristics of asphalt and the practical methods of its use in road construction.** E. H. SCOTT. *Munic. Eng. Sanit. Record* 82, 702-3(1928).—The proportions and the differences of the materials used in sheet asphalt and asphaltic concretes for making paved roads in Canada are discussed.

C. H. BADGER

**The xylene test for roofing felt.** P. W. CODWISE. *Paper Trade J.* 88, No. 12, 66(1929).—The principle of the test is that of gaging the rate at which a light volatile liquid rises in a vertically suspended strip, the lower end of which dips beneath the liquid contained in a suitable dish. The technic is described in detail. When a report is made on the test, the moisture condition of the felt should be stated. In considering the results each wt. or thickness should be classed by itself when translating the results into terms of satg. machine behavior. The results of the test may be used in conjunction with a test for satg. capacity, such as the "kerosene" test (C. A. 23, 4814).

REINER, WILHELM: *Handbuch der neuen Strassenbauweisen mit Bitumen, Teer und Portland-zement als Bindemittel*. Berlin: J. Springer. 400 pp. Linen, M. 30.50.

**Cements.** HENRY E. DOUGHTY. Fr. 655,168, June 2, 1928. See Brit. 280,813 (C. A. 22, 3277).

**Cements.** ROBERT STRITTER. Fr. 655,484, June 7, 1928. A powder of hydrated alkali silicate 2, and  $\text{Ca}(\text{OH})_2$  1 part, is added to cement to increase its setting speed and resistance to traction or compression.

**Cements.** "KOLLOIDCHEMIE" STUDIENGESSELLSCHAFT M. B. II. and JOHANNES B. CARPZOW, ROBERT LENZMANN, MARTIN MARCH and HERMANN SANDERS. Fr. 656,-101, June 19, 1928. Naturally moist salt- or fresh-water mud or the like contg. unsatd Si compds. or the colloidal constituents sepd. therefrom are combined chemically or physically with oxides, salts and metal compds. and are then used as building materials, if desired with the addn. of binding media. They produce valuable cements when baked. The mud may be left standing for some time in aq. suspension, if desired, with addn. of anaerobic bacteria cultures and nutrients before mixing with the metal compds.

**Cement.** ERNST MEIER. Ger. 477,212, Dec. 11, 1927. An air blast blows the raw mixt. and powd. fuel into a rotary horizontal combustion chamber.

**Cement.** OTTO F. HONUS. Ger. 477,270, Apr. 1, 1926. Gypsum rich in  $\text{Al}_2\text{O}_3$  is used instead of bauxite in the manuf. of fusible cements,  $\text{SO}_2$  being obtained as a by-product. Thus, the gypsum may be heated with bituminous shale, clay or bog iron ore, or a baryta cement may be obtained by heating the gypsum with residues from the manuf. of  $\text{BaS}$ , if necessary with addn. of Al silicate and sand.

**Hydraulic cements.** C. HINRICHSSEN (to Chemische Fabrik Grünau, Landshoff, & Meyer A.-G.). Brit. 301,509, Dec. 1, 1927. HCl or chlorides such as those of Ca, Al, Ti, Sn, Fe and Sr are used to accelerate setting and hardening and to render the set product water- and oil-proof.

**Cement mixture.** JOSEPH K. BURN. U. S. 1,719,210, July 2. A compn. which is suitable for stopping leaks, is formed of litharge 2, portland cement 1 and powdered iron 1 part, mixed with waterglass or shellac to form a paste.

**Cellular cement compositions.** G. B. HINTON. Brit. 300,842, Feb. 27, 1928. An app. is described suitable for making a frothy mass from a mixt. of cement, water and a frothing agent. Brit. 300,843 specifies a cellular cement material contg. cells of larger size surrounded by cells of smaller size, formed by mixing 2 masses of material contg. bubbles of different sizes. Cf. C. A. 22, 1026, 4757.

**Cooling drum, with sight tube, for rotary furnaces for cement, etc., manufacture.** G. POLYSIUS A.-G. Ger. 477,097, May 12, 1928.

**Coating concrete with bituminous material to prevent evaporation of water during setting.** BARBER ASPHALT CO. Brit. 300,461, April 23, 1928. After laying, concrete is sprayed with a water-external-phase bituminous emulsion (suitably that known as "cold repair cement").

**Artificial marble.** JOHANN KNEJFL and MARIA MOTYKA. Fr. 655,392, June 5, 1928. A glaze contg. water 25, sol. glass ( $40^\circ \text{Bé}$ ) 25,  $\text{K}_2\text{CO}_3$  8,  $\text{K}_2\text{SO}_4$  5, Ca phosphate 2, coloring materials 35 parts is applied to plates of substances which can be molded such as asbestos cement, the glaze being hardened by heating in a bath contg. water 200,  $\text{CaCO}_3$  8,  $\text{KCl}$  2,  $\text{MgCl}_2$  5,  $\text{CaCl}_2$  30,  $\text{HNO}_3$  ( $40^\circ \text{Bé}$ ) 8,  $\text{AcOH}$  ( $80^\circ \text{Bé}$ ) 6,  $\text{H}_2\text{SO}_4$  ( $66 \text{ Bé}$ ) 6,  $\text{NaCl}$  20,  $\text{MgSO}_4$  8 and citric acid 5 parts.

**Porous gypsum plaster composition, etc.** INSULEX CORP. Brit. 301,344, Aug. 24, 1927. A porous compn. is made by forming bubbles in a fluid mixt. of water, calcined gypsum and a small quantity of a substance such as soap or saponin which assists bubble formation and distribution.  $\text{CO}_2$  preferably is generated in the mixt. by reaction of substances such as Al sulfate and  $\text{CaCO}_3$ . Talc, silica, lampblack or gum arabic or like substances also may be added. Brit. 301,359 relates to similar compns.

**Hardening lime plaster, mortar and stucco.** DOUGLAS M. HARRISON (to McKenzie Mortar Co.). U. S. 1,718,955, July 2. A hardener is used comprising pulverized shale material including the ash content such as residue from oil shale distn. together with  $\text{CaCl}_2$  and  $\text{FeS}_2$ .

**Composition bath mats or flooring tiles.** H. E. DEANE. Brit. 301,195, Nov. 19, 1927. Cork is agglomerated (suitably with a cement of casein and glycerol) and coated with a thin layer of rubber.

**Porous building sheets.** JOSEF WEISS and RUDOLF KARG. Ger. 477,365, July 12,

1927. In prepg. porous sheets by immersing fibrous material such as wood wool in a soln. of kieserite in which magnesite is suspended and then drying the mass, the drying is effected in molds having perforations above and below. Cf. Brit. 274,471 (C. A. 22, 2222).

**Shaft furnace for calcining powdered limestone, etc.** EDOUARD P. C. GIROUARD. Ger. 477,261, July 31, 1926.

**Pavement.** WALTER H. FLOOD. U. S. 1,717,445, June 18. A course of stones coated with bituminous material of sufficient thickness to prevent adherence of cement to the stones is used with a hydraulic cement grouting filling the voids and forming a skeleton to hold the stones in place with the bituminous material forming an expansion and compression medium between the stones and cement.

**Bituminous pavement.** MORRIS L. GORDON. U. S. 1,717,769, June 18. A hot, coarse-aggregate, bituminous concrete mixt. is spread in a layer approx. the desired thickness of the complete pavement, compressed to 75% of the compression it will take, and while still hot is covered with a hot, finer-aggregate, bituminous concrete mixt. in a layer approx.  $\frac{1}{4}$  the desired thickness of the complete pavement; this layer also is compressed to 75% of the compression it will take while still hot, and is then covered with a still finer-aggregate bituminous mixt. and the complete pavement is further compressed into a united structure.

**Road pavements.** J. CAPMANY. Brit. 300,828, Jan. 13, 1928. A binder of non-bituminous cement or mortar is placed on a foundation of concrete or macadam and material such as broken porphyry or granite is laid with its smooth faces uppermost in the binding material so that the latter rises and fills the interstices. Asphalt or a thin mixt. of cement and sand may then be applied.

**Road materials.** STADTGEMEINDE DRESDEN REPRESENTÉE PAR SON CONSEIL. Fr. 655,858, June 6, 1928. A substance resembling asphalt for use on roads is prepd. by treating tars or tar mixts. or mixts. of tars and phenols, the content of PhOH of which is higher than that of normal tars at high temps., and lower than that of normal tars at low temps., with oxidizing substances or with S or both, with or without the addn. of contact substances.

**Road material.** NAAMLooZE VENNOOTSCHAP KONINKLIJKE STEARINE KAARSEN-FABRIEK GOUDA. Fr. 655,853, June 5, 1928. Dry pebbles or the like are mixed first with linseed oil, petroleum, petroleum residues or fatty or minerals oils, oleic acid, resin oil or solvents such as xylene, alc., etc., and afterwards with a bituminous emulsion.

**Asphalt-surfaced roofing.** ALAN R. LUKENS and JOSEPH S. MAYNARD (to Flint-kote Co.). U. S. 1,719,118, July 2. An upper layer of asphalt carries a thin surfacing layer of hydrated ferrous oxide combined with Si in powdered form (a "slag powder" from Cu manuf.) sufficient to cut off all actinic light rays from the asphalt.

**Preserving wood.** ALFRED OBERLE (one-half to Thomas E. Scofield). U. S. 1,717,888, June 18. Wood is impregnated with a halogenated hydrocarbon such as chlorinated crude oil having a natural S content sufficient to give it toxic properties and is subjected to a halogen gas such as Cl under pressure.

**"Wood substitute."** E. J. FOSTER (to Woodcrete, Ltd.). Brit. 300,982, Nov. 22, 1927. Planks or other articles are molded from a mixt. of wood dust, shavings, sawdust, etc., and casein. Water and  $\text{NaHCO}_3$  may be used in making up the compn. and a soln. for imparting flexibility to the product comprises aq.  $\text{NH}_3$ , NaF and glycerol. The product may also be treated with  $\text{CH}_2\text{O}$ , Al acetate or  $\text{K}_2\text{Cr}_2\text{O}_7$  and its resiliency is increased by adding an emulsion of S and oil to the casein compn. used.

**Staining or impregnating logs, etc.** SEMER & Co. GRS Brit. 301,244, Feb. 2, 1928. Mech. features.

**Kiln construction and air circulation system for seasoning lumber.** ROBERT Z. DRAKE. U. S. 1,718,221, June 25.

A. C. FIELDNER

**Radiation and conduction losses in firing and quenching periods with special regard to rubber industry.** E. PRAETORIUS. *Wärme* 52, 405-10, 424-7(1929).—Different kinds of heat losses are discussed. E. I. S.

**Latest literature on motor fuels.** LEOPOLD SINGER. *Petroleum Z.* 25, 513-24 (1929); cf. C. A. 23, 1734.—A very complete review with 227 references. A. A. B.

**Researches upon motor gas producer fuels. I. Thermal fractionation of the**

gaseous products of the pyrogenation of the various fuels subjected to test. P. LEBEAU, H. FIGOUR AND G. VOUT. *Ann. combustibles liquides* 4, 19-64(1929); cf. Haslam, Entwistle and Gladding, *C. A.* 19, 2120.—A series of studies was undertaken upon the reactions in the gas producer of wood charcoal, peat coke, semicoke from coal, various briquetted materials, etc., with the purpose of making clear the reactions of the air  $O_2$ ,  $H_2O$  vapor and  $CO_2$  with the fuel. An elec. furnace was used for heating the 0.5-1.0 g sample of fuel placed in a quartz tube. The total gas evolved within each  $100^\circ$  of temp. rise was measured and analyzed. Curves were plotted for the total gas and for each constituent. Charcoals, charcoal briquets, coal briquets and a semicoke were tested in a gas producer also. The charcoals obtained from a powder factory were from chestnut wood, carbonized at temps. from  $350$  to  $750^\circ$ ; other com. samples were also tested. The graphs show that the temp. of max. evolution of gas from charcoals rises with the temp. of carbonization. The same is true of the temp. of max. evolution of carbon monoxide and  $H_2$ . As a temp. of  $1000^\circ$  is approached the vol. of gas evolved decreases in proportion as carbonization has been more complete, but the % of the combustible gases increases, as well as the  $H_2$  content. % of material volatilized at  $900^\circ$  was also detd. The results were from 1 to 7% higher than those obtained by the thermal fractionation.

EMMA E. CRANDAL

Industrial fuel and power statistics for Ontario, 1925. E. S. MALLOCH AND C. E. BALTZER. Canada Dept. of Mines, Mines Branch, *Report* No. 698, 23 pp. and 12 maps (1928).—This rept. (entirely tabular) shows the industrial use (9561 plants) in 1925 in Ontario of bituminous coal, anthracite, lignite, coke, gasoline, oil, wood, gas, other fuel and electric power. It also shows the distribution of steam engines and turbines, gas engines, oil and gasoline engines, hydraulic turbines and waterwheels, electric motors driven by purchased power, electric motors operated by power generated in each industry and boiler installations.

E. H.

The condensation of steam. D. F. OTHMER. *Ind. Eng. Chem.* 21, 576-83(1929).—The rate of condensation of steam on an isothermal condensing surface was studied by means of a special app. The effects of small quantities of air in the steam, of temp. drop, and of temp. were investigated. The relation  $\log f = \log \Delta T[1.213 - 0.00242T] + \left[ \frac{\log \Delta T}{3.439} - 1 \right] \times [\log(C + 0.505) - 1.551 - 0.009T]$  expresses in B. t. u. per sq. ft. per hr. per  $^\circ F.$  the logarithm of the coeff. as a function of temp., temp. drop and compn. of the steam. The results are considered from the viewpoint of the resistance concept.

Studies in the composition of coal. The rational analysis of coal. WILFRID FRANCIS AND RICHARD V. WHEELER. *J. Chem. Soc.* 1928, 2967-79; cf. *C. A.* 21, 2780.—The "reactivity indices" of the ulmin compds. in 17 coals from the Pittsburgh seam (Carboniferous) and 11 coals (Tertiary and Cretaceous) from mines in the Western U. S. A. were detd. These samples represent coals from semi-anthracites to lignites, having on the ash-free dry basis from 89.1 to 73.4% C. The names of the coals tested, their proximate, ultimate and rational analyses, reactivity index of ulmins, and C % on ash-free dry coal are tabulated. Another table compares for 4 coals the % C of the whole coal and for the vitrain only with reactivity indices of their ulmins. The rational analyses were made by drying the coarsely ground coal samples in a vacuum oven, and then extg. in a large Soxhlet app. with pyridine in an atm. of  $N_2$ . The  $\gamma_1$  and  $\gamma_2$  fractions were sepd. with  $CHCl_3$ . The  $\alpha$  and  $\beta$  compds. were then dried in a vacuum at  $105^\circ$ . Samples (10 g.) of the dried material ground to pass a 100 and remain on a 200-mesh sieve (Tyler-U. S. Standard) were placed in glass tubes in a const.-temp. oven at  $150^\circ$  and their rates of oxidation detd. by drawing pure dry air through for several weeks. The time taken for complete conversion of the coal ulmins to alkali-sol. compds. varied with the character of the coals, being 40 weeks for coals with the highest C content. Further expts. were made to det. the rate of formation of sol. ulmins by atm. oxidation of thin layers of coal in a hot-air oven at  $150^\circ$ . Each week a 1-g. portion was withdrawn from the oven, boiled for  $\frac{1}{2}$  hr. with 150 cc. of 1% KOH soln., filtered hot, the ulmins pptd. by adding HCl, filtered through tarred papers, washed, dried and weighed. A table gives % sol. ulmins formed up to 11 weeks and hr. required for 50% formation; time varied for the Pittsburgh coals from 390 to 1800 hr.; for the other coals from 140 to 468 hr. Accelerated oxidation expts. were made with the coals by using a soln. of HCl plus different wts. of  $KClO_3$ ; the tabulated results are very similar to those obtained by atm. oxidation and this rapid

method is considered sufficiently accurate for practical purposes. A satisfactory simplified method for detg. the hydrocarbons and resins was likewise developed. The pyridine ext. of the coal was concd., an excess of  $\text{CHCl}_3$  was added, the pyridine was neutralized with  $\text{HCl}$ , which pptd. the insol.  $\beta$  and the dispersed  $\gamma_3$  and  $\gamma_4$  compds.; the  $\gamma_1$  and  $\gamma_2$  compds. in soln. were estd. by evapg. the  $\text{CHCl}_3$  and weighing the residue. For rapid detn. of the organized plant entities in coals the following procedure was found to give reasonably accurate data: a 0.5-g. sample freed from hydrocarbons and resins was boiled for 7 hrs. under a reflux condenser with an oxidizing soln. composed of different vols. of  $N$  or  $2N$   $\text{HNO}_3$  plus different wts. of  $\text{KClO}_3$ , depending on the % C in ash-free dry coal. The ash-free material insol. in  $\text{KOH}$  soln. after this treatment was estd. to be the resistant plant entities. There is no general relationship between the quantities of hydrocarbons and resins extractable from a coal, or proportions of organized plant entities it contains and the age of the coal or its degree of coalification. A general relationship exists between the C content of coal as a whole, and the reactivity index of its ulmins; the relation is remarkably close for the % C of the vitrain portion of the coal. With coals from the Pittsburgh seam their C content follows closely the rates of oxidation of their ulmins, but among the other coals tested there were notable exceptions. The rate of formation of sol. ulmins for most of the coals was in approx. the same order as their rates of oxidation, but for some of the younger coals, where greater errors in analyses and oxidations are likely, the rate of formation of sol. ulmins cannot be taken as a measure of their rank. Additional evidence (C. A. 20, 811) has been obtained that the external groupings of ulmin mols. are modified with increasing rank of the coal.

Improvement of coal for the cement industry. ADOLF SPENGLER. *Tonind. Ztg.* 53, 852-4(1929).—Low-temp. distillation may improve the coal considerably for cement burning.

F. O. ANDEREGG

Nitrogen compounds in coal. K. ISHIBASHI. *J. Fuel. Soc. Japan* 8, 523-30(1929).—In order to study the N compds. in coal, I. treated coal with  $\text{PhOH}$  and then carbonized the ext. and residue, and the N of their products was detd. by usual methods. The N compds. in the residue contribute to  $\text{NH}_3$  formation while those in the ext. are the source of the basic substances in tar. The N compds. in coal, therefore, may be classified into resinic (phenol-sol.) and ulmic (phenol-insol.) nitrogen.

F. I. NAKAMURA

Assessing the value of coking coals. G. W. J. BRADLEY AND R. A. MOTT. *Colliery Guardian* 137, 2457-60(1928).—Results are given for many kinds of coals from England, Scotland and Wales, whose cokes are classified into 4 groups according to their shatter indices (A). Another test for quality of cokes is the "barrel abrasion test" in which 25 lb. of coke of 2 to 3 in. size is rotated in a steel barrel 9 in. long and 18 in. diameter for 30 min. The % coke remaining on a 1.5-in. screen is tentatively called the "abrasion index" (B). The shatter, abrasion and mechanical strength ( $A \times B/100$ ) indices of 17 cokes are tabulated. Ranges of indices recorded are: shatter 97.2 to 67.3, abrasion 97.6 to 62.8, and mechanical strength 92 to 53.7. Some cokes with high shatter indices are friable, pieces of the coke being easily rubbed off, especially if subjected to the shearing action of settling in a blast furnace; hence the true quality of such cokes is best detd. from their mechanical strength indices. By embedding cokes in plaster of Paris, cutting, polishing and then dusting with plaster of Paris, a rough correlation was obtained between the shatter index and the no. of fractures. These methods of assessing the values of cokes have enabled simple nos. to be assigned which are in agreement with general experience and do not suffer from the faults of visual exams. The following tests are critically reviewed: attempts to correlate coking qualities with % volatile matter, % C, "caking" and "agglutinating" power, swelling power as detd. in the Gray-King assay app. m. p., and "plastic" range. A new simple method of assessing the coking quality of coal consists in measuring vol. changes of a sample of powd. coal heated in a  $\text{SiO}_2$  retort in an

elec. furnace. For most of the coals tested the vol. was unchanged up to about 400°; then a contraction occurred and continued while the temp. increased 20° or more; an expansion then usually occurred suddenly, attaining a max. below 500° and the coke became rigid. The vol. then remained const. until the coke reached a temp. above 700° when a contraction occurred such as that which causes the coke to leave the walls of an oven before the coke can be discharged. The results of these expts. and comparisons with the shatter, abrasion and mechanical strength indices of oven cokes manufd. from the same coals are discussed. In general no direct relationship was observed between coking values of the coals and their temps. of initial contraction nor of initial expansion, but final expansion temps. average higher for the better-coking coals. The av. coking values of the coals arranged in 4 groups according to the approx. mechanical strength indices of oven cokes vary clearly with the av. expansion range of temp. in °C and % expansion as shown by the data, resp.: 90, 47°, 200%; 80, 39°, 168%; 70, 22.5°, 93%, and for the poorest cokes, 60, 20°, 31%. The highest abrasion indices of cokes are usually associated with the largest % expansions of the coals. Only coals which do not swell at all produce cokes having abrasion indices less than 90. An explanation of the observed contraction and expansion phenomena and the formation of different kinds of cokes is given on the basis of the changes undergone by the oil (tar) which first exudes from fine coal when heated and later serves as the binder between the particles of carbonaceous matter. The detn. of % contractions and % expansions appears to be a simple lab. method for assessing the value of coking coals.

W. W. HODGE

**Coking tests made with Gonwanda coals.** CYRIL S. FOX. *Records Geol. Survey India* 61, Pt. 3, 294-314(1928).—F. gives results of large-scale coking tests of Indian coals which open up the following reserves (in millions of tons): coal for highest-grade metallurgical coke 9, for good metallurgical coke 812, for fair metallurgical coke 1,274 and for good coke, not of metallurgical quality 600. Tables of coal analyses are given

ALDEN H. EMERY

**Extraction and recovery of phenols from ammonia liquor.** ROBERT M. CRAWFORD. *Proc. 2nd Intern. Conference Bituminous Coal* 2, 726-34(1928).—The solvent extn. method for the substantial elimination of phenols from  $\text{NH}_3$  liquor and their recovery as a salable by-product in the form of crude tar acids is outlined and app. are described. The free phenols are extd. with solvents such as  $\text{C}_6\text{H}_6$ , motor fuel or coal-tar light oils, removed from the soln. by passing the latter through  $\text{NaOH}$  soln., and then recovered by neutralization of the phenolate formed.

W. C. EBAUGH

**Low-temperature phantom.** F. C. GREENE. *Proc. 2nd Intern. Conference Bituminous Coal* 2, 808-13(1928).—Expts. are described upon the combustion of leaves and coal screenings, whereby the fuel is converted into gas by a current of air impinging upon its surface, rather than passing through it, and the fly-ash is removed as fast as formed, leaving no clinker or covered fuel surface. Very low blast pressure and velocity are needed; gas is made on a low-temp. char surface, and the radiants from the fire-wall are so much in excess of the requirements of gas-making one may find it possible to employ them for generating steam as a by-product.

W. C. EBAUGH

**Report of test by the director of fuel research on the Maclaurin plant installed at Dalmarnock Gas Works, Glasgow.** C. H. LANDER. *Dept. Sci. Ind. Research*, Dec. 1928, 26 pp.—Official test has been made of a Maclaurin carbonization plant. The retort was 20 ft. high, square in cross-section with a max. width of 8.25 ft. at a point 15 ft. from the bottom and tapering to 6 ft. at the top and 6.5 ft. at the bottom. This system was operated by the heat of combustion of a small portion of the coke; products were removed at low temp., but a part of the coke passed the combustion area at which the temp. was over 1000°. Coke was removed by means of 4 water-sealed doors in the bottom; air was introduced 8.5 ft. from the bottom. A max. throughput of 24.3 tons per day (av. 20 tons) was obtained with satisfactory wt., C, and thermal balances, producing, per ton of coal (dry): coke 1212 lbs., tar 17.8 gals., gas spirit 1.5 gals., gas 33,160 cu. ft. (77.26 therms), liquor 48.1 gals., and  $(\text{NH}_4)_2\text{SO}_4$  41.9 lbs. The coke produced was of good quality, equal to that obtained from low-temp. (600°) externally heated retorts, and of approx. the same size as the coal introduced. The construction and operation of the producer are described and illustrated.

A. S. CARTER

**Localized naphthalene removal.** MIETHING. *Gas u. Wasserfach* 72, 477-8 (1929).—A novel means of using oil scrubbing at entrance to customers' services or on mains to remove naphthalene from the gas, is described. The essential feature of this app. is a porous ceramic body which presents a large oil surface to the gas, without introducing appreciable back pressure and permits efficient scrubbing.

R. W. RYAN

**Simplified iodine pentoxide apparatus for determination of carbon monoxide in flue gas.** F. E. VANDAEER AND R. C. GREGG. *Ind. Eng. Chem., Anal. Ed.* 1, 129-33

(1929).—Existing  $I_2O_5$  methods are simplified for flue-gas analysis by elimination of most of the extensive purification train. The modification is suitable for CO as low as 0.002% in the presence of small quantities of  $CO_2$ ,  $O_2$ ,  $H_2$ ,  $CH_4$ ,  $C_2H_6$ ,  $H_2S$ ,  $SO_2$ ,  $N_2$  and oxides of  $N_2$ .

The by-products of gas manufacture and their role in the chemical industry. HANS TIEMESSEN. *Z. angew. Chem.* 41, 1242-4 (1928).—A review. T. H. CHILTON

Some phases of the organic sulfur problem in the manufacture and utilization of gas. WILBERT J. HUFF. *Proc. 2nd Intern. Conference Bituminous Coal* 2, 814-25 (1928).—In addn. to  $CS_2$  (which represents perhaps 80% of the total S in manufactured gas), mercaptans, org. sulfides, thionaphthene, thionaphthene-2-methyl, thiophene, methylthiophene and diphenylene sulfide have been identified in tar oils, and may be present in gas. Expts. are suggested to discover the genesis of such compds., in the hope that modifications of the gas-making processes may be devised to eliminate their formation in practice. Coal whose temp. was changed very rapidly gave large quantities of  $CS_2$  in comparison with the same coal heated slowly. Cracking expts. on oils also indicated that C-S complexes may be important intermediate substances in the production of S compds. found in gas. The use of catalysts may cause such S to come off as  $H_2S$  rather than as an org. S derivs., thus simplifying purification by ordinary processes.

W. C. EBAUGH

Construction and advantages of the Drehrost gas generators. H. WINKELMANN. *Chem.-tech. Rundschau* 44,762, 800 (1929).—This generator utilizes cheap sources of C. The gas may be hot and unpurified or cold and either partially or completely purified. In either case the degree of efficiency is high, often reaching 92-94% of the heating value of the gasified fuel. The combustible part of the residue amounts to less than 1%. The space and stoking required are less than that of other generators. Power consumption is 0.5 to 2 kw.; water requirements are 0.2-0.3 cu. m. per sq. m. of jacket surface for lignite volatilization, and 3-4 cu. m. for anthracite, the water leaving at 70°. Advantages are high efficiency, low-space requirements, economy, durability, etc. The cost of gas is 0.3-0.4 Pf./cu. m. or a reduction of 50% from that of other generators. The construction is described in considerable detail.

Preparation, characteristics and uses of modern gas coke. BUCK. *Gas u. Wasserfach, Special No.*, 53-61 (Apr. 19, 1929).—German methods of producing coke, pre-treatment of coal, quenching and properties of the resulting coke are described.

R. W. RYAN

Progress made in the manufacture of foundry coke by a new system of coal carbonization. JULIEN PIETERS. *Proc. 2nd Intern. Conference Bituminous Coal* 2, 707-25 (1928).—Exptl. plants treating 10-50 tons/day in France, Belgium and Italy are described to show P.'s process of carbonization. Vertical retorts with continuous recuperation of total heat, progressive and continuous operation, including coke discharge, the removal and distn. of volatile products, and recovery of coke free from breeze and waste, combine to give an efficient process, said to be applicable to even non-coking coals provided an agglomerating agent like pitch or oil be used with them. It is claimed that 20 cwt of bituminous coal contg. 37% volatile matter, 4% moisture and 12% ash, will yield 3 gal.  $C_6H_6$  and motor spirit, 5 gal. Diesel oils, 11 gal. fuel oils, 4 gal. phenols, 24 lb.  $(NH_4)_2SO_4$  and a gas surplus of 7000 cu. ft. (546 B. t. u.).

W. C. EBAUGH

The heat of combustion of coke and other modifications of carbon. W. A. ROTH. *Arch. Eisenhüttenw.* 2, 245-7 (1928).—The heat of combustion of metallurgical coke, water- and ash-free, with 1% S, detd. in a Pt-lined Langbein-Hugerstoff bomb, is 7966

cal./g.; of  $\beta$ -graphite (sp. gr. 2.22), 7856 cal./g.; of  $\alpha$ -graphite (sp. gr. 2.28), 7832 cal./g. The heat of combustion of non-graphitic black C is as high as 8150 cal./g. and this represents the min. value for amorphous C; sp. heats of combustion between 7856 and 8150 cal./g., calcd. for pure C, indicate therefore a mixt. of graphite and amorphous C.

R. D. BUMBACHER

**Factors influencing the reactivity of coke.** F. J. DENT AND J. W. COBB. *Colliery Guardian* 138, 2208-10(1929); cf. *C. A.* 23, 263.—Coke "binder" or the decomposed fusible part of coal is unreactive compared to the non-fusible constituents. Since heating renders the binder still more unreactive, heat treatment reduces the reactivity of the surface. This is due to a mol. rearrangement, which proceeds very slowly inward. Coals with much binder can, therefore, by heat treatment, be made to resemble graphite in reactivity. Wood charcoal, with the least binder, is in all expts. the most reactive. These facts explain the differences between reactivity I, II and III of the Jones-King-Sinnatt method for detg. reactivity (*C. A.* 22, 1841).

**Fuel.** PIERRE A. HOYER. Fr. 655,749, Oct. 25, 1927.  $\text{NH}_3$  is dissolved in liquid fuel such as gasoline, alc.,  $\text{C}_6\text{H}_6$ , etc., for use in explosion motors and decompd. by electric sparks into N and H before mixing with air in the carburetor.

**Fuel.** LUCIEN LIAIS. Fr. 655,724, June 14, 1928. Coal dust to be used in burners is freed from moisture and the pores are closed by treatment with 3-6% of coal tar, petroleum tar, asphalt, etc.

**Coal gas.** ALFRED POTT. Fr. 655,528, June 8, 1928. Coal-distn. water gas, particularly coke-oven water gas, is used for varying the calorific value and d. of coal-distn. gases. The water gas is formed by the interaction of coal-distn. gas with steam alone or with air alone or with a suitable steam-air mixt. to attain the necessary calorific value and d. The amt. of added coal-distn. water gas and its production may be automatically varied.

**Mixed coal gas and water gas.** DESSAUER VERTIKAL-OFFEN GES. and W. BUEB.

Brit. 300,767, Oct. 24, 1927. Steam is passed through coal in an internally heated chamber and the steam and distillates are then passed through coke either in the same or in another internally heated chamber. An app. is described.

**Benzene from coal gas.** C. STILL. Brit. 300,964, Nov. 21, 1927. Light oil obtained as a liquid distillate in distg. wash oil contg. benzene, as described in Brit. 293,702 (C. A. 23, 1740), is rectified in a sep. distg. app. and the resulting naphthalene-charged rectification residue is returned while still warm to the distd. wash oil passing into new circulation. An app. and various details of operation are described.

**Handling powdered coal or other powdered fuels.** J. J. C. BRAND and B. LAING. Brit. 301,413, June 25, 1927. A current of inert gas is used for carrying the fuel and to displace the air in ship holds or other chambers to or from which the fuel is conveyed, to avoid danger of spontaneous combustion. Numerous details are described.

**Purifying coal distillates.** F. HOFMANN and C. WULFF. Brit. 301,420, Nov. 29, 1927. Products of distn. of carbonaceous materials are refined by a soln., in an org. solvent, of an inorg. acid (other than HCl as described in Brit. 298,484 (C. A. 23, 3075)); e. g., a tar oil may be treated with a soln. of  $H_2SO_4$  in alc. after a preliminary treatment with a soln. of HCl in benzene. The use of  $H_3PO_4$  in alc. also is described.

**Refining benzine.** SOC. DU GAZ DE PARIS. Fr. 655,899, Oct. 28, 1927. Benzine from the distn. of coal is refined by fractionating the crude vapors so as to retain only those parts distg. below  $150^\circ$  and directing these warm vapors on to a polymerizing and partially desulfurizing agent such as KOH or alkali or alk. earth sulfide or both at temp. near that of the benzine.

**Low-temperature coal-distillation apparatus.** ALFRED J. A. HERENG. Fr. 655,257, Sept. 27, 1927.

**Apparatus for drying coal or other similar materials.** POVL T. LINDHARD (to F. L. Smidth & Co.). U. S. 1,718,243, June 25.

**Gas purifiers and scrubbers.** R. W. BROADHEAD and BROADHEAD CONSTRUCTIONS, Ltd. Brit. 301,440, Aug. 30, 1927. Purifiers and scrubbers are formed of steel with a protective coating of concrete which may be reinforced. Various details of construction are described.

**Gas producer.** I. G. FARBENIND. A.-G. Brit. 300,277, Nov. 10, 1927. A producer is described suitable for use with small-sized fuel which is agitated strongly throughout the whole depth of the fuel bed. A steam boiler is enclosed in an upper enlarged portion of the producer or in an adjacent dust separator.

**Gas producers.** SOC. ANON. D'EXPLOITATION DES BREVETS COUSIN (called Le Chauffage Industriel.) Fr. 656,347, Nov. 5, 1927.

**Gas-producer construction.** F. L. BROUGHTON and D. HADLINGTON. Brit. 301,208, Dec. 3, 1927.

**Gas generator construction.** F. W. STEERE (to Smet-Solvay Engineering Corp.). Brit. 300,578, Nov. 15, 1927.

**Slagging gas-producer operation.** S. C. G. EKKELUND. Brit. 301,241, Jan. 30, 1928. The fuel is preheated by contact with the producer gas and volatiles, in part at least, are introduced with the producer gas into the hot zone of the producer. According to the character of the slag-forming substances, reagents may be added for forming either pig iron as a by-product or for producing a cement.

**Ash remover for producer-gas generators.** ARTHUR R. PULVER. U. S. 1,719,519, July 2. Structural features.

**Telescopic gas holders sealed with lubricating grease or similar plastic material.** MASCHINENFABRIK AUGSBURG-NÜRNBERG A.-G. Brit. 301,016, Nov. 23, 1927. Structural features.

**Water gas.** PAUL DVORKOVITZ. Fr. 655,183, June 2, 1928. Water gas is enriched by the addn. of oil gas produced separately by gasifying oil at a uniform temp. fixed by the calorific power required.

**Plant construction for water-gas manufacture.** HARALD NIELSEN and BRYAN LAING (to Sensible Heat Distillation, Ltd.). U. S. 1,718,830, June 25. Various structural features are described.

**Enriching water gas, etc.** METALLGES. A.-G. Brit. 301,459, Nov. 30, 1927. Gas such as water gas is enriched in H and  $CH_4$  by reaction with steam under pressure and the pressure thus developed is subsequently utilized for conveyance of the enriched gas.

**Distilling oil residues.** I. G. FARBENIND. A.-G. Brit. 301,130, Sept. 5, 1927. Residues remaining after distn., destructive hydrogenation or similar treatments of carbonaceous materials are heated to above  $300^\circ$  under diminished pressure and gases or vapors contg. liquids of low b. p. such as water,  $C_6H_6$ , toluene or alc. are introduced into

the heated residues, preferably in the state of a mist, to effect further distn. and oil recovery. Various details are given.

**Unsaturated hydrocarbons.** I. G. FARBENIND. A.-G. Brit. 301,402, June 27, 1927. Unsatt. aliphatic hydrocarbons having the same no. of C atoms as the initial material are made by treating hydrocarbons or mixts. (such as those obtained by destructive hydrogenation of coal or mineral oils) at elevated temp. (suitably 450–900°) with catalysts consisting substantially of active charcoal (details of the prepn. of which are given).

**Halogenated hydrocarbons, halohydrins, nitriles, isonitriles and halogenated acid chlorides.** I. G. FARBENIND. A.-G. Brit. 301,009, June 18, 1927. Compds. of these classes are obtained from the products of destructive hydrogenation of carbonaceous materials by addn. of halogens, H halides, hypohalogenous acids, HCN or phosgene to the double bonds. The destructive hydrogenation products may be subjected to a preliminary dehydrogenating, splitting or cracking treatment as described in Brit. 298,584 (C. A. 23, 3074). Catalysts such as active C, Fe oxide, Al, P or I may be used in addition of halogens or halogen halides.

**Alcohols from destructive hydrogenation products.** I. G. FARBENIND. A.-G. Brit. 301,000, June 18, 1927. Products of destructive hydrogenation of carbonaceous materials (if necessary, after a preliminary dehydrogenation, splitting or cracking treatment such as described in Brit. 298,584 (C. A. 23, 3074)) are treated with H<sub>2</sub>SO<sub>4</sub> and the resulting products are hydrolyzed.

**Destructive hydrogenation.** I. G. FARBENIND. A.-G. Brit. 301,059, Nov. 24, 1927. Carbonaceous products to be treated are passed through a series of reaction vessels between which no appreciable cooling of the reacting materials occurs.

**Hydrocarbons of high-boiling point.** I. G. FARBENIND. A.-G. Fr. 655,376, May 30, 1928. Products from cracking, extn. or hydrogenation under pressure of coal, tar, mineral oils, etc., as well as mineral oil or tar fractions are converted into products of higher b. p. and higher viscosity by exposing the said substances to the action of halogen with the simultaneous or subsequent addn. of catalysts, or to the action of halogen compds. capable of liberating halogen, and submitting the products obtained, if necessary after sepn. of any halogen compds. present, to a second condensation, preferably in the presence of a catalyst, the temps. being chosen in each step to avoid production of resins. Elements of the 1st and 2nd group of the periodic system and their compds. are suitable catalysts. Examples are given.

**Carbonization furnaces.** LOUIS WILPUTTE. Fr. 655,529, June 8, 1928. Construction of vertical retorts.

**Distilling carbonaceous materials such as coal and oil shale.** J. W. H. AINSWORTH. Brit. 300,984, Nov. 22, 1927. The material is passed in a continuous stream through an externally heated retort, the temp. of which increases from the inlet to the outlet end and distillates are taken off through openings in the retort wall. Details of the retort construction are described.

**Plant construction for generating steam by solar heat.** E. SPIESS. Brit. 300,995, Oct. 22, 1927.

**Gasifying heavy liquid fuels for internal-combustion engines.** ANTONIO V. DIAZ. U. S. 1,717,767, June 18. A mass of C is heated to redness by heat from exhaust gases, air is aspirated through the mass by suction of the engine so that partial combustion is effected, and liquid fuel which has been vaporized by heat from the exhaust gases is introduced into the heated C mass separately from the air; resulting vapors and gases are fed to the engine. An arrangement of app. is described.

**Lubricating oil rectifier and filter suitable for use with internal-combustion engines.** RALPH L. SKINNER (to Automotive Device Co.). U. S. 1,717,741, June 18. Structural features.

**Sleeve valves for internal-combustion engines.** CHARLES SCHAEFFER (to Soc anon. des anciens établissements Panhard & Levasson). U. S. 1,718,082, June 18. Steel sleeve valves are coated with friction-reducing metal.

**Treatment of high-temperature tar.** ZECHE MATHIAS STINNES. Ger. 477,499, Nov. 20, 1923. Addn. to 430,438. Crude coal tar is stirred with an excess of benzene and the mixt. is allowed to stand, whereby a soln. in benzene of a viscous oil, suitable for lubricating, and an asphaltic residue are obtained. The oil may be freed from its small phenol content by extn. with dil. EtOH and may be rendered more viscous by distg. off its low-boiling constituents under reduced pressure. The asphaltic residue may be used directly or may be distd. to recover the bulk of the phenols.

**Washing coke-oven gas.** W. FRAASS. Brit. 300,275, Nov. 10, 1927. Coke-oven gas, prior to fractional liquefaction, is washed with water under pressure, and dissolved

combustible constituents are recovered in a chamber in which the pressure is reduced. CO<sub>2</sub> remaining in the soln. can be expelled by agitation or released by trickling through coke towers.

**Purifying coke-oven gases or similar gases.** GEORGES CLAUDE (to Soc. l'air liquide, Soc. anon. pour l'étude et l'exploitation des procédés Georges Claude). U. S. 1,717,761, June 18. The gas is treated with a soln. contg. caustic alkali and a polyhydric alc. such as glycerol. Cf. C. A. 23, 505.

**Coke-oven construction.** E. COPPEE ET CIE. Brit. 300,823, Jan. 2, 1928.

**Coke-oven construction.** H. KOPPERS A.-G. (to E. Leyh). Brit. 301,386, Nov. 28, 1927.

**Vertically flued coke-oven construction.** H. KOPPERS A.-G. (to F. Totzek). Brit. 300,278, Nov. 10, 1927.

**Regenerative coking oven.** WILHELM MÜLLER. Ger. 477,434, Sept. 1, 1926.

## 22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. FARAGHER

**Petroleum refining—general study of introduction of petroleum refining in France.** E. LÉGÉ. *Mem. et compl. rend. trav., soc. ing. civils France* 82, 57-240(1929).—E. I. S.

**Occurrence of higher fatty acids in natural petroleum and origin of petroleum.** YOSHIO TANAKA AND TSUTOMU KUWATA. *J. Faculty Eng. Tokyo Imp. Univ.* 17, 203-303(1928).—Cryst. acids have been isolated from the acid constituents derived from a gas-oil distillate of Ishikari petroleum. The yield was about 7.7% of the total acid constituents, or 0.001% of the distillate. Palmitic, stearic, myristic and arachidic acids were present; palmitic acid predominated. The presence of higher and lower acids was suggested. Similar fatty acids occur in variable amounts in many Japanese petroleum and in some California and Borneo oils. Sharks and whales are believed to be the animals responsible for the formation of petroleum. ALBERT L. HENNE

**Vapor tension of petroleum products at high temperatures.** A. SAKHANOV AND A. DOLADUGIN. *Neftyanoe Khozyaistvo* 13, 66-9(1927); *Chem. Zentr.* 1928, 1, 280.—The vapor tensions of light ligroin, gasoline, crude oil, paraffin oil, cylinder oil, 3 kinds of benzine and 2 kinds of kerosene and of machine oil were detd. in an autoclave at temps. of 100° to 400°. The vapor-tension increase with rise of temp. is least with crude oil and is greater the more homogeneous the oil. The vapor pressure is decreased if the vol. of the liquid relative to the vol. of the gas is reduced. In order to crack the oil in the liquid phase, it is necessary to use a higher pressure. FRANCIS P. GRIFFITHS

**Silica gel as a reagent for the extraction of high-sulfur oils from crude petroleum.** GLADYS R. WOODWARD. *Ind. Eng. Chem.* 21, 693-5(1929).—Silica gel reduced the S content of Inglewood (Calif.) crude petroleum from 2.30 to 1.90%. In naphtha soln. a com. gel removed 18%, a Holmes gel, 37% of the S. The S compds. can be extd. fractionally from the gel up to 90% by using, in turn, naphtha, C<sub>6</sub>H<sub>6</sub>, and Me<sub>2</sub>O; NaOH soln. removes the remainder. EMMA E. CRANDAL

**The crude oil produced in the Salt Creek field, Wyoming.** H. P. RUE AND I. N. BEALL. *Bur. of Mines, Tech. Paper* 449, 27 pp.(1929).—Results of distg. samples of crude oil from the Salt Creek field in a 10-gal. still are reported, together with a description of the app. and method used. Products obtained by steam distn. with redistn. of the tops were:

Gasoline	33%	Gear oil	3.8%
Kerosene	5%	Foots oil	7%
Gas oil	18%	Wax	15.8%
Non-viscous lubricating oil	8.3%	Asphalt	1.1%
Viscous lubricating oil	4.7%	Total losses	3.3%
Products obtained by coking distn. were:			
Gasoline	41%	Foots oil	5.5%
Kerosene	2.3%	Wax	4.1%
Gas oil	26.4%	Total coke and losses	6.7%
Non-viscous lubricating oil	11.5%		
Viscous lubricating oil	2.5%		

These products are very similar to those obtained commercially.

D. F. BROWN

**Distillation. I. Vapor-liquid equilibrium in complex hydrocarbon mixtures.**

(1). ALEX. C. BROWN. *Trans. Am. Inst. Chem. Eng.* 21, 87-91(1928).—An exptl. method is outlined for detg. the extent and direction of deviations from Raoult's law of the components of complex hydrocarbon mixts., in order to obtain exact data for the design of distn. equipment. Bottoms and distillate from a continuous still are analyzed in a true-b. p. still, and the wt. of fraction distd. over plotted against the temp. at the column head. An equation is derived by means of which, knowing the av. mol. wts. of the bottoms and distillate and the reciprocal slopes of the true-b.p. curves of the bottoms and distillate at a given temp., the Raoult's law correction factor,  $k$ , may be calcd. (2). ALEX. C. BROWN AND GEO. C. CAINE. *Ibid* 91-7.—Heavy naphthas from Pa., Calif. and Mid-Continent fields were treated by the method outlined in part (1). A technique of analyzing the data is presented; the true-b.p. curve of the bottoms was calcd. from that of the distillate by assuming that  $k$ , the Raoult's Law correction factor, is equal to unity, and the actual  $k$  detd. by comparison of the curve so obtained with the actual true-b. p. curve of the bottoms. Within the limits of exptl. error, all the components were found to deviate to the same extent and in the same direction from Raoult's Law. Values of  $k$  for each of the three naphthas studied are given for use in engineering calcs. II. Plate efficiency in rectification of petroleum. W. K. LEWIS AND H. D. WILDE, JR. *Ibid* 99-126.—The authors present a modification of the Hausbrand method of calcg. plate efficiency, using the Raoult's Law correction factor, which is necessary for computations involving complex hydrocarbon mixts. The exptl. results of a test of the performance of a com. still cutting between heavy naphtha and the higher-boiling fractions of the crude oils are given. The close correspondence between the computed concns. and direct analytical detns. at different points in the column demonstrates that the computation methods presented are sound and, within the precision of the data, represent the conditions of large-scale operations.

E. I. S.

Cracking of light oils in America. GUSTAV EGLOFF. *Chem. Obzor* 4, 159-63 (163 English)(1929).—A survey of American methods.

JAROSLAV KUČERA

Vapor-phase cracking. C. R. WAGNER. *Oil and Gas J.* 27, No. 49, 46, 47, 149 (1929).—In the Gyro process for vapor-phase cracking, the cold stock from the charging-stock tank is sprayed under 100-lb. pressure into an arrester, reducing the temp. of the hot vapors which enter from the converter at 1100°F. The resulting liquid passes into a hot-oil reservoir. The vapors from the arrester pass to a fractionating tower with the reflux so regulated that the distillate condensed from the vapors leaving at the top has the boiling range desired for the gasoline. The uncondensable gas is treated for the recovery of its gasoline content. All oil not yet converted to motor fuel or gas is collected in the hot-oil reservoir from which an automatically controlled amt. is delivered to an economizer while the remainder returns through heat exchangers or coolers to the charging-stock tank. The oil going to the economizer is heated by the waste heat from the cracking still to 700°F. and passes to an evaporator where the fuel oil is removed as residuum. Superheated steam is introduced at the bottom in an amt. not exceeding 3% of the wt. of the vapors leaving at the top. Steam and vapors are freed from entrained liquid in a separator and pass at 650°F. into the converter where they are heated to 1100°F. and cracked. The advantages claimed for the process are: production of high-grade antiknock fuel; economical, easy, and practically continuous operation; ability to handle any crude or charging stock; high value of fixed gas, and desulfurizing character of the reaction.

M. B. HART

Reducing still operating at profit due to partial cracking. W. T. ZIEGENHAIN. *Oil and Gas J.* 27, No. 1, 165(1929).—An increased amt. of light distillate and a fuel oil of low viscosity are obtained in West Texas and Panhandle refineries which have no cracking plants, by partially cracking the residuum from crude batteries in a reducing still at 1000°-1200°F. The tubes of this still are of small diam. and the necessary heating surface is secured by increasing the no. and length of the tubes. The small diam. minimizes the formation and deposition of coke. The cracked oil is shock-chilled 50-100° upon entering the tower by spraying it downward against a round plate or cone and directing upon it by a funnel the knockdown of the tower. Based on the residuum charged, 10-20% of gasoline and about 78% of fuel oil of low viscosity, very low pour point, and high B. t. u. value are obtained with 5-8% loss as gas.

M. B. HART

The oxidation of mineral oils. MAURICE VAN RYSEELBERGE. *Chimie & industrie Special No.*, 275-88(Feb., 1929).—As the aging of transformer oils is due primarily

to oxidation, the work of Moureu *et al.* has suggested that autoxidation may be involved and that the use of antioxygen compds. might retard it. A no. of preliminary expts. are described to show that oils of different origins having similar phys. properties and oils of the same origin but refined to different degrees have quite different autoxidation curves and that the absorption of  $O_2$  can be considerably retarded by addn. of a trace of hydroquinone. The increase in acidity in artificial aging tests (at  $110^\circ$ ) does not follow the  $O$ -absorption curves. The relative degree of refining of oil of the same origin can probably be ascertained by means of the  $O$ -absorption curves, the most highly-refined oils absorbing  $O_2$  the fastest. From a brief discussion of the behavior of oils in aging, it is suggested that in moderately refined oils the resinous compds., which are easily oxidized, are converted into solids which have a protective action on the hydrocarbons; while in fully refined oils the hydrocarbons themselves are oxidized, with formation of free acids. Autoxidation and artificial-aging tests carried out on used oils as such, after filtration, and after regeneration, showed that they still absorb appreciable amts. of  $O_2$ , and that regenerated oils absorb  $O_2$  more rapidly than used oils, either as such or filtered, but stand up particularly well in the artificial-aging test. The no. of expts. was too small to permit of drawing general conclusions; this line of investigation is considered promising.

A. PAPINEAU-COUTURE

West Texas progressive distillation, de-salting, light cracking in special stills. P. TRUESDELL. *Natl. Petroleum News* 21, No. 22, 65, 67-8(1929).—The method of skimming and cracking West Texas crude as used by the Great West Refining Co. at Big Spring, Texas is described. Crude oil preheated in 2 exchangers by hot fuel oil and gas oil is passed through a tube still where it is heated to  $350^\circ$  and flashed into a horizontal tank ( $8 \times 30'$ ). Here the salts held in suspension settle out. Vapors pass into a common header connected with 4 bubble towers in series. Unvaporized portions from the flash tank are pumped into the low-temp. side of the pipe still where they are heated to  $500^\circ F.$  and flashed into a second chamber from which vapors pass into the common header. Bottoms from the second flash chamber are heated to  $675^\circ F.$  and flashed into No. 3 chamber, from which vapors pass overhead and bottoms to the coils of the high-pressure still at  $790^\circ F.$  and 100-lb. pressure. Cracked vapors are scrubbed with caustic and condensed. Pressure distillate is rerun by pumping over the top of the bubble towers.

M. B. HART

Distilling and treating oil. ANON. *Petroleum Times* 21, 416(1929).—The Dampfkessel and Gasometerfabrik A. G. has developed a plant for distg. and treating crude oil in which the oil passes through a heat exchanger into a vapor-separator where light benzene and steam, derived from water in the oil, are sepd. The residual oil is pumped to a gas-fired tube still from which it passes into a second vapor separator at  $300^\circ$ , where the fractions from heavy benzene to gas oil are sepd., leaving only fuel oil and lubricating oil. The vapors receive a certain amt. of steam and pass to 3 condensing columns where by injection of partially cooled condensate into different parts of the column a quantity of heat corresponding to the desired fraction is withdrawn. The final condensing is done as usual, each fraction having its own condenser. The permanent gases are fired in the tube stills. The desired degree of distn. is obtained complete in one operation and the distillates are chemically refined at a much smaller cost in chemicals and loss of oil than in continuous treatment. The plant occupies very little space. It is apparently designed for straight-run products.

M. B. H.

New methods of testing oils. B. MARSHALCO AND I. BARNA. *Intern. Congress Testing Materials* 1927, II, 415-27.—A viscometer is described by means of which 150 viscosity detns. may be run accurately in 10 hrs. on one sample of oil over a wide temp. range. It is composed essentially of 2 concentric cylinders, a few mm. apart, between which the oil is kept. The outer cylinder is rotated at a const. speed, and the pull on the inner cylinder is measured by a lever fitted with an adjustable counterpoise. The temp. of the oil and cylinders can be controlled over a wide range. The Vogel formula,  $\eta = \eta_\infty (t-t_\infty)/(t-t_0)$ , expresses best the viscosity temp. curves of all the oils tested from  $30^\circ$  to  $300^\circ$ . It defines the whole curve by 3 points as a function of the temp.  $t_0$ ,  $t_1$  and  $t_2$  at which the viscosity is 100, 10 and 2.5 centipoises, or by the 3 differences  $t_1 - t_0$ ,  $t_2 - t_1$ , and  $t_2 - t_0$ . The aging properties of an oil depend almost exclusively on oxidizability. M. and B. describe an oxidation test as follows: a thin film of oil is heated in  $O_2$ , the  $CO_2$  and  $H_2O$  formed being absorbed chemically, and the  $O_2$  consumed is taken as a measure of the aging quality of the oil.

G. CALINGAERT

Oil-testing apparatus. H. HERBST. *Chem.-Ztg.* 53, 344-5(1929).—The app. is designed for the detn. of surface tension, adhesive power, and angle of contact of lubricating oils by the rise in a capillary tube; of the viscosity of pitch, resin, etc., of the

thickness of bodies, and for making manometer readings for slight variations of pressure. Directions and calens. are given. J. H. MOORE

The pyrogenation of mineral oils. G. DIXMIER. *Chimie & industrie Special No.*, 272-4 (Feb., 1929); cf. *C. A.* 22, 4238.—In the test as previously outlined, irregularities are caused by oxidation that takes place only at the surface of the oil; this defect has now been overcome by providing means for renewing the surface in contact with the air by automatically pouring the sample back and forth in two tubes. The results can be duplicated readily. Comparison of the results of the test with the behavior of the oil in motors showed that the test can be of value in foretelling the practical value of the oil as a lubricant. A. PAPINEAU-COUTURE

Processing Winkler crude oil. W. T. ZIEGENHAIN. *Oil and Gas J.* 27, No. 50, 136-7 (1929).—Excessive corrosion of equipment is avoided and a good gasoline made in a new refinery of the Burford Oil Co. at Pecos, Texas. The S content is reduced to pass the U. S. motor specification of 0.1% by limiting the production to 410 E. P. gasoline and heavily treating this with  $H_2SO_4$  and doctor soln. The products made are gasoline of high antiknock value and great volatility, a light gas oil resembling kerosene distillate, and fuel oil. The gasoline vapors are washed with a cold  $NH_4OH$  soln. after leaving the fractionating towers. This removes much  $H_2S$  and has so far prevented any noticeable corrosion of the condenser tubes. The gasoline is then treated with weak  $H_2SO_4$  (50 lb. of 28.3% acid per bbl.) followed by a 2nd treatment with 6 lb. of 93% acid per bbl. This is followed by a water wash, which takes out much free S, and by treatment with caustic and doctor soln. The Jenkins cracking process is used. M. B. HART

Methods of refining sulfurous oils. C. J. WRIGHT. *J. Inst. Petroleum Tech.* 15, 214-44 (1929).— $H_2S$  and mercaptans are the two types of compds. which render a petroleum distillate sour.  $NaOH$  will remove  $H_2S$  and some mercaptans. Lime has a similar action, but must be used in much larger vol. because of its low soly.  $Ca(ClO)_2$  and  $NaClO$  oxidize mercaptans, sulfides and disulfides either to  $H_2O$ -sol. compds. or to compds. that are harmless though dissolved in the oil. Na plumbite removes very little S. With the aid of flowers of S it converts mercaptans to disulfides and leaves a gasoline doctor-sweet.  $H_2SO_4$  removes mercaptans, sulfides, disulfides, and thiophenes.  $H_2S$  and thiophenes are oxidized. Mercaptans are partly oxidized to disulfides, and the disulfides to sulfonic acids. Liquid  $SO_2$  is mainly used for removing aromatic hydrocarbons from kerosene distillates. It also removes mercaptans, disulfides and cyclic S compds. Bauxite is useful for treating kerosene because it decolorizes as well as desulfurizes the oil. Mercaptans are probably oxidized catalytically in the pores of the bauxite by the  $O_2$  dissolved in the oil. The recovery of soda used for washing to remove mercaptans is not economical. It can be used up to 80% efficiency without recovery and only up to 87.5% efficiency if fully recovered; that is, if 25 per cent of the liquid is distilled off, a part of the mercaptans go over with the  $H_2O$  vapor. If the temp. at which a straight-run distillate leaves the still condenser is kept at 90–100°F., at least  $\frac{1}{3}$  less soda is required to remove the  $H_2S$  completely than if the temp. is allowed to drop to 70–80°F. Disregarding the  $H_2S$ , economy would best be served by the use of 10% of 0.5% soda for partial mercaptan removal before the hypochlorite treatment. Considering the  $H_2S$ , the use of 5% of 0.5% of soda soln. followed by bleach treatment in the proportion of 2.2 g. per l. is most economical. Soda soln. can be recovered to the extent of about 5% by the Koppers process. Within this limit it can be used repeatedly for  $H_2S$ , but not for mercaptan removal. If no other alkali than soda were available, it would pay to remove  $H_2S$  by "sulfide soda" only and recover this by the Koppers process; and follow with "mercaptide soda"—washing for the mercaptans; the soda could be recovered by boiling, and after 8 recoveries would be run to waste. It does not pay to recover either sulfide or mercaptide lime. Dil. soda solns. are more efficient desulfurizers and are more easily recovered. Sulfide soda serves to remove elementary S. The speed with which hypochlorite oxidizes S compds. is increased by reducing the excess of alkali. But if the alkalinity is reduced too nearly to the neutral point, the sulfonic acids formed in the oxidation may produce an acid condition, leading to excessive chlorination. The excess alk. in the 0.34 N hypochlorite soln. should be 0.5–1.0 g.  $NaOH$  per l. or 0.2 g. lime per l. EMMA E. CRANDAL

Hypochlorite treatment of oils. A. E. DUNSTAN AND F. B. THOLE. *Oil and Gas J.* 28, No. 1, 190, 194-5 (1929).—In treating oils with hypochlorite, the proper effect depends on the right amt. of free alkali. If too little is present, the hypochlorite soln. is unstable and has a chlorinating tendency; too much alkali slows down the reaction to an impractical degree. For the desulfurization of straight-run gasoline the optimum

is 0.5–1.00 g. free NaOH per l. Cracked distillates can also be sweetened but not completely desulfurized by a modified hypochlorite treatment instead of plumbite; because of the presence of gum-forming hydrocarbons, acid treatment or redistn. cannot be dispensed with entirely. The process is used chiefly for sweetening sour straight-run gasolines which have a total S content low enough to permit their use as motor fuel. The advantages of hypochlorite over  $\text{H}_2\text{SO}_4$  and plumbite are: a non-corrosive, non-poisonous reagent which, when spent, can be discharged into rivers; no reduction of antiknock value; smaller losses; low cost. M. B. HART

**Hypochlorite process of refining.** S. F. BIRCH. *Oil and Gas J.* 28, No. 1, 190, 193–4; No. 2, 38, 108, 170, 172, 174 (1929).—In the hypochlorite process of refining gasoline, the Na hypochlorite has been largely replaced by the cheaper Ca salt which is made by introducing Cl into dil. milk of lime or, where Cl is not available, by dissolving bleaching powder. The prepn. of the reagent is described in the first part of the articles. The treatment of S-contg. straight-run gasoline, discussed in Part 2, can be carried out in 2 ways: enough of the reagent is added to oxidize all or nearly all the S compds. to water-sol. products, giving a desulfurized gasoline, or just enough is added to convert the mercaptans into disulfides. The gasoline is first freed from  $\text{H}_2\text{S}$  by washing with lime water or NaOH. It is then agitated with the hypochlorite soln., sepd., and washed with water. This treatment yields a gasoline of pleasant odor, neg. to doctor soln. and non-corrosive. Part 3 describes the application of the process to natural gasoline, cracked gasoline, kerosene and painter's naphtha. Part 4 gives an account of the chem. reactions involved in the process. M. B. HART

**Rowsey flashing system.** GEORGE REID. *Refiner and Natural Gasoline Mfr.* 8, No. 2, 65–7 (1929).—The first installation of the Rowsey flashing system has been put in operation by the Pampa Refg. Co., Tex. All pumps are motor driven, only a small field boiler being required for distn. The tube still has 2 sections and is fired as 2 stills. Three banks of tubes are placed above the furnaces; the preheating tubes are at the top. Eight small stacks instead of 1 large stack secure an even distribution of heat. The crude oil passes first through heat exchangers heated by fuel oil, then through the preheater tubes from which it expands at  $275^\circ\text{F}$ . into the bottom of the first tower. These towers are both separators and fractionators. The vapors rise through 15 bubble trays and are washed in the upper section by refluxing the product of the tower. The overhead gasoline from the first tower, usually  $68\text{--}70^\circ\text{A. P. I.}$  with  $330^\circ\text{F. E. P.}$ , is the larger part of the gasoline in the crude oil. The outgoing oil from the bottom is heated in the first heating bank to  $540^\circ\text{F}$ . and then passed to the lower section of the second tower. The vapors pass through 15 bubble trays, are washed with naphtha, and are removed as  $58\text{--}60^\circ\text{A. P. I.}$  gravity,  $400^\circ\text{E. P.}$  gasoline. Temps. at the top of all towers are kept const. by control of the reflux with Foxboro automatic temp. regulators. Residue from the bottom of the second tower is heated to  $675^\circ\text{F}$ . in the second section of tubes, to vaporize the remaining gasoline, kerosene and gas oil, which are sepd. in the 3rd and 4th towers. The gasoline-recovery system consists of one absorber without special absorption medium, pumps, gathering lines and a No. 4 Connersville blower which takes suction on the gathering lines to the tanks with a vacuum controlled by a Davis regulator, holding the tanks at atm. pressure. Residual gases from the absorber are burned under the pipe still. All lines are gas-tight and so connected that gases in the oil stream find their way to the gasoline-recovery system. M. B. HART

**Effect savings with efficient restoration of fuller's earth.** K. W. NICHOLS. *Oil and Gas J.* 27, No. 51, 222, 224 (1929).—Fuller's earth is restored efficiently by carefully controlling the temp. according to the amt. and kind of earth to be treated and by washing and steaming as far as possible before it is burned. The color of the burnt earth is not taken as a criterion of its quality since often earth having a light gray color due to C is as good as a red earth and the danger of fusing it is lessened. Each batch is burned individually according to the judgment of the operator. M. B. H.

**Composition of natural gasoline.** G. G. OBERFELL, R. C. ALDEN AND L. A. PO-COCK. *Oil and Gas J.* 27, No. 52, 158, 160 (1929).—In a study of the compn. of natural gasolines it was found that approx. data on com. grades are obtainable from the Engler distn. curve. Natural gasoline contains 3 groups of hydrocarbons with relatively distinct boiling ranges: "butanes and lighter," "pentanes" and "hexanes and heavier." The percentage off at  $100^\circ\text{F}$ . (corrected for distn. loss) was found to be the Engler point which bore the best relationship to the content of "butanes and lighter." This relationship is expressed on a chart based on 113 analyses. The percentage of pentanes was very accurately predicted by the relationship between the percentages off at  $100^\circ\text{F}$ .

and 140°F. on the Engler curve (corrected for distn. loss). The propane content has no significance to the refiner.

M. B. HART

Present grades of natural gasolines require revision. G. G. OBERFELL, *Oil and Gas J.* 28, No. 2, 145-6(1929).—A progress report of the Technical Comm. of the National Gasoline Assoc. of America proposed revision of specifications for com. grades of natural gasoline. The conclusions are: vapor pressure is the most important single characteristic; the Engler percentage off at 100°F. (corrected) is the most satisfactory single intermediate b. p. for specification purposes. Present specifications, namely, gravity and distn. loss, are inadequate. Specifications to be proposed will probably be as follows: Grade 3—Reid vapor pressure at 100°F. in lb. per sq. in. abs., 22-26; and Engler percentage off at 100°F. (corrected), 30-60. Natural gasolines in this range having Engler percentage off at 100° less than 30 or more than 60 will be in Grades 2 and 4, resp. Five grades are necessary.

M. B. HART

Oil absorption of natural gasoline. W. K. LEWIS, *Trans. Am. Inst. Chem. Eng.* 20, 1-7(1928).—The method of Walker, Lewis and McAdams for computing continuous countercurrent absorption systems for the absorption of a single component of a gaseous mixt. by a non-volatile, liquid absorbent in which the other components of the gas are insol., is expanded to solve the more complicated problems met in the absorption of the large no. of components of natural gasoline.

E. M. SYMMES

Progress report of the A. S. M. E. Special Research Committee on Diesel fuel oil specifications. Am. Soc. Mech. Eng., Advance paper, June 24-7, 1929, 6 pp.—Suggested specifications are presented which have been modified to meet the views of industry.

E. I. S.

Determination of the carbureting properties of light motor fuels. N. D. GRAMENITZKII, *Izvestiya Teplolekhn. Inst. (Trans. Thermo-Tech. Inst. (Moscow))* 6, 12-9(1928).—The influence of the nature of motor fuels on their vaporization in the carbureter is discussed. The dependence of the percentage of the whole amt. of the fuel which undergoes vaporization on the temp., pressure, vol. and surface and time of vaporization is considered, and a means of evaluating this percentage is evolved. The relationships between the carbureting properties, viscosities and sp. gr. of various Russian petroleum motor fuels are pointed out.

B. C. A.

Determination of the softening point of a pitch or bitumen. G. M. GREEN, *J. Soc. Chem. Ind.* 48, 114T(1929).—A 3-mm. length of the point-end of an ordinary-sized brass drawing pin is flattened out into the form of a spearhead. The bitumen is molded into a sphere of about 6 mm. diam., that is impaled on the spearhead up to the point where it joins the circular shank of the pin. The pin is dropped into a large-sized boiling tube, fitted with thermometer and stirrer, that contains a soln. of KI satd. at 16°. This soln. has a d. which is higher than that of any bitumen and has no effect on the bitumen. If the temp. is raised slowly (the rate should not exceed 0.5° per min. near the softening point), the bitumen "tails off" and floats to the surface. This temp. may be considered the softening point of the sample. Results are reproducible to 1°.

A. J. MONACK

Investigations on the vapor tensions of lubricating oils in relation with the flash point and cracking. M. BOISSELET AND M. ISELIN, *Chimie & industrie Special No.*, 293-5(Feb., 1929).—Flash tests (made by the open-cup method) on Pennsylvania spindle oil, machine oil and cylinder oil, which were analyzed before and after detg. the flash pt., showed that: the depth of color and fluorescence of the oil increases with the time of heating; the higher the rate of heating, the lower the flash pt.; the slower the rate of heating, the greater the increase in d.; the  $n$  of the oil is lower after the test but does not vary appreciably with the conditions of testing; the tar content is higher than in the original oil, but does not vary regularly with the testing conditions; the acidity increases regularly with the time of heating. From the results of a series of vapor-tension detns. of several oils at temps. up to 300°, the general results only of which are given, B. and I. conclude that this detn. is not suitable, at least at the present time, as a substitute for the detn. of the flash pt.

A. PAPINEAU-COUTURE

Investigations on the vapor tensions of lubricating oils in relation to the flash point and cracking. P. ISELIN, *Ann. combustibles liquides* 4, 69-81(1929).—The vapor tension of an oil is a const. at any given temp. unless cracking is taking place. The possible use of vapor tension to characterize an oil instead of flash point was investigated by measuring the vapor tension at successively higher temps. till the temp. was reached at which it ceased to be a const. The oil sample was placed in a cathodic vacuum in a tube bent in such a way that the oil could be heated in an elec. furnace. The gases absorbed from the atm. were first withdrawn, with the aid of careful heating. The oil was cooled and as it was heated again the vapor-tension measurements were

taken at intervals of 20° to 30°. After each reading the temp. was allowed to drop back to that of the preceding one and raised about 40°, a 2nd reading being taken at the point of the last one, for confirmation. Correction was made for the vapor tension of the Hg, the atm. pressure, the capillarity of the tube and the wt. of the oil column; also, for the expansion of the Hg column in the furnace. Two series of oils were tested, the one Pennsylvanian, the other Russian, including spindle, machine, auto and cylinder oils and one transformer oil. In lubricating oils decompn. begins at about 200°; is not very marked at 260°, but increases rapidly from 300° up. The better-refined oils are probably more resistant to heating. The flash point of the lighter oils is always attributable to vapor tension. Even for cylinder oils, flashing is mainly due to vapor pressure, not to the products of cracking. There seems to be no sufficient ground for substituting vapor tension for flash point detn. Vapor pressure for the heavy oils is too small to be measured accurately till temps. are reached at which it is no longer const.

EMMA E. CRANDAL

The chemical composition of Russian turpentine from the galipot of *Pinus silvestris*. B. ARBUZOV. *J. Russ. Phys.-Chem. Soc.* 61, 255-68 (1929); cf. C. A. 23, 1762.—From a brief survey of the pertinent literature it appears that the turpentine from the galipot of *Pinus silvestris* is made up of three main constituents: *d*- $\alpha$ -pinene (I), nopinene (II) and *d*- $\Delta^3$ -carene (III). The conflicting evidence regarding the two latter constituents, as well as the questionable presence of  $\beta$ -pinene, induced A. to investigate the Russian turpentine obtained from the galipot of *P. silvestris*, produced by a method closely resembling that used for com. production. The turpentine content of the galipot was 18-20%. For comparison the turpentine obtained from the galipot by the canula method was investigated along with that obtained by distn. *Exptl. part: Canula method.*—The liquid portion of the galipot was sepd. from the heavy cryst. ppt., and the turpentine obtained from this by distn. under reduced pressure. 222 g. gave the fractions: A 28 g.,  $b_{15}$  46°; B 40 g.,  $b_{15}$  46-6.5°; C 27 g.,  $b_{15}$  46.5-50°; D 12 g.,  $b_{15}$  56-60°. The total recovery was 48.2%. Fractions A, B and C were combined and redistd. giving the fractions: E 80 g.,  $b_{9.5}$  37.6° [ $\alpha$ ]<sub>D</sub><sup>15</sup> + 40.42°,  $\alpha F/\alpha C$  1.964; F 15 g.,  $b_{9.5}$  37.6-9.6°, [ $\alpha$ ]<sub>D</sub><sup>15</sup> + 38.38°,  $\alpha F/\alpha C$  1.982. Fraction D had [ $\alpha$ ]<sub>D</sub><sup>15</sup> + 24.98°,  $\alpha F/\alpha C$  2.042. After six redistns. *in vacuo*, pinene [ $\alpha$ ]<sub>D</sub><sup>15</sup> + 41.76°, was obtained from E. Hence the content of I in the turpentine was 80.85%. *Distn. method.*—Nearly identical turpentines were obtained from the galipot by distn. with steam and under reduced pressure. The product from steam distn. gave the const.:  $d_{15}$  0.8649, [ $\alpha$ ]<sub>D</sub><sup>15</sup> + 25.87°,  $\alpha F/\alpha C$  1.968; that by distn. under reduced pressure:  $d_{15}$  0.8651, [ $\alpha$ ]<sub>D</sub><sup>15</sup> + 25.55°,  $\alpha F/\alpha C$  1.968. Eighty % of this was pure I,  $b_{15}$  49.6-51.5°  $d_{15}$  0.8625,  $\alpha F/\alpha C$  1.97-1.98. The amt. of I is therefore somewhat less than with the canula method. Three hundred and twenty g. of this last turpentine was washed with Na<sub>2</sub>CO<sub>3</sub> soln. and carefully dried with fused K<sub>2</sub>CO<sub>3</sub>. The product had the const.  $d_{15}$  0.8651, [ $\alpha$ ]<sub>D</sub><sup>15</sup> + 25.87°,  $\alpha F/\alpha C$  1.968. This was fractionally distd. at 750 mm. Since II has the const.:  $d_{15}$  0.8740, [ $\alpha$ ]<sub>D</sub><sup>15</sup> - 22.1° and  $\alpha F/\alpha C$  1.428 (cf. C. A. 2, 3190; 4, 583), it can at most be present only in traces since Darmon has shown that abnormal coeffs. of dispersion result in mixts. of substances with rotations of opposite sign and different rotatory dispersions, while in this case no abnormal values were obtained. The coeffs. of rotatory dispersion obtained for the first fractions indicate pure I. Fractions 14, 15 and 16 agree in odor and in phys. const. with pure III. Calcn. of the compn. of Fractions 1-14 by Biot's formula gives I, 85.23%, and III, 14.77%; the compn. of the original turpentine was then: I, 81%; III, 14%; higher boiling substances, 5%. As the next expt. 903 g. of the turpentine obtained from the galipot by steam distn. and carefully dried was fractionated under reduced pressure. Curves are given. The fraction  $b_{20}$  58-62.5° gave the color test for III described by Aschan (cf. C. A. 22, 2559). It also gave the characteristic nitrosate. From these results it appears that Russian turpentine from the galipot of *P. silvestris* differs in compn. from the *P. silvestris* turpentines of Germany and France, which contain II in addn. to I and III (cf. C. A. 21, 818). The evidence available shows that various turpentines all obtained from the same species of pine may vary considerably in compn. The presence of considerable III in Russian turpentine explains the great susceptibility of the latter to oxidation.

LEWIS W. BURZ

The oxidation of turpentine in the open air. K. N. KOROTKOV. *Zapiski Belaruskai Dzyarzhavnai Akad. Seiskae Gaspadarki* (Ann. Weissruth. Staatl. Akad. Landw. Gorky), 7, 142-53 (1928); cf. C. A. 23, 2289.—K. investigated 2 points: (1) Whether O<sub>2</sub> from the air is absorbed as such or is changed to another form (ozone) by

turpentine and (2) whether the  $O_2$  absorbed is capable of giving certain org. compds. from which  $O_2$  may be recovered by heating the aq. soln. with  $MnO_2$  or other catalytic agents. Five cc. of turpentine and a small vol. of  $H_2O$  were poured into a eudiometer which was placed in a cylinder of water and fastened so that the level of the  $H_2O$  in the eudiometer and the cylinder was the same. The original level of the turpentine in the eudiometer was recorded as well as the temp. and pressure of the air surrounding the eudiometer. These values were recorded daily for a period of 7 days, after which a burning splinter was inserted in the eudiometer. The flame was extinguished and analyses showed that 8.83 cc. of  $O_2$  had been absorbed, the theoretical amt. of  $O_2$  in the air being 8.77 cc. Three other expts., slightly modified, were conducted. In one of them pure  $O_2$  was used in place of air. The results were the same as described. In the pure- $O_2$  expt.,  $CO_2$  was found, showing that this gas is formed in the process of absorption of  $O_2$ . Another series of expts. to establish the 2nd point of the investigation was carried out as follows: 25 cc. of turpentine in a definite vol. of acidified  $H_2O$  (3 cc. of 0.1 N  $H_2SO_4$  in 250 cc. of  $H_2O$ ) was poured into a retort and connected with a buret (200 cc.) which served as a eudiometer. The buret was placed in a cylinder of  $H_2O$  and as the  $O_2$  was absorbed and the  $H_2O$  rose in the buret, more  $H_2O$  was added. When no more  $O_2$  was absorbed, turpentine water was siphoned off and the  $O_2$  absorbed detd. by the method described in a former publication. The results of the expts. are summarized as follows: (1) The oxidation of turpentine in the air takes place at the expense of the ordinary  $O_2$  in the air. (2) The turpentine is capable of giving up 30% of the total amount of  $O_2$  absorbed; this is the active  $O_2$  from the turpentine. (3) Turpentine from different sources differ in capacity to absorb  $O_2$ . The turpentine from *Pinus silvestris* can absorb 34 l. of  $O_2$  per l. of turpentine. J. S. JOFFE

**A note on coconut-shell oil.** M. GOVINDA KIDAVU AND E. K. NAMBIYAR. Madras Agr. Dept., Yearbook for 1927, 33-5(1928).—The shells from 30 coconuts yielded 0.5 lb. of oil by dry distn. The oil is a thick black liquid with an acrid penetrating odor. It is acid to litmus and contains pyroligneous acid, creosote, etc. When lightly painted on wood, it dries quickly with a black, slightly glossy surface which is not removed by soap and is not easily affected by acids and alkalis. The oil is an excellent paint for wood and Fe. It is an antiseptic and is used in Malabar as a medicine for all wounds. K. D. JACOB

**Petroleum Products Testing.** Being 2nd ed., revised, of "Standard Methods of Testing Petroleum and Its Products" formulated by the Standardization Committee of the Inst. of Petroleum Technologists. Published by the Institution, Aldine House, Bedford St., Strand, London, W. C. 2. 137 pp. 7s. 6d., net. Reviewed in *Chem. Trade J.* 84, 539(1929).

**Refining crude oil.** PECHELBRONN (Soc. anon. d'exploitations minières). Fr. 656,344, Nov. 5, 1927. Natural crude oils or their residues are refined by treating them dild. in a solvent with  $H_2SO_4$ , the solvent being unattacked by  $H_2SO_4$ , sepg. the acid muds by heating to about  $75^\circ$  and decanting. The acid residues obtained are heated moderately with more solvent and treated as above. The acid oil finally obtained is neutralized and distd. Fr. 656,345 describes the sepn. of  $H_2SO_4$  from the acid tar by dissolving the latter in  $C_6H_6$  or its homologs, heating the soln. thus obtained successively in the presence of residuary or other acids of decreasing concn. to remove completely by successive washings and drawing off all the  $H_2SO_4$ . Fr. 656,346 describes the sepn. of  $H_2SO_4$  by disintegrating and emulsifying the tar or residue in a crude petroleum deriv., etc., preferably with the injection of steam into the mass, and neutralizing with NaOH.

**Purifying oils.** HERMANN BENSMANN. Fr. 656,426, June 25, 1928. Used lubricating oils are purified for reuse by intimate mixt. with 2-5% of a polymerizing agent, decanting and filtering through a hydrated silicate of Al-Mg. Before decanting steam may be passed through to ext. easily volatile hydrocarbons, the particles of water being afterwards sepd. in the filter.

**Destructive hydrogenation of crude oil or other carbonaceous materials.** I. G. FARBENIND. A.-G. Brit. 300,703, Aug. 11, 1927. A catalyst is used contg. 10% of a mixt. of Cu and Zn or Cu and Cd, the remainder comprising one or more of the elements B, Al, Si, Ti, V, Ta, Cr, Mo and W or their compds. or compds. of Co. A high yield of benzine is obtained from crude oil.

**Treating tarry and similar materials in order to effect dehydration and cracking.** ALEXANDER S. KNOWLES (to Tar & Petroleum Process Co.). U. S. 1,717,884, June 18. Material such as tar or petroleum residuum is allowed to flow downwardly into a bed of loose material which is mostly C, in an externally heated closed chamber, heated from below, and gases and vapors from a zone of coking temp. are passed through overlying material and the solid residue is removed as coke. An app. is described.

**Testing soil by an electrical conductivity system to locate oil-bearing formations.** CONRAD SCHLUMBERGER. U. S. 1,719,786, July 2.

**Soaps from sulfonated mineral oil acid sludge.** ORVILLE E. CUSHMAN AND THEODORE W. DOELL (to Standard Oil Co. of Calif.). U. S. 1,718,335, June 25. After a preliminary treatment of mineral oil with  $H_2SO_4$  (which may be of  $66^\circ$  Bé. strength), the sludge is sepd. from the oil and the oil then further treated with  $H_2SO_4$  of a strength over 97% and the sludge thus formed also sepd. Sulfonated products in the second sludge are sepd. from the assoc. free  $H_2SO_4$  and neutralized and the oil-sol. coloring substances are extg. with  $C_6H_6$ .

**Cracking hydrocarbons.** ANGLO-PERSIAN OIL CO. Fr. 655,823, May 15, 1928. During the cracking process liquid hydrocarbons, particularly petroleum, are given a relatively high degree of agitation which may be caused by a pump imparting eddy or wave motions to the oil during its passage through the app.

**Cracking hydrocarbon oils.** F. HOFMANN AND C. WULFF. Brit. 301,395, Nov. 27, 1927. Halides of B or their addn. or substitution products are used as catalysts in cracking processes, with or without use of hydrogenating gases. An example is given of the use of B fluoride at  $380^\circ$  and 150 atm. in treating crude oil.

**Cracking hydrocarbon oils.** HARRY L. PELZER (to Sinclair Refining Co.). U. S. 1,718,375, June 25. In producing gasoline from high-S crude oil, the oil is subjected to vapor-phase cracking and the mixt. thus produced is scrubbed to sep. tar. Caustic alkali is mixed with the crude oil and this mixt. is introduced into the vapors in the scrubbing operation; the vapor mixt. passing from the scrubbing operation is subjected to refluxing and in the refluxing condensation is effected of components heavier than are desired in the gasoline product; reflux condensate is supplied to the vapor-phase cracking operation, and tar and assoc. substances are discharged without return to the cracking operation. An app. is described.

**Cracking hydrocarbon oils in admixture with steam in a pipe coil under pressure.** CHARLES J. GREENSTREET (to Gasoline Corp.). U. S. 1,718,913, June 25. Vapors from the coils after regulated heating are brought directly into contact with liquid water suddenly to chill the products below cracking temp. An app. is described.

**Purifying hydrocarbon oils.** LOUIS LINK AND MAURICE B. AMIS (to Standard Oil Development Co.). U. S. 1,718,714, June 25. An uncracked light hydrocarbon distillate contg. difficultly removable corrosive S is brought into intimate contact with spent alkali from the treatment of a light fraction obtained by cracking petroleum hydrocarbons. An app. is described.

**Hydrogen and carbon by thermal decomposition of hydrocarbons.** ARTHUR

W. BURWELL (to Alox Chemical Corp.). U. S. 1,717,354, June 18. Vaporized hydrocarbon material such as a petroleum fraction is added to a stream contg. "commercial" H or other inert gaseous vehicle heated to a temp. sufficient to effect thermal decomposition of the material, and a closed cycle of operations is followed comprising establishing a zone of thermal decomposition of the material in the vehicle, withdrawing the decomposition products comprising H and C from the zone of decomposition, sepg. C, and withdrawing at least a portion of the gaseous product and preheating the residual components of the stream in the closed cycle to a temp. sufficient to effect further thermal decomposition of hydrocarbon material.

**Apparatus for cracking hydrocarbon oils.** HARRY L. PELZER (to Sinclair Refining Co.). U. S. 1,719,486, July 2. Structural features are described of app. in which the oil is circulated through a bed of finely divided material such as fuller's earth within the distn. app.

**Apparatus for distilling and oxidizing hydrocarbon oils.** JOHN C. BLACK and WIRT D. RIAL (to Pan American Petroleum Co.). U. S. 1,718,679, June 25. An app. is described suitable for blowing asphaltic residuum with air or steam.

**Distilling oil from solid materials such as shale.** CARL POSTEL (to American Shale Reduction Co.). U. S. 1,717,808, June 18. Distn. is effected in an inclined rotary horizontal retort provided with a jacket through which molten metal such as Pb is circulated. Various structural details are described.

**Apparatus (with rotatable annular retort) for distillation of oil shale.** KENNETH E. CLAYTON-KENNEDY (to American Hydrocarbon Co.). U. S. 1,717,786, June 18. Various structural details are described.

**Rotary inclined horizontal retort and associated apparatus for distilling oil shale.** T. M. DAVIDSON. Brit. 301,407, Aug. 25, 1927. Structural features.

**Refining petroleum oils.** ROY CROSS (to Cross Development Corp.). U. S. 1,718,218, June 25. In producing a refined gasoline, a suitable charging stock adapted for cracking is treated with a Na plumbite soln. and with  $H_2SO_4$  and then cracked to obtain gasoline.

**Apparatus for treating petroleum oils with chemical solutions.** JESSE L. TAYLOR and CHRISTOPHER L. HOWSER. U. S. 1,717,744, June 18. Various structural features are specified.

**Centrifugal separation of crude petroleum from sand, water, bottom settlings, etc.** JAMES R. HALL. U. S. 1,718,141, June 18. An app. is described.

**Apparatus for separating oil from exhaust steam.** H. YAMAMOTO. Brit. 300,822, Dec. 30, 1927.

**Treating "sour" naphtha distillates.** JAMES SIMPSON (to Standard Oil Development Co.). U. S. 1,718,713, June 25. A "sour" naphtha distillate is treated with a Na plumbite soln., the soln. is sepd. and a naphtha distillate contg. corrosive S is then subjected to the action of the same soln.

**Rubber-lined tanks for "petrol," etc.** SOC. ITALIANA PIRELLI. Brit. 301,089, Nov. 24, 1927. Structural features.

**Filter for gasoline, etc.** A. COX. Brit. 301,152, Sept. 30, 1927. Structural features.

**Filter for gasoline.** MILTON E. CHANDLER (to Stromberg Motor Devices Co.). U. S. 1,717,875, June 18. Structural features.

**Desulfurizing motor fuel.** W. N. DAVIS and W. H. HAMPTON (to Standard Oil Co. of Calif.). Brit. 301,450, Nov. 30, 1927. Polymerization loss of unsatd. S free hydrocarbons during the desulfurization of materials such as cracked naphthas by treatment with  $H_2SO_4$  is controlled by limiting the max. reaction temp. (preferably to within about  $8^\circ$  of the initial temp. and to below about  $5^\circ$  or lower). An app. is described.

**Liquid motor fuel.** WERNICKE & BEYER. Brit. 301,076, Nov. 25, 1927. Dihydroxybenzene (suitably 0.2-0.5% dissolved in a mixt. of alc. and mineral oil) is added to "petrol, benzole or other motor spirit" to reduce "knock."

**Treating refuse from fuel oils.** H. W. WILDISH. Brit. 301,405, July 28, 1927. Refuse such as that obtained when oil tanks are washed out and the oily water is cleansed by the Perbright process is passed through automatically cleaned strainers to remove sand and heavy sediment, heated to about  $80^\circ$ , and allowed to settle. Floating oil is centrifuged. Water and sediment are passed through a sand filter, water is discharged, and the oily sediment on top of the sand is burned or otherwise destroyed.

**Separating wax from mineral oils.** ROBERT E. WILSON (to Standard Oil Co. of Ind.). U. S. 1,719,350, July 2. A low-viscosity oil contg. naturally assocd. wax is

treated with an oil-miscible liquid such as iso-PrOH which ppts. the bulk of the wax at low temp.

**Paraffin.** CLARENCE A. WARD (to Standard Oil Development Co.). U. S. 1,718,672, June 25. Paraffin slop is chilled and pressed in the presence of a filter aid such as clay, asbestine pulp, paraffin or paper pulp to obtain a pressed oil and a difficultly sweatable slack-wax and the latter is subjected to distn. under cracking conditions to produce a distillate of sweatable slack-wax.

**Lubricating oil mixture.** OLE ROLFSEN. U. S. 1,717,939, June 18. Partially hydrogenated whale oil is mixed with mineral lubricating oil.

**Purifying lubricating oils or oils for Diesel engines, etc.** I. G. FARBENIND. A.-G. Brit. 300,900, Nov. 19, 1927. Crude oils are freed from S impurities, etc., by passing them with H at a temp. of about 300° and under 10 atm. or higher pressure over catalysts immune from poisoning by S (such as Mo trioxide and ZnO treated with magnesia) under conditions which avoid the formation of substantial quantities of products of low b. p.

**Apparatus (with mercury vapor generator and condensers) for distilling lubricating oils.** ARTHUR E. PEW, JR., and HENRY THOMAS (to Sun Oil Co.). U. S. 1,719,235, July 2. Structural features.

**Filter for oil of engine-lubricating systems.** ERNEST J. SWEETLAND. U. S. 1,718,390, June 25. Structural features.

**Bituminous emulsions.** J. A. MONTGOMERIE. Brit. 300,414, Dec. 19, 1927. Aq. emulsions of Mexican asphalt or similar materials are prep'd. by mixing the molten material with a hot aq. soln. contg. normal Na phosphate or other suitable tertiary alkali phosphate or mixts. of such phosphates in a quantity of about 0.5% that of the bituminous material. Other reagents such as alk. hydroxides or carbonates also may be used, as may also stabilizing agents and those increasing wetting, penetrating and spreading power such as Na laurate. Cf. C. A. 23, 698.

**Bituminous emulsions.** J. A. MONTGOMERIE. Brit. 300,415, Dec. 19, 1927. Mexican asphalt or similar material is emulsified by adding it while molten to a hot dil. aq. soln. of an oxidizing alkali such as one formed with a peroxide or percarbonate of Na or K. Other substances also may be present. Cf. C. A. 23, 698.

**Bituminous emulsions.** J. A. MONTGOMERIE. Brit. 300,821, Dec. 24, 1927. Aq. emulsions of Mexican asphalt or like material are prep'd. by mixing the molten material (continuously or in batches) with a hot dil. soln. of Na cresylate or a similar cresylate which may be in the proportion of 0.5% (calcd. as NaOH) of the asphalt. Na laurate or other stabilizing agents, etc., may also be added. Cf. C. A. 23, 698.

**Bituminous compositions.** COLAS PRODUCTS, LTD., W. S. WHITING AND A. G. TERRY. Brit. 301,544, Sept. 2, 1927. Mineral or other aggregate is coated with bitumen by applying it in the form of an emulsion with a small quantity of a salt such as NaCl or Na<sub>2</sub>SO<sub>4</sub> which is a strong electrolyte. A filler such as soft limestone may be added to absorb water set free from the emulsion.

**Removing suspended solid particles from bituminous emulsions.** BURT, BOULTON & HAYWOOD, LTD., and F. J. E. CHINA. Brit. 300,408, Dec. 9, 1927. In order to free emulsions of bituminous materials from solid particles which might block spraying nozzles, the emulsions, on the way to the spraying nozzles, are passed through a pipe in which a helical brush is placed which substantially fills the cross-section of the pipe.

**Aqueous dispersions.** THE FLINTKOTE CO. Fr. 655,355, May 29, 1928. Aq. dispersions of substances such as pitch, bitumens and resins along with insol. mineral powder such as colloidal clay or bentonite are obtained by adjusting and holding the  $p_H$  value within predet'd. const. limits. Thus, with a pitch of acidic character a basic mineral powder such as a metallic oxide or hydroxide is added, which, when incorporated uniformly, makes it possible to disperse more effectively with an acidic clay. The  $p_H$  value of the final system is adjusted to suit more perfectly the final characteristics desired.

**Emulsifying agents.** NAAMLOOZE VENNOOTSCHAP DE BATAAFSCHE PETROLEUM MAATSCHAPPIJ. Brit. 300,574, Nov. 15, 1927. In the production of dispersing, emulsifying or stabilizing agents, mineral oil is treated with liquid SO<sub>2</sub> or other substance of a similar solvent action and is then sulfonated (suitably by the process described in Brit. 291,393 (C. A. 23, 1262)).

**Furnace for carbonizing wood with recovery of tar and pyrolygneous acid.** JAMES R. KONGIER. Fr. 656,293, May 31, 1928.

## 23—CELLULOSE AND PAPER

CARLETON E. CURRAN

**Science and cellulose.** WILDER D. BANCROFT. *Pulp Paper Mag. Can. International No.*, 283-6 (Feb., 1929).—An address. A. PAPINEAU-COUTURE

**Future possibilities in the utilization of cellulose.** CHARLES H. HERTY. *Paper Mill* 52, No. 11, 22-6, 34 (1929).—See C. A. 23, 3342. A. PAPINEAU-COUTURE

**$\alpha$ -Cellulose.** J. H. ROSS AND J. S. G. SHOTWELL. *Pulp Paper Mag. Can.* 27, 379-82, 396-7, 431-4, 454 (1929).—From a review of the literature (with bibliography of 29 references) and an investigation into the effect of variations in the conditions under which the  $\alpha$ -cellulose detn. is carried out, it was found that the amt. of substance extd. from a pulp by NaOH solns. varies with the temp. of extn., the ratio of soln. to pulp, the concn. of the soln. and the time. The following method was evolved and found suitable as a routine method, as it gives closely agreeing results in the hands of different operators: Macerate 3.5 g. of air-dried bleached pulp in 70 cc. of 17.5% NaOH at 20°, mercerize for 2 hrs., filter on a Buchner funnel and pass the filtrate repeatedly till all the fiber is held, suck as dry as possible, suspend the pat in 100 cc. of 17.5% NaOH at 20° for 30 sec., stir well, filter as before, suspend in 200 cc. of 25% AcOH, bring to a boil, filter, wash on the filter with 1 l. of boiling water and dry to const. wt. at 100-5°. A. PAPINEAU-COUTURE

**Hydrolysis of cellulose.** II. RICHARD WILLSTÄTTER AND LÁSZLÓ ZECHMEISTER. *Ber.* 62B, 722-5 (1929); cf. C. A. 7, 3412.—Haber (*Z. angew. chem.* 42, 52 (1929)) believes the new arguments in favor of the view that cellulose is made up of large units joined by primary valences are plausible rather than decisive and do not exclude the possibility that it is built up of short chains. It does not seem superfluous, therefore, to add to the no. of purely chem. proofs of its structure. In 1913 was begun an investigation of the degradation of cellulose with AcBr-HBr and highly concd. HCl, in which it was found that there are first formed dextrin-like\* products and then a mixt. of tetraose, triose, bioses and glucose. The work was interrupted by the war, but it seems appropriate to publish now some of the observations made on these oligosaccharides, which, under the conditions of the expts., cannot be obtained from glucose by reversion. The course of the hydrolysis of cellulose with HCl cannot be brought into harmony with the assumption of small structural units. Pure absorbent cotton (112 g.), dried at 115°, was dissolved in 1100 g. HCl ( $d_{4}^{25}$  1.21, prepd. at a low temp.), allowed to stand 3 days at 19.5°, evacuated 10 min. to remove part of the HCl, poured upon 3 kg. of ice, quickly neutralized with pressed-out  $\text{Ag}_2\text{CO}_3$  sludge, filtered and washed 3 times with 1 l. of  $\text{H}_2\text{O}$ ; the combined filtrates were then freed from most of the dissolved Ag with HCl, concd. *in vacuo* to 1250 cc., filtered from the dextrin-like ppt. and sepd. into 20-30 fractions by fractional pptn. with alc. The more difficultly sol. fractions yielded dextrin-like substances which swelled in  $\text{H}_2\text{O}$ , the more sol. fractions cellobiose, and the last mother liquors glucose. From the intermediate fractions were obtained a *cellostetraose*, sol. in  $\text{H}_2\text{O}$  without swelling, sepg. from hot concd. aq. soln. on addn. of alc. to slight permanent turbidity in cryst. aggregates; it is very faintly sweet, sinters 205°, m. around 240°, loses 6-7% in wt. *in vacuo*, mol. wt. in freezing  $\text{H}_2\text{O}$  648-706,  $[\alpha]_D$  21.0-1.5°, shows no mutarotation, reducing power (Bertrand), 1 mg. corresponds to 0.66-0.72 mg. Cu; and a *cellostriose*, sweetish, m. around 210° (foaming), mol. wt. 456-513,  $[\alpha]_D$  21.2-1.9°, reducing power 0.82-0.83 mg. Cu. C. A. ROUILLE

**Acetylation of cellulose.** ICHIRO SAKURADA. *Cellulose Ind.* (Tokyo) 4, 304-5 (1928).—Cellulose is acetylated by treating alkali-cellulose with acetic anhydride in benzene soln. at room temp. The product approximates to a combination of 1 mol. of acetic acid + 2 mols. of cellulose. B. C. A.

**Unification of the methods for testing cellulose and cellulose esters.** ROBERT GABILLON. *Chimie & industrie Special No.*, 592 (Feb., 1929).—A plea for the unification of such methods, with suggestions as to which detns. would be most suitable. A. PAPINEAU-COUTURE

**The solubility of cellulose acetate.** MAURICE DESCHIENS. *Chimie & industrie Special No.*, 564-70 (Feb., 1929).—A general discussion of the soly. of cellulose acetate and of the methods generally used for detg. it. A. PAPINEAU-COUTURE

**The hydrolysis of lignocellulose.** G. MEUNIER. *Chimie & industrie Special No.*, 553-63 (Feb., 1929); cf. C. A. 16, 1664; 17, 2165; 21, 623.—The theory of the hydrolysis of lignocellulose by dil.  $\text{H}_2\text{SO}_4$  is extensively discussed mathematically, and the results of expts. are described and discussed showing that they agree with the theoretical considerations put forward. The 2 main reactions are hydrolysis of the cellulose to

dextrose and decompn. of the latter by the acid; and the 3 most important factors are time, acid concn. and temp. André's theory of the decompn. of hexoses (*Proc. 4th Intern. Congress Appl. Chem.*, Paris, 1900, p. 165) is extended as follows: under the action of heat and acidity, hexoses lose 1 mol. of  $H_2O$  to form glucosan, to which may be attributed a furfuranic structure. Some of these furfuranic compds. have an aldehydic structure and others a ketonic structure, the former leading to the formation of furfuran and the latter to levulic and formic acids; these can combine (with elimination of  $H_2O$ ) to form furfural-levulic acid, which can condense with loss of  $H_2O$  to form coumarone, or phenofurane, derivs. The production of humic acid is attributed to a rearrangement or condensation of these phenofurane nuclei. The structure of the humic acid is such that it can lose  $CO_2$ , or even  $CH_4$ , giving rise to still more highly condensed phenofuranes. On the other hand, the furfuroles may condense with loss of water to give brown substances having a compn. very similar to that of humic acid. The variations observed in the decompn. products of hexoses according to exptl. conditions are attributed to variations in the relative proportions of the isomeric aldehydic and ketonic glucosans. It is clearly brought out that multiple-stage hydrolysis gives a considerably higher yield of fermentable sugars than single-stage hydrolysis carried to the same degree. The method used for carrying out the exptl. part of the work can be utilized for detg. (with an accuracy of approx. 10%) the optimum conditions for obtaining given results, 4 expts. being necessary, 2 at temp.  $T$  for times  $t_1$  and  $t_2$ , and 2 at temp.  $T_1$  for times  $t_3$  and  $t_4$ .

A. PAPINEAU-COUTURE

The determination of lignin by means of formaldehyde and sulfuric acid. J. H. ROSS AND A. C. HILL. *Pulp Paper Mag. Can.* 27, 541-4 (1929).—The method depends on the fact that all ligneous tissues, when impregnated with  $CH_2O$  soln., will dissolve in concd.  $H_2SO_4$ , especially when the mixt. is slightly warmed, and that the lignin compds. or a portion thereof ppt. on diln. of the soln. The following technic is recommended: Triturate approx. 0.4 g. of dry sample in a 100-cc. beaker with 4 cc. of com. 40%  $CH_2O$  soln., add 4 cc. of 72%  $H_2SO_4$ , stir until the  $H_2SO_4$  has penetrated the mass (usually about 2 min.), add 6 cc. concd.  $H_2SO_4$ , stir vigorously and allow to heat (not above  $70^\circ$ ); when soln. is complete (generally about 10 min.) pour into 200 cc. of distd. water at room temp., add sufficient ignited asbestos to form a good mat on a Gooch crucible, filter on a Gooch crucible, passing the filtrate through repeatedly until a mat capable of holding the floc is obtained, wash with 200 cc. of 5%  $HCl$ , dry to const. wt. at  $105-30^\circ$ , weigh, ignite and weigh again. Attempts to est. the dissolved and the repptd. lignin by volumetric methods were unsuccessful. The amt. of lignin thus found in spruce varies with the preliminary treatment of the wood: when the resins, fats, etc., have been extd., the apparent lignin content is lowered by about  $1/2$  of the material extd.; when the wood is extd. with alkali there is a further lowering of the lignin value. The hardwoods give a lower value by this method than by previously proposed methods, which is not entirely due to the alkali extn., for an alkali-extd. chestnut gives a higher value by the ordinary  $H_2SO_4$  method of detg. lignin. The lignin ppt. obtained as above is insol. in  $H_2O$ , but sol. in alc.,  $Me_2CO$  and  $AcOH$  when these solvents contain a certain amt. of  $H_2O$ ; the ppt. is sol. in concd.  $H_2SO_4$ , even when washed free from  $CH_2O$ , and can be repptd. from and redissolved in this reagent any no. of times. The lignin product reacts with  $Cl$  and with  $HNO_3$  in a manner similar to ordinary lignin; it appears to absorb  $Br$ . The reaction with  $CH_2O$  is so definite that it might be suggested that there is in the ordinary woody tissue a  $-CHO$  grouping or a substance capable of producing this grouping when acted upon by concd.  $H_2SO_4$ , joined to or in close proximity to the lignin bodies; this grouping, when condensed with the lignin compds., gives  $H_2SO_4$ -insol. derivs.; the  $CH_2O$ -condensation product, on the other hand, gives  $H_2SO_4$ -sol. products. As opposed to this view it might be supposed that the lignin value given by  $CH_2O$  would perhaps be considerably lower than that found by means of  $H_2SO_4$  alone, since the  $CH_2O$  would add very little to the wt. of the ppt., unless the lignin bodies had a high mol. wt. It is remarkable that even chips, after being soaked in  $CH_2O$  soln., are entirely dissolved on the addn. of strong  $H_2SO_4$ . Although more rapid at moderately high temps., the reaction proceeds equally well at low temp. The cellulose products pptd. from their soln. are too far degraded to form films.

A. PAPINEAU-COUTURE

Remarks on the 9th communication on lignin and cellulose by K. Freudenberg. KURT HESS. *Ber.* 62B, 924-7 (1929).—Reply to F. (C. A. 23, 3342). C. A. R.

The development of the rayon industry. ROGER UZAC. *Chimie & Industrie Special No.*, 733-4 (Feb., 1929).

A. PAPINEAU-COUTURE

The molecular structure of rayon. ADOLF ROSENZWEIG. *Kunststoffe* 11, 11-13 (1929).—The examn. of a no. of rayon threads has shown that the quality is inversely proportional to the hygroscopicity of the rayon, and is independent of the size of the

filaments, twist, titer and even the chemical character thereof. It is further stated that the consumer can hardly distinguish the better quality from the av. good skeins. The fundamental faults in rayon are not caused by chemical factors and the improvement has to be accomplished through physical methods. These methods consist in variations in pressure, time and temp.

FREDERICK C. HAHN

**Microscopically visible impurities in viscose and viscose rayon.** RUD. BERNHARDT. *Kunstseide* 11, 13-7, 56, 85-90(1919).—The following factors were found to be responsible for the formation of microscopically fine particles in viscose rayon: the content of inorg. and org. foreign materials in the pulp, impurities in the caustic soda, mineral constituents in the water, the absorption of  $\text{CO}_2$  from the air causing the formation of insol. carbonates, Fe (very small but important) dissolved from equipment, particles of incompletely reacted cellulose from the mercerizing and sulfiding operations, and sometimes the proportion of free  $\text{CS}_2$  in the viscose. Air bubbles occur most frequently in the rayon. A synthetic method was used. Various salts were added to an especially purified viscose, and the formed particles were compared with those present in normal viscose. It was shown that  $\text{CaCO}_3$ ,  $\text{MgCO}_3$ ,  $\text{FeS}$ , Ca resinate, Ca salts of fatty acids, and undecomposed particles of pulp were the most important microscopically visible impurities in the rayon. Microchemical reactions were employed also for the identification of the foreign impurities. Oxycellulose and wood gum do not cause microscopically visible particles. Frequently ppts. of resinic and fatty acids cause particles. The particles of cellulose which persist after filtration cause abnormal cross sections in the filaments.  $\text{CS}_2$  exerts a microscopically visible influence at a concn of 1%, but at the normal content, which is 0.15%, nothing is visible. Silicic acid ppts. are present in very small amounts. A method is described for the detn. of O in NaOH soln., and use is made of this method to detect the existence of an intense absorption of O by the dissolved resinic acid. Numerous inhomogeneities of the dyed rayon filament are due to the deposition of dyes on the edges of air bubbles. The dyeing with basic dyes may result in the formation of ppts. Several complicated reactions were observed during the process of dyeing rayon with safranine, which makes this dye not very desirable for the normal optical investigations. With the use of direct dyes impurities are scarcely visible.

FREDERICK C. HAHN

**Hollow and gas-containing rayon.** WILHELM A. DYES. *Kunstseide* 11, 5-11 (1929).—A review and discussion of patents in this connection.

F. C. H.

**Application of the super-centrifuge to problems in the manufacture of viscose rayon.** E. M. NOBLE. *Can. Chem. Met.* 13, 165-6(1929).—A short account of the viscose process is followed by a listing of and discussion of possible applications of the super-centrifuge in the process: clarification of NaOH soln. pressed from the pulp sheets, clarification of the viscose and clarification of the acid fixing bath.

E. G. R. A.

**Viscose. XIX. Pretreatment of alkali-cellulose and the spinning properties, viscosity and surface tension of viscose prepared therefrom.** G. KITA, J. ONOHARA AND K. SAKURADA. *Cellulose Ind.* (Tokyo) 4, 293-7(1928); cf. C. A. 23, 3084.—The effect of varying the periods of steeping and maturation of the alkali-cellulose on the phys. properties of the resulting viscose is examd. Spinning properties and viscosity are closely related. Viscose filaments from alkali-cellulose matured for short periods in closed vessels appear as satisfactory as those from alkali-cellulose steeped and matured for longer periods in air or in an atm. of H. **XX. Comparison of the properties of steeped and pressed alkali-cellulose.** *Ibid* 298-300. Maturing alkali-cellulose in the pressed-out condition resulted in slightly higher viscosity of the viscose prep'd. from it than when the cellulose was steeped for a long period, pressed out and used immediately. Definite differences in spinning properties and in the phys. properties of the spun filaments were also observed.

B. C. A.

**The emission of fumes from artificial silk works.** T. LEWIS BAILEY. *Chem. Age* (London) 20, No. 519; *Dyestuffs Mo. Suppl.* 47-8(1929).—Efficient drafting by fans is required by regulation in the viscose process of mfg. artificial silk. This has caused complaints due to unpleasant odors contained in such air when leaving the works. This air contains a few p. p. m.  $\text{H}_2\text{S}$  and smaller quantities of other noxious compds. which, probably not dangerous to health, are distinctly disagreeable. In some of the larger works this vol. of air amounts to 500,000 cu. ft. per min. The offensive odors seem to be due to small quantities of  $\text{CS}_2$  from the cleaning of the churns and in the decompn. of the viscose soln. in the spinning baths, which contain chiefly  $\text{H}_2\text{SO}_4$  and other inorg. salts, whereby  $\text{H}_2\text{S}$  is produced. Complete boxing-in of the machines is impracticable. Towers contg. NaOH soln. washed out some of the S compds. but did not remove the most troublesome odors. Other methods of using NaOH soln. as a deodorizer and the use of gaseous Cl and  $\text{SO}_2$  were unsuccessful. Some improvement

has been made by adding suitable materials during the manuf., but as the chem. reactions are obscure, more study of absorbents is needed. Glucose has been used in the baths as it absorbs  $H_2S$  readily. Acid effluent should be neutralized and sulfides should be pptd. and removed before the effluent leaves the works. C. H. BADGER

**Review of the sulfite process.** EMIL HEUSER. *Pulp Paper Mag. Can. International No.*, 121-8 (Feb., 1929); *Paper Mill* 52, No. 5, 18-26 (1929).—A review of recent progress and modern practice, covering acid-making, prepn. of the wood, gas and heat recovery, pulp dryers and chemistry of the cooking process. A. P.-C.

**Practical study of the cooking of wood for the production of sulfite pulp.** G. OGDON. *Papeterie Special No.*, 265-76 (1928).—The following are considered to be the optimum conditions for the production of strong sulfite: the cooking liquor should contain 4.5-5.0% total  $SO_2$  at the start and 0.8-0.9% at the end of the cook; pressure should be 4 kg. per sq. cm., the temp. should be raised rapidly to a little under  $110^\circ$ , kept at  $105-110^\circ$  for 3-4 hrs., and raised gradually to  $125^\circ$ ; relieving should be done as seldom as possible consistent with obtaining the required temp.; the time of cooking depends on the rate of exhaustion of the total  $SO_2$ . Results are given of a no. of com. cooks bearing out the above conditions. A. PAPINEAU-COUTURE

**Control and evaluation of sulfite pulp quality.** G. P. GENBERG and E. O. HOUGH-CON. *Paper Trade J.* 88, No. 17, 71-8; No. 18, 53-9 (1929).—The Roe Cl no. detn. (A) (C. A. 18, 2808) and the initial strength test advocated by Roe and developed by the Technical Assn. of the Pulp and Paper Industry sulfite comm. are described, together with their application; they are compared with the other methods in use, and their relation to the various mfg. steps is discussed. Microscopic analysis was found unreliable for the detn. of the relative percentage of sulfite and groundwood in catalog paper; but A was found sufficiently reliable and accurate for the purpose (cf. G. and Jonsson, C. A. 20, 3082). The A of groundwood averages 35.0, but varies for sulfite depending on the grade of the pulp, and the A of the sulfite used must be known in calcg. the compn. of the paper. Working with known mixts. gave a max. deviation between calcd. and true sulfite content of 3.7%, while in over 75% of the cases the deviation was less than 2%, which is much closer than can be obtained by microscopic analysis. Investigation of the effect of size, alum and filler showed that, within certain limits, the presence of these materials had no adverse effect on the detn.; when the amt. of filler was large, however, it was necessary to allow for this in weighing up the sheets prior to the Cl treatment. Comparison of the detn. of sulfite by A with the other methods put forward from time to time was favorable to the former. It has the advantage of being simple in operation, rapid and capable of being checked by inexperienced operators; with the pulps used (A varying from 2.50 to 4.50) the max. deviation from the av. was  $\pm 3\%$ . A gives a direct indication of the bleachability. Plotting A against bleach consumption obtained in lab. tests gives a straight line, and A can be converted into bleach consumption by multiplying it by a factor which is detd. by existing conditions. The straight-line relationship, however, does not hold in mill practice because of operating conditions, there being a rapid increase in bleach requirements for the lower A values and then a continually diminishing rate of increase for the higher A. If the amt. of bleach is corrected for consistency variations and other factors, the relationship approaches more nearly to the theoretical, especially for the lower Cl nos., and is indicative of the bleach required to obtain an av. uniform white. When bleaching to a low color, however, the same ratio of bleach to A being used, pulps of low A give better colors than those of higher lignin content, the color decreasing progressively with increase of A of the unbleached pulp, and the lignin content of the bleached pulp increasing correspondingly. This is explained on the assumption that bleaching takes place in 2 main stages: (a) a reaction between the hypochlorite and the lignin with formation of colored reaction products, and (b) oxidation of these products to produce sol. colorless compds. While there is no apparent relation between A and strength properties of pulp in individual detns., the average of a large no. of tests indicates some relationship between these properties: the bursting strength (Mullen) increases with A; the tear and freeness increase up to an A of about 3.7-3.8, after which they drop again while the Mullen continues to rise though at an increasingly slower rate. This general relationship holds only for a given grade of unbleached sulfite, but not for different grades; in the latter case pulps having practically the same A can have entirely different strength properties. A comparison of 2 sulfite pulps (mill runs, each lasting over several days) produced by 2 types of cooks lasting 10 and 16 hrs., resp., is reported. Practically the same yield was obtained in both cases, although the shorter cooks were carried to about  $10^\circ$  higher than the long cooks. The long cooks, though finished at a higher blow-test of the cooking acid, gave a pulp

with appreciably lower A (3.21 against 4.32) than the short cooks. The strength properties of the bleached pulps were approx. the same in both runs, because of differences in bleaching conditions. There was less variation in the individual cooks with the longer cooking period. In trying to duplicate a European sulfite of low bleach consumption and high strength, it was shown that a slow and careful cook at a low temp produces a pulp of both satisfactory strength and low A, a condition which is difficult to duplicate at a short cooking time and the increased temp. requisite for the high degree of lignin removal desired. Bleaching with NaOCl gave a brighter color and much higher strength properties than bleaching with Ca hypochlorite. Overbleaching caused an appreciable drop in strength properties; in bleaching with the proper amt of bleach the strength first increased and then dropped to a const. value, which was slightly higher than that of the unbleached pulp; at the same time there was progressive decrease in  $\alpha$ -cellulose content. By reducing the bleaching temp., less bleach could be used without much decrease in color but with definite increase in strength of the bleached pulp. The same bleach ratio being used, 2-stage bleaching with intermediate washing gave slightly lower strength properties and  $\alpha$ -cellulose content, but much better color than single-stage bleaching. At 6% consistency, when a lower bleach ratio was used in 2-stage bleaching, the same color was obtained as with the single-stage bleaching, and the total strength and  $\alpha$ -cellulose content were higher. Less time was required to exhaust the same amt. of bleach in single-stage bleaching than in double-stage. Using a high consistency (about 15%) for the 2nd stage of the bleaching considerably reduced the time required, had no effect on the final color and lowered the  $\alpha$ -cellulose value from 0.5 to 1.0%. In the exptl. bleaching there was greater hydration of the stock at low consistency, because there was no mixing, except at the start and occasionally thereafter to ensure an even penetration of the bleach. Bleaching at high consistency, whether in one stage or in the 2nd stage of a 2-stage bleaching system, had a detrimental effect on the chem. purity of the pulp as measured by the  $\alpha$ -cellulose content. The results of strength detns. carried out on the stock over a period of 2 weeks at various stages of the paper mill processing showed that there is a decided increase in total strength in pumping the slush stock from the pulp mill to the paper mill, a mile away; the other variations in strength were such as might be expected. Comparative strength tests of pulp and of the paper made therefrom in the mill showed that the bursting strength of the pulp undoubtedly had a definite influence on the bursting strength of the paper, any change in the former causing a corresponding change in the latter; the changes in tear and total strength of the pulp bear a somewhat similar relationship to the bursting strength of the paper, though their effect is not so pronounced and regular as that of the Mullen test.

A. PAPINEAU-COUTURE

**Action of sulfite liquor upon Douglas fir.** W. L. BRUSCHLEIN. *Paper Trade J.* 88, No. 19, 66-7 (1929).—Exptl. cooks were carried out on extd. Douglas fir (ground to pass a 60-mesh sieve) with liquors contg. 3.10 and 3.99% total SO<sub>2</sub> and 1.05 and 0.96% combined SO<sub>2</sub>, at 130°, 140° and 150°, and for periods varying from 2 to 11 hr. Comparison of the results with those obtained by Miller and Swanson on white spruce showed that the fir pulp has a lower cellulose content, though less of the original cellulose of the wood is removed from the Douglas fir than from the white spruce. Conclusion Douglas fir is more resistant to sulfite liquor, i. e., more difficult to pulp than is white spruce.

A. PAPINEAU-COUTURE

**Hot acid accumulator.** A. D. MERRILL. *Pulp Paper Mag. Can. International No.*, 101-4 (Feb., 1929); *Paper Trade J.* 88, No. 14, 54-6 (1929).—A discussion of the merits of the Chemipulp Heat, Gas and Liquor Recovery and Cooking Process, in which the acid and gas relieved from sulfite digesters during cooking are absorbed under pressure in hot acid, instead of being cooled before absorbing as is the current practice. The direct advantages claimed are steam saving, increased yield, increased gas recovery with a resultant increase in the strength of the acid. The following indirect savings are also claimed: cooking can be controlled so that a soft easy-bleaching or a modified Mitscherlich pulp can be obtained with a great reduction in screenings; the hot gas recovery eliminates the troubles that most sulfite mills experience with the cold gas recovery during the summer months and assures more uniform acid; it is possible practically to eliminate, by recovery and saving, the blowing of obnoxious gases into the atm.; the strength of the pulp is increased, so that less sulfite is required for furnishing such papers as news print or any other paper that requires a mixt., such as groundwood and sulfite.

A. PAPINEAU-COUTURE

**The so-called copper number of pulps.** J. H. ROSS, H. P. STOCKWELL AND A. C. HILL. *Pulp Paper Mag. Can.* 27, 473-5 (1929).—A brief study of the Cu no. of pulp resulted in the conclusion that the Cu no. is too intimately bound up with the phys.

state of the sample to allow of its use as a quant. test for impurities in fibrous substances.

**The baryta resistance of pulp.** J. H. ROSS AND A. I. DAVIDSON. *Pulp Paper Mag. Can.* 27, 508-9(1929).—On treating pulp with boiling  $\text{Ba}(\text{OH})_2$  soln., max. extn. is obtained with a soln. which is satd. at a temp. of  $25^\circ$  (about 4.5%  $\text{Ba}(\text{OH})_2$ ). The residue obtained by boiling 5 g. of bleached sulfite pulp with 250 cc. of this soln. for 30 min. under a reflux condenser, washing with distd. water, then with  $\text{AcOH}$  and again with distd.  $\text{H}_2\text{O}$ , and then drying, corresponds very closely to the actual  $\alpha$ -cellulose content of the pulp.

**Some aspects of freeness testing.** D. S. DAVIS. *Paper Mill* 52, No. 8, 62, 64, 88 (1929); *Paper Trade J.* 88, No. 11, 60-2(1929).—Previously published data are brought together (*C. A.* 20, 3808; 21, 1710; 22, 4812).

**Chromium-nickel alloys for sulfite equipment.** LEE W. GIBBONS. *Paper Trade J.* 88, No. 19, 61-3; *Paper Mill* 52, No. 19, 24-5, 40; *Pulp Paper Mag. Can.* 27, 715-6, 750(1929).—A brief discussion of some of the salient characteristics of these metals, with suggestions as to how to secure the most satisfactory equipment through a better understanding of the limitations of metals of this description.

**The chemistry of sulfite pulping.** XVI. Pulping beech wood by the sulfite process. ERIK HÄGGLUND AND HELMUT URBAN. *Inst. Holzchem. Akad. Abw. Tech. Chem. Papier Zellstoff- Fabr.* 25, 173-8(1928); cf. *C. A.* 22, 3291, 4801, 4805.—With an ordinary cooking acid (0.88 free and 4.18 total  $\text{SO}_2$ ) beech wood gave yields of 45-50% of a reddish pulp, which consumed 10-12%  $\text{Cl}_2$  in bleaching. The bleaching loss was 3-5%. The strength was surprisingly high for such a short-fibered wood. These data confirm the results of Sembritzki (*Wochbl. Papierfabr.* 45, 2309(1914)) and others. Heuser and Ohlsen (*C. A.* 7, 3022) obtained burned pulps, probably because the very strong acid which they used decomposed spontaneously to  $\text{H}_2\text{SO}_4$ . Deins. of yield,  $\text{SO}_2$ , ash, S and acidity during the pulping show that the behavior is very similar to that of spruce. To obtain good results, it is even more necessary than in pulping spruce that the action be stopped at the proper time. Since the liquor turns dark very early in the cook, the color cannot be used as an end test; the titration test of Sander (cf. *C. A.* 14, 2600) is satisfactory.

**Recovery of soda black liquors.** RAYMOND FOURNIER. *Papeterie Special* No., 228 40(1928).—A discussion of the economic advantage of black liquor recovery, illustrated by means of an example of the recovery of black liquor from the cooking of straw.

**Wood consumption in news print mills.** J. S. BATES. *Paper Trade J.* 88, No. 14, 51-2(1929).—The various factors dependent on the wood (species, size, growth, decay, etc.) are discussed, more particularly to show how yield of pulp per vol. (either cord or 100 cu. ft.) of wood can easily vary 15-20% from one mill to another, while the true comparison of wood consumption on the wt. basis may be favorable. A table is given showing the relative wood consumption per ton of finished news print in 2 mills, the consumption being traced through the various stages of the mfg. process.

**Measurement of wood receipts at the mill.** CHESTER W. ALDEN. *Paper Trade J.* 88, No. 16, 53-6(1929).—An outline of some of the systems of measuring wood receipts in use in Canadian mills, showing the necessity for developing a universally workable wood measurement to correlate mill operations and yields with woodlands operations.

**The tinting and coloring of news print.** E. W. CAMP. *Pulp Paper Mag. Can.* 27, 657; *Paper Mill* 52, No. 14, 24; *Paper Industry* 11, 88(1929).—The methods and the necessary precautions in use are discussed briefly.

**The discoloration of paper.** ANON. *Boll. reg. staz. sper.* No. 2(1929); *Pulp Paper Mag. Can.* 27, 461-4(1929).—Some of the chief factors causing discoloration of fine papers which are intended to be preserved for a considerable length of time are discussed briefly.

**United States patents on paper making issued during the first quarter of 1929.** C. J. WEST. *Paper Trade J.* 88, No. 16, 61-2(1929); cf. *C. A.* 23, 977.—A list of the U. S. pulp and paper patents issued during Jan., Feb. and March, 1929.

**Paper research literature.** VII. C. J. WEST AND B. W. SCRIBNER. *Paper Trade J.* 88, No. 16, 57(1929); cf. *C. A.* 22, 3296.—A list of the contributions by the members of the U. S. Bureau of Standards, Dept. of Commerce, during 1928.

**Research as a commercial enterprise.** R. W. HOVEY. *Paper Ind.* 10, 2145-7 (1929).—Observations on the place of research in the pulp and paper industry.

A. PAPINEAU-COUTURE

Work of the United States Bureau of Standards. ANON. *Paper Mill* 52, No. 15, 20; No. 17, 24(1929); *Paper Ind.* 11, 268-9(1929).—Brief notes are given on recent activities of the paper section of the U. S. Bur. of Standards. A. P.-C.

Paper-making value of wild rice (*Zizania latifolia*). F. HEIM DE BALSAC, H. HEIM DE BALSAC AND A. DEFORGE. *Chimie & industrie Special No.*, 580-2(Feb., 1929).—Wild rice straw, consisting of leaves and sheathes and contg. no nodes, on cooling 4.5 hrs. under a pressure of 3 kg. per sq. cm. with 4° Bé. NaOH soln. (28 g. per l.), gave a light brown pulp which bleached readily with NaOCl soln., the combined yield of unbleached and bleached pulps (in approx. equal amts.) being 38.8%. The paper made from the pulp had fairly good tensile strength, rather poor tearing resistance and medium folding resistance. The unbleached and bleached pulp contained on the dry basis (H<sub>2</sub>O 6.70 and 6.61%, resp.); ash 6.87, 4.88; cellulose 74.25, 90.10; furfural (on the cellulose content) 3.45, 1.66; methoxycellulose present, present; lignin 18.88, 5.02%. The compn. of the ash was: SiO<sub>2</sub> 5.15, 3.80; Al<sub>2</sub>O<sub>3</sub> 4.40, 2.65; CaO 90.45, 93.55%. Wild rice straw soda pulp is considered suitable for paper making for the same uses as ordinary rice straw soda pulp. A. PAPINEAU-COUTURE

Comparison of the Zennström and other processes used at the present time for the production of paper pulp and by-products from maritime pine and other resinous woods. R. RIVIÈRE. *Papier* 32, 289-91(1929).—A brief discussion of the profits to be made by the Zennström recovery process, which consists essentially in recovery of MeOH, rosin, spirits of turpentine, (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> and lignin by a distn. of the black liquor, the details of which are not disclosed. A. PAPINEAU-COUTURE

Conductivity and hydrogen-ion measurements. W. N. GREER. *Instruments* 2, 209-12(1929).—Suggestions for the use of electrometric app. for studying, and possibly controlling, processes in the pulp and paper industries. J. H. MOORE

Conductivity measurements. W. N. GREER. *Paper Mill* 52, No. 19, 12, 37 (1929).—Results of preliminary expts. indicating the practicability of cond. measurements for controlling the sulfite cooking process and the washing of chem. pulp. A. PAPINEAU-COUTURE

Manufacture of sensitized papers for photography, plans and tracing. ANON. *Papeterie Special No.*, 29-30(1928).—Formulas and mfg. directions are given for neg. blue-print and brown-print papers, pos. white-print paper, ferrocyanide paper, post cards and note paper sensitized with Cr salts, and tracing paper. A. P.-C.

The manufacture of greaseproof paper. PAPYRO. *Papeterie Special No.*, 81-4 (1928).—Practical directions are given. A. PAPINEAU-COUTURE

Composition of the commoner grades of paper. A. RETTORI. *Papeterie Special No.*, 299-355(1928); cf. C. A. 18, 1907.—The more usual compns. of a large no. of printing, wrapping, tissue, writing, greaseproof, banknote, photographic and specialty papers and cardboards are given. A. PAPINEAU-COUTURE

The manufacture of cigaret papers. J. ODDON. *Paper Trade J.* 88, No. 15, 51-6 (1929).—See C. A. 22, 685. A. PAPINEAU-COUTURE

Recipes for paper and pasteboard. K. G. JUNG. *Paper Ind.* 11, 279-81(1929).—A no. of processes for making paper and pasteboard impervious to moisture or fats are briefly described. A. PAPINEAU-COUTURE

Light-sensitivity of artists' drawing and water-color papers. ERNST TAUBER. *Chem.-Ztg.* 53, 449(1929).—Having reported 3 years ago that artists' papers of German make turned brown upon exposure to light, while Whatman's papers did not, and not having been able to secure improved German papers meanwhile, T. sized some filter paper with glue and with gelatin, and used this home-made drawing paper successfully. The expts. confirmed his belief that the trouble with German papers is due to sizing with resins. W. C. EBAUGH

Paper mill made bleach and caustic soda. J. E. PLUMSTEAD. *Paper Trade J.* 88, No. 11, 59(1929).—Figures are given showing the high return on investment (up to 92%) obtainable from an electrolytic bleach-plant installation in a pulp and paper mill, particularly if the mill is making soda pulp so that the NaOH can be used to supply the make-up soda requirements of the recovery department, but also in connection with sulfite mills where the NaOH can be used (if there is no outside market for it) for the prepn. either of the bleach or of the cooking liquor. Ordinarily, a plant having a capacity of less than 10,000 lbs. per day of 35% bleach would not be recommended. A. PAPINEAU-COUTURE

Losses in pulp and paper mills. W. G. MACNAUGHTON. *Pulp Paper Mag. Can. International No.*, 359-62(Feb., 1929).—A discussion of white water waste, barking drum refuse, pulp screenings, losses through inefficient use of steam and losses in chem. pulp mills. A. PAPINEAU-COUTURE

Chlorine for slime in paper mills. W. L. SAVELL. *Paper Mill* 52, No. 16, 24-6

(1929).—A discussion of the merits of the use of Cl in eliminating slime troubles in pulp and paper mills, giving examples of a no. of mills where it is used successfully for this purpose. A. PAPINEAU-COUTURE

Comments on the design and operation of paper pulp plants. E. G. MILHAM. *Paper Mill* 52, No. 11, 5, 6, 10, 12(1929).—A general discussion of various methods of working up of waste paper stock. A. PAPINEAU-COUTURE

Recording instruments. J. H. FERGUSON. *Paper Mill* 52, No. 15, 18, 23(1929).—A brief discussion of the application of recorders on washers, beaters, jordanans and paper machines. A. PAPINEAU-COUTURE

Temperature of bleaching vs. strength of fiber. WILFRED V. TORREY. *Paper Ind.* 11, 248-9(1929).—The results obtained showed that varying the temp. of bleaching from 25° to 50° had practically no effect on the bursting and tearing strength of the bleached fiber. A. PAPINEAU-COUTURE

Beating. III. Direct measurement of the water of imbibition of [paper] stuff. M. NAKANO. *Cellulose Ind.* (Tokyo) 4, 300-4(1928).—No difference in the water content of sheets made of the stuff whether boiled or unboiled, after pressing them at 20°, was noted. The water of imbibition is very small, and is therefore difficult to det. by any pressing method. B. C. A.

Beating under control. A. B. GREEN. *Paper Trade J.* 88, No. 15, 57-8(1929).—The Green beater drag was developed with a view to controlling the action of the beater by measuring the change which it effects in the stock instead of by measuring the adjustment of the beater roll, as is current practice. The instrument consists of a specially shaped object of smooth surface immersed to a given depth in the stock; the amt. of power required to rotate it at const. speed under known temp. and consistency conditions is measured; it has recently been improved and simplified by replacing the recording wattmeter by a torsion dynamometer and designing it so that it can be bolted to the curb of the beater instead of spanning the tub from the midfeather to the curb. Results obtained in com. beater runs are given to show the accuracy and sensitiveness of the instrument. A. PAPINEAU-COUTURE

The Delthirna sizing process. R. DE SAINT HILAIRE. *Pulp Paper Mag. Can.* 27, 691-3, 706(1929).—Application in mill operations of the process, which consists essentially in treating lump rosin with a dil. NaOH soln. (about 15 g. per l.) at not less than 15°, has shown that it automatically gives a size soln. of practically const. compn. without requiring any attention other than filling the rosin towers; superior sizing is obtained with an approx. 20% lower rosin consumption. A. PAPINEAU-COUTURE

Control of sizing material losses. E. FRANK WHITTINGTON. *Paper Ind.* 11, 68-72(1929).—An investigation carried out to trace the source of a considerable discrepancy between the size and alum consumption of a mill as obtained from purchases and inventories, on the one hand, and from beater room reports, on the other, showed that the discrepancy was attributable to carelessness and inaccuracy in measuring solns. going into the beater. A. PAPINEAU-COUTURE

Modified washing system for old papers. W. K. KIDDER. *Paper Mill* 52, No. 12, 20-3; *Pulp Paper Mag. Can.* 27, 531-3(1929).—The following system is operating successfully, at a decrease in cost over the usual process, and is giving cleaner, brighter stock: the stock is sorted, dusted, run through a hog, blown into the cookers and cooked about 3 1/2 hrs. with 3% NaOH, the cookers being provided with agitators and with a centrifugal pump to ensure circulation; the cooked stock is dumped into an agitator-equipped storage tank, passed into a hollander washer where water is added to bring it to the required consistency, pumped to a metering box whence it flows by gravity into a series of riffle boxes where pins, paper clips, rubber, etc., settle out, then to flat screens where the final screening takes place, and to a thickener consisting of a rectangular screen 30 ft. long by 12 ft. wide, set at an angle of 45° and covered with fourdrinier wire; the thickened stock is washed by passing through a conical cylinder 25 ft. long, 4 ft. in diam. at the inlet and 6 ft. in diam. at the discharge end, covered with 80 mesh wire and revolving at 4 r. p. m., the whole of the ink being removed in the approx 20 min. required for the stock to pass through the cylinder; the washed stock passes to a bleaching tank where it is mixed with bleach contg. about 18 g. per l. of available Cl, requires about 3-4 hrs. to pass through the tank, coming out at the desired color and brightness, is washed and finally sent to the beater storage chest. and leaves (Brit. pat. 301,226) **25**. Coloring paper (U. S. pat. 1,719,159) **29**. Paper pulp [from sugar cane] (Fr. pat. 655,163) **28**.

**Manufacture of Pulp and Paper, Vol. V.** 2nd ed., revised and enlarged. Prepared under direction of the Joint Executive Committee on Vocational Education of the American and Canadian Pulp and Paper Industry. New York: McGraw-Hill Book Co. \$6. Reviewed in *Mech. Eng.* **51**, 560(1929).

**Cellulose.** OTTO C. STRECKER. Fr. 655,483, Jan. 12, 1927. See Brit. **284**,846 (C. A. **22**, 4815).

**Cellulose solutions.** HERMINGHAUS & CO. G. M. B. H. Fr. 655,649, June 12, 1928. Cellulose is cut up by a single passage through a cutting machine, or is treated for only a short time in a disintegrator and then xanthogenated or dissolved in the usual way; formation of cellulose sol. in alkalis is thereby avoided.

**Artificial fibers.** I. G. FARBENIND. A.-G. (Emil Hubert, Otto Leuchs and Ludwig Lock, inventors). Ger. 477,066, Oct. 19, 1924. The products obtained by spinning acidyl celluloses into salt solns. contg. a solvent or swelling agent for the acidyl cellulose are improved by superposing on the pptg. bath a liquid, such as paraffin oil, which does not mix with the bath and which is a nonsolvent for the acidyl cellulose.

**Artificial fibers.** I. G. FARBENIND. A.-G. Fr. 655,511, June 8, 1928. In unwinding artificial fibers spun in a centrifuge, a hollow rubber or like balloon is inserted into the centrifuge and blown up to form a support for the thread.

**Cellulosic pulp.** ROBERT A. MARR. U. S. 1,717,794, June 18. Cellulosic material such as white birch chips is cooked under pressure and at near the b. p. of the soln. used at the pressure employed, with a soln. contg. as its principally dissolved component a sulfate such as  $\text{Na}_2\text{SO}_4$  and which is free from substantial quantities of sulfide, sulfite and hydroxide, until the interstitial matter is rendered readily crushed and the material is then reduced to a pulp. U. S. 1,717,795 specifies a similar process in which a soln. contg. 0.05–0.2% of sulfates such as  $\text{Na}_2\text{SO}_4$  and  $\text{MgSO}_4$  is used. U. S. 1,717,796 specifies use of a cooking soln. contg. sulfates of Mg and K together with a chloride such as  $\text{MgCl}_2$ . U. S. 1,717,797 specifies rendering the interstitial matter readily friable by cooking in a 1–5% soln. of a salt such as  $\text{NaCl}$  and a sulfate and then pulping by mech. treatment. U. S. 1,717,798 specifies boiling in a dil. aq. soln. of a nitrate such as  $\text{NaNO}_3$  and then soaking in water and mech. pulping. U. S. 1,717,799 relates to sheets formed of cellulosic fibers and assocd. plant material such as are produced by similar processes. U. S. 1,717,800 specifies digesting cane material in a soln. of alkali metal sulfate and  $\text{ZnSO}_4$  to obtain a product which may be used for making brushes, burlap, cordage, etc.

**Drying cellulose films in long lengths, etc.** WOLFF & CO. and R. WEINGAND. Brit. 300,496, Nov. 12, 1927. To avoid tensioning, the cellulose films or like material are passed over drying rollers which are heated and which are rotated by the film itself.

**Recovery of heat and chemicals in the treatment of spent liquor from digestion of cellulosic materials.** GEORGE A. RICHTER and WALLACE B. VAN ARSDEL (to Brown Co.). U. S. 1,719,130, July 2. Gases from the smelting and combustion of spent liquor material resulting from the digestion of cellulosic material with  $\text{Na}_2\text{SO}_4$  or other reagents are passed periodically through one mass of tile, brick or rock or other inert interstitial material and then through another similar mass, thus causing a condensation of water vapor present and formation of a soln. of sol. compds. in the condensate, this soln. is recovered and used for the prepn. of fresh digesting liquor, and heat transfer from one mass of the inert material is effected while the gases are being passed through the other. An app. is described.

**Treating waste liquors from digestion of cellulosic materials.** GEORGE A. RICHTER (to Brown Co.). U. S. 1,719,129, July 2. Liquors—such as those produced by the digestion of wood with a soln. contg.  $\text{Na}_2\text{SO}_4$  and  $\text{SO}_2$  are concd. and the inorg. material is smelted in a reducing atm. and an aq. soln. is prepd. from the smelted product for alk. digestion of raw cellulosic material. An app. is described.

**Treating cellulose to increase its reactivity.** ZELLSTOFFFABRIK WALDHOF, V. HOTTENROTH and O. FAUST. Brit. 301,088, Nov. 24, 1927. Cellulosic material such as air-dried bleached sulfite cellulose is satd. with caustic alkali soln. (suitably a 12% soda lye) and subjected to a ripening process.

**Cellulose derivatives.** ERNEST MULLER. Fr. 655,279, April 27, 1927. In making films, etc., from cellulose derivs., particularly cellulose hydrate regenerated from viscose, a supplying agent such as glycerol or glucose is incorporated in the film, etc., only during the course of or towards the end of the drying.

**Cellulose esters.** KODAK-PATHÉ (SOC. ANON. FRANÇAISE). Fr. 655,803, May 3, 1928. Hydrated or partially hydrated cellulose is esterified by a monocarboxylic acid contg. an ethylenic side chain by heating them together to a temp. below that at which a harmful degradation of the cellulose takes place. Examples are given of esterification with crotonic, cinnamic and undecylenic acids, substances such as PhCl being added to lower the b. p.

**Delustering articles of cellulose esters or ethers.** SOC. POUR LA FABRICATION DE LA SOIE RHODIASETA. Fr. 655,435, June 6, 1928. Articles such as films, threads or cloth made of cellulose derivs. are delustered by treatment with an emulsion or suspension in water of swelling or solvent agents for cellulose derivs. at a temp. below boiling. Suitable swelling agents are cyclohexanone, cyclohexanol, di- and tri-acetins, Me phthalate, AcOAm, anisol, phenetole, nitrobenzene, etc. The agents may be emulsified by means of soap.

**Use of liquid sulfur dioxide in making cellulose esters.** I. G. FARBENIND. A.-G. Brit. 301,036, Nov. 23, 1927. Liquid  $\text{SO}_2$  is used as a vehicle in various esterification processes in which acid anhydrides or acid halides may be used, as in making cellulose acetate or cellulose butyrate. The  $\text{SO}_2$  can be sepd. from the esters by distn.

**Cellulose ethers.** LEON LILIENFELD. Ger. 477,154, May 22, 1912. See Brit. 6,035, 1913 (C. A. 8, 2947).

**Mixed esters and ester-ethers of cellulose.** I. G. FARBENIND. A.-G. Brit. 300,942, May 12, 1927. A cellulose ester or ether contg. reactive OH groups, such as "commercial" cellulose acetate or ethyl cellulose, swollen or dissolved in an org. solvent, is treated with an inorg. acid chloride in the presence of an acid-binding agent (other than pyridine), such as an org. base,  $\text{NH}_3$ , MgO or a carbonate. Radicals of silicic acid, phosphoric acid, phosphorous acid, sulfuric acid, antimonious acid, etc., may be introduced, and by the use of mixed acid anhydrides such as boroacetic acid anhydride and lauric-myristic acid anhydride, mixed esters of const. compn. may be formed. Numerous details are given. Products suitable for *films, lacquers, artificial threads*, etc., are obtained.

**Cellulose acetate.** J. W. BULMER. Brit. 300,824, Jan. 2, 1928. See U. S. 1,692,-622 (C. A. 23, 704).

**Cellulose coating compositions.** W. H. Moss (to British Celanese, Ltd.). Brit. 301,497, Dec. 1, 1927. Naphthalene is used as a plasticizer in coating compns. contg. cellulose esters or ethers and a volatile solvent; they may contain synthetic or natural resins and various other modifying ingredients.

**Apparatus for making transparent films from viscose or cellulose cuprammonium solutions.** C. RUZICKA. Brit. 300,477, May 15, 1928.

**Transparent signs, etc., of cellulosic material.** ALBERT SCHWARZ. U. S. 1,717,738, June 18. Meshes of wire cloth are filled with translucent material, the filled sheet is coated with translucent pigmented material and when the coating is dry it is printed with a second pigmented coating; while the latter is tacky an opaque powder which does not adhere to the first coating is applied.

**Glucose.** THE COMMERCIAL ALCOHOL CO., LTD. Fr. 656,384, June 23, 1928. Cellulosic substances are disintegrated by means of concd. acid, e. g., HCl; the formation of sugar is avoided by using a temp. below  $70^\circ$  and the soln. of cellulose thus obtained is saccharified by treating with steam. An app. is described. Fr. 656,385 describes the use in the same app. of gaseous HCl at temps. below  $0^\circ$  without formation of a paste, followed by saccharification with steam.

**Removing knots from mechanical or chemical wood pulp.** AXEL C. ANDERSEN and ARNE SCHIE. U. S. 1,718,399, June 25. An app. is described.

**Nitrocellulose.** I. G. FARBENIND. A.-G. Brit. 300,551, Nov. 14, 1927. A product of good homogeneity and soly. in alc. is formed by a 2-stage process; in the first stage nitration is effected and in the second stage the soly. of the product in alc. is increased and its N content decreased by heating with water under pressure to above  $100^\circ$ . Brit. 300,552 relates to a similar process.

**Nitrocellulose viscosity reduction, etc.** M. G. MILLIKEN (to Hercules Powder Co.). Brit. 301,267, Feb. 23, 1928. Nitrocellulose and water are forced together under pressure and at considerable velocity through an app. comprising a long narrow passage such as a pipe coil. Various features of the app. are described. The treatment reduces the viscosity and increases the stability and purity of the material.

**Artificial silk.** J. P. BEMBERG A.-G. Brit. 300,572, Nov. 15, 1927. In the manuf. of artificial silk from ammoniacal-Cu-cellulose solns. by a stretch-spinning process in which a circulating pptg. liquid is used, a portion of the liquid is withdrawn

and freed from Cu and  $\text{NH}_3$  in an amt. proportionate to the Cu and  $\text{NH}_3$  added to the bath by the pptn. process.

**Artificial silk.** J. P. BEMBERG A.-G. Brit. 300,896, Nov. 19, 1927. In prepg ammoniacal Cu cellulose solns. for artificial silk manuf., the use of an excess of  $\text{NH}_3$  is avoided by dissolving the cellulose as far as possible with the necessary quantity of solvent and then treating the cellulose mechanically to reduce the size of its particles. The half-prepd. soln. may be filtered through material such as sand.

**Artificial silk.** NAAMLOOZE VENNOOTSCHAP NEDERLANDSCHE KUNSTZIJDEFABRIEK. Brit. 301,017, Nov. 23, 1927. A sized "acetate silk" is obtained directly by the dry-spinning method by adding to the spinning soln. a small proportion of oils or fats such as olive oil, olein, coconut oil, butter fat, beef suet, lard, bone oil or peanut oil.

**Artificial silk.** I. G. FARBENIND. A.-G. Fr. 655,565, June 9, 1928. Artificial silk obtained by centrifugal spinning is given all the necessary treatments for purification, etc., on bobbins of variable diam. or elastic inserted into the spinning pot.

**Artificial silk.** THE NUERA ART-SILK Co., LTD. Fr. 655,519, June 8, 1928. In spinning artificial threads or filaments the spinning is carried out in such a way that the friction arising between the threads and the bath causes a stretching of the threads, *e. g.*, the threads are led through narrow grooves in the spinning bath.

**Artificial silk.** HERMINGHAUS & Co., G. M. B. H. Fr. 655,729, June 14, 1928. Articles made from viscose are desulfurized by substances which exert no or very little swelling action on the articles, and contg. little water. Examples are  $\text{PhOH}$ , crystd.  $\text{Na}_2\text{S}$  in alc., pyridine, glycerol in  $\text{MeOH}$ , or glucose in alc.

**Artificial silk.** HERMINGHAUS & Co., G. M. B. H. Fr. 656,240, June 22, 1928. A viscose artificial silk which is resistant to water is obtained by submitting the thread, more or less coagulated, to an energetic mech. treatment by appropriate means, exerting a friction or tension thereon, *e. g.*, passing it backwards and forwards through an instrument like a comb.

**Spinning artificial silk.** HENRY DREYFUS. Fr. 656,068, June 18, 1928. Valve for controlling the amt. of soln. supplied to the spinning nozzles.

**Spinning artificial silk.** I. G. FARBENIND. A.-G. Fr. 655,468, June 7, 1928. In "pot" spinning artificial silk the threads are given an initial twist in the pot and receive a final twist in a 2nd operation on exit from the pot.

**Apparatus for making artificial silk.** I. G. FARBENIND. A.-G. Brit. 300,581, Nov. 15, 1927. Structural features of spinning nozzles, guides, reels, etc.

**Nozzles for making artificial silk.** H. COLOMB. Brit. 301,080-1, Nov. 25, 1927. Structural features.

**Apparatus for dry-spinning of artificial silk filaments.** SOC. POUR LA FABRICATION DE LA SOIE RHODIASETA. Brit. 300,672, Aug. 10, 1927. A soln. of cellulose acetate or the like is heated before extrusion and a cold evaporative atm. is introduced into the cell adjacent the extrusion nozzles and in such a manner that it moves in the same direction as the filaments.

**Apparatus for making artificial silk by the dry-spinning method.** A. E. GULL. Brit. 301,141, Sept. 14, 1927. The current of air or gas with which the extruded filaments are treated passes through the treating chamber in contact with the filaments in the same direction as the filaments and has a greater velocity at the exit than at the point of entry. Various structural details are described.

**Apparatus for dry-spinning of artificial silk.** BRITISH CELANESE, LTD., E. KINSELLA, J. BOWER, W. I. TAYLOR and H. DREYFUS. Brit. 300,998, May 23, 1927. Various structural features are described, designed to facilitate full evaporative effect of the air or other gaseous medium used adjacent the spinning nozzles.

**Apparatus for making artificial silk by a stretch-spinning process.** J. P. BEMBERG A.-G. Brit. 300,953, Nov. 21, 1927. Structural features.

**Spinning viscose.** JACQUES C. HARTOGS. Ger. 477,312, May 27, 1924. Viscose is spun into acid baths contg. a small quantity, *e. g.*, 1%, of a ferric salt, with or without other salts. A suitable bath contains  $\text{H}_2\text{SO}_4$  9,  $\text{Na}_2\text{SO}_4$  16,  $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$  30,  $\text{Fe}_2(\text{SO}_4)_3$  1 and  $\text{H}_2\text{O}$  45 parts by wt.

**Viscose threads and films.** O. KOHORN & Co. and A. JÄGER. Brit. 301,305, Nov. 26, 1927. Keratin- or glutin-contg. substances, or their decompn. products, are added to the coagulation baths used.

**Paper, etc.** C. DREYFUS and G. W. MILES (to British Celanese, Ltd.). Brit. 301,428, Nov. 29, 1927. Paper pulp is mixed with hydrated cellulose acetate or other suitable cellulose deriv., preferably in the form of fibers; thermoplastic water resistant sheets are formed from the mixt. Various solvents, plastifiers and other modifying ingredients may be added to the compn.

**Coated paper for shop window signs, etc.** H. C. MITCHELL. Brit. 300,303, Aug. 10, 1927. A coating which is removable with a clean fracture by use of a dry pen, pencil or stylo may comprise paraffin with an overlying coating of colored shellac or like compn.

**Gummed paper.** WM. W. MCLAURIN. U. S. 1,719,712, July 2. Paper is coated on one face with a water-sol. adhesive and the latter is protected by a coating of soap.

**Metallized paper.** MOTTALL G. M. B. H. Ger. 477,163, Sept. 21, 1924. Bronze powder is dusted on to sheet paper coated with a binder comprising stearin pitch and wax.

**Impervious paper board.** GEORGE H. ELLIS. U. S. 1,717,878, June 18. A web of absorbent non-adhesive stock is first applied to the felt of a cylinder paper machine and on this there is then deposited an impervious adhesive web contg. liquid bituminous material and another web of pervious stock over the adhesive layer; the webs are compressed and dried together to form a multi-ply board suitable for making boxes. An app. is described.

**Paper, boxboard and like material.** FRED B. WELLS (to Ohio Boxboard Co.). U. S. 1,718,096, June 18. After deposition of a layer of pergameneous material, excess water is withdrawn from the layer, an overlying layer of similar material is deposited on the first layer, and over these two layers there are deposited layers of filler material to provide the desired thickness, excess water is removed and the composite web is treated in a usual manner to form a finished product.

**Finishing mineral coated paper.** DONALD B. BRADNER (to Champion Coated Paper Co.). U. S. 1,719,166, July 2. Paper such as that coated with mineral filler is contacted, while the coating is in plastic condition, with a solid non-adhering surface having a finish substantially the same as that desired on the mineral-coated paper; the coating is rendered non-plastic, as by drying or cooling, and is then sepd. from the assoc. solid surface (which may be formed of Cr, Monel metal or rubber).

**Composition for coating carbon paper, etc.** HAROLD W. A. DIXON. U. S. 1,718,949, July 2. An app. and various treatments are described for prepg. a colloidal compn. of oil and wax, in successive batches.

**Thickening paper pulp.** ANTON J. HAUG and RICHARD J. HAUG. U. S. 1,717,604, June 18. Mech. features.

**Paper-making apparatus.** PAPER PATENTS CO. Brit. 301,287, June 22, 1928. Mech. features.

**Paper-drying apparatus with roll doctors.** JOHN E. ALEXANDER (to Minton Vacuum Dryer Corp.). U. S. 1,719,793, July 2. Various structural features are described.

**Forming and drying continuous sheets of paper.** WM. H. MILLSPAUGH (to Paper & Textile Machinery Co.). U. S. 1,718,573, June 25. An app. is described.

**Forming multi-ply paper sheets in continuous lengths.** WM. H. MILLSPAUGH. U. S. 1,718,574, June 25. App. is described.

## 24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE

**Firedamp and its detection.** HEYER. *Z. ges. Schiess- u. Sprengstoffw.* 24, 164-9 (1929).—A discussion of the sources, occurrence in mines, properties and chem. methods for the detection and detn. of  $\text{CH}_4$ . A large proportion of gas explosions in mines have resulted from use of the Davy "Safety Lamp" and similar app. intended for the detection of  $\text{CH}_4$ . Several modern types of  $\text{CH}_4$  detectors are described. C. G. STORM

**The vapor pressure of glycerol trinitrate and certain glycerol dinitrates.** WILLARD DE C. CRATER. *Ind. Eng. Chem.* 21, 670-2 (1929).—Detns. were made of the vapor pressures of glycerol trinitrate, ethylene glycol dinitrate, diethylene glycol dinitrate, propylene glycol dinitrate and trimethylene glycol dinitrate, all prepd. in a high state of purity, by the method of Baxter, Hickey and Holmes. Their ester detns. were made over a temp. range from 15° to 55°.

CHARLES E. MUNROE

**The vapor pressure of nitroglycerin and nitroglycol.** P. NAOUM and K. F. MEYER. *Z. ges. Schiess- u. Sprengstoffw.* 24, 88-90 (1929).—Detns. by a static method at 20° gave for nitroglycerin 0.009 mm. Hg, and for nitroglycol 0.030 mm. Hg; by an aspirator method the results were 0.011 and 0.035 mm., resp., at 20°; 0.036 and 0.115, resp., at 35°. Both methods are described in detail. In the latter method, rapid aspiration must be avoided or the result will be too low. The comparative volatilities of the 2

substances on exposure to air under equal conditions do not agree with the difference between their vapor pressures, nitroglycerin being much more volatile than nitroglycerin. Equal vols. were exposed at room temp. in open dishes 75 mm. in diam. In 2 days nitroglycerin lost 0.0136 g., nitroglycerol 0.0816 g.; in 21 days the resp. losses were 0.0300 g. and 2.6046 g. No explanation is suggested for this marked difference. C. G. STORM

Vapor pressures of nitroglycerin and nitroglycerol. A. MARSHALL. *Z. ges. Schiess u. Sprengstoffw.* 24, 177(1929).—The aspirator method used by Naoum and Meyer, (preceding abstract) gives higher results than the static method of collecting and weighing the volatilized nitroglycerin, because  $H_2O$  and other volatile impurities are driven off by the air current. M.'s tests do not substantiate the claim of N. and M. that different velocities of air current give different values for vapor pressure. C. G. S.

Vapor pressures of nitroglycerin and nitroglycerol. P. NAOUM AND K. F. MEYER. *Z. ges. Schiess- u. Sprengstoffw.* 24, 177(1929).—Contrary to the assumption of Marshall (cf. preceding abstr.), the samples used were carefully purified and dried *in vacuo*, and therefore contained no volatile impurities. Also, the claim that vapor-pressure results are independent of the velocity of the air current is contrary to the published conclusions of other investigators. C. G. STORM

Determination of stability of smokeless powder and guncotton by measurements of hydrogen-ion concentrations. N. L. HANSEN. *Förh. III Nord. kemistmötet* (Finland) 1926, 227–30(1928).—A method for determining the stability of explosives of the nitrocellulose class has been devised based on the formation of acid when the explosive undergoes slow decompn. The material (in the case of smokeless powder, after sifting to obtain grains of 0.35–0.8 mm. diam.) is dried *in vacuo* at 40° for 8 hr., or in the case of guncotton, until the water content is less than 1%. 5 g. of smokeless powder or 2.5 g. of guncotton is weighed out into each of nine glass cylinders, closed by rubber stoppers carrying a capillary tube and stopcock. Eight of the cylinders are placed in a  $CaCl_2$  bath, heated at 110°, and after immersion for 15 min. any condensed moisture is removed. One cylinder is removed each hour, filled with distilled water (free from  $CO_2$ ) after cooling, and the  $p_H$  value of the soln. detd. at once without previous filtration, using a quinhydrone electrode; the  $p_H$  value of the ninth (unheated) sample is similarly detd. The results are plotted, using  $p_H$  values as ordinates and the times of heating in hours as abscissas, the curves obtained indicating the relative stability of the material under examn. Expts. show that in respect to the decompn. of the explosive, 8 hrs. heating under the above conditions correspond to upwards of 30 years' magazine storage at 10°. B. C. A

Explosive priming composition. JOSEPH D. McNUTT (to Winchester Repeating Arms Co.). U. S. 1,718,370, June 25. A fulminate such as that of Hg is used with a metal dioxide such as  $BaO_2$  and a silicide such as that of Ca which together form a non-corrosive priming compn.

Mercury fulminate. JOSEPH D. McNUTT (to Winchester Repeating Arms Co.). U. S. 1,718,371, June 25. Hg fulminate is freed from elemental Hg by heating (suitably at 60° for 16 hr.).

Granular gunpowder coated with a film of nitrocellulose. H. E. ELLSWORTH (to Imperial Chemical Industries, Ltd.). Brit. 300,611, Nov. 16, 1927. The nitrocellulose coating retards the rate of combustion, and the powder is suitable for safety fuses.

Binder for priming compositions for explosives. LAWRENCE W. JORDAN (to Winchester Repeating Arms Co.). U. S. 1,718,358, June 25. A metallic caseinate such as Na caseinate is used as a binder with Hg fulminate compns. or similar priming substances.

Explosive toy bombs molded in the form of fruits. E. GREENHALGH. Brit. 301,219, Dec. 19, 1927. Structural features.

Igniting tip for cigars and cigarets. JUAN E. ANCHONDO. U. S. 1,719,794, July 2. A material for igniting tips comprises an alkali metal chlorate, tinder and a non-combustible filler such as clay and is adapted to burn by forming a live coal without flaring into a flame.

Nitroglycerin, etc. F. E. SMITH, A. P. H. DESBOROUGH, W. T. THOMSON, W. LEDBURY and E. W. BLAIR. Brit. 301,112, Aug. 26, 1927. Glycerol or similar compds. are nitrated by a process in which the heat of reaction evolved is absorbed in 2 or more stages. The first stage may be carried out with  $HNO_3$  and little if any  $H_2SO_4$  and most or all of the  $H_2SO_4$  may be used in the second stage.

Preventing explosions in liquid-air apparatus. ROBERT G. AUBERT. U. S. 1,717,540, June 18. Air contg. an admixt. of combustible gases such as  $C_2H_2$  is subjected to a sufficiently low temp. to cause liquefaction of the air and solidification of the combus-

tible gases; the solidified combustible substances are then sepd. from the liquid air by filtration at a point in the system where the temp. is lowest, before the liquid air reaches the O zone of the app.

## 25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

**A study of the soluble lakes of aurintricarboxylic acid.** WALTER E. THRUN. *J. Phys. Chem.* **33**, 977–83 (1929).—The sol. Al lake was produced by mixing various concns. of  $\text{AlCl}_3$  and  $\text{NH}_4$  aurintricarboxyate; the resultant equil. concn. of the sol. lake was detd. at  $\text{pH} = 7.0$  colorimetrically. "Free" aurin is that part of dye not adsorbed by alumina, and "free" alumina is that part of alumina which has not adsorbed any dye. Results indicate:  $K = [\text{free Al}_2\text{O}_3][\text{free aurin}]/[\text{total Al}_2\text{O}_3][\text{lake}]$ . Similar results are obtained with  $\text{FeCl}_3$ ,  $\text{FeCl}_2$  and  $\text{CrCl}_3$ . The reaction with titanilic sulfate indicates existence of two different kinds of lakes of the dye. A. P. SACHS

**Black chrome dye from aminodisulfobenzoic acid.** V. G. GULINOV. *J. Chem. Ind. (Moscow)* **6**, 432–3 (1929).—Having previously shown (*C. A.* **22**, 3648) that aminosalicylic acid can easily be prepd. from nitrososalicylic acid, G. now utilizes the process for the manuf. of the tri-Na salt of 6-hydroxy-3-[4-(2-hydroxynaphthylazo)naphthylazo]-2,4-disulfobenzoic acid, which is a black chrome dye intended to replace the diamond black dyestuff which is at present used in Russia for dyeing wool. The product of sulfite reduction of nitrososalicylic acid is, before further treatment, sepd. from the soln. by acidifying the latter by HCl, boiling the soln. to drive off  $\text{SO}_2$ , and then cooling. After 24 hrs.' standing  $2,4,3,6\text{-(HO}_2\text{S)}_2\text{(H}_2\text{N)(HO)C}_6\text{HCO}_2\text{H}\cdot 2\text{H}_2\text{O}$  is filtered; the  $2\text{H}_2\text{O}$  of crystn. can be eliminated by heating at  $103\text{--}5^\circ$ . A soln. of 37.1 g. of the sulfo acid and 10.6 g.  $\text{Na}_2\text{CO}_3$  in 2 l.  $\text{H}_2\text{O}$  is cooled to  $7\text{--}10^\circ$ , acidified by concd. HCl and diazotized with a 20% soln. of 7 g.  $\text{NaNO}_2$ . On acidifying, the acid salt of aminodisulfo acid seps., redissolves in the soln. with a yellow-brown coloration and, after cooling to  $3\text{--}5^\circ$ , is then, treated by a thin stream of a soln. of 14.3 g.  $\alpha$ -naphthylamine in the equiv. quantity of HCl and the necessary quantity of  $\text{H}_2\text{O}$ . After stirring for 1.5 hr., the mixt. is gradually treated with  $N$  NaOAc to weakly acid reaction. After 24 hrs.' standing, the mixt. is acidified by HCl and heated to  $50\text{--}60^\circ$  in order to free the aminoazo dye obtained from unchanged  $\alpha$ -naphthylamine; then the dye is filtered. The paste obtained is dissolved in a soln. of 10.6 g.  $\text{Na}_2\text{CO}_3$  in 2 l.  $\text{H}_2\text{O}$ , the soln. is cooled to  $0^\circ$  by ice, acidified by HCl and diazotized with a 20% soln. of 6.8 g.  $\text{NaNO}_2$ . The diazotation is continued about 3 hr., the diazonium compd. is poured in a thin stream into an alk. soln. of 14.4 g.  $\beta$ -naphthol, which has also been cooled to  $0^\circ$ . However, it is best first to filter off the diazo compd. and introduce it in form of paste into the  $\beta$ -naphthol soln. The diazonium compds. having been introduced, the alk. soln. is maintained for 1 hr. at  $3\text{--}5^\circ$ , then warmed to  $30\text{--}35^\circ$  and let stand 24 hr. The diazo dyestuff is salted out at  $80\text{--}83^\circ$  with 18% salt and is then filtered. The dyeing is carried out thus: The bath is made up with 20% Glauber salt, 3% AcOH and 5% of the dyestuff and brought to boiling during 30 min. The dyeing takes place in the boiling bath for 30 min., then 5% AcOH is added and the boiling is continued another 30 min. After cooling to  $70^\circ$ , 1% dichromate is introduced and the chromation is continued 1 hr. in the boiling bath. Wool is thus dyed black with a slightly violet shade. The dye is as fast to light, washing, perspiration, water, alkalies, etc., as the diamond black, and is even somewhat more fast toward rubbing. In a similar manner, but with  $p$ -cresol instead of  $\beta$ -naphthol, the dyestuff  $2,5\text{-HOMeC}_6\text{H}_2\text{N}_2\text{C}_{10}\text{H}_6\text{N}_2\text{C}_6\text{H(OH)(SO}_2\text{H)}_2\text{CO}_2\text{H}$  was prepd.; it dyes wool in a brown-black shade. BERNARD NELSON

**Manufacture of  $\beta$ -naphthol.** A. BUNTROCK. *Z. Farbenind.* **20**, 218–9 (1929); cf. *C. A.* **22**, 4823. F. C. HAHN

**Action of light on diazo derivatives and on azo dyes.** A. SEYEWETZ and D. MOUNIER. *Chimie & industrie Special No.*, 513–8 (Feb., 1929); cf. *C. A.* **22**, 2373.—Previously reported work on diazo derivs. is given in greater detail. The action of light on chrysoidine (yellow, basic, monoazo dye), diamine pure blue 2B (diamino acid dye) and roccellin (hydroxyazo acid dye) was studied under the same conditions as for the diazo derivs., leading to the following conclusions: (1) Decolorizing of azo dyes by ultra-violet light is apparently due to an oxidation, as it is increased in presence of oxidizing agents and decreased in presence of reducing agents. (2) The oxidation products obtained by the action of  $\text{H}_2\text{O}_2$  give various color reactions comparable to those given by the decompn. products of the dyes under the action of ultra-violet light. (3) The decompn. products of azo dyes under the action of ultra-violet light act as stabilizers to—

ward the same dyes. (4) The decompn. products obtained by the action of ultra-violet light are apparently the same as those obtained by the action of oxidizing agents on the same dyes.

A. PAPINEAU-COUTURE

**A new white reserve under indigosol.** H. SUNDER. *Chimie & industrie Special No.*, 491-2 (Feb., 1929).—On a fabric bottomed in a bath contg. 12% indigosol and 1.75%  $\text{NaNO}_2$ , good whites can be obtained by printing with:  $\text{Na}_2\text{S}_2\text{O}_3$  200 g., ground chalk and gum tragacanth soln. (1:1) 400 g., 1:1 British gum soln. 400 g., and then developing by passing 15 sec. at 25° in a bath contg. 1.5%  $\text{H}_2\text{SO}_4$  and 1.0% oxalic acid. On leaving the acid bath the white is yellowish, but can be cleared by passing for a few sec. at 70° in a bath contg. 1.5% of 30° Bé.  $\text{NaOH}$  soln. A rapid and satisfactory removal of indigosol can be obtained by printing with the following mixt.:  $\text{NH}_4\text{NO}_3$  150, 1:1 ground chalk and gum tragacanth soln. 200, rongalite C or redol C 50, neutral starch British gum thickener 600, passing 15 sec. at 25° in a bath contg. either 2.5%  $\text{H}_2\text{SO}_4$  and 1.5% oxalic acid or 3.5%  $\text{H}_2\text{SO}_4$ , rinsing and passing through a hot alk. bath as above.

A. PAPINEAU-COUTURE

**The determination of nitrogen by the Kjeldahl method as applied to dyestuffs and intermediate products.** P. SISLEY AND M. DAVID. *Bull. soc. chim.* [4], 45, 312-24 (1929).—A method for the exact detn. of N by the Kjeldahl method is proposed in which the compd. is first reduced with  $\text{Na}_2\text{S}_2\text{O}_4$  and then the analysis carried out in the usual manner, with  $\text{CuSO}_4$  as a catalyst. Data are given on analysis of a large no. of azo dyes and intermediates.

WALLACE R. BRODE

**New method of dyeing with sulfur dyes.** H. SUNDER. *Chimie & industrie Special No.*, 489-90 (Feb., 1929).—Addn. of  $\text{Na}_2\text{S}_2\text{O}_3$  to a S-dye vat increases the intensity of the shade, which is due to a specific intensifying action and not merely to a salting out effect, as the addn. of large amts. of  $\text{NaCl}$  or of  $\text{Na}_2\text{SO}_4$  does not give the same intensity. In some cases the intensity may be twice that obtained in the usual way. Shades equiv. to those obtained by the usual sulfide process can be obtained with  $\text{Na}_2\text{S}_2\text{O}_3$  and  $\text{NaOH}$ , without any  $\text{Na}_2\text{S}$ , but they are not quite as deep nor as bright as those obtained with  $\text{Na}_2\text{S} + \text{Na}_2\text{S}_2\text{O}_3$ .

A. PAPINEAU-COUTURE

**New process for printing vat dyes.** M. JEANMAIRE AND E. EBERSOL. *Chimie & industrie Special No.*, 493-4 (Feb., 1929).—The dye (indanthrene, algal, etc.), is merely thickened and printed on the white fabric, which is jigged in a soln. of  $\text{Na}_2\text{CO}_3$  or  $\text{NaOH}$  contg. a suitable reducer, preferably rongalite. Finishing is carried out as usual. The advantages of the process are: the use of strongly alk. colors is avoided; after printing the goods can be allowed to stand indefinitely before jigging with  $\text{NaOH}$  or  $\text{Na}_2\text{CO}_3$ , multicolored designs can be printed with these dyes in conjunction with oxidation colors. The process can be modified by printing on fabric which has been previously prepd. with  $\text{Na}_2\text{CO}_3$  and reducer. The I. G. has recently described a process which is identical, except that the use of "colloresin D" is said to be indispensable to obtain a sharply defined design. J. and E. have found, however, that its use is not essential. Very good results have also been obtained by using the following "lysogum" thickener: wheat starch 1500 g., 5% lysogum thickener 35 l., glycerol 1 kg.,  $\text{H}_2\text{O}$  12.5 l., the presence of lysogum facilitating penetration, both during jigging and during steaming, and also helping to eliminate by washing the small quantity of starch incorporated with the color.

**Industrial skin lesions from salts of antimony in the textile industry.** A. B. SELISKY. *Dermat. Woch.* 86, 723-7 (1928); *Bull Hyg.* 3, 723-7 (1928).—A description of 200 cases where Sb salts were used as mordants. Usually arms were affected. The injury is attributed to the acid reaction products. Chalk was used to good advantage in combating the toxic effects.

GEORGE R. GREENBANK

**The hygroscopic properties of artificial fibers derived from viscose.** L. MEUNIER AND R. GUYOT. *Chimie & industrie Special No.*, 585-91 (Feb., 1929); cf. *C. A.* 23, 3103.—Using viscose from a given lot of the com. article, M. and G. studied: (1) the isothermal absorption and desorption of  $\text{H}_2\text{O}$  in normally manufd. viscose; (2) the isothermal adsorption and desorption of  $\text{H}_2\text{O}$  in viscose which had been previously heated 15 hr. at 105°, and the effects of the time of heating at 105° on the hygrometric properties, swelling, dyeing by direct dyes, tensile strength and elasticity; (3) the desorption curves of viscose at different temps.; (4) the modifications in hygrometric properties produced by the more or less complete blocking of the alc. functions by treatment with  $\text{CH}_2\text{O}$ , and the relation between the hygrometric properties and the swelling of the fibers after treatment with  $\text{CH}_2\text{O}$ . Conclusions: the isothermal desorption equil. corresponds to a higher  $\text{H}_2\text{O}$  content than the absorption equil. The  $\text{H}_2\text{O}$  content, detd. at 105° by absorption, is higher than the  $\text{H}_2\text{O}$  content by absorption detd. in dry vacuum, and the same is true for desorption, and in the latter case the difference is greater than for ab-

**sorption.** The various curves show the characteristic S-shape, indicating that at a given point there is a certain modification in the activity of fixation of  $H_2O$ , on the one hand, and of its elimination on the other. On prolonged heating there is a slight decrease in hygroscopicity and a much greater decrease in swelling properties and in the capacity to fix substantive dyes, but the mech. properties are not appreciably affected. The desorption curves detd. at  $0^\circ$ ,  $11^\circ$ ,  $25^\circ$  and  $37^\circ$  showed that for a given hygrometric state the  $H_2O$  content decreases with the temp. of the expt. With viscose which has been treated with  $CH_2O$ , the difference between absorption and desorption (for a given degree of swelling) decreases with the degree of swelling, particularly for low values of the latter, indicating that, on the whole, the hygroscopicity of the fiber is a function of the no of free alc. radicals remaining in the mol. The results are in general agreement with those of Urquhart and Williams (*C. A.* 18, 1754, 2067; 19, 898, 1631, 2749).

A. PAPINEAU-COUTURE

**Studies in flax retting.** ANTOINETTE TREVETHICK, B. B. ROBINSON AND R. M. SNYDER. *Mich. Agr. Expt. Sta. Tech. Bull.* No. 95, 49 pp. (1928); cf. *C. A.* 23, 1754.—The acidity which develops in a ret plays an important role in the retting of flax. Numerous H-ion tests prove that the retting of flax in water proceeds faster if the  $p_H$  is neutral. An acid or alk. retting soln. makes a slower ret than one which is neutral. The speed of the retting depends upon the temp. and with high temps.,  $25^\circ$  or more, the difference in time between a  $p_H$  7 and a  $p_H$  5 or  $p_H$  10 ret might be only a few hr., but with the temp. of  $22^\circ$  the  $p_H$  7 ret will be several days faster. This acceleration in speed of retting would make it practical in medium warm water rets to control the  $p_H$  of the retting soln. especially if the retting water was free of mineral salts. If the retting water contains mineral salts in soln., they will tend to prevent the  $p_H$  from going low. As far as could be detd. from the small quantities of straw used, the quality of the fiber of a  $p_H$  7 ret was better, or, in no case poorer, than the fiber from more acid or alk. rets. Retting with buffers requires a smaller addn. of alkali and gives a faster ret than that without buffer. The fiber from the rets where the buffer was added was considerably stronger for the same degree of retting. The passing of air through a retting soln. keeps the acidity from becoming low. Retts conducted in this manner showed a slightly higher percentage of fiber than the stagnant-water retting, but this may have been due to lack of the same degree of retting. Retting done where the water circulates tends to become acid unless the addn. of fresh water is sufficient to replace the old water at least once in 6 hr. This makes the entire control of acidity impractical. However, the replacing of the old water once in 24 hr. is better than every 6 hr. as it produces a fiber of better quality.

J. J. SKINNER

**Mercerization of cellulose.** F. I. BOGOYAVLENSKII. *Zhur. Prikladnoi Khim.* (*J. Applied Chem.* (Moscow)) 2, 167-78 (1929).—The quantity of NaOH soln. absorbed by cellulose at  $20-22^\circ$  increases with the increase in concn. of NaOH up to 4-5 *N*. For 5-8 *N* NaOH the quantity absorbed is approx. const. (about 12% NaOH) and corresponds to  $(C_6H_{10}O_5)_4 \cdot 2NaOH$ . With 9-10 *N* NaOH up to 16% NaOH is absorbed, suggesting the possibility of the existence of  $(C_6H_{10}O_5)_8 \cdot 5NaOH$ .  $(C_6H_{10}O_5)_8NaOH$  is not formed, contrary to the general belief. The rate of reaction is at a max. with 5 *N* NaOH. Absorption equations are not applicable. In the cold the action of NaOH on cellulose is very complicated and chem. changes undoubtedly take place. Absorption of KOH by cellulose is greater than that of NaOH by wt. but smaller by mol. %. Absorption increases rapidly up to 5 *N* KOH and very slowly with higher concns. With 10 *N* KOH,  $(C_6H_{10}O_5)_4 \cdot 2KOH$  is probably formed.

V. KALICHEVSKY

**The chemistry of jute refining.** HANS J. BRAUN. *Metallhölse* 19, 1293-4 (1929).—Jute is said to contain 60-65%  $\alpha$ -cellulose, 15-20%  $\beta$ -cellulose, 18-22% furfural complexes and 7-9% ketocyclohexene derivs. In refining it 3 steps are used, viz. (1) sepn. of non-cellulose materials, by the action of alk. solns., dil. acids and hydrolysis, or fermentation processes; (2) bleaching, usually by  $CaOCl_2$ , but sometimes by  $NaOCl$  or peroxides; and (3) giving back to the purified fiber its original softness, etc., by the use of soap baths or oil emulsions. Quite recently "N. T. Jute" has been perfected by Viallet; its method of prepn. has not been revealed. Another product is obtained by fermentation with diastase, treatment with K phosphate, bleaching and mercerizing. These products can be used as substitutes for other fibers, even for wool. W. C. E.

**Purification of cotton.** V. SHAPOSHNIKOV AND S. YESERSKII. *Z. Farben-Ind.* 20, 219-21 (1929); cf. *C. A.* 22, 4827.—A study is made of the consumption of Cl during bleaching. 4-5 hrs. bleaching with 0.5-1.0 g. Cl per l. at ordinary temp. is sufficient for bleaching well-cooked cotton fibers.

FREDERICK C. HAHN

**The determination of the silk and cotton content of asbestos yarn.** H. SOMMER. *Gummi-Ztg.* 43, 2103-4 (1929); cf. *C. A.* 23, 2391.—No procedure has been known for

the sep. detn. of silk and cotton in asbestos. An exptl. investigation led to the development of 2 methods. *Cupric-glycerol method*.—Agitate 0.5–1.0 g. of disintegrated and dried sample for 20 min. with 50 cc. of alk. cupric-glycerol soln. (prepd. from 10 g.  $\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$ , 5 g. glycerol, 100 cc. water and enough concd. KOH to dissolve the ppt. formed at first), filter through a weighed Gooch crucible, wash the residue (asbestos and cotton) with cold  $N$  NaOH, then with dil.  $\text{NH}_4\text{OH}$  until Cu is no longer detected and finally with water until no longer alk., dry at  $110^\circ$  and weigh. *Boiling method*.—Boil 0.5–1.0 g. of disintegrated and dried sample in 50 cc. of  $N$  NaOH for 0.5 hr., filter hot through a weighed Gooch crucible, wash the residue (asbestos and cotton) with hot water until no longer alk., dry at  $110^\circ$  and weigh. Since asbestos is partially sol. in the aq. NaOH, the Gooch crucible must be packed with asbestos which has been boiled with  $N$  NaOH and washed and a correction must be made for the partial soln. of the asbestos in the sample. Detns. of the soly. of various types of asbestos in cupric-glycerol soln. and in boiling  $N$  NaOH showed that they are more sol. in NaOH and that there is too much variation to allow a mean correction factor. Therefore, it is advisable to det. the % asbestos ( $a$ ) content by the cuprammonium process, then with a new sample det. silk by the cupric-glycerol or boiling method, and thus obtain the asbestos + cotton ( $g$ ). Then det. the cotton in this mixt. by the cuprammonium process, and obtain by difference the asbestos ( $g_1$ ). The % cotton ( $c$ ) can be calcd. from  $g - g_1$ , while the % silk is  $100 - (a + b)$ . The boiling method is simpler and more rapid than the cupric-glycerol method. In the boiling method, about 3.5% of the cotton dissolves; so with cotton contents below 10%, this error may be ignored, whereas above 10% this correction factor is advisable. The difference between  $a$  and  $g_1$  is an indication whether the asbestos is serpentine or hornblende. If this difference is over 2%, the asbestos is probably hornblende. C. C. DAVIS

**Weighting and dyeing silk.** ADOLF PREISING. *Deut. Färber-Ztg.* **64**, 809 (1928).—A general article. FREDERIC C. HAHN

**Green coloration in wool.** H. R. SEDDON AND T. T. MCGRATH. *Agr. Gaz. N. S. Wales* **40**, 206 (1929).—The greenish and reddish colorations occasionally observed in wool are due to the growth of pigment-producing bacteria. The bacteria were readily cultivated from samples of discolored wool and the condition was reproduced experimentally on sheep. The bacteria require a considerable amt. of moisture for growth and appear to grow better on fine than on coarse wool. When very old the color turns a brownish red, but the green color can be restored by the addn. of alkali, and conversely the green color becomes red on the addn. of acid, both types of discoloration apparently being produced by the growth of the same organism. HUBER, CHAS. J.: *The Raw Silk Industry of Japan*. New York: Silk Assoc. of America. 50 pp.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 300,432, Feb. 1, 1928. Anthraquinone vat dyes are obtained by condensing a tetrahalo-2,2'-dibenzanthronyl with an aminoanthraquinone, preferably in the presence of acid-fixing agents such as calcined soda and of catalysts such as Cu or its compds. Several examples are given and the prepn. of intermediates including tetrabromo-2,2'-dibenzanthronyl is described.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 300,557, Nov. 14, 1927. Diazotized 1-methyl-2-amino-4-isopropylbenzene or a deriv. is coupled with an aryldide of 2,3-hydroxynaphthoic acid or of  $\beta$ -ketocarboxylic acids. Several examples are given.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 300,683, Aug. 17, 1927. Pyridazinanthrone derivs. of 1,2,5,6-dipthaloylacridone contg. an aroylamino group, which are green vat dyes, are made by the action of hydrazine upon an aroylamino-1,2,5,6-dipthaloylacridone with subsequent ariation of the product. Examples are given.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 300,722, Aug. 29, 1927. The disazo dye formed by coupling equimol. proportions of tetrazotized benzidine, 1-amino-8-naphthol-3,6-disulfonic acid and 1,3-phenylenediamine is converted into a tetrakisazo dye producing greenish black shades on chrome leather either by coupling with 2 mols. of diazotized 4-aminoacetanilide and saponing the product or by coupling with 2 mols. of 4-nitroaniline and reducing the product.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 300,987, Nov. 22, 1927. In producing trisazo and higher polyazo dyes, any initial diazo component is coupled with a 1-naphthylamine deriv. contg. an *O*-alkyl or *S*-alkyl group or a sulfonic or carboxylic acid of such a deriv., capable of coupling in *p*-position to the amino group, and the product is diazotized and coupled with a compd. of the type CyARX, in which Cy represents a cyanuric ring, A represents a substituted or unsubstituted residue of a 1,8-aminonaphthol such as a 1,8-aminobenzoylaminonaphthol or a substitution product or equivalent in which  $\text{-NHC.O-}$  is replaced by  $\text{-NH.CO.NH-}$ , R represents a residue of an aminoazo compd., and X represents either halogen or a residue united to the ring through N, O or S. Numerous examples, details and alternative procedures are described.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 301,197, Nov. 21, 1927. Dibenzanthrone and isobenzanthrone dyes are made by alkali fusion of 5-, 6-, 7- and 8-aminobenzanthrones. Several examples are given of the production of the dyes, the aminobenzanthrones and halogen derivs. from which the amino derivs. may be prep'd.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 301,410, Aug. 29, 1927. Azo dyes yielding clear shades fast to kier-boiling and to light are formed in substance, on a substratum or on the fiber by coupling with any component a diazotized arylamine substituted by a CN group, with or without other substituents. Several examples are given.

**Dyes.** I. G. FARBENIND. A.-G. Brit. 301,423, Nov. 29, 1927. Monoazo dyes are made by combining a non-nitrated *o*-diazophenolsulfonic acid or a halogen deriv. of such an acid with 2-naphthylamine-3-carboxylic acid. When chromed on the fiber, green shades are obtained.

**Dyes.** SOC. ANON. POUR L'IND. CHIM. A BALE. Brit. 301,096, Nov. 24, 1927. Monoazo dyes are made by coupling a diazotized dichloroaniline with a 1-aryl-3-methyl-5-pyrazolonesulfonic acid in which the aryl nucleus contains at least 1 halogen atom. They dye wool and silk yellow in an acid bath and may be used for lakes.

**Dyes.** IMPERIAL CHEMICAL INDUSTRIES, LTD., W. GIBSON, A. J. HAILWOOD, J. B. PAYMAN AND A. SHEPHERDSON. Brit. 300,800, Aug. 29, 1927. Aq. pastes or suspensions of substantially insol. dyes are made by use of a polychloronaphthalenesulfonic acid or a salt of such an acid. Various examples are given.

**Dyes.** DURAND & HUGUENIN A.-G. Brit. 301,329, Nov. 26, 1927. Various specified gallocyanines derived from *m*-substituted alkylanilines are converted into derivs. such as anilino derivs. which are of greater stability than the unsubstituted compds. and are suitable for use in discharge printing. Several examples are given.

**Dye compositions.** BRITISH DYESTUFFS CORP., LTD., H. ADAMS AND A. SHEPHERDSON. Brit. 301,549, Aug. 3, 1927. Dry dispersed dye prepsns. or dye pastes (such as compns. suitable for dyeing cellulose esters and ethers) are made with the acid of a product obtained by heating ligninsulfonic acid with aq. alkali metal hydroxides or carbonates. Details and examples are given.

**Dye.** A. ZINKE AND W. PENNECKE (to F. Bensa). Brit. 300,922, Nov. 19, 1927. A dye giving blue shades on cotton from the hyposulfite vat turning green on exposure to the air is formed by condensing 1:12-perylenequinone with benzoyl chloride in the presence of  $\text{AlCl}_3$  at  $140\text{--}180^\circ$ .

**Dyes.** J. R. GEIGY A.-G. Brit. 300,549, Nov. 14, 1927. Acid wool dyes fast to alkali and light and generally of violet shades are produced by condensing an unsymmetrical *N*-alkylated *p*-phenylenediaminesulfonic acid in which the sulfonic group occupies the *o*-position to the primary amino group, with various specified isorosinduline-6-sulfonic acids which may contain substituents such as halogen, OH, alkyloxy, methyl, acetylamino, alkyl or aryl. Several examples are given.

**Intermediates and dyes.** I. G. FARBENIND. A.-G. Fr. 655,356, May 29, 1928. See Brit. 291,361 (*C. A.* 23, 1283).

**Dye intermediates.** I. G. FARBENIND. A.-G. Brit. 301,311, Nov. 26, 1927. Monoketones are prep'd. by the action of a carboxylic acid chloride or anhydride and  $\text{AlCl}_3$  on a polyhalogen naphthalene with or without a diluent. Examples are given of

the production of 1,4-dichloro-8-benzoylnaphthalene, 8-benzoyl-1,5-dichloronaphthalene, 1,4-dichloro-8-(*p*-chlorobenzoyl)naphthalene, 1,4-dichloro-8-(*o*-chlorobenzoyl)naphthalene, 1,4-dichloro-8-( $\alpha$ -naphthoyl)naphthalene and 1,4-dichloro-8-(*p*-toluyl)naphthalene and similar products.

**Opaque colors.** "KOLLOIDCHEMIE" STUDIENGESellschaft M. B. H. and JOHANNES B. CARPZOW, ROBERT LENZMANN, MARTIN MARCH and HERMANN SANDERS. Fr. 656,066, June 18, 1928. Opaque colors are prepd. by bringing salt- or fresh-water mud or colloids sepd. therefrom by washing, into intimate contact with either org. or inorg. dyestuffs already formed or the components forming the dyestuffs.

**Mixed dyes.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Fr. 656,133, June 20, 1928. Mixed dyes which together give a rich brown on fibers are obtained by mixing sym. 1,2-thionaphthindigo with sym. 2,1-thionaphthindigo either mechanically or by oxidation of a mixt. of the leuco derivs. or the corresponding hydroxythionaphthene in substance or on the fiber.

**Azo dyes.** I. G. FARBENIND. A.-G. Brit. 300,504, Nov. 12, 1927. Azo dyes fast to kier-boiling, to Cl and to light are formed in substance, on a substratum, or on the fiber by coupling diazotized halogen-substituted 1-amino-3,5-dimethylbenzenes with arylides of 2,3-hydroxynaphthoic acid or of  $\beta$ -ketocarboxylic acids. Several examples are given.

**Azo dyes.** I. G. FARBENIND. A.-G. Brit. 301,175, Oct. 28, 1927. Azo dyes for wool, or cotton, and lakes are prepd. by combining an aromatic diazo compd. with 2,6-naphtholcarboxylic acid. Several examples are given of dyes by which wool is dyed yellowish red to brown, turning to blue to violet to black when after-chromed, and which dye cotton reddish to brownish shades by chrome printing.

**Azo dyes.** I. G. FARBENIND. A.-G. Fr. 655,706, June 13, 1928. Azo dyes are produced on the fiber, by treating any coupling components with diazonium fluoborates or tetrazonium fluoborates. Examples are given.

**Azo dyes.** I. G. FARBENIND. A.-G. Fr. 655,822, May 14, 1928. Azo dyes are prepd. by sulfonating in the aryl ring monoazo dyes obtained by coupling diazotized *o*-nitroarylamines with acetoacetic arylides or by coupling diazotized *o*-nitroarylamines with acetoacetic-arylidiosulfonic acids. In an example 3-nitro-4-toluenazoacetoacetic *o*-chloroanilide is sulfonated with H<sub>2</sub>SO<sub>4</sub> or ClHSO<sub>3</sub>, giving a product which dyes wool a fast greenish yellow shade.

**Azo dyes.** I. G. FARBENIND. A.-G. Fr. 656,050, June 18, 1928. Azo dyes contg. Cr are obtained from the dyes prepd. by combining 1,3-phenylenediamine-5-sulfonic acid with diazotized *o*-aminophenols by treating them with agents capable of liberating Cr. Examples are given of the prepn. of dyes giving brown shades on wool by treating with Cr<sub>2</sub>O<sub>3</sub>, the dyes obtained by coupling 1,3-phenylene diamine-5-sulfonic acid with (1) diazotized picramic acid, (2) diazotized 4-nitro-2-aminophenol-6-sulfonic acid.

**Azo dyes.** I. G. FARBENIND. A.-G. (Josef Halter, inventor). Ger. 477,118, June 29, 1926. Violet azo dyes are prepd. by coupling diazo compds. from aminonaphthol ethers with arylamides of 2,3-hydroxynaphthoic acid. The components may be coupled in substance or on the fiber. The initial materials used in the example are 7-methoxy-1-naphthylamine and the  $\beta$ -naphthylamide of 2,3-hydroxynaphthoic acid.

**Azo dyes.** I. G. FARBENIND. A.-G. (Johann Huismann, Hugo Schweitzer and Richard Stüsser, inventors). Ger. 477,449, Jan. 20, 1927. See Brit. 283,897 (C. A. 22, 4257).

**Azo dyes.** I. G. FARBENIND. A.-G. (Johann Huismann, Hugo Schweitzer, and Richard Stüsser, inventors). Ger. 477,450, July 5, 1927. See Brit. 293,352 (C. A. 23, 1756).

**Azo dyes.** I. G. FARBENIND. A.-G. (Heinz Eichwede, inventor). Ger. 477,151, Dec. 24, 1925. See U. S. 1,694,117 (C. A. 23, 990).

**Azo dyes.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Fr. 656,179, June 21, 1928. Dyes contg. Cr are obtained by adding to a mixt. of an azo dye with a chroming agent, org. acids or their salts or both or salts of inorg. acids and free org. acids. Examples are given.

**Azo dyes derived from 2-hydroxynaphthalene-3-carboxylic acid arylamides.** HERMANN WAGNER (to General Aniline Works). U. S. reissue 17,364, July 2. See original pat. No. 1,622,690 (C. A. 21, 1714).

**Chromium compounds of azo dyes.** I. G. FARBENIND. A.-G. Brit. 300,425, Jan. 11, 1928. The azo dyes obtained by coupling *o*-hydroxydiazo compds. with acetoacetic esters or arylides are converted into Cr compds. by heating them in aq. soln., under pressure, in the absence of a water-sol. org. solvent, with Cr compds. in such propor-

tions as to provide at least 1 atom of Cr for each chromable group in the dye. Examples are given.

**Disazo dyes.** I. G. FARBENIND. A.-G. Fr. 655,962, June 15, 1928. Disazo dyes are prepd. by coupling an arylide of 2,3-hydroxynaphthoic acid with a diazotized aminoazo compd. of the general formula  $\left[ \begin{array}{c} \text{R}^1-\text{N}=\text{N}-\text{R}^2 \\ -\text{NH}_2 \\ -\text{SO}_3\text{H} \\ -\text{X} \end{array} \right]$ , in which  $\text{R}^1$  and  $\text{R}^2$

represent aryl groups, capable of being substituted with univalent groups, and X is a sulfonic group or carboxylic group. The dyes dye wool blue to bluish black shades. They may be after-chromed if the aminoazo compd. contains a group capable of being chromed. Examples are given.

**Diazo salt preparations for use in dyeing.** FERDINAND KELLER and KARL SCHNITZPAHN (To Grasselli Dyestuff Corp.). U. S. 1,717,453, June 18. A textile material, impregnated with a 2,3-hydroxynaphthoic acid arylide or other suitable coupling compd. is treated with a neutral 1,5-naphthalenedisulfonic acid diazonium salt of an unsulfonated substituted aromatic amine

**Trisazo dyes.** I. G. FARBENIND. A.-G. (Karl Holzach, inventor). Ger. 477,061, July 6, 1926. Trisazo dyes are prepd. by a series of operations comprising (1) coupling a diazo compd. from aminosalicylic or aminophthalic acid or a deriv. or homolog thereof with a primary aromatic amine coupling in the *p*-position, (2) diazotizing the aminoazo dye so obtained and coupling the diazo compd. with the same amine as before or with another primary aromatic amine coupling in the *p*-position, and (3) again diazotizing and coupling with salicylic acid or a homolog thereof. At least 1 of the amines used in (1) and (2) must contain a sulfo group. The products dye cotton directly in brown shades which are rendered fast by chroming or coppering. The Cr and Cu compds. of the dyes can also be used directly. An example is given in which the initial material is *p*-aminosalicylic acid. The amines used in (1) and (2) are 1,6- and 1,7-naphthylaminesulfonic acid, resp., and the final component is *o*-cresotinic acid.

**Indigoid dyes.** I. G. FARBENIND. A.-G. (Wilhelm Neelmeier and Theodor Nocken, inventors). Ger. 477,062, Apr. 4, 1926. See Brit. 291,825 (C. A. 23, 1285).

**Dyes of the anthraquinone series.** FRANZ ACKERMANN and PAUL SCHETELIG (to Soc. anon. pour l'ind. chim. à Bâle). U. S. 1,719,792, July 2. Dyes giving fast red-violet to brown, gray, blue and green tints are made by causing 1 mol. of a compd. such as cyanuric chloride to react on 1 mol. of a compd. of the general formula

and condensing the resulting condensation product with one mol. of the same compd. of the above specified general formula. Several examples are given.

**Condensation products of the anthraquinone series.** GUSTAV REDDELIEN and WERNER MÜLLER (to Grasselli Dyestuff Corp.). U. S. 1,717,809, June 18. An amino compd. of the anthraquinone series such as 1-aminoanthraquinone is condensed with a halohydrin in the presence of an acid-binding agent with or without a solvent or diluent. Products are obtained which may be used in dyeing "acetate silk," as oil- and fat-sol. dyes, and, generally, in a weak acid bath for dyeing wool, or as intermediates for making other dyes. Several examples are given.

**Dyes of the triarylmethane series.** BRITISH DYE STUFFS CORP., LTD., F. W. LYNCH and E. H. ROBB. Brit. 301,193, Nov. 17, 1927. The process described in Brit. 272,321 (C. A. 22, 1859) for producing triarylcarbinols is carried out at a temp. of about 60° in the presence of a solvent such as benzene.

**Pyrone dyes.** K. CARPMAEL, K. S. CARPMAEL and I. G. FARBENIND. A.-G. Brit. 300,594, June 16, 1927. Pyrone dyes prepd. as described in Brit. 247,003 (C. A. 21,

500) are freed from secondary products, usually of a browner shade, by converting the dyestuff acids into salts and sepg. the more sol. secondary products. Examples and details are given.

**Pyrazolones, etc.** IMPERIAL CHEMICAL INDUSTRIES, LTD., and M. MENDOZA Brit. 300,321, Aug. 19, 1927. Aminodiaryl sulfones such as are described in Brit. 297,855 (C. A. 23, 2724) and aminodiaryl sulfides such as are described in Brit. 299,501 (C. A. 23, 3234) are converted into the corresponding hydrazines and from these into the corresponding pyrazolones, which may be used in the manuf. of dyes. Several examples are given.

**Vat dyes.** I. G. FARBENIND. A.-G. (Max A. Kunz and Guido von Rosenberg, inventors). Ger. 477,394, Mar. 31, 1927. Dyes prepd. by the method of Ger. 475,687 (C. A. 23, 3814-5) and contg. at least 1 free  $\text{NH}_2$  group are treated with fuming  $\text{H}_2\text{SO}_4$  in the presence or absence of accelerators such as I or S. The new dyes so obtained may be alkylated, e. g. with methyl *p*-toluenesulfonate. The products, whether alkylated or not, give deeper shades than the initial materials, generally blue or violet. Examples are given.

**Vat dyes.** I. G. FARBENIND. A.-G. Fr. 655,339, May 16, 1928. Vat dyes are prepd. by treating with alk. agents the 1'-anthraquinonyl-6-aminobenzanthrone or other compds. of the anthraquinonylaminobenzanthrone series not substituted in the 2- and *Bz*-1-positions, or having in the *Bz*-1-position an OR group ( $\text{R} = \text{alkyl, aryl, etc.}$ ) or 1'-anthraquinonyl-2-aminobenzanthrone or its derivs. Examples include the prepn. of dyes from (1) 1'-anthraquinonyl-6(or 7 or 8)-aminobenzanthrone (by condensation of 6(or 7 or 8)-chlorobenzanthrone with 1-aminoanthraquinone), (2) 4'-methoxy-1'-anthraquinonyl-6-aminobenzanthrone (by condensing 6-chlorobenzanthrone with 1-amino-4-methoxyanthraquinone), (3) the condensation product of 6-chlorobenzanthrone with 1,6(or 1,5)-diaminoanthraquinone, (4) 1'-anthraquinonyl-*Bz*-2-aminobenzanthrone (by condensing *Bz*-2-chlorobenzanthrone with 1-aminoanthraquinone), (5) the condensation product of 6-aminobenzanthrone and 1-chloroanthraquinone-2-carboxylic acid, (6) 2'-anthraquinonyl-6-aminobenzanthrone (by condensing 6-chlorobenzanthrone with 2-aminoanthraquinone), (7) the condensation product of bromo-*Bz*-1-methoxybenzanthrone (by brominating *Bz*-1-methoxybenzanthrone in  $\text{AcOH}$ ) and 1-aminoanthraquinone, (8) the condensation product of 6-halo-*Bz*-1-phenoxybenzanthrone (by heating 6-halogen-*Bz*-1-bromobenzanthrone with  $\text{PhOH}$  in the presence of  $\text{K}_2\text{CO}_3$  and  $\text{CuO}$ ) with 1-aminoanthraquinone, (9) 4'-methoxy-1'-anthraquinonyl-2-aminobenzanthrone (from 1-amino-4-methoxyanthraquinone and 2-chlorobenzanthrone), (10) 1',1'-dianthraquinonyl-2,6-diaminobenzanthrone (from 2,6-dichlorobenzanthrone and 2 mols. of 1-aminoanthraquinone).

**Vat dyes.** I. G. FARBENIND. A.-G. (Walter Mieg, inventor). Ger. 477,284, Mar. 25, 1926. See Brit. 291,878 (C. A. 23, 1276).

**Vat dyes.** SOC. ANON. POUR L'IND. CHIM. À BÂLE. Fr. 655,412, June 6, 1928. New derivs. of vat dyes are prepd. by the action of org. acids having a reactive halogen atom on leuco derivs. of vat dyes. These compds. are readily transformed to the dyes by oxidizing agents in the presence of acids or alkalis. In examples leucothioindigo or leucoindigo is dissolved in  $\text{NaOH}$  soln. and a soln. of monochloroacetic acid or  $\beta$ -chloropropionic acid in  $\text{Na}_2\text{CO}_3$  soln. is added, the mixt. being heated for 1 hr. to 75-80°.

**Vat dyeing.** I. G. FARBENIND. A.-G. Fr. 655,231, June 5, 1928. Phosphoric acid or sol. phosphates are used in vat-dye baths contg. alk. earth compds. to prevent formation of alk. earth salts of the dye.

**Dyeing.** CHEMISCHE FABRIK VORM. SANDOZ. Brit. 300,662, Nov. 18, 1927. In processes such as continuous dyeing of printed reserve goods with anthraquinone vat dyes, the stability of the vat is increased by the addn. of a mixt. of aromatic hydroxy compds. and hydroaromatic compds. such as phenols or naphthols and cyclohexanol, methylcyclohexanols, hydrogenated naphthalenes or hydrogenated naphthols.

**Dyeing.** I. G. FARBENIND. A.-G. Brit. 301,166, Oct. 15, 1927. Pptn. of vat dyes which are normally sensitive to Ca and other alk. earth salts present in the dye bath, is prevented by the addn. of  $\text{H}_3\text{PO}_4$  or a sol. phosphate.

**Dyeing textiles.** BENNO BORZYKOWSKI. Fr. 656,043, June 18, 1928. Two or more colors are obtained on cloth by treating part of the fibers, before manuf. of the cloth, in such a way that the treated fibers behave differently toward dyes than untreated fibers. An example is given in which part of the fibers of cotton or artificial silk are treated with a warm soln. of gallnut in water. The cloth is dyed with direct green, 2 different shades being obtained.

**Dyeing animal fibers.** ERWIN SCHWENK, KARL REICHNER and METHODIUS KNOB

(to Verein für chemische und metallurgische Produktion). U. S. 1,718,882, June 25. In producing azo dyes on the material such as wool it is grounded with an aromatic org. compd. contg. the group  $\text{—SO}_2\text{NH—}$  capable of coupling with a diazo compd. to form a dye and the dye is then developed by a diazo compd. Numerous examples are given.

**Dyeing textiles.** EVERHARD E. BOUWMAN. Fr. 655,661, June 13, 1928. A curved plate is arranged in the vat so that the cloth falls on it in pleats. A similar curved plate is placed outside the vat to receive the cloth for oxidation.

**Dyeing furs with spots or mottled designs.** R. R. BALUT. Brit. 300,352, Sept. 23, 1927. Spots of lighter color are applied first, then darker spots, to imitate spotted animal skins, etc. Cf. C. A. 22, 503.

**Impregnating, dyeing and printing textile materials.** POLLOPAS, LTD., and G. SPENCER. Brit. 301,365, June 24, 1927. Yarns, fabrics, etc., such as those formed of cotton are impregnated, prior to dyeing or printing, with a water-sol. condensation product of  $\text{CH}_3\text{O}$  with urea or thiourea. Several examples are given. The condensation product may be rendered insol. before dyeing or printing and may be colored before use.

**Dyeing in multi-color effects.** B. BORZYKOWSKI (to Borvisk Syndicate, Ltd.). Brit. 300,951, Nov. 21, 1927. Part of the fibers or threads are subjected, prior to manuf. of yarn or fabric, to treatment which causes them to act differently in a subsequent dyeing operation, *e. g.*, a cotton or viscose thread may be treated with a hot. aq. ext. of gallnut, washed in cold water contg. tartar emetic, dried and then twisted or woven with untreated fiber or thread. Dyeing treatments are described.

**Dyeing apparatus.** WM. W. BROWN (to H. W. Butterworth & Sons Co.). U. S. 1,717,494, June 18. Mech. features.

**Centrifugal dyeing apparatus.** SOC. KARPELES FRÈRES. Brit. 300,623, Nov. 17, 1927. Structural features.

**Dyeing cellulose silk.** BRITISH DYESTUFFS CORP., LTD. Fr. 655,076, June 1, 1928. Regenerated cellulose silk is uniformly dyed with dyes obtained by combining the tetrazo compds., the 2,2'-substituted derivs. of 4,4'-diaminodiarlys other than 2,2'-dinitrobenzidine with 2 mol. proportions of a coupling component or with 2 different coupling components. An example is given of tetrazotizing 2,2'-dichloro-4,4'-diphenyldiamine and combining with 1 mol. of salicylic acid and 1 mol. of 2-amino-8-naphthol-6-sulfonic acid. A table of coupling components and the colors obtained is given.

**Dyeing artificial silk made from viscose, etc.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Brit. 300,916, Nov. 19, 1927. Artificial silk "other than acetate and like silk" is dyed from a neutral, slightly alk. or slightly acid bath with a complex metal compd. of a dye contg. a plurality of metals. Examples are given of the use of compds. of azo dyes contg. Cu and Cr or Cu, Cr and Ni.

**Dyeing cellulose derivatives.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Fr. 656,057, June 18, 1928. Fast shades are obtained on the ethers and esters of cellulose by the use of tetraaminoanthraquinones in which an atom of H of one or both amino groups is substituted by an aryl group. Examples are 1,5-diamino-4,8-diphenylaminoanthraquinone (greenish blue), 1,8-dianilino-4,5-diaminoanthraquinone (blue), 1,5-diamino-4,8-(4',4''-diamino)-dianilinoanthraquinone (bluish green).

**Dyeing cellulose derivatives.** HENRY DREYFUS. Fr. 656,431, June 25, 1928. Cellulose derivs., particularly the acetate, are dyed, printed or stenciled with azo dyes derived from aminonaphthols or naphthylenediamines or their substitution products. The dyes may be applied in the form of aq. dispersions.

**Dyeing cellulose acetate.** GEORGE H. ELLIS (to Celanese Corp. of America). U. S. 1,719,324, July 2. Basic dyes of the anthracene series such as aminoanthraquinones are used in the form of sol. modifications obtained by pretreating them with a sulfonated ricinoleic acid compd. or other suitable solubilizing agent comprising a material of oily or fatty character.

**Dyeing cellulose acetate.** SOC. ANON. POUR L'IND. CHIM. À BAËLE. Brit. 300,299, Aug. 9, 1927. Dry solid preps. of dyes suitable for dyeing cellulose acetate are made by evapg. to dryness, in the presence of sulfite cellulose liquor, a fine dispersion produced by stirring the dye with water in the presence of saponin or a condensation product produced from  $\text{CH}_3\text{O}$  and a naphthalene sulfonic acid. Azo dyes, indophenols or anthraquinone dyes may be used; several examples are given.

**Dyeing cellulose esters and ethers.** BRITISH CELANESE, LTD., G. H. ELLIS and H. C. OLPIN. Brit. 300,929, July 20, 1927. Dyeing is effected by coupling on the material either (1) diazotized amino-( $\beta$ -ketoacidylamino) or amino-( $\beta$ -ketoacidylamino)-azo compds. with suitable components, or, (2) diazotized amines or aminoazo compds. with acetoacetic arylides. Several examples are given.

**Dyes for cellulose esters and ethers.** I. G. FARBERIND, A.-G. Fr. 655,167, June

2, 1928. Dyes suitable for dyeing cellulose esters and ethers are obtained by submitting naphthazarin to the action of aliphatic amines in such a way as to avoid the formation of vat dyes. In examples, naphthazarin is heated for 20 hr. at 60° in an autoclave with a 30% aq. soln. of MeNH<sub>2</sub>, with the addn. of Zn dust. The product obtained represents a tris(methylamino)naphthoquinone which dyes cellulose acetate green shades. If crystal. boric acid is used instead of Zn dust a bis(methylamino)hydroxy-naphthoquinone is obtained giving red shades.

**Dyeing cellulose esters and ethers.** BRITISH DYESTUFFS CORP., LTD. Fr. 655,948, June 15, 1928. Cellulose esters and ethers are dyed fast green shades by salts, *e. g.*, oxalates of unsulfonated triarylmethane derivs. of the formula (R'R''NC<sub>6</sub>H<sub>4</sub>)<sub>2</sub>C(OH)(C<sub>6</sub>H<sub>4</sub>RXY) in which R' and R'' are Me or Et groups, R is an alkyl group, and X and Y are other groups, *e. g.* NO<sub>2</sub>, conveniently chosen. The following derivs. are specified: (1) the 2,4-dimethyl deriv. of Malachite green obtained by oxidizing the condensation product of 2,4-dimethylbenzaldehyde and 2 mols. of PhNMe<sub>2</sub>, or by condensing 4,4'-tetramethyldiaminobenzophenone with 4-chloro-*m*-xylene in the presence of Na as in Fr. 626,703, or by oxidizing the condensation product of 4,4'-tetramethyldiaminobenzohydrol and *m*-xylene (2) the 2,5-dimethyl deriv. of Malachite green prep'd. by condensing 4,4'-tetramethyldiaminobenzophenone with 2-chloro-*p*-xylene in the presence of Na, (3) the 2,4-dimethyl deriv. of Brilliant green from 4,4'-tetramethyldiaminobenzophenone and 4-chloro-*m*-xylene. Cf. C. A. 23, 2836.

**Fiber or cellulose from straws and leaves.** U. GENNARO and G. ROSSI. Brit. 301,226, Dec. 30, 1927. Materials such as straw of wheat, oats or rye or leaves of *Stipa tenacissima* are heated to 40° with a reagent such as a 3 or 4% NaOH soln. to dissolve out the silica, then washed or neutralized and subjected to an enzymic retting process.

**Lightening the color of dyed fabrics.** GEORGE F. LLOYD (to Spectrum Dyes Proprietary, Ltd.). U. S. 1,717,792, June 18. Dyed fabrics are subjected to a uniformly and selectively controlled semi-stripping process with water contg. the reaction products of NaHSO<sub>3</sub> with Zn, with the addn. of coal-tar naphtha.

**Mercerizing fabrics.** ARNOLD BOSSHARD. U. S. 1,717,870, June 18. The fabric is subjected to a series of baths of mercerizing liquid, of gradually increasing concns. and decreasing temps., is subjected to squeezing after each bath, and is subjected to longitudinal tension. An arrangement of app. is described.

**Washing textile materials.** ELISEE C. DUHAMEL. U. S. 1,717,439, June 18. Material such as wool or silk is washed in at least one detergent bath of water and alk. salts of fatty acids and impurities are removed rapidly and continuously from the detergent bath during the washing operation, by sedimentation. An app. is described. U. S. 1,717,440 specifies washing uncarded wool at least once with a bath of suint liquor, collecting the suint in the bath and, during the process, removing portions of the suint liquor contg. settled impurities, purifying them and returning them to the bath for reuse. An app. is described.

**Treating vegetable textile materials with swelling agents.** HEBERLEIN & CO., A-G Brit. 301,392, Nov. 28, 1927. In producing woolly, linen-like or other effects (which may be in the form of a pattern) the material is treated successively with 2 or more swelling agents (of which several examples are given) without permitting intermediate coagulation.

**Treating plant fibers.** CASIMER MASSE (to Soc. Cicile des Procèdes Masse). U. S. 1,719,066, July 2. Fibers such as those of ramie are subjected to the action of a starch soln. to loosen the fibers from the outer skin covering, dried, and then beaten to remove excess starch and sep. the fibers from the skin.

**Treating waste liquor from fiber production.** H. R. FOUQUE. Brit. 301,284, May 30, 1928. See Fr. 650,110 (C. A. 23, 3300).

**Treating cotton fabrics with caustic alkali.** MARCEL MELLIAND (to Meliana Corp. of America). U. S. 1,717,991, June 18. Cotton fabrics are subjected to the action of strong hot solns. of caustic alkalis for a short time, without tension, and are subjected to at least one mercerizing treatment.

**Lustering cotton with alkali and carbon disulfide.** L. LILIENFELD. Brit. 300,663, May 11, 1927. In treating cotton or other cellulosic yarns or fabrics with alkali and CS<sub>2</sub> to give the material a silky luster, a caustic alkali soln. of over 12% strength (or lower concn. at temps. below 0°) is used to produce a sol. xanthate, which is removed at least in part before the material is brought into contact with a viscose-pptg. agent. If the material is allowed to shrink during the treatment a wool-like effect is produced.

**Reducing the tendency to laddering of knitted fabrics containing cellulose acetate or similar materials.** CAMILLE DREYFUS (to Celanese Corp. of America). U. S.

1,719,173, July 2. The material is treated with a substance such as acetone which has a slight solvent action on the org. cellulose deriv. present so that the fibers and threads are caused to adhere slightly together without substantial alteration in texture and appearance.

**Lustering textiles.** H. TH. BÖHME A.-G. Fr. 656,157, June 20, 1928. Emulsions of lustering agents such as paraffin, wax, or stearic acid are added to the dressing bath contg. salt.

**Bleaching fibers, skins, etc.** HANS GOLDARBEITER. Fr. 655,236, June 5, 1928. See Brit. 201,743 (C. A. 23, 1290).

**Mildew-proofing textile materials.** CLARENCE B. WHITE (to Vitatex Processes, Inc.). U. S. 1,717,483, June 18. Textile materials are rendered resistant to mildew and like fungus growth and also repellent to water and more resistant to acids by impregnation with a rare earth metal compd. insol. in alk. solns.

**Carroting animal fibers.** VIKTOR BÖHM. U. S. 1,719,043, July 2. A neutral carroting agent contg. a carbonyl group such as  $\text{CH}_2\text{O}$  or other aldehyde or ketone is used for treating rabbit hair for making hats, etc.

**"M of i-proofing."** M. G. MINAEFF (to Larvex Corp.). Brit. 301,421, Nov. 29, 1927. In treating fabrics or other materials, solns. are used contg. thiourea, phenylthiourea or other thiourea compd. or deriv. in which at least one of the  $\text{NH}_2$  groups is unsubstituted.

**Washing wool or other textile materials.** ELISÉE C. DUHAMEL. U. S. 1,717,375, June 18. The material is soaked in a succession of pairs of baths each utilizing detergent liquid such as soap soln., the liquid is circulated in series through certain of the baths while the circulation of the material is in parallel and in opposite direction to the liquid. An app. is described.

**Degreasing wool.** I. G. FARBENIND. A.-G. Brit. 300,941, Aug. 20, 1927. Raw wool is degreased with a mono- or di-chlorinated hydrocarbon such as monochloride of octane, nonane or xylene or dichloride of hexane or benzene or of branched-chain isomeric compds. Solvent is removed from the wool by washing and aeration and from the wool fat by steaming.

**Degreasing raw wool and other textile fibers.** ALFRED ENGELHARDT (to I. G. Farbenind. A.-G.). U. S. 1,718,548, June 25. Cyclohexanone or a homolog is used as a solvent, alone or in various mixts. prepd. to produce desired effects. Several examples are given. Cf. C. A. 23, 536.

**Curling and increasing the strength and elasticity of cotton fibers.** MARCEL MELLIAN (to Meliana Corp. of America). U. S. 1,717,992, June 18. The fiber is treated with caustic alkali soln. of at least  $50^\circ \text{Bé}$ . at a temp. of  $60\text{--}100^\circ$  without tension.

**Coating fabrics.** M. N. NICKOWITZ (to E. I. Du Pont de Nemours & Co.). Brit. 301,024, Nov. 23, 1927. A casein varnish is applied to a fabric and subsequently halogenated, e. g., with Br. The fabric may be previously coated with other materials such as a rubber compn., pyroxylin or oxidized oil. Numerous details and modifications are given.

**Treating silk fabrics.** R. CLAVEL. Brit. 300,894, Nov. 19, 1927. Silk fabrics are loaded by application (either to one or both sides or in the form of a pattern) of a metal compd. in paste form such as  $\text{SnCl}_2$ , thickened with gum arabic, dextrin, starch, starch degradation products, sugar, etc. The silk is then further treated with other loading baths and substances such as alkali phosphates for converting the metal compds. into insol. form. Mordant and other dyes may be used for producing variegated color effects. Various details and modifications are described.

**Charging silk.** MARKUS WERDER. Fr. 656,424, June 25, 1928. Silk, after treatment in a  $\text{SnCl}_2$  bath, is brought directly into a bath of  $(\text{NH}_4)_2\text{H}_2\text{PO}_4$  and a little  $\text{H}_3\text{PO}_4$  which may be followed by a bath contg.  $\text{Na}_2\text{HPO}_4$ .

**Degumming silk.** J. TAKAMINE (to Takamine Laboratory, Inc.). Brit. 301,419, Nov. 29, 1927. Woven or skein silk is boiled under pressure of about 50 lb. per sq. in. for about 15 min., with agitation, washed and subjected to a similar boiling in a 0.5–1.0% neutral soap soln., again washed, subjected to acid treatment and to a final washing. An app. is described.

**Artificial silk.** SOC. POUR LA FABRICATION DE LA SOIE RHODIASETA. Brit. 301,335, June 22, 1927. Mat or woolly effects are produced on material comprising cellulose acetate by immersion in a soln. of a chloride of Ca, Mg or Li of 10–30% strength and then subjecting for a short time to a boiling dil. acid bath of a concn. not exceeding decinormal. Different specified acids give different effects of texture and color.

**Artificial silk.** C. HENNINGSEN (to DuPont Rayon Co.). Brit. 301,307, Nov. 26, 1927. Yellow discoloration of products formed from viscose is removed, or products of

desired color are obtained, by adding dyes (of which various examples are given) to the viscose before coagulation.

**Artificial silk.** I. B. MERRIMAN (to Manville-Jenckes Co.). Brit. 301,026, Nov. 23, 1927. Artificial silk, such as that formed from viscose, is wound in a compact mass, while still moist with the pptn. bath, and in this condition is subjected to further operations such as washing, desulfurization, oiling, soaping, sizing and dyeing, by forcing liquids through the material. An app. is described.

**Apparatus for loading natural or artificial silk.** RENÉ CLAVEL. Fr. 655,440, June 6, 1928.

## 26—PAINTS, VARNISHES AND RESINS

A. H. SABIN

**A new accelerated test for paints.** W. H. DROSTE AND MAX WERNER. *Farben-Ztg.* **34**, 2131-3(1929).—The Ritter (cf. C. A. **23**, 2048) elec. test is criticized on the ground that it is not merely a cond. test but is a resultant of many factors, such as polarization, concn. cells, etc. The Liesegang ring test is of no value, for paints are never applied to films of gelatin. Advances in accelerated testing will come not from mere mech. improvements but from optimum arrangements of factors already in use, such as water, light, etc.

G. G. SWARD

**Testing the suitability of paints.** PAUL NETTMANN. *Farben-Ztg.* **34**, 2181-3(1929).—N. briefly outlines the intermolecular forces and phys. states existing in paint films. Among them are cohesion, adsorption, surface tension, diffusion, polarization of polar mols., solvation of colloidal particles, etc. The considerations involved in accelerated weathering are tabulated.

G. G. SWARD

**Tentative Australian standard specification for ready mixed linseed oil paint red oxide of iron.** *Australian Commonwealth Eng. Standards Assoc.* No. K40, April, 1929, 18 pp.

E. I. S.

**Australian standard specifications and methods of sampling and testing for zinc oxide, dry, and zinc oxide in oil (genuine zinc white).** *Australian Commonwealth Eng. Standards Assoc.*, Nos. K17 and 18, April, 1929, 22 pp.

E. I. S.

**Paints containing casein.** F. MARGIVAL. *Peintures, pigments, vernis* **5**, 551-3(1928); cf. C. A. **23**, 3585.—Formulas are given.

B. HAMILTON

**Modern practice in paint grinding.** E. W. FASIG. *Paint, Oil and Chem. Rev.* **87**, No. 24, 8-10, No. 25, 14-5(1929).—A review.

G. G. SWARD

**Influence of inerts in tinted paints.** HANS WAGNER. *Farben-Ztg.* **34**, 2011-4(1929).—Chalk imparts less durability to paints than either gypsum or barytes. This is probably due to the flocculated condition of the former. It cannot be due to the influence of light for chalk is less transparent to both visible and ultra-violet light than the other 2 pigments. The opacity of ZnO to ultra-violet light is not due to the absorption of the incident light but may be accounted for by the exceedingly long wave length of the scattered light which is not detected by the photographic plate.

G. G. SWARD

**The drying of raw and boiled linseed oil.** HANS WOLFF AND W. TOELDT. *Farben-Ztg.* **34**, 2069-72(1929).—The progress of the drying of raw linseed oil and of boiled oil prepd. with Mn or Co driers was followed by means of the Wolf "spreading drop" method. For nominal thickness (not given) of film the rate of drying was proportional to the gain in weight. With Co drier, the drying at the beginning proceeded faster than the gain in weight. For thicker films, there was a loss in weight at the beginning, although the drying proceeded in the normal manner.

G. G. SWARD

**Clear mixing lacquers.** R. L. MASTERSON. *Ind. Finishing* **5**, No. 8, 53-4(1929).—Explanation of some interesting characteristics about clear mixing lacquers, and how, where, why, and when to use them in connection with modern wood-finishing operations.

E. I. S.

**Nitrocellulose lacquers and their possible applications to railroad rolling stock.** MAURICE DESCHIENS. *Chimie & industrie Special* No., 581-4(Feb., 1929); cf. C. A. **21**, 3752.—A brief general discussion of the compn. of cellulose lacquers and of their advantages for railroad rolling stock.

A. PAPINEAU-COUTURE

**Pigment and oil.** E. KLUMPP. *Farben-Ztg.* **34**, 2130-1(1929); cf. C. A. **22**, 877.—Grinding dry pigments in a mortar to reduce the particle size did not, as expected, increase the oil absorption. On the other hand, the oil absorption was decreased 20-50%. The anomalous result is ascribed to the coalescence of small particles.

G. G. SWARD

**The microstructure of films and evidence of internal tension.** A. V. BLOM. *Farben-Ztg.* 34, 2127-30(1929).—Photomicrographs of the cross sections of films show a stratification of the pigment and other constituents. Enormous intermolecular forces must therefore be present in a film. Among the special treatments used to reveal the different layers are grinding with a paste of chalk and water, etching with different liquids and coloring with aniline dyes. To explain scaling which sometimes takes place in cold weather, B. introduces the term "thrustability." If the force (thrusting tension) with which a film resists contraction when it is chilled be greater than the adhesion of the film to the metal, the film will scale off the metal. G. G. SWARD

**New aluminous and titaniferous fillers for paints.** J. DE LAROCHE AND G. MEUNIER. *Peintures, pigments, vernis* 5, 590-1(1928).—A disclosure of the use of the residues resulting from  $H_2SO_4$  digestion of bauxite as a paint filler; also of the residues from the manuf. of  $Al_2(SO_4)_3$ . These residues are valuable for their lake-forming properties. B. HAMILTON

**China oil.** A. GERARD. *Peintures, pigments, vernis* 5, 592-6(1929).—A review of the origin, compn., properties and analysis of China oil. B. HAMILTON

**Titanium pigments.** G. GENIN. *Peintures, pigments, vernis* 5, 631-7(1928).—A discussion of the history and occurrence of titaniferous materials usable as pigments and of the methods of prep. Ti pigments. Methods of analysis are outlined. B. H.

**The ultramarines.** A. DUBOSC. *Peintures, pigments, vernis* 6, 782-6, 804-10(1929).—A general discussion of natural and artificial ultramarines. B. H.

**The standardization of colored printing inks and its advantages.** T. W. ANSTEAD. *Printing Industries (A. S. M. E. Trans.)* 50, No. 34, 1-6(1928).—Confusion exists in the color field at present, as discussions and instructions regarding color have no common basis or viewpoint. The materials entering into the manuf. of printing ink are discussed. Standardization of colored inks is really standardization of the pigments involved; proposed methods are considered. E. I. S.

**Testing of stoving varnishes used in electrotechnic.** A. R. MATTHIS. *Chimie & industrie Special No.*, 545-52(Feb., 1929).—A brief discussion of the properties required of such varnishes, with a description of the methods for detg. d., fluidity value,  $H_2O$ -sol acidity, action on Cu, time of drying, resistance to transformer oils at 100°, flexibility, aging and dielec. strength. A. PAPINEAU-COUTURE

**Wood-oil varnish.** A. DUBOSC. *Peintures, pigments, vernis* 5, 527-8(1928).—On suitably cooking the ingredients, an increase in the proportion of wood oil in a varnish dets. an increase in the durability, without which it would be necessary previously to harden the resin with lime. Directions are given for the making of wood-oil varnishes for various purposes. For cheap varnishes a certain amt. of wood oil can be replaced by soy-bean oil. The addn. of Co drier not only increases their drying properties but also clarifies them. For absolutely white varnish, it is advised to use zinc resinate pptd. in the oil and treated with a small quantity of Co drier. B. HAMILTON

**Tung oil.** LOUIS A. JORDAN. *J. Oil and Colour Chem. Assoc.* 12, 113-53(1929).—A review. Tung trees, principally *A. fordii* and *A. montana*, have been known outside of China since 1760, were introduced into America in 1896, Germany in 1897 and England soon after. Expts. on cultivation outside of the native habitat have progressed most rapidly in Florida. Nearly every part of the British Empire has been tried. The most promising part of the latter seems to be the Kenya, Middle East Africa. A complete bibliography is appended. G. G. SWARD

**The catalytic effect of oxygen on tung oil.** JOHANNES SCHEIBER. *Farbe u. Lack* 1929, 284-6.—When tung oil is treated with small quantities of  $O_2$ ,  $I_2$ , etc., the  $\beta$ -glyceride is formed; with large amts. of the reagent a polymerized product is formed. E. g., radial crystal formations of the  $\beta$ -glyceride were formed in tung oil preserved between a microscope slide and a cover glass. If crystals of the  $\beta$ -glyceride be dissolved in warm tung oil they reappear as very min. crystals, but if a trace of the original crystals be undissolved, they recrystallize normally. G. G. SWARD

**Glycerol used to reclaim China wood oil.** EDWARD STEINHOFF. *Paint, Oil and Chem. Rev.* 87, No. 84, 21(1929).—A batch of tung-oil varnish that has gelled may be liquefied by heating with glycerol and litharge, 1 gallon of glycerol and 5 lb. of litharge being used for each 60 gallons of varnish. A second addn. of glycerol and litharge may sometimes be necessary. G. G. SWARD

**Working up low-grade resins.** M. TOMBO. *Anales soc. españ. fis. quim.* 27, 77-106(1929).—Distn. of low-grade gums and galipot gives a limited yield of oil of turpentine and a dry, brown pitch. Total sepn. of  $H_2O$  and impurities is interesting because elimination of  $H_2O$  by distn. prolongs the operation considerably and because the impurities

injure the rosin. The results obtained by addn. of oil of turpentine in the most suitable proportions, with a small loss of turpentine and an advantage of 2 or 3 grades of pitch, are shown. Although the variable quality of the gums studied can be the cause of variations, results are very favorable for a 50% addn. of turpentine. E. M. SYMMES

**Contribution to our knowledge of phenol resins.** G. HUGEL AND M. VINCENT. *Chimie & industrie* Special No., 540-4 (Feb., 1929).—In order to det. the difference between phenol-CH<sub>2</sub>O resins condensed in presence of alkalies and of acids, the effect of varying CH<sub>2</sub>O and keeping NaOH const., and the effect of varying NaOH and keeping CH<sub>2</sub>O const. was investigated. The results showed that the residual CH<sub>2</sub>O is a straight-line function of the total amt. of CH<sub>2</sub>O added when the NaOH is kept const., and that the residual NaOH is a straight-line function of the total amt. of NaOH added when the CH<sub>2</sub>O is kept const., at least up to the point where CH<sub>2</sub>O disappears completely from the residual soln. This shows that there is a partition coeff. of CH<sub>2</sub>O and of NaOH between the resin formed and the residual soln., and that the functions of CH<sub>2</sub>O and NaOH are similar. H. and V. infer that there are 2 distinct phenomena: (1) condensation of CH<sub>2</sub>O with the phenol to form a resin, (2) soln. of CH<sub>2</sub>O and NaOH in the resin. From a discussion of the interpretation of their results, they conclude that there is no basic difference in the constitution of acid and alk. condensation products, that the phenomenon of bakelization is due to the presence of a large amt. of dissolved CH<sub>2</sub>O in the resin, and that this soln. is favored by the presence of small quantities of alkali and hindered by acid. A. PAPINEAU-COUTURE

**The cultivation of lac in the plains of India.** C. S. MISRA. Agr. Research Inst., Pusa, *Bull.* 185, 115 pp. (1929).—This publication discusses all phases of the lac industry in India, including the growing, harvesting, storage, prepn. for the market and adulteration of lac and the *manuf., uses, etc., of shellac.* K. D. JACOB

**The effect of storage on the properties of turpentine.** W. B. BURNETT AND H. K. SALZBERG. *Proc. Am. Soc. Testing Materials* 1929 (preprint) No. 84, 4 pp.—Tests on samples of gum turpentine from tanks in storage for 15 to 18 months at the 2 in 1-Shinola Bixby Corp., Indianapolis, Ind., indicate that turpentine in storage for that time is entirely satisfactory for general commercial use as embodied by the A. S. T. M. Standard Specifications of distn. range, sp. gr., and refractive index for Gum Spirits of Turpentine and Steam-Distilled Wood Turpentine. However, the effects of storage are noticeable, and at the end of this period the turpentine does not meet the German requirements in regard to bromine number and evapn. residue. F. E. WALSH

Comparison of the Zennström and other processes for the production of paper pulp and by-products from maritime pine and other resinous woods [recovery of rosin] (RIVIÈRE) 23. A note on coconut-shell oil [a paint] (KIDAVU, NAMBIYAR) 22. Coating fabrics [with casein varnish] (Brit. pat. 301,024) 25. Apparatus for extracting resin from plants (Fr. pat. 655,733) 1. Trichloroethane [as solvent for resins] (Fr. pat. 655,930) 10. Insulating and other compositions from cashew-nut shell liquid (Brit. pat. 300,654) 13. Lampblack, etc. [for preparing inks or paints] (Brit. pat. 300,610) 18. Mixed esters and ester-ethers of cellulose [for films, lacquers, etc.] (Brit. pat. 300,942) 23. Dispersion agents [for preparation of lacquers] (Swiss pat. 126,575) 18.

**Paint.** JULIUS J. HORAK (to Albert A. Hemmen). U. S. 1,717,924, June 18. A paint which may be used on damp concrete surfaces, etc., is formed from a mineral base such as whiting, ZnO or asbestine, rosin cut in ammonia, linseed oil, a linoleate such as that of Co, Mn or Pb and an aq. soln. of animal glue treated with NH<sub>4</sub>CNS.

**Paint.** SOC. MINÈRE "LA BARYTINE" and MAURICE RAFFIN. Fr. 655,085, Oct. 14, 1927. Ti white is prepd. from Fe-Ti ores, by heating the ores with Na<sub>2</sub>CO<sub>3</sub> and coal to reduce the Fe to the metal, which is removed by treatment with dil. H<sub>2</sub>SO<sub>4</sub>. The Ti is converted to the sulfate by treatment with stronger acid and to TiO<sub>2</sub> by addn. of BaO.

**Paint.** SOZOL (1924), LTD. Fr. 655,475, June 7, 1923. A paint is composed of bitumen with about 10% of neutral wool-fat free from soap dissolved in a volatile solvent such as white spirit. Coloring substances are added as desired.

**Pigments.** SOC. ROCHES ET MINÉRAIS. Fr. 655,905, Oct. 28, 1927. A white pigment is obtained by attacking finely powd. ilmenite with 60° Bé. H<sub>2</sub>SO<sub>4</sub>, with the addn. of sulfates of Fe and Ti, heating to 300° to transform Ti(SO<sub>4</sub>)<sub>2</sub> to TiSO<sub>4</sub> without decomp. the FeSO<sub>4</sub>, treating with water to convert the TiSO<sub>4</sub> to insol. TiO<sub>2</sub> and treating the pptd. TiO<sub>2</sub> with H<sub>2</sub>SO<sub>4</sub> anew to obtain Ti(SO<sub>4</sub>)<sub>2</sub> free from Fe, from which the pigment, titan acid, is extd. by hydrolysis.

**Luminescent paints.** MICHEL DE LEZINIER. Fr. 655,265, Oct. 10, 1927. Phosphoric alk. luminescent earth sulfides are prep'd. by using a mixt. in aq. suspension of sulfides and photogen substances, both being brought to the colloidal state before mixing. The vessels used are covered with porcelain, bakelite, etc.

**Weatherproof paints containing fungicides.** DEUTSCHE GASLÜHLICHT-AUER-GES. Brit. 300,580, Nov. 15, 1927. Weatherproof paints contg. fungicides as described in Brit. 288,601 (*C. A.* 23, 721) are used only for upper coatings or as a finishing coating. Cf. *C. A.* 23, 3587.

**Alkaline earth titanates.** REGINALD H. MONK. Fr. 655,399, June 5, 1928. A pigment consisting of alk. earth titanates is prep'd. by heating pptd.  $Ti(OH)_2$  free from  $SO_4$  to 750–880° with an alk. earth carbonate in the presence of an accelerator such as HCl or an alk. earth chloride. The  $SO_4$  is eliminated by treatment with NaOAc or  $NH_4OAc$  and washing.

**Mixing apparatus for paints, enamels, lacquers, etc.** ROYAL L. VILAS. U. S. 1,717,478, June 18. Mech. features.

**Lacquers containing cellulose esters, etc.** I. G. FARBENIND. A.-G. Brit. 301,133, Sept. 6, 1927. Lacquers are formed contg. cellulose esters such as nitrocellulose together with urea- $CH_2O$  condensation products and vegetable oils such as poppy-seed oil, linseed oil, soy bean or perilla oil, sunflower oil, olive oil or castor oil or animal oils such as fish oils, and solvents, with or without natural resins, etc.

**Material for covering floors, walls, furniture, etc.** A. MÜLLER. Brit. 301,321, Nov. 25, 1927. Products such as those having a marble or jasper effect comprise a backing such as linoleum or tarred board coated with a ground color and then sprayed with different colors to give the design. Various cellulose ester compns. and compns. contg. drying oils and resins, and an app. for applying the compns. are described.

**Linoleums.** HERCULES POWDER CO. Fr. 656,204, June 21, 1928. Compns. for linoleum contain (1) sol. nitrocellulose 28, Et abietate ( $C_{19}H_{29}COOC_2H_5$ ) 31, tricresyl phosphate 7, wood powder 34% or (2) sol. nitrocellulose 18.2, Et abietate 67.3, ground cork 14.5%.

**Coating compositions.** COMPAGNIE FRANÇAISE POUR L'EXPLOITATION DES PRO-  
CÉDÉS THOMSON-HOUSTON. Fr. 655,281, Dec. 28, 1927. See Brit. 284,348 (*C. A.* 22, 4845)

**Coating metals.** WALKER, HUNTER & CO., LTD., and J. WALKER. Brit. 300,764, Oct. 20, 1927. Metal articles or parts are coated with a liquid or paste contg. material such as powd. slate or talc with a vehicle such as "white spirit" and linseed oil; after drying and rubbing down, a dull coating of a nonvitreous enamel to which rubber soln. has been added is applied and the product is baked, coated with a finishing enamel and again baked.

**Fire- and weather-resistant coatings on wood or other surfaces.** NEVIL M. HOPKINS (to Burnot Fireproofing Products, Inc.). U. S. 1,717,561, June 18. A surface such as wood is treated with a primary coating contg. pigments including borax and a linseed oil vehicle having an acid value sufficient to prevent the borax from sapon. the oil, and with an overlying coating of weather-resisting paint contg. Pb carbonate, Pb sulfate, ZnO and a linseed oil vehicle. Cf. *C. A.* 23, 2309.

**Marking composition.** WINTHROP S. LAWRENCE (to Kaumagraph Co.). U. S. 1,718,966, July 2. A mixt. of rosin soap and shellac soap is used for making transfer inks.

**Insulating varnishes.** H. OHTA and ASAHI GARASU KABUSHIKI KAISHA. Brit. 301,341, Aug. 17, 1927. Ingredients of varnishes formed mainly of tung oil and rosin are treated with a sulfide or selenide in the presence of a catalyst such as Al (suitably at a temp. of 240–300°).

**Refining wood rosin.** HARRY E. KAISER and ARTHUR LANGMEIER (to Hercules Powder Co.). U. S. 1,719,431, July 2. The rosin is heated to 260–340° under an abs. pressure of about 3 in. Hg or less and a portion of the material is condensed at a temp. now lower than 175°.

**Artificial resins.** W. DUX. Brit. 300,956, Nov. 21, 1927. Shellac substitutes are made by heating suitable halogen derivs. of unsatd. aliphatic or hydroaromatic acids such as abietic acid, linseed-oil acid, ricinic acid or of the aleuritic or shellol acid type with a similar halogenated compd. or with a suitable hydroxycarboxylic acid such as trihydroxystearic acid, hydroaromatic carboxylic acids, etc.; HCl is split off. Examples are given.

**Artificial resins.** E. VON HERZ. Brit. 301,429, Nov. 29, 1927. Pentaerythritol (or the water-sol. condensation product obtained as a by-product in the manuf. of penta-

erythritol) is condensed with phthalic acid or anhydride. Heating at 140° produces a resin sol. in alc. and acetone which on further heating at 180° loses its soly. in alc. and on still further heating becomes infusible and insol.

**Artificial resins.** RENÉ MEYER. Fr. 655,737, Oct. 22, 1927. The amt. of filling material in artificial resins such as  $\text{PhOH}\cdot\text{CH}_2\text{O}$  resin capable of being molded may be increased up to 95% by adding it during manuf. of the resin. An example is given.

**Artificial resins.** I. G. FARBENIND. A.-G. (Arthur Voss, inventor). Ger. 477,226, Jan. 4, 1925. Resins prepd. by the condensation of  $\text{AcH}$  and other aliphatic aldehydes are rendered available for purposes for which, on account of their poor soly. properties, they have not hitherto been used by heating them with other artificial or natural resins until the end product exhibits the soly. properties of the 2nd component. The heating is effected in the absence of solvents or in the presence of solvents removable by distn. Suitable resins are coumarone resin and colophony. Examples are given.

**Phenolic resin.** GEORGE W. MILLER (to Bakelite Corp.). U. S. 1,717,614, June 18. Cresol is caused to react with furfural in the presence of a basic condensing agent such as  $\text{Ca}(\text{OH})_2$  until a fusible resinous condensation product is formed; more of the basic condensing agent is then added and the reaction is continued.

**Phenol resin composition.** HOWARD L. BENDER (to Bakelite Corp.). U. S. 1,717,600, June 18. A phenol is caused to react with more than an equimol. proportion of  $\text{CH}_2\text{O}$ , and at least a portion of the excess  $\text{CH}_2\text{O}$  is combined with urea or a similar resin-forming reagent. Cf. C. A. 23, 1517.

**Laminated sheet material containing synthetic resins.** BAKELITE CORP. Brit. 300,836, Feb. 10, 1928. Sheets such as paper or cloth for making laminated products are impregnated with an artificial resin of the glycerol-phthalic anhydride type, and the sheets are bonded with a phenolic resin. Various details are given.

**Ornamenting molded articles of synthetic resins, etc.** J. EATON (to British Thomson-Houston Co., Ltd.). Brit. 301,432, Nov. 29, 1927. Articles such as switch plates formed of a glyceride resin, phenolic resin or similar substance are formed in a mold, the surface of which is sprinkled with a finely divided material such as bronze powder or Cu or Al powder against which the material is hot pressed during the molding.

**Glycerol-phthalic anhydride resins.** BAKELITE CORP. Brit. 300,668, July 11, 1927. Colorless resins are obtained from glycerol and phthalic anhydride or similar reacting materials by effecting the initial reaction at a temp. not exceeding 175° and heating the product at a temp. not exceeding 100° until it has attained a rubbery consistency, and finally hardening at a temp. not exceeding 135°. The total heating time may be 1 to 12 weeks. Glycols and malic or succinic acid also may be used.

**Condensation products.** SOC. POUR L'IND. CHIM. À BAËLE. Fr. 655,583, June 11, 1928. New condensation products are obtained by treating primary aromatic amines with  $\text{C}_2\text{H}_2$  in the presence of a catalyst such as salts or oxides of Hg. The products, which are in the form of resins, form salts with mineral acid and find application as lacquers or varnishes resistant to alkalis, and in the rubber industry as vulcanization catalysts and antioxidants. They may be sulfonated, nitrated, reduced or treated with aldehydes. Examples are given. Cf. C. A. 23, 3589.

**Dimethylolurea.** POLLOPAS, LTD. Fr. 656,238, June 22, 1928.  $\text{CO}(\text{NHC}_2\text{H}_4\text{OH})_2$  is prepd. by condensing urea and an aq. soln. of  $\text{CH}_2\text{O}$  in the presence of alkali of an OH-ion concn. equal to a NaOH soln. of between 0.02 and 0.005 N at a temp. below about 35°, giving a pure product m. 138–140°. The product may be condensed to a transparent resin by boiling in a slightly acid aq. soln.

## 27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

**The effect of clay on rancid fats.** GEO. W. FIERO. *J. Am. Pharm. Assoc.* 18, 491–3(1929).—Rancid coconut oil and rancid lard were treated (1) by simple agitation with clay, (2) by boiling aq. colloidal suspension of clay and (3) by clay with superheated steam under reduced pressure. The rancidity of coconut oil was entirely removed by each method but the first was most satisfactory since no  $\text{H}_2\text{O}$  was used. None of the methods entirely removed the rancidity from lard although it was diminished. L. E. WARREN

**Fractionation of horse fat.** J. ROSELLO. *Chimie & industrie* Special No., 520 (Feb., 1929).—Horse fat (a) was melted below 60° and fractionated by cooling very

slowly (each fraction required about 2 weeks for sepn.) into 5 fractions by removing the portions which were solidified at 40° (b), 30° (c), 16° (d) and the residue which solidified about 12° (e). The liquid fat has a characteristic horse odor, but can be easily and completely deodorized by treating in vacuum with superheated steam. Fractions (b) and (c) consist mainly of dipalmito-linolein. The analysis of a, b, c, d and e gave the following results, resp.,  $d_{15}$  0.914, 0.9219, 0.9214, 0.9184, 0.9186;  $d_{40}$  0.894, 0.8902, 0.8925, 0.8912, 0.8940; m. p. 26°, 41°, 36°, 20°, —; solidifying pt. 34–24°, 39–37°, 35–32°, 25–19°, 15°; oleorefractometer reading at 45° —5, —13, —11, —6, —2; viscosity at 16° —, —, —, —, 0.8834; viscosity at 60° 0.162, 0.170, 0.1703, 0.167, 0.162; acid no. (mg. KOH) 1.11, 0.99, 0.99, 1.06, 1.24; sapon. no. 201, 203, 205, 202, 200; I no. 74, 55, 57.5, 62.7, 75.4; Reichert no. 2.24, 2.12, 1.9, 1.54, 1.45; Ac no. 8.1, 5.6, 3.3, 0, 7.3; unsaponifiable matter % 0.38, 0.44, 0.51, 0.30, 0.48; fatty acids 95, 94.7, 94.6, 95.5, 94.9%; liquid fatty acids 51.2, 35.2, 38.2, 44, 47.4%; solid fatty acids 43.8, 59.5, 56.4, 49.5, 47.5; titer of insol. acids 38.6, 43.8, 42.4, 39, 37; titer of sol. fatty acids 49.8, 51.2, 49.4, 48.4, 47; mean mol. wt. of insol. acids 266, 257.6, 264.6, 259.4, 267; mean mol. wt. of solid acids 260, 255.2, 259.8, 263, 262.4; mean mol. wt. of liquid acids 279.6, 276.4, 275, 276, 276.2; I no. of insol. acids 74.5, 57.6, 60.8, 66.3, 78.4; I no. of solid acids 3, 2.3, 2.8, 3.6, 4.5; I no. of liquid acids 144, 148, 145, 140, 147.

A. PAPINEAU-COUTURE

The saponification of oils and fats. VIZERN AND GUILLLOT. *Chimie & industrie Special No.*, 525–6 (Feb., 1929).—From expts. on tallow and vegetable oils it is concluded that no error is introduced because of the strength of the alc., provided it does not fall below 45–50% at the end of the titration; that sapon. is generally complete in 15 min. and 30 min. is ample for all ordinary purposes; and that a 3-g. sample should preferably be taken, 5 g. giving a less sharp end point and less than 3 g. being inadvisable because of greater weighing or measuring error. From a discussion of the possible errors in the detn. it is shown that duplicate detns. carried out with different standard solns. can vary by up to 6 units; and it is recommended that the acid (generally 0.5 N HCl) be standardized directly against c. p.  $\text{Na}_2\text{CO}_3$  and that detns. be made in duplicate.

A. PAPINEAU-COUTURE

Examination of marine animal oils by Wood's light. HENRI MARCELET. *Chimie & industrie Special No.*, 527–30 (Feb., 1929); cf. *C. A.* 22, 1215.—In addn. to the previously reported results on cod-liver oils, results are also given of the examn. by the same technic of 46 fish and marine animal oils of known origin and purity.

A. P.-C.

Residues from the refining of carnauba wax. V. VESELY. *Chimie & industrie Special No.*, 534 (Feb., 1929).—Analysis of 3 samples of crude wax gave: m. p. 81.1–83.1°, acid no. 4.1–13.8, ester no. 57.0–65.0, sapon. no. 69.1–75.5. Two samples of bleached wax gave: acid no. 0.6, 0.4; ester no. 9.2, 7.4; sapon. no. 9.8, 7.8. Three samples of residue from the refining of the wax gave m. p. 72.0–72.5°, acid no. 4.9–49.7, ester no. 7.3–9.9, sapon. no. 12.6–59.6.

A. PAPINEAU-COUTURE

Pine nuts, pistachio nuts and their oils. W. PEYER. *Apoth. Zig.* 44, 699–700 (1929).—The kernels of pine nuts (*Pinus pinea* L.) and of pistachio nuts (*Pistacia vera*) and their resp. oils have been examd. and the results obtained reported as follows: Kernels: moisture 5.5, 4.4; mineral constituents 4.4, 2.6; fatty oil (petr. ether ext.) 45.6, 50.6;  $\text{Et}_2\text{O}$  ext. 48.1, 52.2; alc. ext. 56.3, 55.5; N 6.5, 2.0; crude protein 40.6, 12.5; wt. 100 kernels 17, 41.2 g. The 1st values apply to pine, the 2nd to pistachio nuts. Pine kernel oil: bright yellow,  $d_{15}$  0.920, sapon. no. 193.1, I no. 118.0, acid no. 4.4, solidification point —20°, unsaponifiable 1.98, elaidin test via D. A. B. 6 partly solid yellowish brown, behavior toward fuming  $\text{HNO}_3$  via D. A. B. 6 viscous orange-brown. The corresponding values for pistachio oil are: bright yellowish brown with green tinge, 0.9179, 192.0, 88.2, 4.0, —9°, 1.02, foamy white solid mass, bright brown solid.

W. O. E.

Determination of the oil content of seeds. PÁL LIPTÁK. *Magyar Gyógyszerésztud. Társaság Értesítője (Ber. ungar. pharm. Ges.)* 2, 155–8 (1926); *Chem. Zentr.* 1928, I, 1562–3.—The acid no. was detd. by crushing the seeds, washing with  $\text{EtOH}$  and titrating the washings. Detn. was made on flax, castor and poppy seed and on walnuts and sweet almonds.

FRANCIS P. GRIFFITHS

Euphorbia esula L. PAUL GILLOT. *Mat. grasses* 21, 8390–2 (1929).—The percentage compn. of the seeds is:  $\text{H}_2\text{O}$  7.81, fats 30.85, protein 22.9, sugars 2.82, ash 5.25, cellulose 30.37. The oil extd. by pressure possesses these const.: color pale yellow, no absorption spectrum,  $d_{15}^{25}$  0.9385,  $n_D^{25}$  1.4829,  $n_D^{15}$  1.4855, Crismer index +64°, f. p. —30°, free fatty acids in mg. KOH for 1 g. 4.4, in oleic acid per 100 g. 2.21, sol. fatty acids in cc. 0.1 N KOH per 150 cc. 6, in butyric acid per 100 g. 1.05, Hehner index

95.2%, volatile fatty acids (sol.) in cc. 0.1 *N* KOH 3, (insol.) 0.5, sapon. index 196.2; I index 207.5, acetyl index 12.5, unsapon. 0.93%, Hehner and Mitchell index 52.3; elaidin, Bellicr, Halphen, Villavecchia and Falris; Blarez, Bellier's arachidic acid tests, all negative, Halphen Br test immediate ppt.; Bellier resorcinol test, oil deep violet and acid yellow. Consts. of total fatty acids:  $n_D^{22}$  1.4735, I no. 217, neutralization index 197.7. Consts. of extd. oil (petroleum ether): color pale yellow, no absorption spectrum,  $d_{15}^{15}$  0.938,  $n_D^{15}$  1.4854, Crismer index +62.5°, free fatty acids, in oleic acid per 100 g., 3.22, sapon. index 196.6, I no. 206.8, Hehner index 95.1, Reichert-Volny index 3.2, unsapon. 0.89%. This oil has the same drying properties as the other oils of this group.

P. THOMASSET

**Determination of the "titer" of fatty acids.** L. MARGAILLAN. *Chimie & industrie Special No.*, 521-2 (Feb., 1929).—The detn. should be carried out in a tube about 26-30 mm. in diam., a tube 14 mm. in diam. giving results about 0.8° too low; the presence of a trace of H<sub>2</sub>O can lower the results about 1°; allowing the acids to cool without agitating with the thermometer introduces an error of about -0.5°.

A. P.-C

**Progress in the soap industry. III. Saponification of neutral fats by means of alkali carbonates.** J. DAVIDSOHN. *Chem. Umschau Fette, Oele, Wachse Harze* 35, 253-4 (1928); cf. C. A. 22, 1697, 3547. **IV. Welter's spray-method.** *Ibid* 254 5 - Manuf. of soda crystals and soap powders. **V. Ammoniacal saponification.** *Ibid* 255 - Review of patented methods.

P. ESCHER

**Errors in the methods of determination of neutral fat in soaps.** K. RIETZ. *Chem Umschau Fette, Oele, Wachse Harze* 35, 258-9 (1928).—R. criticizes Kroper's article under above caption (C. A. 22, 4851) for omitting in his comparison the present standard method of the "Einheitsmethoden" for detg. neutral fat.

P. ESCHER

**Determination of detergency of soap products.** L. T. HOWELLS. *Oil & Fat Ind* 6, No. 6, 23-9 (1929).—A machine known as the Launder-Ometer made by the Atlas Co was used under the following conditions: Distd. H<sub>2</sub>O at 150°F. was used. The suds strength was 0.2% based on original soap. The cloth pieces were 2.5 × 4 in. The jars contained 10 rubber balls 1 cm. in diam. and weighing 1.5 g. A 20-min. suds followed by two 5-min. rinses constituted a wash; and the vol. of the suds bath was 100 cc. and of the rinses 200 cc. The no. of washes required completely to remove the soil from the cloth was taken as an index of detergency. Most of the collaborators reported between 4 and 5 washes. However, when the same cloth samples were placed on a white background and shaded from direct light, outlines of the stripes could be seen up to 16 washes. This method has proved the best thus far suggested. Practical washing tests in standard laundry machines give sharp end points and consistent results. The present lab. machine was found unsatisfactory. The last traces of soil are hardest to remove.

E. SCHERUBEL

**Report of 1928-1929 color committee.** W. D. HUTCHINS, et al. *Oil & Fat Ind* 6, 19-22 (1929).—The committee made the following recommendations: (1) That a standard set of Lovibond glasses consists of yellow 4.0, 6.0, 8.0, 10.0, 14.0, 16.0, 18.0, 20.0, 35.0, 50.0; red 0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0, 2.0, 2.5, 3.0, 3.5, 4.0, 5.0, 6.0, 7.0, 7.6, 8.0, 9.0, 10.0, 11.0, 12.0, 16.0, 20.0; (2) that only one yellow glass, not more than 2 red glasses up to and including 13.0 red and not more than 3 red glasses above 13.0 red be used to make a color detn.; (3) that the Society adopt the enclosed Wesson type tintometer; (4) that only artificial light produced by 100-Watt blue frosted electric bulb be allowed; (5) that the Society adopt the tube for holding the oil samples, eliminating the glass oil sample bottle; (6) the question of filter paper is a problem for the refining as well as the color committee. On off and cold-pressed oils, and those not refined clear, the type of filter paper makes a diff. in color. At present it is sufficient to recommend a good, heavy, close-texture, white paper.

E. S.

**Palm oil from the Belgian Congo.** GEORGE S. JAMIESON AND ROBERT S. McKINNEY. *Oil & Fat Ind*, 6, No. 6, 15-8 (1929).—The constns. found were:  $d_{25}^{25}$  0.9146,  $n_D^{20}$  1.4578, acid value 20.65, sapon. no. 197.9, unsapon. 0.39%, I no. 53.7, acetyl no. 15.27, R.-M. no. 0.10, Polenske no. 0.29, satd. acids 44.3, unsatd. acids 50.6, I no. of unsatd. acids 99.9. The % compn. of the oil was oleic acid 47.2, linolic acid 5.6, myristic acid 0.5, palmitic acid 40.8, stearic acid 5.2, lignoceric acid 0.1.

E. SCHERUBEL

**Utilization of oil-mill residues; the manufacture of edible aleurone meals (ANDRÉ) 12. Apparatus for extracting oils from plants (Fr. pat. 655,733) 1. Trichloroethane [as solvent for fatty substances] (Fr. pat. 655,930) 10. Discharging solids, liquids and gases simultaneously from high-pressure reaction vessels [in hydrogenating fats.] (Ger.**

pat. 477,038) 13. Wick filters for oil (Brit. pat. 301,507) 1. Soaps from sulfonated mineral oil acid sludge (U. S. pat. 1,718,335) 22. Filter for oil (U. S. pat. 1,719,346) 1. Degreasing wool (Brit. pat. 300,941) 25. Degreasing raw wool and other textile fibers (U. S. pat. 1,718,548) 25.

**Ubbelohde's Handbuch d. Chemie u. Technologie d. Ole u. Fette.** Bd. 3, Abt. 1. *Chemie, Analyse, Technologie der Fettsäuren, des Glycerins und der Türkischrothöle.* 2nd ed., revised by HANS HELLER. Leipzig: S. Hirzel. 392 pp. M. 36.

**Oils and fats.** METALLBANK UND METALLURGISCHE GES. A.-G. Fr. 655,458, June 7, 1928. Chem. reactions particularly the production of oils and fats by the neutralization of fatty acids with glycerol, are carried out under a high vacuum obtained by interposing an injector worked by steam between the reaction vessel and a condenser cooled by water.

**Separation of unsaponifiable matter from oils.** JOSEPH K. MARCUS. Fr. 655,799, Apr. 27, 1928. Vitamins A, D and E are sepd. along with the unsaponifiable and difficultly saponifiable matter from fish, vegetable or animal oils, etc., by saponif. and extg. with an org. chloride such as  $C_2H_2Cl_2$ . An example is given of the extn. of cod-liver oil.

**Splitting oils and fats.** IMPERIAL CHEMICAL INDUSTRIES, LTD., and E. CHAPMAN. Brit. 300,360, Sept. 29, 1927. Oils and fats are split by the sulfonic acids or their salts obtained as described in Brit. 274,611 (C. A. 22, 2268) by the condensation of an alc. with sulfonated mineral oil fractions.

**Recovering fats from waste waters, etc.** C. VAN OVERSTRAETEN. Brit. 300,386, Nov. 5, 1927. Wool-washing and similar liquors are strained, settled and treated with acid, "chloride of lime," Al sulfate or the like to ppt. fatty substances. The sepd. solid substances are all combined, washed with a small quantity of water which may contain alkali, to remove fat, and passed through a "mud separator." The soapy emulsions of grease produced are boiled (suitably with further addn. of alkali) and further treated for the sepn. of grease. Various details are described.

**Apparatus for measuring the oiliness of liquids such as oils.** HENRI VOLLET. Fr. 655,705, June 13, 1928.

**Fatty acid peroxides, etc.** WM. B. STODDARD and VAMAN R. KOKATNUR (to Pilot Lab., Inc.). U. S. 1,718,609, June 25. An aliphatic acid chloride such as lauryl chloride is treated with a soln. of an alkali metal peroxide.

**Soap.** ADOLF WELTER. U. S. 1,719,349, July 2. In producing an air-resisting molded soap, com. fatty acids, at about their m. p., are mixed with a quantity of alkali carbonate free from water, sufficient to saponify up to twice the quantity of fatty acids present and, after sapon., grain soap is added and the product is milled.

**Liquid soap compositions.** HENKEL ET CIE. GES. Brit. 301,020, Nov. 23, 1927.  $NH_4$  thiosulfate is used to prevent gelatinization of soap mixts. such as may also contain glycerol and other ingredients.

**Soap flakes.** ERNST FLAMMER and CHRISTIAN KELBER. U. S. 1,717,553, June 18. Soap contg. somewhat less than 15% of water is used with a persalt such as Na perborate and an "oxyhydrocarbon" deriv. such as cetyl palmitate.

**Soap flakes.** BERTRAM W. COLTMAN. U. S. 1,718,778, June 25. Soap flakes are formed comprising small bodies having voids surrounded by thin walls, the surfaces of which have min. cellular formation.

**Shampoo composition.** HARRY M. WEBER (to Ellis-Foster Co.). U. S. 1,719,251, July 2. Anhyd. water-sol. soap substantially free from rancid ingredients is mixed with a dry non-rancid "clean-smelling" vegetable oil such as coconut oil which is substantially stable in the atm., to form a creamy mass of uniform character.

## 28—SUGAR, STARCH AND GUMS

J. K. DALE

The attempts at rationalization by the sugar industry. BEDŘICH NEUMANN. *Listy Cukrovar.* 47, 417-8(1929).—A discussion. FRANK MARESH

The use of conductivity for controlling the manufacture of sugar. K. ŠANDERA. *Listy Cukrovar.* 47, 373-6(1929).—Š. indicates a curve for control work use in refineries. The limits of accuracy and applicability of the conductivity method are indicated. FRANK MARESH

Some crop experiences in 1928. Q. A. D. EMMEN. *Arch. Suikerind.* **37**, 315-24 (1929).—The reasons for mill break-downs are discussed. Max. extn. is possible with proper mill settings without any special app. Boiler trouble is discussed. In mills where a part of the boiler plant was used as reserve and where river water was used in part for feeding, trouble was caused by settling of the river water dirt when the boiler was idle. Trouble with centrifugal pumps for carbonation juice was caused by incrustation; E. advises discharging the pumps when stopped. P. R. P

Polarigraphic measurements in sugar experimentation. K. ŠANDERA AND B. ZIMMERMANN. *Listy Cukrovar.* **47**, 377-82(1929).—The polarographic method as modified by J. Heyrovsky was used in the study of the decompn. of sucrose in dil. and concd. solns. and at various degrees of alky. and acidity. The method was found to be very precise and permitted following the changes in sugar solns. during heating or changes in temp. with greater accuracy than by observing changes in luminescence or surface potentials photometrically. Sucrose was found to be labile in soln. and in the dry state undergoes a decompn. at 70° which is marked when the sugar is damp or when the removal of H<sub>2</sub>O vapor is slow during drying. FRANK MARESH

A colorimetric study of the colors of sugar refinery products. A. RUŽIČKA. *Listy Cukrovar.* **47**, 385-7(1929).—Using the objective photometer modified by Šandera which eliminates subjective errors and allows measurements over a wide range of concns., the validity of the Lambert-Beer law was tested with various solns. of molasses. Comparisons were made against distd. H<sub>2</sub>O. All samples which had been carefully filtered obeyed Beer's law more closely than unfiltered ones. Each was diluted 1/50 before making comparisons in the colorimeter. Filtering molasses through filter paper removes substances which otherwise cause the soln. to deviate from the law. Adding 0.1% of quartz to a sugar soln. is sufficient to cause a deviation and filtering through filter paper does not remove the causative agent. A small amt. of active charcoal has little influence upon a deviation. FRANK MARESH

Technological notes on regenerating activated charcoal. J. KADLEC. *Listy Cukrovar.* **47**, 388-92(1929).—I. Mineral salts are removed from charcoal with the aid of dil. HCl during regeneration. The amount of mineral which is converted into sol. chlorides and removed by washing is quite variable. In plant operations, the chief contaminant is sand while the Ca and Fe content of the ash is very high (60-90%). The affinity between charcoal and Ca and Fe is very great. Examples are given for computing the HCl to be added in order to accomplish full regeneration. II. Gas flue deposits were removed during cleansing operations and boiled to remove the adsorbed methylamines and oily fractions. The activated charcoal is coarse and sinks to the bottom of the tank; unactivated charcoal is finely divided and remains suspended in the water. The Fe content is high and 2 treatments with HCl are necessary for a complete removal of the Fe. In operation, this charcoal is equal to any other commercial grade, but contamination from oil must be watched. FRANK MARESH

Determination of ash in the products of the sugar industry. I. B. MINTZ AND YA. I. ZILBERMAN. *Nauchnuie Zapiski* (Russian) **5**, 227-30(1928); cf. C. A. **21**, 3280—M. and Z. present data which show the accuracy of the oxalic acid method for detn of ash. J. S. JOFFE

Determining the absorption of ultra-violet light by sugar solutions. W. EISEN SCHIMMEL. *Listy Cukrovar.* **47**, 383-4(1929).—The golden color of raw sugar solns suggests high absorption for ultra-violet rays. Sucrose is very transparent to ultra-violet rays; the absorption bands for glucose and fructose are disputed. Extinction curves for various sugars are given. E. suggests using the method for detg. the coloring impurities of raw sugars. FRANK MARESH

Clarification. B. J. VAN SANTEN. *Arch. Suikerind.* **36**, 579-81(1928).—In 1921 the author proposed clarification of concd. juice with the object of fuel economy. Lab tests with raw sirup of 62° Brix resulted in an easy filtering, clear liquor. The author suggests repetition of the expts. utilizing a Honig and Bogstra pressure evaporator. The even and moderate temp. at the outlet of the evapn. is advantageous for the sulfitation. The entire process will be shortened by 1-2 hr. P. R. PEKELHARING

Observation of saturation by conductometric titration. K. ŠANDERA AND J. SCHATZ. *Listy Cukrovar.* **47**, 369-72(1929).—One l. of soln. was satd. at a selected temp. (20° and 85°) in double-walled vessels. The solns. were juices from refineries, or solns. made up to equivalent concns. and decolorized with purified or technical grades of CaCO<sub>3</sub>. The CO<sub>2</sub> came from compressed cylinders. Toward the approach of satn. (when the alky. reached 0.3% CaO), 50-cc. samples were collected, cooled to 20° and titrated with 0.10 N HCl against phenolphthalein. The gained values were

plotted on special diagrams according to the degree of alky. and while  $\text{CaCO}_3$  is being pptd. the number of ions, and hence conductivity, decreases until the soln. becomes neutral; the  $\text{CO}_2$  then saturates the soln. and the conductivity increases. A 15% sugar soln. shows a gradual drop and rise due to a lower mobility of ions. A  $\text{Ca}(\text{OH})_2$  soln. with sugar gives a different curve than either used alone. The cond. of  $\text{Ca}(\text{OH})_2$  is decreased rapidly by small addns. of sugar; for higher concns. the change in cond. is less marked; for a 15% sugar soln. the cond. is decreased 14% and further increases in the sugar concn. have very little effect. The viscosity curve is inversely proportional to the cond. curve, showing a close relation between the two properties. Sugar also decreases the cond. of other dissolved inorg. substances.  $\text{KCl}$  cond. is decreased directly proportional to the sugar concn., a 15% sugar soln. decreasing the cond. 29%. The linear function decrease in cond. also holds for  $\text{NH}_4\text{Cl}$ ,  $\text{KCl}$ ,  $\text{K}_2\text{SO}_4$  and  $\text{MgSO}_4$  solns. The departure from the linear function in alk. solns. is due to the formation of polysaccharides.

FRANK MARESH

Effect of hot molasses on exhausted beet slices. V. KOHN. *Z. Zuckerind. Tschoslovak. Rep.* 53, 157-61 (1928).—On treating exhausted beet slices for  $\frac{1}{2}$  hr. with molasses, d. of 19.6-25.4° Balling, at 85-95°, the following were found to have passed over from the latter to the former material: sugar 0.79-1.87% (of the dry substance of the molasses), N 0.07-0.16% (of the polarization of the molasses soln.), ash 0.94-1.71% (of the polarization of the molasses soln.),  $\text{K}_2\text{O}$  0.60-1.10 and  $\text{Na}_2\text{O}$  0.1-0.3% (of the carbonated ash of the molasses soln.). No transfer of either Ca or Mg took place.

B. C. A.

A comparative precipitation method for the qualitative identification for each of the common gums. WALTER WEINBERGER AND MORRIS B. JACOBS. *J. Am. Pharm. Assoc.* 18, 34-6 (1929).—W. and J. find that each gum when pptd. by EtOH from an aq. soln. has a characteristic appearance and texture. Usually a 1% soln. is used, although for agar and karaya a greater diln. is recommended. To 20 cc. of the soln. 75 cc. of EtOH is added, drop by drop, with notation of the first permanent ppt. The texture, quality, etc. are then compared with the tabulated findings from known gums. The method is an easy, rapid and definite one for the differentiation of the several gums.

**Isoprene and rubber.** XV. H. STAUDINGER. *Kautschuk* 5, 94-7, 126-9(1929); cf. C. A. 23, 3372.—A detailed review and discussion of recent investigations by different experimenters on the *chem. constitution of rubber, gutta-percha and balata*. Numerous references are included.

C. C. DAVIS

**The dispersion of carbon black in rubber.** Comparison of the heats of wetting of raw rubber and different samples of carbon black. L. HOCK. *Kautschuk* 5, 147(1929).—Tests of the heats of wetting (cf. Hock and Bostroem, C. A. 21, 1335) of 2 C blacks (Durex 1 extra and D 7 of Wegelin A.-G., Köln) gave values of 7.12 and 3.89 cal., resp., per g. of C black immediately after mixing. After standing, the heats of wetting increased, indicating that on standing combination between rubber and pigment progressed further.

C. C. DAVIS

**The dispersion of carbon black in rubber.** Microscopic examination of carbon black in rubber mixtures. M. HÜNEMÖRDER. *Kautschuk* 5, 147-8(1929).—A study of the ease of dispersion and behavior during vulcanization of the 2 blacks examd. by Hock (cf. preceding abstr.) showed that Durex 1 extra is finer and can be dispersed better than the other black. During vulcanization the finer black dispersed still more until plastic flow ceased, whereas the coarser black retained its original state of dispersion.

C. C. DAVIS

**Dispersion of pigments in rubber.** II. ERNST A. GRENQUIST. *Ind. Eng. Chem.* 21, 665-9(1929); cf. C. A. 22, 4875.—Expts. are described which show the microscopic structure of raw rubber under various conditions, the size and shape of C black particles, the wetting capacity of C black in water and in rubber and the behavior of rubber resins, S, ZnO, C black, stearic acid and accelerators in rubber during heating and during vulcanization. Reinforcement of rubber by a pigment depends upon 3 fundamental factors: (1) the free surface energy of the system, which is governed to a considerable extent by the size, shape and uniformity of the particles and their dispersion; (2) the intensity of wetting of the pigments by the rubber or of the rubber by the pigments, which is governed by the state of dispersion, the nature of the surfaces of rubber and pigment and the surface-active substances adsorbed at the interface; and (3) the strength of the rubber matrix, which is governed by the degree of polymerization, the state of globular structure and the action of dissolved substances and compounding ingredients.

C. C. DAVIS

**The electrokinetic potential of rubber.** B. N. GHOSH AND P. STAMBERGER. *Kautschuk* 5, 99-100(1929).—A preliminary note. The electrokinetic potential of rubber

with water and 7 solns. of different concns. was measured, the electroendosmotic capillary transference method with a modified form of the app. described by Briggs (cf. *C. A.* 13, 1784) being used. The rubber capillaries were prepd. from latex and a  $C_6H_6$  soln. of rubber, the same results being obtained in each case. Measurements were made at 200 v. in the usual way. The elektrokinetic potential  $\xi$  was calcd. from the formula  $\xi = 4\pi\eta vl/(ERq)$ , where  $\eta$  is the viscosity of the liquid,  $v$  the quantity of liquid transferred per sec.,  $E$  the voltage (200), and  $l/q$  the ratio of the length to the cross section of the capillary. The following  $\xi$  values were obtained, the data giving the normality of the soln. and the  $\xi$  value in v., resp.: water—, -0.038; NaOH 0.005, -0.048; 0.010, -0.048; 0.025, -0.067; 0.50, -0.060; 0.100, -0.072;  $NH_4OH$  0.08, -0.045; 0.32, -0.059; 0.76, -0.066; HCl 0.033, -0.021; 0.05, -0.023; AcOH 0.23, -0.038; 1.0, -0.052; 2.0, -0.059; KCl 0.02, -0.031; 0.04, -0.028;  $BaCl_2$  0.01, -0.019; 0.03, -0.015;  $Th(NO_3)_4$  0.1, 0.015; 0.3, 0.019. To what extent the elektrokinetic potentials measured in this way correspond to those of rubber latices, and in what way the potential and stability are influenced by changes in compn. are being investigated. The expts. are also to be continued with other substances

C. C. DAVIS

**Mechanical tests of rubber and probabilities.** R. FRIC. *Rev. gén. caoutchouc* 6, No. 51, 3-8(1929).—See *C. A.* 22, 4870.

C. C. DAVIS

**Some observations on rubbers with low nitrogen content.** A. D. CUMMINGS AND L. B. SEBRELL. *Ind. Eng. Chem.* 21, 553-7(1929).—Rubber cannot be prepd. free of N by the method of Pummerer and Pahl (cf. *C. A.* 22, 885) even by continuing the treatment with NaOH for twice as long as recommended by P. and P. The residual 0.004-0.009% N is not protein N, since it can be removed by extn. with acetone to a point where it is so low that it cannot be detd. precisely by the colorimetric method with Nessler soln. Comparison of the results of vulcanizing protein-free rubber with the corresponding results with untreated rubber, and with the results of previous researches, shows that the rate of vulcanization is const. for different conditions of coagulation. Furthermore, the quality of vulcanizates low in N is very good compared with the quality of the corresponding controls and earlier expts. described by Dinsmore (cf. *C. A.* 21, 194). The variation in the rate of vulcanization and in the quality noted by D. was, therefore, a result solely of the condition of the rubber protein resulting from the  $pH$  value during coagulation. After extn. with acetone, protein-free rubber is practically free of N, and it vulcanizes slowly, giving vulcanizates of poorer quality than the corresponding ones obtained from the unextd. protein-free rubber. This effect may, however, not depend wholly upon the absence of N compds. Protein-free rubber can be compounded and cured so that vulcanizates of good quality are obtained, so the protein is not an essential factor governing the phys. properties of vulcanized rubber. The condition of the protein does, however, influence the rate of vulcanization, and consequently affects indirectly the quality of the vulcanized rubber.

C. C. DAVIS

**A new flexing machine for rubber.** PHILIP M. TORRANCE AND LESTER C. PETERSON. *India Rubber World* 80, No. 4, 62(1929).—The new app., which is described and illustrated, is designed to imitate the cracking of tire treads in service. Results show a qual. agreement with road tests. Based on these lab. tests, it was found that some antioxidants reduce tread cracking, whereas others have no such beneficial influence. The conditions during processing and the modulus also influence the tendency to crack. "Cold checks" and grain cause premature cracking, phenomena which are probably related to the premature cracking at the junction of the tread and sidewall of a tire. The app. should be particularly useful in studying temp. effects

C. C. DAVIS

**Sipalin, a new light colored plasticizing agent for rubber.** RUDOLF DITMAR. *Gummi-Ztg.* 43, 1932-3(1929).—Plasticizing agents marketed under the name "Sipalin" (Deutsche Hydrierwerke A.-G., Berlin-Charlottenburg) are esters of adipic acid, e. g., *Sipalin AOM* is the methylcyclohexyl ester of adipic acid and *Sipalin MOM* is the methylcyclohexyl ester of methyladipic acid. They are very effective softeners in that they shorten the time of mixing and allow the use of higher proportions of such pigments and fillers as C black without detriment to the quality.

C. C. DAVIS

**Fossil rubber.** E. KINDSCHER. *Kautschuk* 5, 98-9(1929).—The geological discovery of vulcanized rubber in brown coal deposits (cf. K., *C. A.* 18, 2862; Gothan, *C. A.* 19, 1240; 22, 933) is of great interest from a practical point of view, for it shows that when rubber is completely protected from oxygen it remains in good condition for many thousands of years.

C. C. DAVIS

**Physical characteristics of sponge rubber.** H. F. CHURCH. *Trans. Inst. Rubber Ind.* 4, 533-42(1929).—Data on the phys. properties of sponge rubber are very few. In the present paper an attempt was made to develop a test which would allow accurate measurements and at the same time give a reliable judgment of the quality. Tensile strength tests cannot be made directly and they do not represent conditions prevailing in use. Methods were developed for detg. the "cellularity," compressibility and permanent set. Tests on sponges of different types showed that, in contrast to other types of rubber products, the phys. properties of sponge rubber are governed more by the form of the cell structure than by the phys. properties of the rubber itself. Consequently, the quality of sponge depends relatively little on the compn. of the vulcanizate or on its degree of cure. However, other factors which do depend upon these properties, e. g., the aging, are of importance. Photomicrographs of different forms of sponging are shown. C. C. DAVIS

**Aging tests for sponge rubber.** HENRY P. STEVENS. *Trans. Inst. Rubber Ind.* 4, 486-92(1929).—When rubber sponge is compressed laterally between metal plates and heated at 70° for 2-3 days, the rubber does not recover when the pressure is released, but retains the forms of a flat sheet from which test pieces can be cut and tensile tests obtained. Twelve different types of sponge were aged in this way for 1 month and the progressive changes in tensile properties detd. The same samples were aged for 1 week without compression and consequent protection, and the changes in org. acetone ext. detd. The quant. tests revealed wide differences in properties after the artificial aging, not only among different makes but among different samples from the same source. The tests conformed to the results obtained by general examn. and hand tests before and after the artificial aging. C. C. DAVIS

**The double refraction of stretched rubber.** W. C. VAN GEEL AND J. G. EYMERS. *Z. phys. Chem., Abt. B*, 3, 240-6(1929).—Though the double refraction of rubber has already been measured (cf. *Ann. Physik* 43, 808(1891); Rossi, *Rend. accad. sci. Napoli* [3], 16, 125, 142(1910); *Nuovo cemento* [5], 20, 226, 268(1910); [6], 2, 151(1911)) no relation between elongation and double refraction has been described. Accordingly, expts. were carried out to ascertain the existence of such a relation. Films of raw rubber, prepd. by drying fresh latex, were examd. with a Babinet compensator. Rubber, which had been plasticized by milling, was also examd. in a similar way. With elastic rubber under a const. stress, the elongation reached a const. value in a very short time. When equil. was thus reached, the double refraction was measured. New samples were used for each increased stress, for with the same sample a repeated stress of const. magnitude gave increasing double refractions. The curves showing double refraction as a function of stress were very similar to those showing the double refraction of liquid crystals as a function of field strength in a magnetic field (cf. Ornstein, *C. A.* 18, 2827). An anisotropic alignment of mols. like that suggested by Ornstein probably exists in the stretched rubber. On this assumption, analogous curves were constructed, with the *b* value of the Ornstein formula proportional to the elongation. Comparison of these curves with exptl. curves showed agreement up to a certain stress. Above this limiting stress, the double refraction increased progressively with increase in stress in a strictly linear relation. This linear relation began in all cases at just the same stress (6 kg. per sq. cm.). The elongation being plotted as a function of stress, the curve showed that at this same stress, which corresponded to 70% elongation, the relation between elongation and stress became strictly linear. This crit. value of 70% elongation is the point at which an x-ray fiber diagram was first obtained (cf. Katz, *Naturwissenschaften* 1925, 110), and so this point is a characteristic of raw rubber. It probably depends, however, upon the compn. of the rubber and upon the temp. With raw rubber which had been plasticized, there was no equil., a const. stress causing elongation which increased progressively. Double refraction was a linear function of the stress, as with certain liquids. When the plasticized rubber was held at a const. elongation, the double refraction diminished with time, rapidly at first, but more and more slowly, leaving a residual pos. double refraction and also a residual stress. This residual double refraction and residual stress were almost wholly independent of the initial elongation. C. C. DAVIS

**The value of reclaimed rubber in tread stock.** C. W. SANDERSON. *India Rubber World* 80, No. 4, 53-6(1929).—A typical high-grade tread stock contg. no reclaim and a stock contg. a high proportion of whole tire alkali reclaim were blended in different proportions (0, 25, 50, 75, 100%); the resulting vulcanizates were tested for their relative resistances to abrasion and for other phys. properties, including resistance to tear, fatigue effects, tensile strength and elongation. The results on the different vulcanizates are compared on an abs. basis (cf. Vogt, *C. A.* 22, 1058) and on a basis of

the relative cost per unit of abrasion. The value of reclaim varied from 25 to 42% of the value of new rubber, the highest value being obtained with the stock contg. no new rubber. With rubber at \$.20 per lb., the relative cost of the reclaim per unit of abrasion was above that of rubber in all the stocks, while with rubber at \$.40 per lb., the relative cost of the reclaim was less than that of rubber when there was more reclaim than rubber present. Road tests agreed well with the lab. tests. Tensile strength, lamination tear and abrasion with 30% slip gave the best indication of road wear.

C. C. DAVIS

**Chemical reactions in rubber compounds. I. Reactions between pine tar and litharge.** W. H. REECE. *Trans. Inst. Rubber Ind.* **4**, 526-32(1929).—The expts. are the beginning of an investigation to ascertain what reactions, other than those involving rubber, S and accelerators, take place during vulcanization, knowledge of which is very scant. A com. pine tar with d. 1.07, neutral oils 50.9%, water 1.4%, carbonaceous substances 0.8%, acids (by difference) 46.9% were used. When PbO and anhyd. pine tar were refluxed in  $C_6H_6$  for 24 hr., a reaction ensued with evolution of water (2.45 g. per 100 g. pine tar) and formation of Pb soaps (corresponding to 30.37 g. PbO per 100 g. pine tar). Similar rubber-pine tar (100:15) mixts. prepd. in the same way with and without PbO were let stand 24 hr. and their plasticities (extrusion at 85°) detd. The values were 11 and 2.3 sec., resp., showing the pronounced hardening resulting from the reaction of PbO and pine tar. When the 2 mixts. were heated at 70°, that with PbO remained stiff, whereas the mixt. without PbO showed plastic flow. The acetone exts. were 9.11 and 15.81%, resp., from which calcs. show that 43.3% of the pine tar combined with PbO (any reaction between PbO and rubber resins being disregarded). By a special exptl. technic, it was found that when a mixt. of rubber 200, S 6, PbO 30, pine tar 30 was vulcanized, 1.31 parts of water was evolved, compared with 1.17 in the absence of rubber (*loc. cit.*), the excess probably arising from a reaction between PbO and rubber resins. The results in general show that PbO and pine tar react in a rubber mixt. in essentially the same way that they do in the absence of rubber. The values conform with the assumption that the pine-tar acids react with PbO to form soaps.

C. C. DAVIS

**The distribution of ingredients in rubber mixings.** H. PAGE. *Trans. Inst. Rubber Ind.* **4**, 521-5(1929).—The unforeseen results obtained by Reiner (cf. *C. A.* **22**, 2290, 2855) on the homogeneity of factory rubber mixings induced P. to make similar analyses. The results disprove the general conclusions of R. Detns. of the free S and the ash of 7 different types of rubber mixings before and after calendering showed variations which were all well within a fraction of 1%, and which proved, therefore, that with ordinary care in factory mixing, no such variations as reported by R. are at all necessary.

C. C. DAVIS

**Studies in the oxidation of rubber mixings.** W. CECIL DAVEY. *Trans. Inst. Rubber Ind.* **4**, 493-8(1929).—Vulcanized rubber mixts., unaccelerated and accelerated, were cured to different degrees, were then aged in a Geer oven at 70° and the increase in wt. and changes in acetone ext. detd. as deterioration progressed to an advanced stage. In some cases before aging, the vulcanizates were extd. with acetone, in other cases with acetone and then with  $CHCl_3$ . In still other cases the vulcanizates were given alternate periods of aging and extns. with acetone. *Unextd. vulcanizates.*—The higher the % combined S, the more rapid was the increase in wt. after a given period of aging. During the early stages of deterioration the higher the combined S, the higher the org. acetone ext., whereas in more advanced stages of deterioration the samples with the lowest combined S had the highest org. acetone exts. The formation of acetone-sol. substances was very slow at first; it then became rapid and finally became slow again. *Acetone-extd. vulcanizates.*—Oxidation was rapid, while the acetone-sol. substances increased to a max. proportion and then diminished to a value which remained const. over a long period of subsequent aging. In the early stages, the vulcanizates with the highest combined S showed the highest proportion of acetone-sol. substances, but on further aging these with the lowest combined S eventually yielded the highest acetone ext., so that the higher the vulcanization coeff., the lower the ultimate proportion of acetone-sol. substances. For a given increase in wt., the vulcanizates with the highest combined S gave the smallest acetone ext. *Acetone and  $CHCl_3$ -extd. vulcanizates.*—Oxidation was still more rapid, and the increases in wt. and in acetone-sol. substances were higher throughout than those of the corresponding vulcanizates extd. with acetone alone. *Repeated aging and extn.*—A vulcanizate alternately aged and extd. with acetone and  $CHCl_3$  gave a final insol. residue contg. more O (25.41%) than the same sample alternately aged and extd. with acetone alone (residue contg. 19.15% O). In the early stages of oxidation, the vulcanizate with highest combined S yielded

the highest acetone ext., but in the more advanced stages of oxidation, the converse was true. *Aging of the acetone ext.*—On heating at 70°, the acetone exts. gained wt. and became insol. The longer the vulcanizates had been aged before extn. with acetone, the smaller were the subsequent gains in wt. of the exts. *Aging of the CHCl<sub>3</sub> ext.*—On heating at 70°, the CHCl<sub>3</sub> exts. gained wt. and became insol. in ordinary org. solvents. A vulcanizate accelerated with diphenylguanidine oxidized much more slowly than the corresponding rubber-S mixt., but gained more ultimate wt. and had a higher ultimate acetone ext. The results in general show that there are 3 stages of oxidation: (1) a slight oxidation, with formation of acetone-sol. substances; (2) an intermediate stage, characterized by a rapid gain in wt. and relatively slow formation of acetone-sol. substances; and (3) a period characterized by an increased rate of formation of acetone-sol. substances, but a const. rate of absorption of O. The change of acetone-sol. to acetone-insol. substances is probably reversible. The 3rd stage is not reached in ordinary practice, while the 2nd stage is the most important, for then the resinous components polymerize and become insol., with resultant brittleness. C. C. D.

**Rubber solutions.** CACITEM. *Gummi-Ztg.* **43**, 2099-102 (1929).—A review and description, dealing with the prepn., phys. properties and uses of rubber solns.

C. C. DAVIS

**Is latex a solution of rubber?** FINI G. A. ENNA. *Gummi-Ztg.* **43**, 2043-4 (1929).—A discussion of the colloid chemistry of latex.

C. C. DAVIS

**Concerning antioxidants.** T. L. GARNER. *India Rubber J.* **75**, 623-4, 634 (1929); cf. *C. A.* **23**, 1772.—For ascertaining the general characteristics of an unfamiliar antioxidant, the following mixt. is recommended: pale crepe 100, S 3.5, diphenylguanidine 1, ZnO 3, antioxidant 0.5-1. The vulcanizates should then be tested in a manner which simulates service conditions in the closest practical way. This latter manner of procedure is very important, for there may be little or no relation between the relative merits of 2 antioxidants in preventing oxidation in darkness, cracking from repeated stresses, changes due to sunlight, resistance due to heating or abnormal deterioration caused by overcuring. Tendencies to stain or discolor may also be determinant factors. Tests by G. show that, contrary to general belief, antioxidants have a protective action on gutta-percha and balata.

C. C. DAVIS

**The automatic control of vulcanization.** MATHIAS MOHR. *Kautschuk* **5**, 114-6 (1929).—An illustrated description of app. for temp. control.

C. C. DAVIS

**An attempt at a rational classification of the principal accelerators of vulcanization.** G. MARTIN AND R. THIOLLET. *Caoutchouc & gutta-percha* **26**, 14494-7; *Rubber Age* (N. Y.) **25**, 201-2 (1929).—The object of the study was a classification based not only on activity, but also on other important characteristics of accelerators (cf. Dinsmore and Vogt, *C. A.* **22**, 4273, 4876), viz. (1) the time required for the "fixation" of rubber mixts. at different temps.; (2) the time required at different temps. to effect a cure with the max. mech. properties; (3) the aging; and (4) the plasticizing power of the accelerators and the influence of different charges on their action. The present paper deals with (1) and (2). The following base mixt. was used: pale crepe 100, S —, accelerator —, ZnO 5, palm oil 1, stearic acid 0.5. To define the *point of fixation*, a mixt. was fixed when (1) without being cured it could be removed from an Al mold without sticking and without distortion; (2) cut surfaces could be reunited; and (3) just before the crit. point the mixt. softened when carried quickly to higher temp., and just beyond the crit. point the mixt. acquired more nerve when its temp. was raised. The point of fixation thus indicates the tendency to "scorch." By plotting temps. as ordinate and times of fixation as abscissa, a series of curves showing the characteristics of each accelerator according to the rate of fixation of mixts. contg. the accelerators was obtained. The accelerators which were tested fell into 6 general groups, typified by (1) Zn isopropylxanthate, (2) Zn methylphenyldithiocarbamate (I), (3) thiocarbanilide (II) and ethylidene-aniline (III), (4) mercaptobenzothiazole (IV) and tetramethylthiuramdisulfide (V), (5) *p*-nitrosodimethylaniline and disubstituted guanidines, and (6) triphenylguanidine (VI), anhydroformaldehydeaniline (VII) and anhydroformaldehyde-*p*-toluidine. Those in (1) caused rapid fixation even at low temps.; those in (2) caused slower fixation so that they can be used with caution in milling operations; those in (3), (4) and (5) caused progressively slower fixations and are still safer; and those in (6) caused fixation only at relatively high temps. V is peculiar, however, in that, when once begun, fixation is extremely rapid, an almost "explosive" vulcanization taking place, with resulting danger of scorching. This classification according to the rapidity of fixation or "precocity of action" serves to distinguish accelerators, e. g., II and VI, or III and diphenylguanidine (VIII), which

are ordinarily regarded as similar. Different effects were obtained with combinations of accelerators, mixts. in some cases being more precocious than their components. Thus with 3% S and 0.7% VIII the mixt. was not fixed at 105°, whereas with 2.5% S, 0.4% VIII and 0.3% IV the mixt. was fixed still more rapidly at 105°. Therefore, mixts. of 2 accelerators may be more precocious than either of the components. On the other hand, it is possible to retard the precocity of action of rapid accelerators by the simultaneous use of another. Thus with 1.8% S and 0.7% I, the mixt. was fixed at 100° in 10 min., whereas if 1% VII is added, fixation at 100° occurred only after 30 min. The addn. of accessory ingredients changes these quant. relations, but the results show that it is possible to det. the most suitable degree of acceleration for a rubber mixt. for any particular operating condition.

C. C. DAVIS

**Tetramethylthiurammonosulfide and tetramethylthiuramdisulfide.** HENRI LEDUC *Rev. gén. caoutchouc* 6, No. 51, 20(1929).—Certain important advantages of tetramethylthiurammonosulfide (I) over tetramethylthiuramdisulfide (II) are cited, including the fact that I is far less active than II below temps. around 115° but just as active above this range, which allows far greater ease of handling uncured rubber mixts. contg. I and allows the prepn. and storage of master batches of I. Contrary to Esch (cl. C. A. 23, 1526, 2323) the activity of I is not impaired by the absence of ZnO.

C. C. DAVIS

Se and its use in the arts [in rubber vulcanization] (KUFFERATH) 18. Radiation and conduction losses in firing and quenching periods with special regard to rubber industry (PRAETORIUS) 21. Plant construction for production of carbon black by decomposition of hydrocarbon gas (U. S. pat. 1,718,720) 18. Filters [for aqueous dispersions of rubber] (Fr. pat. 656,310) 1. Condensation products [vulcanization catalysts and antioxidants] (Fr. pat. 655,583) 26. Lampblack, etc. [as filler for rubber] (Brit. pat. 300,610) 18. Dispersion agents [for preparation of rubber solutions] (Swiss pat. 126,575) 18.

**Rubber.** MONTE L. CAMBERN, HERMAN O. LANGSTAFF and CHARLES J. STAPEL FELD. Fr. 656,094, June 19, 1928. A crude rubber-like compd. or compd. suitable for addn. to rubber is obtained by distg. shale and condensing the vaporized portion. An app. is described.

**Synthetic rubber.** I. G. FARBERIND. A.-G. Brit. 301,515, Dec. 2, 1927. 1,3-Butadiene or a homolog or analog may be polymerized in the presence of a water sol. salt of a bile acid or deriv., which serves to accelerate the polymerization. Cf. C. A. 23, 2071.

**Synthetic rubber.** I. G. FARBERIND. A.-G. Fr. 655,785, Mar. 2, 1928. See Brit. 286,272 (C. A. 23, 310).

**Rubber compositions.** C. MACINTOSH & Co., LTD., S. A. BRAZIER and E. H. HURLSTON. Brit. 300,936, Aug. 19, 1927. In the manuf. of transparent or translucent rubber compns., a Zn or Cd salt of an org. fatty acid such as stearic, palmitic, oleic or linoleic acid is incorporated with the mixt. before vulcanization.

**Rubber articles from dispersions.** MERWYN C. TEAGUE (to Naugatuck Chemical Co.). U. S. 1,719,633, July 2. In forming gloves, toys or other articles, a form is repeatedly coated with a rubber dispersion and the dispersion is coagulated on the form. The coated form is washed after each coagulation operation and the coagulated rubber is subsequently dried on the form.

**Rubber sheet material.** DUNLOP RUBBER CO., LTD., R. F. MCKAY and W. H. CHAPMAN. Brit. 301,367, July 25, 1927. In the manuf. of rubber sheets or impregnated fabrics, a creamy deposit is formed electrophoretically from a suitable dispersion, partially dried if desired and then removed from the surface of the drum or like device on which the deposit is formed. Numerous details are given.

**Perforated metal sheets, spools, etc., coated with rubber.** ANODE RUBBER CO., LTD. Brit. 301,300, Nov. 26, 1927. The coating may be formed by dipping the metal sheet or article into latex which may be thickened and mixed with fillers, vulcanizing ingredients, etc. Electrophoresis also may be used for producing the coating after a preliminary coating of the metal with an easily oxidizable metal such as Zn to prevent gas formation. Various details are given.

**Artificial rubber.** I. G. FARBERIND. A.-G. Fr. 656,049, June 18, 1928. Masses resembling rubber are prepd. by polymerizing vinyl alc. in the presence of substances which increase the elasticity, particularly org. N compds. Examples are given of the

polymerization of vinyl acetate in the presence of casein, albumin, glyceroll and benzoyl peroxide, or  $C_{10}H_8$ , and benzoyl peroxide.

**Artificial rubber.** I. G. FARBERIND. A.-G. Fr. 656,428, June 25, 1928. Rubber-like compds. are obtained by heating olefin hydrocarbons such as butadiene, isoprene or dimethylbutadiene with metallic oxides finely divided or sol. in colloids, such as  $PbO_2$ ,  $MnO_2$ , and  $Ag_2O$ . Cf. C. A. 23, 2603.

**Artificial rubber.** I. G. FARBERIND. A.-G. Fr. 655,217, June 4, 1928. The quality of artificial rubber from hydrocarbons is improved by a thorough mixing before vulcanization with finely divided C such as lampblack, active C or graphite. The C may be added to the hydrocarbons before polymerization. An example of both methods is given.

**Artificial rubber.** I. G. FARBERIND. A.-G. Fr. 655,456, June 7, 1928.—See Brit. 292,103 (C. A. 23, 1528).

**Rubber and like substances.** THE ANODE RUBBER CO. (ENGLAND), LTD. Fr. 655,535, June 8, 1928. Very viscous aq. dispersions of rubber, gutta-percha and balata are prepd. by adding polysaccharides, albuminoids or vegetable exts., which do not take a gel form even at high concn. Substances such as gelatin capable of forming gels may be added if hydrolysed after addn. to a form incapable of gel formation, e. g., by  $NH_3$  or amines.

**Electrophoretic deposition of rubber.** DUNLOP RUBBER CO., LTD., and D. F. TWISS. Brit. 301,100, July 25, 1927. In electrophoretic deposition of rubber, balata or the like from natural or artificial dispersions,  $H$  ions are introduced as by adding HOAc in excess of that required for coagulation (coagulation being prevented) and the deposit is formed on a cathode or on a deposition base surrounding the cathode.

**Rubber tubing.** A. S. GREGG. Brit. 300,357, Sept. 27, 1927. Rubber tubing is provided with an external reinforcing of fabric and is then "doped" with a compn. such as one contg. cellulose acetate, nitrocellulose or a phenolic condensation product. The tubing is suitable for use for carrying coal gas and for various other purposes.

**Rubber-working apparatus with a liquid-spray cooling system.** F. H. BANBURY. Brit. 301,372, Nov. 28, 1927. Structural features.

**Testing strength of rubber or other fabrics.** F. SCHUBERT. Brit. 301,324, Nov. 24, 1927. Mech. features.

**Coagulating rubber from latex.** I. G. FARBERIND. A.-G. Brit. 300,719, Aug. 27, 1927. Proteases (such as those contained in succus caricae papayae) are used in the presence of addnl. substances facilitating the reaction or improving the properties of the rubber such as HCN,  $H_2S$  or saline mixts. having buffer properties. Air may be preliminarily passed through latex stabilized with  $NH_3$  until a  $pH$  of 8 is attained.

**Preserving latex.** I. G. FARBERIND. A.-G. Brit. 300,394, Nov. 18, 1927. The process described in Brit. 294,412 (C. A. 23, 2071) is modified by the use, for preserving latex, of salts of sulfonic acids having tanning properties, of which several examples are given. Latex may be thus prepd., which is especially suitable for impregnating fabrics

**Preserving latex.** I. G. FARBERIND. A.-G. Brit. 300,456, April 2, 1928. To latex preserved as described in Brit. 294,412 (C. A. 23, 2071) or Brit. 300,394 (preceding abstract) by the salts of sulfonic acids having soap-like or tanning properties, there is added aliphatic or aromatic alcs. which may contain substituted halogens, ketones, hydrocarbons or halogen, nitro or amino substitution products of hydrocarbons such as heptyl alc., cyclohexanone, tetrahydronaphthalene or  $PhNO_2$ . The mixt. formed is stable and readily penetrates fabrics.

**Treating latex.** W. B. WESCOTT (to Rubber Latex Research Corp.). Brit. 301,077, Nov. 25, 1927. See U. S. 1,690,150 (C. A. 23, 547).

**Forming inner tire tubes, etc., by deposition from latex.** SOC. ITALIANA PIRELLI. Brit. 301,476-7, Nov. 30, 1927. Mech. features.

**Centrifuging rubber latex to remove suspended impurities.** AKTIEBOLAGET SEPARATOR. Brit. 301,085, Nov. 24, 1927.

**Rubber-surfaced pavements.** HAZEL GROVE RUBBER CO., LTD., and T. GARE. Brit. 300,319, Aug. 19, 1927. Structural features.

**Rubber vulcanization.** J. TEPPERMA (to Goodyear Tire & Rubber Co.). Brit. 300,949, Nov. 21, 1927. A mercaptoarylthiazole in which at least one of the H atoms of the aryl ring is substituted, e. g., 5-chloromercaptobenzothiazole, is made to react with an amine, aryl or aliphatic compd., e. g., diphenylguanidine; the reaction product is used as an accelerator. Cf. C. A. 23, 3376.

**Vulcanizing rubber.** RUBBER SERVICE LABORATORIES CO. Brit. 300,287, May 9, 1927. Vulcanizing accelerators are made by treating the condensation products of aldehydes and amines known as "Schiff's bases" or the aldehyde derivs. of such bases with an acid, neutralizing the acid and then reacting on the product with addnl. aldehyde or with  $CS_2$ . Examples are given.

**Vulcanizing rubber to leather.** LEON B. CONANT (to Standard Patent Process, Corp.). U. S. 1,719,101, July 2. See Brit. 275,194 (*C. A.* 22, 2292).

**Steam-jacketted apparatus for vulcanizing rubber articles such as tires.** JOHN R. GAMMETER (to B. F. Goodrich Co.). U. S. 1,719,218, July 2.

# CHEMICAL ABSTRACTS

Vol. 23.

SEPTEMBER 10, 1929

No. 17

## 1—APPARATUS AND PLANT EQUIPMENT

W. L. BADGER

**A laboratory device for vacuum distillation.** TADEUSZ W. JEZIEFSKI. *Przemysl Chem.* 13, 236-7(1929).—The adapter of a vacuum distg. app. is provided with 3 side tubes, one of which leads to the vacuum pump, and the other two form a Y, one branch of which is provided with a one-way stopcock, and the other branch with a 3-way stopcock, and the stem leads to the receiver. When the receivers for fractionation are changed the vacuum in the distg. flask is maintained, and the small quantity of condensate formed in the adapter during this changing is allowed to enter the receiver without splashing by properly manipulating the stopcocks.

A. C. ZACHLIN

**Large-capacity laboratory condensers.** D. F. OTHMER. *Ind. Eng. Chem., Anal. Ed.* 1, 153(1929).—Two types of double-coil glass app. are described. J. H. MOORE

**Rapid calibration of pipets and burets.** ALFRED T. SHOHL. *Ind. Eng. Chem., Anal. Ed.* 1, 152-3(1929).—An accurate method by weighing Hg is given. J. H. M.

**A modified Pauly receiver.** J. B. BROWN. *Ind. Eng. Chem., Anal. Ed.* 1, 160(1929).—A no. of glass-tube legs are sealed into the periphery of the bottom of a Pyrex suction flask, the adapter being shifted over each leg, which stands in its own receiving flask. J. H. MOORE

**A constant-level water-bath.** NORVAL F. WILSON AND R. K. CARLETON. *J. Chem. Education* 6, 1335-6(1929). E. H.

**Simple graduated wash bottles.** EARLE R. CALEY. *Ind. Eng. Chem., Anal. Ed.* 1, 162(1929).—A graduate, or a graduated test tube, may be used. J. H. MOORE

**A modification of the Kjeldahl trap.** GEO. H. W. LUCAS. *Ind. Eng. Chem., Anal. Ed.* 1, 140(1929).—A trap designed for the detn. of small quantities of Br, and for use with frothy liquids and steam distns. where the ordinary trap is useless. J. H. M.

**A large metal Soxhlet extractor.** L. R. BRYANT. *Ind. Eng. Chem., Anal. Ed.* 1, 139-40(1929).—Details are given for constructing an app. to hold about 7 kg. of material. J. H. MOORE

**A simple, efficient refluxing apparatus for quantitative work.** JEROME E. ANDES. *J. Chem. Education* 6, 1337(1929). E. H.

**Bottle for accurate weighing of volatile liquid mixtures.** Z. BLASZKOWSKA. *Ind. Eng. Chem., Anal. Ed.* 1, 170-1(1929).—The app. consists of 2 containers joined by an S-shaped tube. The first liquid is weighed in one container and transferred by means of an S-tube to a second flask. Each of the other liquids is weighed separately in one flask and transferred to the second, the S-tube forming an hydraulic seal, thus preventing volatilization of the previously weighed liquids. J. O. COLLINS

**An improved volumometer.** ALFRED W. FRANCIS AND EDWARD P. OXNARD. *Ind. Eng. Chem., Anal. Ed.* 1, 169-70(1929).—A description of the usual type of volumometer, the known vol. being measured in a calibrated pipet with greater accuracy than in the usual cylindrical tube. An improved air-tight wide-mouth sample bottle is used. J. O. COLLINS

**A new volumeter using water as the measuring medium.** J. A. FRIES. *Ind. Eng. Chem., Anal. Ed.* 1, 123-5(1929).—The vol. of the app. to be measured is calcd. from the expansion of the contained air caused by the drop in a column of H<sub>2</sub>O in a connected buret. The results are quite satisfactory. J. H. MOORE

**The Fairweather recording gas calorimeter.** ANON. *Engineering* 127, 817-20(1929).—The construction and operation of this improved app. are described in detail. Cf. *C. A.* 16, 2773; 17, 3596; 20, 2572. J. H. MOORE

**An improved air-gas ratio apparatus.** CRANDALL Z. ROSECRANS. *Ind. Eng. Chem., Anal. Ed.* 1, 156-8(1929).—An app. of the thermal cond. type, especially designed for measuring the ratio of air to fuel gas. J. H. MOORE

**A stopcock in which contamination with grease is prevented and its application to a problem in gas technic.** HERMAN C. RAMSPERGER. *J. Am. Chem. Soc.* 51, 2132-4

(1929).—A cock for work under high vacuum in which a Hg seal prevents contact between the gas and grease. J. H. MOORE

A new quinhydrone microelectrode. MAURICE DELAVILLE AND PAUL TCHERNIAKOFSKY. *Compt. rend. soc. biol.* 101, 735-7(1929).—The electrode is designed to measure the  $p_H$  of 0.2 cc. of soln., without loss of  $CO_2$ , and with negligible diffusion potential between the satd. KCl soln. and the liquid studied. B. C. BRUNSTETTER

A new plastometer. E. KARRER. *Ind. Eng. Chem., Anal. Ed.* 1, 158-60(1929).—A detailed description is given with 3 cuts. J. H. MOORE

An improved constant current regulator. LEWIS G. LONGSWORTH AND DUNCAN A. MACINNES. *J. Optical Soc. Am.* 19, 50-7(1929). E. H.

A large reciprocating C. T. R. Wilson cloud expansion apparatus. GORDON L. LOCHER. *J. Optical Soc. Am.* 19, 58-64(1929). E. H.

Color measurements with the Moll's "extinctionmeter." M. J. VAN TUSSEN BROEK. *Chem. Weekblad* 26, 374-81(1929); cf. *C. A.* 21, 2402.—The use of glass filters overcomes the difficulty that sep. readings cannot be taken for each wave length. The advantages of the method are rapidity, sensibility and independence of the imperfections or fatigue of one's eyes. E. SCHOTTE

A mercury arc with thin glass windows. SIMON SONKIN. *J. Optical Soc. Am.* 19, 65-7(1929). E. H.

Evolution of the slag-tap furnace at the Charles R. Huntley station of the Buffalo General Electric Co. H. M. CUSHING. *Trans. Am. Soc. Mech. Eng.*, Advance paper No. 7, 8 pp.(May 13-6, 1929).—Reasons are given why powd.-coal firing was chosen for the 60,000-kw. 1926 extension. Expts. on a furnace designed to remove ash in dry form led to development of slag-tap furnaces. Advantages are enumerated. E. I. S.

A new type high-temperature fusion furnace. J. B. SHAW AND G. J. BAIR. *J. Am. Ceram. Soc.* 12, 447-50(1929).—Details of an oxyacetylene furnace are given. C. H. KERR

Experiments on chain-grate furnaces. W. KOENIGER. *Arch. Wärmewirt* 10, 243-8(1929).—Results of many boiler tests are presented, especially to illustrate the effect of load variation. The modern grates tested responded to changes almost as well as powd. coal. ERNEST W. THIELE

The Todd pulverized coal burner. R. C. BRIERLY. *J. Am. Soc. Naval Eng.* 41, No. 2, 191-220(1929). E. I. S.

An apparatus for removing foams from samples of liquors. JOSEF HERNYCH. *Listy Cukrovar.* 47, 449-50(1929).—A thick-walled glass vessel 110 mm. in diam. and 150 mm. high is illustrated. The app. has its bottom removed. It is replaced by a rubber plate about 10 mm. thick which overlaps the edges 20 mm. A glass tube in the form of a T enters the center of the plate; one exit is connected to an aspirator, the other to a tube with a pinchcock. A rubber stopper through which a glass tube passes is inserted into the neck. For use, the rubber base is removed, the vessel filled, and the cover replaced. An aspirator evacuates the vol. above the liquid, draws the cover in, and establishes a firm contact. The foam arises to the surface; the vacuum is broken by releasing a pinchcock; the liquid is drawn out through a tube. FRANK MARESH

Adsorption of gas in a vacuum tube by Mg (CZUKOR) 2. Treating Cu leading in wires of lamps, discharge tubes or similar electrical devices (U. S. pat. 1,719,877) 19.

MELHARDT, HANS: Die Wandstärkenberechnung druckbeanspruchter Gefässe aus Schweisstahl-, Flusstahl-, Kupfer- und Aluminiumblech im Apparatenbau. Monographien zur chemischen Apparatur established by A. J. Kieser. Leipzig Otto Spamer. 61 pp. Paper, M. 7; bound, M. 8.50. Reviewed in *Ind. Eng. Chem.* 21, 802(1929).

Device for lifting laboratory crucibles from supporting triangles, etc. G. S. HARTLEY. *Brit.* 301,685, March 13, 1928. Structural features.

Differential thermometer (comprising two bimetallic strips). HARTMANN & BRAUN A.-G. *Ger.* 478,412, July 16, 1926.

Glass-bulb hydrometers. F. F. W. FLAIG. *Brit.* 302,034, Nov. 16, 1927. Structural features are specified designed to reduce changes in volume due to temp. changes.

Comparison photometer. R. H. DAVIS. *Brit.* 301,665, Jan. 10, 1928. Structural features.

Colorimeter, especially for hemoglobin determinations. JOHANN PLESCH. *Ger.* 478,289, Aug. 3, 1926.

**Bomb calorimeter.** ÉTABLISSEMENTS POULENC FRÈRES (to Soc. des usines chimiques Rhone-Poulenc). Brit. 302,579, Dec. 17, 1927. Structural features.

**Calorimetric apparatus for determining the calorific value of gases.** OTTO DOMMER. U. S. 1,720,782, July 16. Various structural features are described.

**Gas-analysis apparatus.** CARL D. ZIMMERMAN. U. S. 1,719,864, July 9. Various structural details are described of an app. suitable for testing flue gas, etc.

**Apparatus for revaporizing liquefied gases.** SOC. L'AIR LIQUIDE, SOC. ANON. POUR L'ÉTUDE ET L'EXPLOITATION DES PROCÉDÉS G. CLAUDE. Brit. 302,681, Dec. 20, 1927. Structural features.

**Conversion apparatus for catalytic gas reactions.** A. O. JAEGER (to Selden Co.). Brit. 301,799, Dec. 5, 1927. Structural details are described of an app. with a chamber divided by concentric partitions into concentric annuli; alternate annuli are filled with catalyst and the intermediate annuli serve as heat exchangers.

**Apparatus for producing gas mixtures under pressure.** AKTIEBOLAGET GÖTAVÄRKEN. Ger. 477,533, Sept. 18, 1925.

**Apparatus for proportioned admixture of flowing gases or liquids.** T. W. BARBER. Brit. 302,745, Sept. 30, 1927. Structural features.

**Gas filter (comprising grids moistened by a viscous liquid).** ANDERS JORDAHL. Ger. 478,081, Apr. 12, 1925.

**Sector drum filter.** JEAN B. VERNAY. U. S. 1,720,156, July 9. Structural features.

**Filter-pressing and supplemental pressing method for separating liquid and solid materials.** W. B. EDDISON. U. S. 1,720,211, July 9. An app. is described.

**Ultrafilter membranes.** JACQUES DUCLAUX. U. S. 1,720,670, July 16. Cloth is impregnated with a soln. of nitrocellulose and the solvent is permitted to evap. sufficiently to effect solidification of the impregnating nitrocellulose film before the material is immersed in a coagulating bath. Cf. C. A. 23, 981.

**Separator for liquids of different densities.** WHITE OIL SEPARATORS, LTD. Ger. 478,330, Oct. 15, 1924.

**Separator for oil and water.** KOMMANDIT-GES. ROSENTHAL & Co. Austrian 113,339, Jan. 15, 1929.

**Filter for dry-cleaning liquids, etc.** NORMAN SMITH. U. S. 1,720,384, July 9. Structural details of a filter formed in part of spirally wound woven wire.

**Apparatus for clarifying used dry-cleaning liquids or other liquids by precipitation, filtration, etc.** HARRY MILLER. U. S. 1,720,185, July 9. Structural features.

**Apparatus for extracting and rectifying volatile substances.** CHARLES LE MELLE-TIER. Fr. 657,174, July 9, 1928.

**Apparatus for separating suspended solid particles from gases.** WOODALL-DUCKHAM (1920) LTD., and A. W. DUCKHAM. Brit. 302,400, Oct. 8, 1927.

**Combined fan and classifier for solids carried by gases.** ALBERT H. STEBBINS. U. S. 1,720,863, July 16.

**Apparatus for classifying fine solids by the action of an apertured vibrating table and of an air blast.** ALBERT H. STEBBINS. U. S. 1,720,861, July 16.

**Flotation apparatus for graphite or other minerals.** REGINALD DE ROBILLARD. U. S. 1,720,264, July 9. Structural features.

**Apparatus for separating lighter from heavier mica flakes by suction.** JOSEPH M. COFFEY (to Mica Insulator Co.). U. S. 1,720,666, July 16. Structural features.

**Mechanical purifiers.** I. G. FARBENIND. A.-G. Fr. 657,463, July 12, 1928. Distributing disks or wheels in mech. purifiers are constructed so that they retain a certain amt. of the liquid to be treated, the liquid passing over an edge as more liquids collect.

**Apparatus for purifying liquids.** CLAUDE LARDET. Fr. 656,533, June 27, 1928. An app. is described having a well in which impurities heavier than the liquid to be purified collect, and at the bottom of which is a float valve the density of which lies between that of the liquid to be purified and that to be eliminated.

**Apparatus for spray evaporation of liquids.** F. H. DOUTHITT. Brit. 301,952, Sept. 8, 1927. Modifications are described of the app. of Brit. 260,453 (C. A. 21, 3401).

**Distilling and evaporating apparatus.** SWENSON EVAPORATOR Co. Fr. 657,389, May 31, 1928. Liquid to be distd. or evapd. is pumped at a high speed through the heated zone. A heating liquid is pumped in the opposite direction, both liquids reaching their max. speed at the same point.

**Apparatus for mixing liquids with flavoring or other ingredients in constant proportions.** L. L. DA COSTA. Brit. 302,023, Nov. 5, 1927. Structural features.

**Apparatus for intermittent agitation of liquids.** A. C. TUPPER. Brit. 302,387,

Sept. 15, 1927. A reciprocating stirrer operated by a solenoid is further controlled by a second solenoid and dash-pot device.

**Agitating apparatus for hydrogenating liquids.** SCHERING-KAHLBAUM A.-G. Fr. 657,248, July 10, 1928.

**Röntgen-ray tubes and similar apparatus.** ÉTABLISSEMENTS GAIFFE-GALLOT ET PILON. Brit. 301,855, Dec. 7, 1927. Structural features.

**Cathode-ray tube.** H. PLAUSON. Brit. 301,719, Feb. 29, 1928. The window of a cathode-ray tube is made of Be or an alloy high in Be such as one composed of Be 95-98 and Al 5-2 parts, to which a small proportion of Mg may be added. The window may be coated with a thin layer of Au, Pt, Ni or Co.

**Cathode arrangement for x-ray tubes.** KARL W. DAUMANN. U. S. 1,720,210, July 9. Structural features.

**Radio-tube cathode.** RALPH E. MYERS (to Westinghouse Lamp Co.). U. S. 1,719,988, July 9. Electron-emitting cathodes for radio tubes or like devices comprise a core of metal such as Mo of high resistivity, a conductive tube (which may be formed of Pt) around the core and having its outer surface treated for electron-emission purposes, and a filling of refractory insulating material such as MgO between the core and tube.

**Mounting misch metal in radio tubes.** EDWARD W. RYAN (to Westinghouse Lamp Co.). U. S. 1,720,005, July 9. A mount for an electron emission device comprises an electrode of Ni, and an iron support secured to the electrode to support misch metal. Various structural details are described.

**Microphone electrode material.** SIEMENS BROS & CO., LTD., and G. F. DUTTON. Brit. 301,656, Dec. 22, 1927. Finely divided C is mixed with a carbonaceous binder to form a stiff paste; this is shaped and a coating of C or anthracite granules is applied to the surface and the product is baked.

**Three-electrode "salinometer."** EVERSIED & VIGNOLES, LTD. and C. E. PERRY. Brit. 302,498, Dec. 14, 1927. Structural features.

**Vacuum electron discharge tubes.** H. C. THOMPSON (to British Thomson-Houston Co., Ltd.). Brit. 302,307, Dec. 14, 1927. An electrode-emitting cathode is used with at least 2 other electrodes, one of which has a coating comprising a metal of alk. properties such as borates of K, Li, Na, Ba, Sr and Ca, which increases its efficiency as an emitter of impact electrons. Various details of manuf. and modifications and auxiliary features are described.

**Photoelectric cell.** SAMUEL WEIN (to Radio Patents Corp.). U. S. 1,720,651, July 9. A light-sensitive coating is formed on an electrode by the action of a brush discharge, in the presence of H, on a metallic salt such as a nitrate of an alkali metal assocd. with a reducing agent, e. g., hydroxylamine, which has been deposited on the electrode. Various structural details are described.

**Photoelectric cells.** FIRM OF O. PRESSLER. Brit. 302,183, Dec. 9, 1927. Structural features.

**Photoelectric cells.** RENÉ AUDUBERT and GEORGES VALENSI. Fr. 34,054, Apr. 2, 1927. Addn. to 584,723. An auxiliary electrode is used so that the sensitive layer is automatically submitted to alternate periods of work and rest. A differential mounting for the photometer composed of 2 sensitive plates in opposition lit up respectively by the source to be measured and the standard is used.

**Muffle furnace with a flameless hearth.** ROBERT MÜLLER, JR. Ger. 477,776, June 12, 1926.

**Rotating annular-hearth furnace for distillation or drying.** TROCKNUNGS-VERSCHWELUNGS- UND VERGASUNGS-GES. Fr. 656,718, June 26, 1928.

**Movable nozzles in a revolving tube furnace.** G. POLYSIUS A.-G. Ger. 477,743, June 9, 1928. Details of arrangement.

**Annular rotary hearth furnace or oven for heating loose material in a thin layer.** TROCKNUNGS-VERSCHWELUNGS- UND VERGASUNGS-GES. Brit. 301,904, Dec. 9, 1927. Structural features.

**Conserving heat of furnaces.** FELIX SINGER. Ger. 478,493, July 14, 1927. A large no. of bodies of the Dewar vessel type are built into the furnace wall.

**Automatic two-part furnace-draft regulator.** DYNAMIT-A.-G. VORM. ALFRED NOBEL & CO., and RUDOLF SCHRÖDER. Ger. 478,022, Apr. 25, 1926.

**Method of operating doors of electric and other furnaces.** SOC. GÉNÉRALE DES FOURN ÉLECTRIQUES. Fr. 656,973, July 4, 1928.

**Support for furnace walls.** AMERICAN ENGINEERING CO. Fr. 657,373, Apr. 3, 1928.

**Burners for powdered fuel.** SOC. FRANÇAISE DES CONSTRUCTIONS BABCOCK ET WILCOX. Fr. 656,621, June 28, 1928.

**Furnace for coal dust.** FIRMA WILHELM RUPPMANN. Ger. 478,120, Jan. 15, 1922.

**Burner for coal dust.** SIEMENS-SCHUCKERTWERKE A.-G. (Karl Mayr, inventor). Ger. 478,352, June 13, 1926.

**Coal-dust burner for hearth furnaces.** WITKOWITZER BERGBAU- UND EISEN-  
HUTTEN-GEWERKSCHAFT and CARL SALAT. Ger. 478,379, Jan. 25, 1924.

**Arrangement of water tubes in coal-dust furnace.** INTERNATL. COMBUSTION  
ENGINEERING CORP. Ger. 477,559, Dec. 18, 1925.

**Burner for oil fuel.** CHARLES G. HAWLEY. Fr. 657,471, July 13, 1928.

**Cup burner for liquid fuels.** AKT.-GES. PRIOR, PATENTVERWERTUNGS-GES.  
Ger. 477,855, Dec. 5, 1926.

**Burner for gaseous and liquid fuels.** ARTHUR J. SESSIONS. U. S. 1,720,761,  
July 16. Structural features.

**Gas burner.** ALVARADO L. R. ELLIS (to General Elec. Co.). U. S. 1,721,381,  
July 16.

**Gas burners.** ÉTABLISSEMENTS BRACHET ET RICHARD (Soc. anon.). Fr. 656,707,  
June 15, 1928.

**Heat exchanger (fan type).** MASCHINENFABRIK ING. HANS SIMMON. Austrian  
113,190, Jan. 15, 1929.

**Heat-exchange apparatus.** H. FÖGE (to W. F. Kochs & Co., Ltd.). Brit. 302,562,  
July 21, 1928. Structural features.

**Heat-exchange apparatus suitable for use at high temperatures.** ROBERT L.  
FRINK. U. S. 1,721,442, July 16. Portions of a heat-exchange app. such as a recuper-  
ator are formed from a mixt. contg. a refractory material such as sillimanite, a "low  
temp." cement such as Mg oxychloride cement and substances which when heated form  
a glass; the cement is allowed to set and define the form and size of the structure and  
the product is then heated to produce a glass-like bond for the refractory material.

**Heat exchange apparatus suitable for heating air, etc.** JOHN W. YOUNG (to  
Westinghouse Elec. & Mfg. Co.). U. S. 1,720,536, July 9. Structural features.

**Air heater (plate type).** MAX HARTMANN and ERNST HARTMANN. Ger. 478,403,  
Feb. 6, 1926.

**Device for heating air by flue gas.** MAX SCHWABACH. Ger. 477,757, Nov. 28,  
1924. Details of arrangement.

**Apparatus for burning finely divided solid fuels.** W. B. CHAPMAN. U. S. 1,719,-  
874, July 9.

**Apparatus for producing a fuel mixture of predetermined calorific value.** ROLAND  
S. McNEIL (to General Electric Co.). U. S. 1,719,898, July 9. The flame from a test  
Bunsen burner impinges on a metal target assocd. with a thermostatic device which  
controls the pressure of the fuel, which may be an ordinary illuminating gas.

**Ozonizers.** L'AGENCE METALLURGIQUE. Fr. 657,446, July 12, 1928. Construc-  
tional improvements are given.

**Ozonizing device in combination with an air filter and ventilator.** MARIUS P.  
OTTO. Ger. 477,758, June 24, 1924. Details of arrangement.

**Acetylene generator.** MESSER & Co., G. M. B. H. Ger. 477,560, May 17, 1925.  
The generator has several carbide containers which can operate simultaneously or  
separately.

**Acetylene generator.** EMIL MENZ. Ger. 477,785, Mar. 17, 1928. Details of  
arrangement.

**Apparatus for the production of hydrogen peroxide.** OESTERREICHISCHE CHEM-  
ISCHE WERKE G. M. B. H. Fr. 657,188, July 9, 1928. An app. is described for the pro-  
duction of  $H_2O_2$  by distn. of  $H_2S_2O_8$  or persulfates and for the concn. of  $H_2O_2$ . Cf. C. A.  
23, 1650.

**Surface condenser.** WORTHINGTON PUMP AND MACHINERY CORP. Ger. 478,035,  
July 2, 1926.

**Surface condenser.** J. F. KIRGAN (to Ingersoll-Rand Co.). Brit. 302,347,  
Dec. 16, 1927. Structural features.

**Surface condenser.** A. R. SMITH (to British Thomson-Houston Co.). Brit.  
302,167, Dec. 10, 1927.

**Condenser (with a hollow annular nest of tubes) suitable for steam power plants.**  
JOHN H. SMITH (to Westinghouse Elec. & Mfg. Co.). U. S. 1,721,261, July 16. Struc-  
tural features.

**Apparatus for catalytic synthesis in gaseous phase.** UNION CHIMIQUE BELGE. Belg. 355,732, Dec. 31, 1928. Constructional features.

**Apparatus for carrying out highly endothermic reactions.** E. CONNERADE. Belg. 356,944, Jan. 31, 1929. The chamber in which the reaction takes place is heated externally by placing it in a mass of incandescent fuel, and internally by a (preferably gaseous) substance, compatible with the reaction or reactions taking place in the chamber and superheated by being passed through the mass of incandescent fuel.

**Device for discharging cylindrical reaction chambers particularly in the manufacture of superphosphates.** MASCHINENFABRIK. M. EHRHARDT. A.-G. Ger. 477,509, May 16, 1928.

**Apparatus for annealing galvanically plated jewellery and similar ware.** KOLLMAR & JOURDAN A.-G. Ger. 477,597, July 26, 1927. Details are given.

**Digester.** J. W. PENNMAN. Brit. 302,077, Jan. 31, 1928. A false bottom is fitted in a digester so that it is slightly flexible or yielding between the rivets of the joint. Fine saw-cuts may extend radially inwardly from the periphery.

**Pressure-resisting cover for digesters, vulcanizing pan, autoclaves, etc.** D. BRIDGE & Co., LTD., and E. BRADSHAW. Brit. 302,787, Nov. 18, 1927. Structural features.

**Apparatus for feeding detergents into water flowing through pipes.** STANLEY M. HALSTEAD and ANTON I. WICKLAND. U. S. 1,720,326, July 9.

**Device for testing the insulating properties of insulating liquids such as oils.** CHRISTIAN DANTSIZEN (to General Elec. Co.). U. S. 1,721,374, July 16. Structural and elec. features.

**Kiln for the treatment of lime, dolomite, natural cement, etc.** I. HUBEAUX. Belg. 356,177, Dec. 31, 1928. Constructional features.

**Portable kiln-stack blower.** EDWARD G. FINZER. U. S. 1,721,336, July 16. Structural features.

**Sprayer for powdered material, especially metal powder.** FRITZ SCHORI. Ger. 477,505, Sept. 19, 1923.

**Apparatus for drying clay, sand, chalk, etc.** ROBERT DE REYTERE. Fr. 656,913, July 2, 1928.

**Apparatus for treating pipes, bars, etc., with cleaning and pickling liquids.** KURT T. POTTHOFF (to U. S. Galvanizing & Plating Equipment Corp.). U. S. 1,720,525, July 9. An app. is described by which tubular articles may be passed through a tank while the liquid within the article is renewed by passing it in alternately opposite directions within the interior of the article.

**Electromagnetic thermostatic apparatus.** AKT.-GES. DER MASCHINENFABRIKEN ESCHER, WYSS ET CIE. Brit. 302,344, Dec. 15, 1927. Structural features.

**Thermostatic electric switch.** ESTEL C. RANEY. U. S. 1,719,851, July 9

**Thermostatic electric switch.** EUGENE J. RAY (to United Shoe Machinery Corp.) U. S. 1,720,057, July 9.

**Bimetallic thermostatic electric switch.** CLYDE S. SANDERS (to Midwest Reining Co.). U. S. 1,720,294, July 9. Structural features.

**Thermostat suitable for control of electric circuits.** JOHN J. FAGAN. U. S. 1,721,012, July 16. Structural features.

**Thermostatic control device for electric circuits.** ÉTABLISSEMENTS POULENC FRÈRES and A. CHAGNAUD. Brit. 302,454, Oct. 28, 1927.

**Thermostatic cut-outs, etc., for electric circuits.** CUTLER-HAMMER MFG. Co. Brit. 302,840, Dec. 28, 1928. Structural features.

**Thermostatic and electric control system for heating systems.** PARKER DODGE. U. S. 1,720,723, July 16.

**Thermostatic and electric system for controlling burners used for heating baths such as molten metal for coating wire.** RALPH W. NEWCOMB (to Charles Engclhard, Inc.). U. S. 1,720,231, July 9.

**Thermostatic control for gas ovens.** G. KROMSCHRÖDER A.-G. Brit. 302,327, Dec. 15, 1927. Structural features.

**Thermostatic control for the valve of gas burners.** S. J. LONERGAN and H. E. GINTHER (to Bastian-Morley Co.). Brit. 302,735-6, May 28, 1927. Structural features.

**Thermostatic regulator for heating plants.** EMIL T. JOHNSON. U. S. 1,720,792, July 16. Structural features.

**Thermostatic device suitable for controlling valves.** RALPH L. SKINNER (to Skinner Automotive Device Co.). U. S. 1,721,321, July 16. Structural features.

**Thermostatic air control for radiator valves, etc.** ALEXANDER A. RICCIO. U. S. 1,720,572, July 9. Structural features.

**Thermostat suitable for use with die blocks for molding rubber.** LEE P. HYNES and HARRY A. WILLIAMS (to Hynes & Cox Elec. Corp.). U. S. 1,720,837, July 16. Structural features.

Topochemical reactions. V. KOHLSCHÜTTER. *Helv. Chim. Acta* 12, 512-29(1929). The term is defined and examples are cited from previous work. Chem. phenomena are divided into topochem. and kinetic, or into localized (as at crystal surfaces) and space reactions. Cathodic sepn. of metals is a case of the topochem. type. The topochem. action of formation of  $\text{Cu}(\text{OH})_2$  by the treatment of solid basic Cu salts with  $\text{NaOH}$  is fully illustrated with photomicrographs and x-ray diffraction patterns. G. L. CLARK

Determination of the organic matter in sea water. OLIMPIO G. IBÁÑEZ. *Inst. español oceanografía Notas y resúmenes Ser. II, No. 26*, 10 pp.(1928).—Tables give the following data for numerous samples of sea water: location, time, depth, temp. of the water and of the air,  $d_4$  of the water, amt. of  $\text{O}_2$  per l., amt. of org. matter (in mg. O per l., as obtained by  $\text{KMnO}_4$  titration), % Cl and ratio of org. matter to  $\text{O}_2$ . A. L. H.

The influence of temperature on the composition of the atmosphere in the uppermost layers. HELGE-PETERSEN. *Physik. Z.* 29, 879-84(1928).—If a static diffusion equil governed the ratio of the constituents of the atm. in the higher strata, He alone should exist above about 200 km. However, no He lines are found in the spectrum of the aurora borealis. Also, the total He content of the atm., calcd. from its partial pressure at the earth's surface, on the assumption of a diffusion equil., appears too small compared to the amt. known to be issuing from the earth. The dissipation of He into space, as a result of the thermal agitation of the mols., has previously been rejected because the temp. of the stratosphere appeared much too low. Since newer investigations indicate that temp. may increase again at high altitudes, the concn. of He has been calcd. on the basis of a "stationary streaming equil." instead of a static diffusion equil. The newer

result indicates that the He concn. decreases more rapidly with height and vanishes at the altitude of the aurora. In spite of uncertainties in the kinetic theory and in the amt of He issuing from the earth, the result is considered to afford a probable explanation of the absence of He at high altitudes. The possibility is pointed out that He atoms may be dissipated as a result of collisions with corpuscular radiation from the sun without raising the higher strata of the atm. to the high temps. necessary according to the kinetic theory of gases.

MERRILL W. SEYMOUR

**The law of periodicity.** P. PETRENKO-KRITCHENKO, A. RAVIKOVICH, V. OPOTZKII, E. PUTYATA AND M. D'YAKOVA. *J. Russ. Phys.-Chem. Soc.* **61**, 29-40(1929).—In previous communications (*C. A.* **22**, 3574; **23**, 3134) P. pointed out that the curves of activity of org. halides are to a certain extent independent of the individual character of the reagents and of considerable fluctuations of temp. and concn. This is confirmed by the circumstance that Tronov's expts. (*C. A.* **22**, 2737), which were carried out at much higher temps. and without solvents, show, nevertheless, the same relative activities of pyridine and piperidine as those obtained by P. under totally different conditions, the solvent and temp. evidently have but an insignificant influence on the character of the curves. It is, therefore, certain that the curves studied really express the relative affinities. The study of the reactions of org. halides with colloidal Ag gave an important result; the curves obtained were practically identical with those obtained in the reactions of halides with KOH,  $\text{NMe}_4\text{OH}$ ,  $\text{NEt}_4\text{OH}$ ,  $\text{Ba(OH)}_2$ ,  $\text{TlOH}$  and  $\text{NaOEt}$ . Wherever there is a deviation of the curves, it must be attributed to the appearance of new chemical forces. The unchanged character of many curves on passing from methane derives to those of ethane, as well as on introducing Ph and COOH in methane compounds, and the similarity of action of widely different alkalies, alcoholates and Ag, show that the most important factor detg. the character of the curves is the rupture of the link between C and the first halogen atom. The substitutions and fissions consequent to this rupture have but a secondary part. Diagrams of curves, tables and descriptions of expts. are given.

BERNARD NELSON

**Chemical valency considered as an electrostatic phenomenon. VIII.** A. E. VAN ARKEL AND J. H. DE BOER. *Chem. Weekblad* **26**, 326-30(1929); cf. *C. A.* **23**, 3384

F. DE LEEUW

**Reactions of atomic hydrogen. I. Behavior toward ethylene.** ALFONS KLEMENS AND FRANZ PATAT. *Z. physik. Chem.*, Aht. B, **3**, 289-98(1929).—The action of atomic H, prepd. by the resonance method, upon  $\text{C}_2\text{H}_4$  is not smooth. Hydrogenation occurs to about 30%. Also  $\text{C}_2\text{H}_4$  can be dehydrogenated to  $\text{C}_2\text{H}_2$ , an intermediate product, then polymerization takes place, the product being a very volatile liquid with a petroleum-like odor. When the product takes up no more H, it appears to have the power of absorbing great quantities of  $\text{O}_2$  and the formation of an alc. is indicated. A diagram of the app. with data for 10 expts. is given.

MARY E. LEAR

**Measurements of the equations of state of solid argon.** FRANZ SIMON AND FRIEDA KIPPERT. *Z. physik. Chem.* **135**, 113-28(1929).—The value of  $\gamma$ , which is of importance in the detn. of the equation of state, was detd. by a direct method. To det. the thermal pressure of A and other gases at const. vol. the gas was condensed at very low temp. in a brass container, the container then closed and heated a few degrees. The increase in pressure was detd. by means of a manganin resistance manometer. The value of  $\gamma$  is calcd. from the thermal pressure from  $\gamma = [(\partial p/\partial T)_v \times V]/C_v$ . The following are values of the thermal pressure obtained, expressed in atm./degree abs.: solid A 38, between 72.0-85.0° abs.; liquid A 25, between 84.5-90.1° abs.; solid  $\text{CH}_4$  28, between 67.0° and 90.1° abs.; liquid O 24, between 67.0° and 90.1° abs.; liquid N 24, between 68.0° and 77.0° abs. The d. of solid A at 76° abs. was found to be 1.505, by 2 different methods. The calcd. compressibility ( $K$ ) in abs. units is for liquid A  $180 \times 10^{-12}$  at 86° abs., for liquid O  $169 \times 10^{-12}$  at 82° abs.; for liquid N  $247 \times 10^{-12}$  at 75° abs. The calcd. value for  $\gamma$  is 4.5, which is in accordance with the value obtained by Simon and v. Simson. Because of its high  $\gamma$  value, solid A is a very suitable material for the detn. of the zero-point energy.

J. A. SZILARD

**The density, compressibility and atomic weight of argon. II.** GREGORY P. BAXTER AND HOWARD W. STARKWEATHER. *Proc. Natl. Acad. Sci.* **15**, 441-4(1929).—A redetn. of the densities of A yielded a value for the normal d. 1.8394 and the limiting d. 1.78204. The at. wt. of A is 39.944 as found previously (*C. A.* **22**, 1503).

G. B. TAYLOR

**Fundamental atomic weights. VIII. The atomic weights of silver and barium.** Analyses of barium perchlorate. O. HÖNIGSCHMID AND R. SACHTLEBEN. *Bayer Acad.*, Munich. *Z. anorg. allgem. Chem.* **178**, 1-32(1929); cf. *C. A.* **23**, 3382. Prepn. of pure  $\text{Ba(ClO}_4)_2$  is described and methods used to change it to  $\text{BaCl}_2$  by heating. The

Cl is detd. by Ag and from detns. made the at. wts. are given: Ag 107.880; Ba 137.355 and Cl 35.457. R. C. ROBERTS

**Periodic phenomena at the anode.** WOLF JOHANNES MÜLLER. *Z. Elektrochem.* 34, 850-2(1928).—Criticism of Strauss and Hinnüber (*C. A.* 23, 3393). Their explanation of passivity on the basis of the  $O_2$  theory is refuted by M.'s previously published expts. (cf. *C. A.* 21, 3526, 3784; 22, 3090, 4346). Remark on the paper by W. J. Müller. J. HINNÜBER. *Ibid* 852-3.—Answer to the criticism of Müller. ALBERT L. HENNE

**The anode reactions of fluorine.** NEWTON C. JONES. *J. Phys. Chem.* 33, 801-24 (1929).—F by virtue of being the most electroneg. of all known chem. agents is shown to be capable of duplicating by purely chem. means any electrochem. anode process or any oxidation process using any other oxidizing agent. A Mg cell is described by which large amounts of F can be prepd. by the electrolysis of molten  $KHF_2$ . F is found to effect the formation of persulfate from acid sulfate solns.; perphosphate, percarbonate, and perborate from the corresponding phosphates, carbonates and borates; hydrogen peroxide from alkali, and ethane from potassium acetate soln.; it oxidizes cobaltous, chromic, manganous and plumbous salts to salts contg. the metal with a higher valence. A critical discussion of the literature pertaining to the above reactions is given. In general the chem. action of F on solns. is the same as the electrolytic anode reaction plus any disturbances due to the HF formed. P. H. EMMETT

**Pure iron and allotropic transformations.** T. D. YENSEN. *Am. Inst. Mining Met. Eng. Tech. Pub. No.* 185, 3-16(1929); cf. *C. A.* 23, 2332. G. L. CLARK

**Question of iron activity.** A. SIMON AND K. KÖTSCHAU. *Süddeut. Apoth. Ztg.* 69, 3-5(1929).—Polemical. W. O. E.

**Berthollet's detonating silver and the formation of silver mirrors.** FRITZ BAUM. *Chem.-Ztg.* 53, 354, 374(1929).—Berthollet called attention to the dangerous properties of detonating Ag 140 years ago. The use of dil. stock solns. is recommended for safety. It is suggested that detonating Ag is an unstable isomeric form of some  $Ag_2O-NH_3$  complex, rather than  $Ag_3N$ ,  $Ag_2O \cdot 2NH_3$  or  $AgNH_2$ . There seems to be little connection with detonating Hg, Pt and Au. The use of  $SnCl_2$  soln. in making silver mirrors probably causes the fixation of Sn ions by exchange with some materials in the glass, and then these act catalytically and as nuclei in causing the deposition of Ag. In spite of advances in the knowledge of Ag reactions in photography, and of colloidal conditions of the noble metals, the chemistry of silver mirror formation is still unexplained. W. C. EBAUGH

**Comparison of Corbino and Hall effects in silver and brass.** K. K. SMITH AND H. M. O'BRYAN. *Phys. Rev.* 31, 149(1928). E. J. C.

**The preparation of a single-crystal tungsten rod from tungsten powder.** IMRE TARIÁN AND PÁL TÓRY. *Chem. Rundschau Mitteleuropa u. Balkan* 4, 165-8(1927); *Chem. Zentr.* 1928, I, 237-8.— $WO_3$  powder contg. 1.5 to 2%  $ThO_2$  was reduced in an atm. of  $H_2$  at 700-950°. After reduction the 85-g. ingot was heated for a short time at a temp. near the m. p. Crystn. took place in cylinder fashion from the inside to the outside. FRANCIS P. GRIFFITHS

**The mutual dependence of atomic bonds.** FR. EBEL AND E. BRETSCHER. *Helv. Chim. Acta* 12, 450-63(1929).—The heat tone of the reaction  $2PF_3 + O_2 = 2POF_3$  is detd. as an example of the rare type  $AC + B = ACB$ . The following data are obtained partly by calcn. and partly by expt., on heats of formation: 1.  $[P] + 3(Cl) = (PCl_3) + 155.0$  kg.-cal.; 2.  $(PCl_3) + \frac{1}{2}(O_2) = (POCl_3) + 63.3$ ; 3.  $[P] + 3(F) = (PF_3) + 286$ , from extrapolation from  $PBr_3$  and  $PCl_3$  and from  $PCl_3$ ,  $SbCl_3$  and  $SbF_3$ ; 4.  $(PF_3) + \frac{1}{2}(O_2) = (POF_3) + 70.6$ . The last step is measured with a new gas calorimeter, which is described in detail. G. L. CLARK

**The true strength of bonds in polyatomic molecules.** FR. EBEL AND E. BRETSCHER. *Helv. Chim. Acta* 12, 443-9(1929).—The strength of the C-O bond from  $C + 2O = CO_2 + 398.3$  kg.-cal. is  $398.3/2 = 199.2$ . The strength of the C-S bond from  $CS_2$  is  $263.3/2 = 131.7$ . The energy of formation of COS should be  $199.2 + 131.7 = 330.9$ , while the actual value is 327.0. For the splitting of S from COS the value is 76.9, which is only half as great as the value predicted by Fanjans, namely the 131.7 above. Hence the S in COS is bound only half as strongly as in  $CS_2$ . Similarly the energy of formation of  $COCl_2$  can be calcd. on the assumption that O is bound as in  $CO_2$  and Cl as in  $CCl_4$ :  $C-O = 199.2$ ,  $C-Cl = 280.8/4 = 70.2$ ,  $COCl_2 = 199.2 + 2 \times 70.2 = 339.6$ , found 331.2. But in the direct splitting of Cl the value is 83.2 instead of the expected 140.4. The theory and calcs. of Fajans are criticized. G. L. CLARK

**Molecular motions in rarefied gases.** ERNEST RUTHERFORD. *Engineering* 127, 319-21; cf. *C. A.* 23, 3609.—This is a review of the kinetic theory of gases as applied to the motion of a gas at very low pressures, how heat is transported at these low

pressures and from one surface to another, thermal transpiration, the radiometer and the condensation of vapors and gases at cooled surfaces. F. V. J., Jr.

**Molecular dimensions of organic compounds. I. General considerations.** T. M. LOWRY AND A. G. NASINI. *Proc. Roy. Soc. (London)* A123, 686-91 (1929).— $C_6H_6$  was compared in phys. properties with  $C_6H_5S$ ,  $PhMe$  with  $\alpha-MeC_6H_5S$ , and  $C_6H_6$  with cyclohexane. Collision areas are altered about 10% when 2 CH groups are replaced by S; in each case, however, a const. decrement of 2 sq. A. U. is observed. The replacement of H by Me shows an increment of 3 sq. A. U.; and replacing CH by N ( $C_6H_6$  to  $C_6H_5N$ ) gives an increment of 1 sq. A. U. Identical properties were not found, but regular increments in the properties were observed to be the rule on passing from one series to another. Properties dependent upon the force fields as well as dimensions of the mols. gave wider differences. **II. Viscosity of vapors: benzene, toluene and cyclohexane.** A. G. NASINI. *Ibid* 692-704. **III. Viscosity of vapors: thiophene and  $\alpha$ -methylthiophene, pyridine and thiazole.** *Ibid* 704-13.—By means of the Smith modification (C. A. 19, 592) of Rankine's viscometer, vapor viscosities ( $\eta$ ) were detd. for  $C_6H_6$  (I),  $PhMe$  (II), cyclohexane (III),  $C_6H_5S$  (IV),  $MeC_6H_5S$  (V),  $C_6H_5N$  (VI) and  $C_6H_5NS$  (VII). From these data, *Sutherland's const.* (S) and the mean collision areas (A) were calcd. The following values are given for I:  $\eta_{0.684} \times 10^{-1}$ ,  $\eta_{100} 0.94 \times 10^{-4}$ , S 380, A 19.0 sq. A. U.; for II:  $\eta_{0.8} 0.789 \times 10^{-4}$ , S 370, A 21.8 sq. A. U.; for III:  $\eta_{11.4} 0.820 \times 10^{-4}$ , S 330, A 22.3 sq. A. U.; for IV:  $\eta_{0.2} 1.031 \times 10^{-4}$ , S 407, A 16.7 sq. A. U.; for V:  $\eta_{0.965} \times 10^{-4}$ , S 400, A 19.9 sq. A. U.; for VI:  $\eta_{0.2} 0.958 \times 10^{-4}$ , S 320, A 20.0 sq. A. U., and for VII (provisional)  $\eta_{99.4} 1.161 \times 10^{-4}$ . Values for other temps. over a wide range are given in tables and curves. A. S. CARTER

**Configuration of quadrivalent atoms.** T. M. LOWRY. *Proc. Cambridge Phil. Soc.* 25, 219-21 (1929).—The tetrahedral configuration of le Bel and van't Hoff is contrasted with the octahedral configuration of Werner. The dimethyltelluronium dihalides are cited as examples of quadrivalent Te representable by a tetrahedral model. Werner's statement that radicals ( $MA_4$ ) are results of "octahedrally conceived radicals ( $MA_6$ ) by loss of two groups A but with no function change in the acid residue" is incorrect. Such a change may result in a new configuration.  $SnI_4$  has a tetrahedral structure, while  $(NH_4)_2(SnCl_6)$  is octahedral. The configurations of salts of Pt, Pd, Zn and others are discussed, and it is asserted that both atomic structures, planar and tetrahedral, are possible, such as the tetrahedral anion of  $K_2(ZnCN_4)$  and the planar  $K_2(PtCl_6)$ . Many references are given. WILLIAM E. VAUGHAN

**Observations and investigations on the electric moments of molecules and the method of determining these moments.** G. B. BONINO AND PIERO CELLA. *Gazz. chim. ital.* 59, 79-105 (1929).—Following a discussion of the importance of the elec. moments of mols. in problems of mol. structure, critical examn. is made of methods based on measurements of dielec. consts. which have been used for detg. these elec. moments. Special attention is called to the value of the const. of the intermol. field, showing certain contradictions that result from the use of the classic value of this const. Expts are then described, the object of which was to utilize the elec. moments for the derivation of consts. of the internal field for 2 liquids, viz.,  $CCl_4$  and  $C_2Cl_4$ . The values obtained are at variance with the classic value, but they are confirmed by the better agreement, resulting from the introduction of the new consts., between the exptl. data and the Debye theory of the dependence of dielec. consts. on the temp. of a liquid. C. C. DAVIS

**Magnetic susceptibility in weak fields.** J. KOENIGSBERGER. *Z. Physik* 54, 511-7 (1929).—A small magnet located in a medium of susceptibility,  $K_1$ , is acted upon by a force if a surface of another medium,  $K$ , is brought near. The arrangement may serve after calibration for the detn. of  $K$ . GEORGE GLOCKLER

**Electric moment of ethylene chloride and ethylidene chloride.** P. N. GHOSH, P. C. MAHANTI AND D. N. SEN-GUPTA. *Z. Physik* 54, 711-4 (1929).—The elec. moment of  $(CH_2Cl)_2$  is  $1.567 \times 10^{-18}$  and of  $CH_3CHCl_2$  is  $2.045 \times 10^{-18}$  e. s. u. Cf. Sircar, C. A. 23, 2333. GEORGE GLOCKLER

**Electrostriction by dissolved dipolar molecules.** GERHARD JUNG. *Z. physik. Chem., Abt. B*, 3, 204-8 (1929).—A mathematical discussion of electrostriction, the contraction of a liquid in a condenser when it is charged, shows that electrically neutral, dipolar mols. have the same order of magnitude of influence as ions. Published data of Tammann's on the internal pressures of electrolytic and non-electrolytic solns. are qualitatively in accord with this, as is also the behavior of  $ClCH_2COOH$  in  $H_2O$  and of EtOH and amyl acetate in  $C_6H_6$ . A. W. KENNEY

**Molecular theory of crystals.** K. WEISSENBERG. *Z. physik. Chem., Abt. A*, 139, Haber Bd., 529-83 (1928).—The fundamental conception of mols. in vapor, soln. and crystal are outlined. The Schoenflies-Federov symmetry rule governs not only the

morphological and phys. properties of the crystal but also its chem. constitution. A guiding lattice hypothesis (Leitgitterhypothese) is presented as the equivalent for crystals of Avogadro's hypothesis for ideal gases and solns. The crystal mol. is the largest particular group whose symmetry elements do not include translations. The no. of such groups possible in a given space group is geometrically fixed by the known symmetry elements of the space group. A table is given for 459 elements and for inorg. and org. compds. of detd. space groups, showing that with 58 exceptions the crystal mol. is identical with the ordinary chem. mol. Polymerization is believed to account for 44 exceptions, and may account for the 14 others in which the crystal mol. is a small integral multiple of the ordinary chem. mol. G. L. CLARK

The crystal structure of acetamide. O. HASSEL AND N. LUZANSKI. *Z. physik. Chem., Abt. B*, 3, 282-8(1929).—Data are given for the x-ray analysis of the crystal from which it is deduced that the form is rhombohedral of the type  $C_{3v}^6$ . Interpretation of the data according to Weissenberg (cf. preceding abstr.) shows that the mol. unit is  $3CH_3CONH_2$  and is, in that sense, polymerized. HELEN GILLETTE WEIR

Crystal-structure types. JOHN W. GRUNER. *Am. Mineral.* 14, 173-87(1929).—The recent investigations of crystal-structure types by V. M. Goldschmidt and others are presented in condensed form. Structure types and their valence coordinate bonds are discussed and illustrated. Morphotropism, polymorphism, the formation of radicals due to deformability of ions and the effects of counter-deformability are explained with the aid of simple structure types. A. M. BRANT

A table of possible reflecting planes in cubic crystals. I. W. MCKEEHAN. *Am. J. Sci.* [5], 17, 548-56(1929).—In order to facilitate the computation of the parameter from data resulting from measurements of the diffraction pattern a table was compiled which gives values of  $Q^2$  from 1 to 360 where  $Q^2 = h^2 + k^2 + l^2$ , ( $hkl$ ) the Miller indices of the plane, values of  $\log 1/Q$  to 5 decimal places, a value of  $z$  for each ( $hkl$ ) where  $z$  is the relative no. of planes of each form in holohedral crystals, and letters  $B, F, D$ , to indicate which values of  $Q^2$  remain of account in body-centered, face-centered and diamond-like arrangements. H. W. WALKER

The determination of crystallographic constants in the triclinic system. A. L. PARSONS. *Am. Mineral.* 14, 154-9(1929).—Formulas and graphical methods are given, by which a high degree of accuracy can be obtained. A. M. BRANT

Spiral markings on carborundum crystals. ALAN W. C. MENZIES AND C. A. SLOAT. *Nature* 123, 348-9(1929).—A photograph and a description are given of spiral markings on smooth hexagonal basal pinacoid surfaces of carborundum crystals. G. L. C.

The possible dissymmetry of etch figures obtained with an active isotropic liquid. L. ROYER. *Compt. rend.* 188, 1176-8(1929).—Friedel's conclusion that the form of etch figures is detd. by the symmetry of the soln. as well as by that of the crystal is confirmed. Hot concd. racemic and inactive tartaric acid solns. produced etch figures on the cleavage faces of calcite which were symmetrical with respect to the trace of the planes of symmetry of the crystal whereas the etch figures with *d*- and *l*-tartaric acid solns. were dissymmetrical. Etch figures with *d*- and *l*-tartaric acid separately on the same face were enantiomorphous and those resulting from the attack by either acid on the six rhombohedron faces were the same for any two opposite faces as (100) and ( $\bar{1}00$ ). Such figures were symmetrical with respect to the binary axes of symmetry of the crystal. The symmetry of calcite according to the action of active acids is  $A^3, 3L^2$  (Bravais) and according to the inactive acids  $A^3, 3L^2, C, 3P$ , the latter being the true symmetry. In each of several other cases where the soln. of the etching agent was active the etch figures were dissymmetrical with respect to the crystal planes of symmetry and symmetrical where the solns. were inactive. H. W. WALKER

The corrosion of a crystal of dolomite by an active isotropic liquid. L. ROYER. *Compt. rend.* 188, 1303-5(1929); cf. preceding abstr.—Etch figures on a dolomite crystal obtained with inactive org. acids are in accord with the true crystal symmetry of one trigonal axis and a center of symmetry, whereas those with active org. acids are such as to attribute only a ternary axis of symmetry to dolomite. Hot concd. solns. of the inactive acids, *dl*-tartaric, mesotartaric, maleic, glyceric, pyruvic, mucic, levulinic and camphoric, gave identical etch figures on the three faces at either end of the trigonal axis and enantiomorphous figures on opposite faces as (100) and ( $\bar{1}00$ ). Solns. of the active org. acids, tartaric, maleic, aspartic, glucosic, and the amino acids, alanine and leucine, produced identical etch figures on the faces (100), (010) and (001) and on the opposite faces ( $\bar{1}00$ ), ( $0\bar{1}0$ ), ( $00\bar{1}$ ). The figures on (100) and ( $\bar{1}00$ ) were no longer enantiomorphous. These results further confirm Friedel's conclusion. H. W. WALKER

Lattice constant of gypsum. SR. V. FRIESEN. *Z. Physik* 54, 679-85(1929).—

Various samples show the same lattice const. to within 0.004%. Cf. *C. A.* 23, 555.

GEORGE GLOCKLER

The elastic constants, lattice constants and densities of metallic solid solutions. ZENJI NISHIYAMA. *J. Study of Metals* 6, 17-41(1929).—The binary solid solns. of Ni, Si, Al, Co, V, W, Cr and Mn with Fe, of Al, Sn, Zn, Mn and Ni with Cu, of Fe and Cu with Ni, and of Zn and Mn with Al were examd. for elastic const., lattice const. and the d. The value of the sp. gr. as detd. by expt. and that calcd. from the x-ray data on the assumption of simple substitution are in good agreement. The change of elastic const. with compn. is very small; so the elasticity has no direct bearing upon the change of hardness due to the formation of solid soln. With a few exceptions the change of at. vol. is parallel to the change of elastic const. Particularly with alloys of the Cu-rich solid solns. the relation can be deduced mathematically.

K. SOMEYA

X-ray investigation of palladium-silver-hydrogen alloy. I. ATOMI OSAWA. *J. Study of Metals* 5, 443-54(1928).—Pd and Ag both have face-centered cubic lattice, with the lattice const. 4.069 A.U. and 3.86-3.874 A.U., resp., and form a solid soln. for all ranges of compn. The relation between the lattice const. and the concn. deviates only slightly from a straight line. Pd absorbs  $H_2$  well on electrolysis, and when satd. with  $H_2$  the lattice const. becomes larger by 3.6-3.87%. Some authors report the formation of the compd.  $Pd_2H$ , but O. considers that it is rather a solid soln. of  $H_2$  in the Pd lattice. Pd-Ag alloys also absorb  $H_2$  well; at 150° the 40% Ag alloy has the greatest absorptive power, the quantity of  $H_2$  absorbed being greater than at ordinary temp. When the Pd-Ag alloy is made to absorb  $H_2$  by electrolysis, the expansion coeff. of the alloys begins to increase from 30% Pd with the increase of Pd content, showing a max. expansion at 100% Pd.

K. SOMEYA

X-ray contributions to the problem of polymerization. GEO. L. CLARK. *Ind. Eng. Chem.* 21, 128-33(1929).—Mention is made of substances in which several mols. associate in the unit crystal cell. X-ray data on rubber, silk, cellulose, etc. show the presence of a small cell or unit of structure, contg. comparatively few mols. of the parent substance. The work of Hengstenberg and Ott on polyoxymethylenes (*C. A.* 22, 728, 1879) shows that this unit cell may contain less than one macromol., though for the lower polymers the length of the macromol. can be measured. The polyoxymethylenes, cellulose, rubber, etc. are long-chain mols., extending through many unit cells, and built by a repetition of identical structure units. This accounts for the presence of a small unit cell. This cryst. structure in the case of rubber appears only on stretching. The unit cell contains 8  $C_6H_8$  groups. Detns. of line breadth and particle size are valuable in studies of regenerated cellulose. X-ray studies on liquids show the possibility of detg. the degree of assocn. The principal spacings of many polymers are the same as those of the parent substance, but the appearance of an inner diffraction ring, corresponding to a large spacing, is characteristic of polymerized substances. G. L. CLARK

The nature of dextrin, gelatin and sodium oleate solutions as revealed by x-ray diffraction. P. KRISHNAMURTI. *Indian J. Physics* 3, 307-29(1929); cf. *C. A.* 23, 1348.—Dextrin, gelatin and sodium oleate were examd. both in the solid state and in aq. solns. at different concns. with monochromatic x-rays by the method of Debye and Scherrer, cutting out the central beam in the expts. Dextrin gave patterns similar to those of the sugars, resembling particularly those for glucose, the hydrolysis product of dextrin. In dil. solns. dextrin gave rise to gaseous scattering at small angles and the calcd. mol. wt. by the Bragg formula was about 600. Highly purified gelatin at concns. up to 1:1 by wt. showed gaseous scattering at small angles and its mol. wt. came to 3000. Sodium oleate solns. up to 1:3 by wt. and down to 1:7 showed a sep. ring just below the water ring, which is believed to be due to the presence of micelles of sodium oleate contg. several simple mols. arranged parallel to one another. A gaseous scattering at small angles and a general scattering inside the water halo were observed. The latter was probably due to Na and OH ions produced by hydrolysis. An excess of scattering adjoining the central spot was probably due to groups of McBain's "ionic micelles." An intense ring at very small angles in addn. to the rings at larger angles appeared in the patterns for powdered gelatin and starch. Three plates of patterns are given.

H. W. WALKER

X-ray diffraction in liquid mixtures. P. KRISHNAMURTI. *Indian J. Physics* 3, 331-55(1929); cf. *C. A.* 23, 1348.—Aq. binary liquid mixts. of phenol,  $Me_3COH$ , piperidine, pyridine, butyric acid, EtOH, glycerol and lactic acid were investigated by means of the  $K_\alpha$  radiation of Cu. Wyckoff's conclusion that the pattern for the mixt. is a superposition of those due to its components is not valid. A very dil. soln. gave a pattern consisting of the water ring and a general scattering inside the ring as in dil. sugar solns. With phenol,  $Me_3COH$  and piperidine in more concd. solns. rings due to the two com-

ponents existed separately for the mixt. With glycerol, EtOH and lactic acid in concd. solns. only one ring was observed, the water ring having contracted and the ring due to the liquid having expanded. In pyridine solns. the pyridine ring had expanded, but the water ring was in the same position. Only one broad ring was found for a soln. of butyric acid. The difference between the two classes of solns. is believed to be due to the difference in attractive forces between similar and dissimilar mols. in the mixts. The non-aq. mixts. of Me salicylate and *o*-nitrobenzaldehyde, and aniline and cyclohexane gave the same patterns as for the pure liquids. But with the dissimilar mols. of cyclohexane and Me salicylate a different pattern was obtained for the mixt. In the aq. solns. the presence of groups contg. several mols. is postulated. The x-ray patterns are pictured.

H. W. WALKER

**Hydrodynamics and the kinetic theory of gases.** Y. ROCARD. *Compt. rend.* 188, 453-4(1929); cf. *C. A.* 23, 1542.—One has a perfect or viscous fluid if the function of distribution of mol. speeds is that of Maxwell or near it; the equations of movement can only be those of Stokes. The problem of interaction of liquids or gases with moving solids must be studied from the kinetic rather than from the classical theory.

E. G. VANDEN BOSCHE

**The equations of state and thermodynamics.** VASILESCO-KARPEN. *Compt. rend.* 188, 496-8(1929); cf. *C. A.* 23, 1792.—A reply to Verschaffelt's criticism of a paper by K. showing that the Maxwell-Clausius relation and Clapeyron's equation can be derived from van der Waals' equation without using the second principle of thermodynamics.

E. G. VANDEN BOSCHE

**The critical state. II. Limiting curve of ethyl ether.** ERICH SCHRÖER. *Z. physik. Chem., Abt. A*, 140, 241-53(1929); cf. *C. A.* 22, 341.—The temp.-d. curve of Et<sub>2</sub>O in the crit. region is detd. by a new app. permitting observations for wide vol. limits. Within the limits of *d* from 0.23 to 0.29 change from the 2-phase to a 1-phase system is independent of the mean *d*. The following values are obtained: *t<sub>c</sub>* = 193.4 ± 0.15°, *p<sub>c</sub>* = 36.15 ± 0.05 kg./sq. cm., *d<sub>c</sub>* = 0.265 ± 0.004 g./cc. The influence of stirring and of adiabatic dilatation and compression on crit. opalescence is attributed to an emulsion of 2 phases before the actual temp. of miscibility is reached. The nature of the temp.-d. curve is explained by the crit. isotherm. **III. Behavior of ethyl ether under isothermal compression in the critical and hypercritical region.** *Ibid* 379-90.—The isotherms of Et<sub>2</sub>O are detd. from 185° to 250° and 30 to 75 kg./sq. cm., and the following values obtained: *t<sub>c</sub>* = 194.6 ± 0.3°, *p<sub>c</sub>* = 36.7 ± 0.2 kg./sq. cm., *v<sub>c</sub>* = 3.77 ± 0.02 cc. The coeff. of compressibility, *β*, calcd. from the diagram of state rises to a sharp max. at a definite pressure; the max. becomes flatter with rise in temp. but still exists at 250°, the position altering only slightly with temp. The variation of *β* with vol. may be represented by van der Waals' equation.

G. L. CLARK

**Fluorine-chlorine, an explosive, gaseous mixture.** KARL FREDENHAGEN AND OSWALD T. KREFFT. *Z. physik. Chem., Abt. A*, 141, 221-2(1929).—The combination of F. with Cl<sub>2</sub> is a strongly exothermic reaction, the heat of reaction being greater than for the combination of Cl<sub>2</sub> with H<sub>2</sub>.

L. B. MILLER

**A problem offered by N. S. Kurnakov (fusion curves of binary systems).** N. V. LIPIN. *Ann. inst. anal. phys.-chem. (Leningrad)* 4, 39-47(1928).—In a study of the m-p curves at various degrees of dissocn. of two component systems which form a compd., Kurnakov encountered a problem which may be described as follows: Given two intersecting curves  $Y = \varphi_1(X)$  and  $Y = \varphi_2(X)$  where  $\varphi_1$  and  $\varphi_2$  are continuous and single-valued functions of *X*. Find a general equation  $F(X, Y, K) = 0$  contg. an arbitrary parameter *K* of a system of curves such that at *K* = 0 the equation should represent the two curves  $\varphi_1(X)$  and  $\varphi_2(X)$ ; at *K* > 0 the equation should give a concave downward curve lying below the intersecting branches of  $\varphi_1(X)$  and  $\varphi_2(X)$  and with increase of *K* the curve should continuously change its shape but at all times satisfy the stated condition. The equation obtained was  $\nu = [(\varphi_1 + \varphi_2)/2] - \sqrt{[(\varphi_1 - \varphi_2)^2/4] + k(\varphi_1 - \varphi_2)(\varphi_2 - \varphi_1) - R}$  where  $\varphi$  is any function of *X*, and where *R* is a definite continuous function that satisfies the equation  $R(x, 0) = 0$ ;  $R(x, 1) = 0$  and the inequality  $-(1 - k)(\varphi_1 - \varphi_2)(\varphi_2 - \varphi_1) < R < 1 < (\varphi_1 - \varphi_2)(\varphi_2 - \varphi_1)$ , which does not fluctuate sharply when the parameter *K* remains const. and the abscissa *X* varies within the given interval. REA MAIZEL

**Expressing the different curves of the melting point of a binary mixture by one general equation.** N. V. LIPIN. *Ann. inst. anal. phys.-chem. (Leningrad)* 4, 48-58(1928); cf. preceding abstract.—Each of the four branches of the phase diagram (or m-p curves) of two-component systems in which a compd. is formed can be expressed by an exponential equation of Shreded  $\log x = (Q/2)[(1/t_0) - (1/t)]$ . Basing his conclusions on this assumption L. shows that his equation discussed in the previous article can

be reduced to  $t = [(\varphi_1 + \varphi_2)/2] - \sqrt{[(\varphi_1 - \varphi_2)^2/4] + KR}$ , where  $\varphi_1 = Q_0/[(Q_0/2) - \log x_1]$ ;  $\varphi_2 = (Q_0/2) \div [(Q_0/2) - \log x_2]$ ;  $x_1 = (x - 1)/[p - 1 - (p + q - 1)x]$ ;  $x_2 = x/[p - (p + q - 1)x]$ . This holds true for all the binary systems where the reaction proceeds according to the formula  $pA + gB = ApBy$ . When dissoen. is present  $K > 0$ , when it is absent  $K = 0$ .

**Constitution of liquids: some new experiments.** H. BRERETON BAKER. *J. Chem. Soc.* 1928, 1051-5.—Drying of a liquid leads to assocn. as shown by (1) increase in b. p.; (2) change of surface tension (*C. A.* 16, 2441); (3) increase in vapor d.; (4) decrease in latent heat of evapn. A table of mol. wt. detns. by vapor d. (V. Meyer's method) is given for  $\text{Br}_2$ ,  $\text{CS}_2$ ,  $\text{CCl}_4$ ,  $\text{Et}_2\text{O}$ ,  $\text{MeOH}$ ,  $n\text{-C}_6\text{H}_{14}$ ,  $\text{C}_6\text{H}_6$  and  $\text{N}_2\text{O}_4$ , dried 2-15 years with  $\text{P}_2\text{O}_5$ . All showed assocn. The latent heat of  $\text{C}_6\text{H}_6$  (dried 3.5 yrs. with  $\text{P}_2\text{O}_5$ ), as calcd. from the vol. of  $\text{C}_6\text{H}_6$  distd. and the rise in temp. of the known wt. of  $\text{H}_2\text{O}$  surrounding the distg. flask, was 57.2 and 58 (2 expts.) for 1 g.  $\text{C}_6\text{H}_6$  (normal, 83). B. p. of the dried  $\text{C}_6\text{H}_6$  was  $94^\circ$ , which by Trouton's rule would make the mol. wt. 136. The best explanation of the action of  $\text{H}_2\text{O}$  in assocn. and dissoen. is J. J. Thomson's (*Phil. Mag.* 36, 320), that charges are induced in drops of  $\text{H}_2\text{O}$  and hence the attraction of the atoms for each other in the nearby mols. of the liquid is lessened. Since, as C. T. R. Wilson showed, the presence of ions in a gas causes the condensation of  $\text{H}_2\text{O}$  in drops on the ions, it should cause dissoen. of the surrounding mols. and hence an increase in reactivity. Silica tubes, contg.  $\text{H}_2$  and  $\text{N}_2\text{O}$  and only a few mg.  $\text{H}_2\text{O}$  to a million l., were heated. The presence of lime and thoria (which increase ionization in gases) increased the rate of reaction 5 and 20 times, resp., over that of the gases with powdered Jena glass present. After 15 min. heating, when a large amt. of  $\text{H}_2\text{O}$  had been formed, the rate of reaction was the same in all 3 cases. Addn. of 2 mg.  $\text{RaBr}_2$  in a sep. expt. caused an explosion on heating. Prevention of the condensation into drops of  $\text{H}_2\text{O}$  in a liquid (as by removal of the ions by an elec. field) also must lead to assocn.  $\text{C}_6\text{H}_6$  (dried with concd.  $\text{H}_2\text{SO}_4$ ) boiled at  $79.6^\circ$ . After an elec. current had been sent through it some hrs. in a tube of 1 cm. diam. with Pt electrodes, it boiled at  $91^\circ$ , while the same  $\text{C}_6\text{H}_6$  untreated boiled at  $79.6^\circ$  in a similar tube. Reapplication of the current during boiling stopped it. Surface-tension detns. indicated a mol. wt. 2-3 times the normal.  $\text{C}_6\text{H}_{14}$  and  $\text{CS}_2$  showed similar behavior.

JANET D. SCOTT

**The apparent influence of an electric field on the boiling point of benzene.** JOHN WM. SMITH. *J. Chem. Soc.* 1929, 788-91.—As shown by Baker (cf. preceding abstract), when an elec. field is applied to  $\text{C}_6\text{H}_6$  in a tube heated in an oil bath, the apparent b. p. registered by a thermometer in the liquid, rises (S. found  $85\text{--}7^\circ$ ). The vapor temp. is normal ( $80^\circ$ ). S.'s work also confirms that of Smits (*C. A.* 23, 1327), that there is no change in the b. p. of  $\text{C}_6\text{H}_6$  exposed to an elec. field when the tube is heated directly with a small flame, and that the vapor pressure is unchanged. S. agrees with Smits that the rise in b. p. must be due to superheating. S. used two types of cell: a tube contg. 2 parallel electrodes of Pt foil, and a flat bulb with silvered parallel sides about 7 mm. apart and with Pt wires sealed through each face. The high b. p. of  $\text{C}_6\text{H}_6$  to which an elec. field had been applied was lowered by stirring, the more so the more vigorous the stirring. Application of the field during boiling to previously untreated  $\text{C}_6\text{H}_6$  had no effect on the b. p.

**Theory of anisotropic liquids. VIII. The plane structures.** C. W. OSENF. *Arkiv Mat. Astron. Fysik* 21A, No. 11, 1-13(1928); cf. *C. A.* 19, 3060; 23, 2085. A purely mathematical development of great complexity in terms of free energies. IX. The propagation of light through a helicoidal twisted structure parallel to the axis. *Ibid.* 14-35.—Mathematics of even greater complexity without evident physical or chem. interpretation.

G. L. CLARK

**Liquid drops on the same liquid surface.** J. B. SETH, CHETAU ANAND AND LACHMAN DAS MAHAJAN. *Phil. Mag.* [7], 7, 247-53(1929).—The phenomenon of liquid drops forming and floating on the surface of liquids was studied in some detail. Primary and secondary drops are formed. The primary drops form when the tip of a buret delivering the liquid is maintained at a height of one or two cm. above the surface of the liquid on which they float. Secondary drops form when the drops fall from a sufficient height to splash. Primary drops are as a rule larger than secondary drops. In general, light liquids of low surface tension and low viscosity show the formation of secondary drops with no primary drops or primary drops of very short life. Inorg. substances and their solns. and thick sirupy liquids do not exhibit the phenomenon. Fats and oils at higher temps. exhibit the phenomenon very well, as do solns. of soap, "phenyle" and cresol in water. The latter are best suited for such studies. Viscosity was found to be mainly responsible for the stability and life of the drops, while surface tension detd. their

size. A break in the surface tension-concn. curves for the soap and "phenyle" solns. was found at the point where primary drop formation was best exhibited. L. H. R.

**Rheology. I. The nature of fluid flow.** EUGENE C. BINGHAM. *J. Chem. Education* 6, 1113-9(1929).—A semi-popular treatment of the subject of the flow of matter. Some simple demonstrations are given of hydraulic (or turbulent) as well as viscous (or linear) flow.

EUGENE C. BINGHAM

**Viscosity of ether at low temperatures.** EDM. VAN AUBEL. *J. Chem. Soc.* 1929, 1111.—Values for the fluidity of  $\text{Et}_2\text{O}$  calcd. from A.'s formula,  $\phi = m + n \log (\theta - t)$  (*C. A.* 15, 3779) are compared with the measurements of Archibald and Ure (*C. A.* 21, 2084); good agreement is obtained down to  $-92.2^\circ$ . The consts. used were:  $\theta$   $193.8^\circ$ ,  $m$  4003.46,  $n$  -1599.7.

C. J. WEST

**Ring methods for surface tension measurements.** N. ERNEST DORSEY. *Science* 69, 187-8(1928); cf. *C. A.* 22, 1071.—A discussion of the proper way to use the Du Nouy tensimeter. As a ring is slowly raised from an extended surface of a liquid that wets it, the resultant downward pull of the liquid passes through a distinct max., and if the ring is not too small, it then reaches a lower and const. value before rupture occurs. The surface tension can be derived from either of these values of the pull, but the procedures differ. As the max. pull is the least that will suffice to detach the ring from the liquid, the method based on it could be called "the ring detachment method." The lower and const. pull, observed when the ring is raised sufficiently higher than the position of max. pull, corresponds to the existence of a true double film between the liquid and the ring, and this should be called "the ring film method." In both cases, the surface tension will be computed from empirical tables. The failure to report the method used in the measurements detracts from the value of recent American publications.

ALBERT L. HENNE

**Experimental determination of surface tension by the removal of disks.** J. E. VERSCHAFFELT. *Bull. sci. acad. roy. Belg.* 14, 663-5(1928).—V. simplifies his previously given calcs. by means of successive approximations and gives an application of the method. This method of det'n. of surface tension is claimed to be the most practical and precise of those in use.

F. W. LAIRD

**Distillation. III. The mechanism of rectification.** W. K. LEWIS AND K. C. CHIANG. *Trans. Am. Inst. Chem. Eng.* 21, 127-38(1928).—The analogies and the distinctions between the processes of rectification and of absorption of vapors from gaseous mixts are pointed out. The fundamental diffusion laws are integrated and applied to the case of rectification. The equations given, together with the exptly. detd. liquid-vapor equil., make it possible to compute diffusional processes on the basis of a knowledge of the physical consts. involved, and the area and thickness of the surface films, and to analyze quant. the influence of the various factors affecting rate of rectification and plate efficiency.

F. E. WALSH

**Orientation of organic compounds by cylindrical glass surfaces and superficial orientation of glass.** JEAN J. TRILLAT. *Compt. rend.* 188, 555-6(1929).—A glass cylinder was covered with a thin coating of palmitic acid by dipping it in a  $\text{C}_6\text{H}_6$  soln. and allowing the solvent to evap. By means of K rays of Cu, diagrams were obtained showing perfect radial orientation of the mols. Diagrams of the glass alone showed that the surface of the glass is also oriented.

E. G. VANDEN BOSCHE

**Capillary phenomena in non-circular cylindrical tubes.** W. O. SMITH AND PAUL D. FOOTE. *Ind. Eng. Chem.* 21, 567-8(1929).—The total force sustaining the wt. of a liquid in non-circular capillary tubes was calcd. and results are given for tubes having elliptical cross sections, calcd. from the equation developed and by actual expt. The agreement between the observed and calcd. values with  $\text{CCl}_4$  and  $\text{H}_2\text{O}$  as the liquids is within the error of measurement. The practice of treating non-circular capillaries as circular capillaries of equiv. cross-section or as having a radius equal to the arithmetical mean of the semi-axes of the ellipse leads to erroneous results. Formulas are given showing that the v. p. over a meniscus is diff. for circular and non-circular capillaries of the same cross-sectional area.

J. W. SHIPLEY

**Thickness of an oleic acid film in the saturated condition and the saturation pressure of the film.** FAHIR EMIR. *Compt. rend.* 188, 1284-6(1929); cf. *C. A.* 20, 855.—The temp. and the nature of the supporting liquid have an influence on the speed of decrease of the surface tension of a film of oleic acid. The film is more sol. when the surface density is greater. The soly. is greater with neutral than with acidified  $\text{H}_2\text{O}$  and increases with the temp. Measurements are made with a monomol. film of known surface under 1 dyne/cm. surface pressure. By compression the pressure is increased to 10, 20 and 30 dynes/cm. From this the value of 2.3  $\mu\mu$  is found for the length of the

mol. instead of 2.5 as obtained by Marcelin. Between 15° and 30° the satn. pressure of the film varied from 30.9 to 32.7 dynes/cm. The pressure values detd. by Marcelin are probably more accurate.

E. SCHOTTE

**Adsorption by pure carbon. I. An interferometric investigation of adsorption by pure carbon from non-aqueous binary systems.** F. E. BARTELL AND C. K. SLOAN. *J. Am. Chem. Soc.* **51**, 1637-43 (1929).—The interferometric method is used to measure the adsorption by pure C of  $\alpha$ -bromonaphthalene, benzene and ethyl carbonate from dil. solns. in EtOH. The adsorption tends to be in the same order as the adhesion-tension values of these same solutes (as pure liquids) against C. **II. Adsorption by pure carbon from non-aqueous binary systems over the entire concentration range.** *Ibid* 1643-56.

The interferometric method is employed to measure the adsorption from various non aq. binary systems. An equation is developed representing the preferential adsorption over the entire concn. range, being based on the assumption that the adsorption of each component follows the Freundlich equation. The importance of measurements of adhesion tension values is pointed out, and the Gibbs principle restated in terms of adhesion tension rather than interfacial tension.

R. I. RUSH

**Adsorption of coloring matters by charcoal powder.** SHOSETSU SASAKI. *Kyoto Imp. Univ. Kyoto J. Med.* **25**, 425-7 (1928).—The adsorption of methylene blue and crystal violet on C powder attains equil. only in 1 to several hrs.; the initial stage of the process is represented by  $Kt + l = \log x_{\infty}/(x_{\infty} - x)$ , where  $t$  is the time,  $x$  the quantity of the coloring matter adsorbed in the time  $t$ ,  $x_{\infty}$  that adsorbed at the equil. state and  $k$  and  $l$  are const. Between the quantity of coloring matter adsorbed on unit mass of adsorbent ( $x/m$ ) and that remaining in the soln. ( $c$ ) there holds an exptl. relation  $\sqrt{m} = \alpha/c^{1/n}$ , where  $\alpha$  and  $n$  are const.

K. SOMIYA

**Adsorption of gas in a vacuum tube by magnesium.** KÁROLY CZUKOR. *Chem. Rundschau Mitteleuropa Balkan* **4**, 153-4 (1927); *Chem. Zentr.* **1928**, I, 238. A vacuum tube was exhausted to 0.01-0.001 mm. Hg. The remaining gas was adsorbed by a Mg mirror by means of complicated chem. and phys. processes. It is possible to det. whether the electrode is entirely free from gas by means of the equation,  $dp/dt = k(p - P_{\infty})$ . By plotting the corresponding temp. and pressure in the above equation, in the form  $K = (1/t) \ln(p_t - P_{\infty}) / (P_0 - P_{\infty})$ , a straight line is obtained if the tube is free from gas.

FRANCIS P. GRIFFITHS

**The relation between the electric moment and the potential difference at an interface.** A. FRUMKIN AND JOHN W. WILLIAMS. *Proc. Natl. Acad. Sci.* **15**, 400-5 (1929).—The elec. moment of a mol. detd. from the temp. coeff. of the dielec. const. of the vapor or from this const. and the d. of the binary mixt. is well grounded theoretically. The elec. moment calcd. from potential diff. at an interface by Gans' theory gives only the order of magnitude and the theory is unsound. Similar conclusions can be drawn from either kind of data but any comparison between the two can be but qualitative.

G. B. TAYLOR

**Electrolytic dissociation of colloidal solutions. I.** KOJI TAKATA. *Hokkaido J. Med.* **6**, 577-86 (1928).—In 0.00001 to 0.001 *N* HCl or NaOH soln. contg. mastic sol there is a discrepancy between the calcd. and exptl.  $p_H$  values, which shows that H or OH ion is combined with mastic. Measurement of the elec. cond. of the same soln. showed that it decreases with the addn. of mastic, the change being apparent only when the NaOH concn. lies between 0.0002 and 0.00025 *N*; hence over this range the dissociation of the compd. is complete. In the case of HCl, the corresponding concn. is at 0.001 *N* to 0.004 *N*.

K. SOMIYA

**The dielectric constant of emulsions of water and mercury in oil.** A. PIEKARA. *Bull. intern. acad. Polonaise* **1928**, 201-22.—The various theories proposed for deriving the dielec. const. of mixts. take the general form  $f(\epsilon) = \delta_1 f(\epsilon_1) + \delta_2 f(\epsilon_2)$ , in which  $\delta_1$  and  $\delta_2$  are the relative vols. of the components ( $\delta_1 + \delta_2 = 1$  if no alteration in vol. occurs during emulsification) and  $\epsilon$ ,  $\epsilon_1$  and  $\epsilon_2$  are the dielec. consts. of the mixt. and its components and  $f$  is a function of the dielec. const. which is additive with respect to the relative vols. Expts. on emulsions of water in transformer oil, EtOH and water in paraffin oil, and Hg in paraffin oil showed that: (1) The value of the dielec. const. of the emulsion  $\epsilon$ ,  $\epsilon_1$  and  $\epsilon_2$  and  $\mu$  (diam. of the droplets) being const. depends upon the volume concn.,  $\delta$ , much more than is demanded by the Lorenz and Lorentz formula, the dielec. consts. found being much greater (about 70%) than calcd. Moreover, this relation is not linear for low concns. as this formula would indicate. (2) The value of the dielec. const. of the emulsion ( $\epsilon$ ,  $\delta$  and  $\mu$  being const.) depends upon that of the dispersed phase,  $\epsilon_1$ , much more than would follow from the L. and L. formula. (3) The dielec. const. of the emulsion increases with the degree of dispersion; consequently, it is a function not only of  $\epsilon_1$ ,  $\epsilon_2$  and  $\delta$  but also of the diam. of the drops,  $\mu$ , i. e.,  $\epsilon = f(\epsilon_1, \epsilon_2, \delta, \mu)$ . There is no

appreciable influence of the elec. charge of the drops on dielec. const. in a mixt. whose mols. are not pronouncedly dipolar.

C. H. PERR

**The relation between the dielectric constant of an emulsion of mercury in vaseline and the degree of dispersion of the particles.** A. PIEKARA. *Bull. intern. acad. Polonaise*, 1928, 223-39; cf. preceding abstract.—To escape the secondary effects which might have affected the results obtained in the preceding paper, P. measured the dielec. consts. of emulsions of Hg in petrolatum and in a mixt. of petrolatum, paraffin oil and lanolin. The results obtained were on the whole in accordance with those obtained with freely mobile liquid emulsions. The secondary factors (influence of surface tension at the interfacial surfaces of the 2 phases, possibility of chem. reactions between the components, movement of droplets within the emulsion, effects due to elec. charges upon the droplets, polarization of the dispersing medium due to the charges upon the droplets) exercise only an inconsiderable effect on e.

C. H. PERR

**The adsorption of iodine, bromine and some halogen salts by carbon from different organic liquids. III. Study of the adsorption of iodine from binary mixtures of solvents.** JOSEPH TRIVIDIC. *Rev. gén. colloïdes* 7, 118-23(1929); cf. *C. A.* 23, 3613.—Freundlich's adsorption isotherm holds for the adsorption of I from mixts. of water and alc.,  $\text{CHCl}_3$  and  $\text{CCl}_4$ . I is adsorbed more strongly from toluene than from benzene or alc. and the compn.-adsorption curves are straight lines, all of which is contrary to N. Shilov and Lepin. **IV. Study of the adsorption of bromine from some pure organic liquids or mixtures. Verification of Freundlich's law.** *Ibid* 123-5.—Br is adsorbed in accordance with Freundlich's law from solns. in  $\text{CHCl}_3$ ,  $\text{CCl}_4$  and their mixts. If the adsorption from the pure liquids is known, the adsorption from any given mixt. of these liquids can be detd. from the straight-line relationships. **V. The study of the adsorption of some halogen salts by carbon in aqueous, alcoholic and hydro-alcoholic media.** *Ibid* 125-6.—C adsorbs  $\text{KI} > \text{KBr} > \text{LiCl}$  from water, alc. and water-alc. mixt. They are, however, very weakly adsorbed. Inherent errors in the detn. of the small quantities of the halogens prevent drawing definite conclusions in regard to the amt. of adsorption.

F. W. LAIRD

**The structure of colloids.** AUGUST LUMIÈRE. *Rev. gén. colloïdes* 7, 1-8(1929).—L. reiterates and upholds his theory of colloid structure, and his classification of colloids into 2 fundamental states, namely, the mol. colloidal state and the micellar colloidal state (cf. *C. A.* 19, 2896).

E. P. WIGHTMAN

**Studies on the stability of suspensions of coarse particles dispersed in solution. IV. Formation and disintegration of liquid shells in suspensions of bolus alba (kaolin)—a contribution to the understanding of the sol-gel, or thixotropic changes.** HANS WERNER. *Ber* 62B, 1525-34(1929); cf. *C. A.* 22, 3080.—The flocculent ppt. of bolus alba in water suspensions contg. electrolytes exhibits thixotropic properties. The particles are surrounded by a sheath of liquid. The vol. of this liquid in the floc is from 2.6 to 26.6 times the vol. of the particles and constitutes the dispersing medium. A method is described for detg. the thickness of this liquid layer. Variations in the electrolyte used cause the thickness to vary from 1.0 to 3.4  $\mu$ . The expts. show the presence of the film of liquid on the particles, and the relationship of this film to the flocculation of the particles. The results are used to interpret the action of thixotropic gels.

L. F. MAREK

**Nephelometric study of the colloidal solutions of metallic sulfides.** MANJIRO WATANABE AND CHOSHUN NAKAU. *J. Petrol. Mineral and Ore Deposits* 1, 61-4(1929).—Colloidal solns. of metallic sulfides were made by mixing equal vols. of aq. solns. of various metallic sulfates and of  $\text{Na}_2\text{S}$ . The course of the pptn. was studied nephelometrically. When the concns. of both salts are small but the relative concn. of  $\text{Na}_2\text{S}$  is larger than that of metallic sulfate, the metal sulfide forms ultramicroscopic colloidal particles and does not easily coagulate. The relation between the time required for coagulation and the relative concn. of the 2 solns. was detd. by measuring the change of turbidity by means of a Hellige-Dubosq nephelometer. The result shows that at an initial period the turbidity increases, and is then kept const. for a certain length of time. When coagulation begins to take place, the turbidity decreases suddenly. In some cases the first or the second stage of the above phenomena is not apparent.

K. SOMEYA

**Unsymmetrical metal colloids.** H. ZOCHER. *Metallwirtschaft* 8, 467-9(1929).—Colloidal metal sols are isotropic, are identical with their image or not enantiomorphic. By drying a metal sol on glass and gently brushing, the crystallites are oriented by an action similar to that in wire drawing. The behavior of metal colloids toward light is extraordinarily variable. The colloidal metals exhibit dichroism. The anisotropic properties are more pronounced when the metal colloid is deposited in bundles of cellulose

fibers than in the form of a mirror, and may be evidenced in the sol by application of forces to overcome the random orientation of the particles. Exposure of photo-halides to linear polarized light produces a metal colloid with marked dichroism and double refraction. Circular dichroism is exhibited by partly chlorinated colloidal Ag mirrors which have been exposed to circularly polarized light. The use of polarized light in the examn. of colloids too small for microscopic examn. makes possible an understanding of some of their actions.

L. F. MAREK.

**Catalysis and colloidal transformations. I. Catalytic decomposition of hydrogen peroxide by iron compounds.** E. I. SHPITALSKIY, N. N. PETIN AND E. I. BUROVA *J. Russ. Phys.-Chem. Soc.* 60, 1271-89(1928); cf. *C. A.* 23, 2873.—Cond. measurements were made with the aid of movable Pt electrodes (cf. *C. A.* 21, 3529). The catalytic effect of  $\text{FeCl}_3$  was studied in strongly acid (homogeneous), weakly acid (heterogeneous) and alk. (macroheterogeneous) media. Basic salts ppt. from weakly acid solns. of  $\text{Fe}_2(\text{SO}_4)_3$ , while  $\text{FeCl}_3$  under similar conditions forms stable hydrosols. The catalytic activity varies with  $p_H$  in the same way with both  $\text{FeCl}_3$  and  $\text{Fe}_2(\text{SO}_4)_3$ . In the decompn. of  $\text{H}_2\text{O}_2$  in the presence of Fe salts the const. for 1st-order reaction increases as the  $p_H$  is raised by adding alkali until the stoichiometrically neutral point is reached. Further addn. of alkali results in a decrease, to a min. when the ratio of concns. of Fe and  $\text{NaOH}$ ,  $C_{\text{Fe}}/C_{\text{NaOH}} = 2.4$ , followed by a second increase to a max. at  $C_{\text{Fe}}/C_{\text{NaOH}} = 3$ . At this point an insol. gel is pptd. which is the catalyst in alk. media. In acid media  $\text{Fe}^{10n}$  only exhibits catalytic properties and, being present in  $\text{Fe}_2\text{O}_3$  sols, renders the latter active. Complex ions or other Fe compds. do not influence the rate of decompn. of  $\text{H}_2\text{O}_2$ . The mechanism of catalysis by the Fe ion invites further investigation. **II.** A study of the mechanism of hydrolysis of iron salts and the properties of colloidal hydrosols through the catalytic action of ferric ions. *Ibid* 1291-1316.—In acid solns. the reaction const.,  $K$ , changes only slightly with time, and repeated measurements with fresh portions of  $\text{H}_2\text{O}_2$  give reproducible results. In weakly acid or alk. media  $K$  declines sharply and is not influenced by the addn. of  $\text{H}_2\text{O}_2$ . This aging process is due to the action of  $\text{NaOH}$  since  $\text{FeCl}_3$ - $\text{NaOH}$  mixts., when allowed to stand for 24 hrs. before being used as catalysts, gave low values of  $K$  to begin with. Diln. and preliminary treatment with  $\text{NaOH}$  do not affect the activity of the sols  $C_{\text{Fe}}/C_H$  gradually decreases to an equal value within 10 min. after the sol is dild. with aq.  $\text{H}_2\text{O}_2$ ; any ppt. which may thereafter sep. does not change this ratio. Sp. cond. of the sols does not change during the expt. The aging process (change in  $K$ ) proceeds faster in more alk. media, but  $K$  is in general min. for  $C_{\text{Fe}}/C_{\text{NaOH}} = 2.4$ , because on the alk. side of this point irreversible jellies ppt. which are very active catalysts. On the other hand, any ppt. formed on the acid side is reversible (forms hydrosols on diln.) and inactive. Moreover, such reversible gels decrease the activity of the portion remaining in soln., probably by adsorbing  $\text{Fe}^{10n}$  since the Cl content and cond. of the sol portion remain unchanged during the process. Hydrolysis is viewed as adsorption of Fe ions by the colloid. **III.** Colloid hydrogels and their transformations. *Ibid* 1317-32.—Hydrated  $\text{Fe}_2\text{O}_3$  is the actual catalyst, its activity is detd. by the "age" and the alky. of the reaction medium. The method of prepn. does not seem to have any influence. The catalytic decompn. depends upon the soly. of the hydrated oxide in alk. solns. of  $\text{H}_2\text{O}_2$ , thereby forming Fe compds. which serve as intermediate products in the decompn. of  $\text{H}_2\text{O}_2$ . The "aging" phenomenon, as manifested in a loss of catalytic activity, is attributed to the decrease in soly. of the hydrated oxide of Fe caused by alkali and consequent decrease in the surface of the dispersed phase.

B. SOYENKOFF

**The swelling of gelatin.** W. V. MORACZEWSKI AND E. HAMERSKI. *Biochem. Z.* 208, 299-327(1929).—The swelling of gelatin in salt solns. increases with the concn. of the salt. Only alc. and citrate form an exception to this rule. The swelling is greater the higher the temp. Acids cause greater swelling than salt solns., and  $\text{HCl}$  and  $\text{H}_2\text{SO}_4$  of the same normality produce practically the same effect, causing max. swelling in  $N/60$  ( $p_H$  1.7-1.8).  $\text{AcOH}$  causes swelling more like salt soln. only much more strongly and the swelling curve has a uniform course, while the curves of swelling with mineral acids at first rise slowly, and only after reaching a max. behave like the salt soln. curves. Water has the smallest swelling effect, and only alc. or citrate may under certain conditions produce a smaller effect. The  $\text{SCN}$  is the most effective of the anions, and the citrate and tartrate are the weakest. Among the cations  $\text{Ca}^{++}$  causes the greatest swelling. Mixts. of salts produce an additive effect on swelling, but the cations retain their individual characteristics. Addn. of acid to salt soln. increases, while the addn. of salt soln. to acid diminishes the swelling. Nonelectrolytes in general have a slight effect on the swelling of gelatin but urea and thiourea cause very powerful swelling. It seems that the  $\text{H}^{10n}$  concn. is the most essential factor, next the  $\text{Ca}^{10n}$ , in the matter of pro-

ducing swelling, while the org. anions are inhibitory. Swelling is regarded as a sort of soln. S. MORGULIS

**Desiccation patterns (obtained) from colloidal solutions of aluminum and chromium oxides.** PAUL BARY AND JOSÉ V. RUBIO. *Rev. gén. colloïdes* 7, 97-105(1929); cf. *C. A.* 23, 3389.—The colloidal sesquioxides of Al and Cr in the process of desiccation resemble that of Fe to some extent. The structure of these colloidal solns. consists of a heterogeneous mixt. of an anhyd. or slightly hydrated oxide as the dispersed phase, suspended in a dispersion medium of a stabilizing hydrophilic substance of a similar nature. It is suggested that these solns. be classified as Wo. Ostwald's isocolloids. The aging of these solns. is explained by a more or less slow transformation from a hydrophilic to an anhyd. or less hydrated (hydrophobic) state. Veimarn's theory fails to explain the formation of these patterns. F. W. LAIRD

**Cataphoretic measurements and the theory of the critical potential.** H. R. KRUYT AND D. R. BRIGGS. *Proc. Acad. Sci. Amsterdam* 32, 384-91(1929).—When an electrolyte is added to a sol, flocculation occurs when the crit. potential is reached. For alkali or H ions, the cataphoretic velocity may still be at a high value and in some cases as much as in the original sol. This may be due to the high adsorption at the surface of the particles increasing the dielec. const., and while the cataphoretic velocity may remain high the crit. potential is reduced. Cataphoretic velocities and flocculation values for  $As_2S_3$ , Se and red Au sols were measured with KCl,  $AlCl_3$ ,  $BaCl_2$ , new fuchsin Cl and strychnine nitrate as flocculants. There is indication that the flocculation value in the presence of  $BaCl_2$  decreases with time. Univalent cations which are highly adsorbed and cause flocculation at low concns. reduce cataphoretic migration to approx. the same value as characteristic of multivalent cations at their corresponding concns. A. F.

**The study of the  $p_H$  values which cause flocculation of sols of arsenic sulfide and ferric hydroxide.** A. BOUTARIC AND G. PERREAU. *Bull. sci. acad. roy. Belg.* 14, 666-70(1928).—The  $p_H$  (1.22) at which an  $As_2S_3$  sol (1.55 g. per l.) flocculates infinitely slowly is approx. the same for different strong acids. Weaker acids fail to cause flocculation of this sol. The concn. of the H ions necessary for flocculation varies with the concn. of the sol. Concd. or dil.  $As_2S_3$  sols may be flocculated by weak acids, the  $p_H$  concn. curve passing through a min. Sols of  $Fe_2O_3$  contg. 2.18 g. per l. are flocculated by certain bases whenever the  $p_H$  is about 5.11. F. W. LAIRD

**Sols in crystals.** FRANZ URBACH. *Sitzb. Akad. Wiss. Wien, Abt. IIa*, 137, 147-56 (1928).—A detailed descriptive study is given of foreign particles such as colloidal metals in crystals of simple inorg. salts. G. L. CLARK

**The study of hydration changes by a volume-change method.** H. A. NEVILLE AND H. C. JONES. *Colloid Symposium Monograph* 6, 309-18(1928).—A new type of dilatometer consists of a petrolatum mold enclosed in a bottle and covered with a layer of oil which can rise in a capillary tube, and thus register vol. changes. With plaster of Paris there is a min. vol. at 20 min., corresponding to initial set. Heat of reaction then causes rapid increase in vol. to a max. at 45 min., const. vol. being reached after 4 hrs. Portland cement shows an initial expansion due to thermal effects (e. g., heat of wetting or Pouillet effect; hydration of lime and burned gypsum; hydrolysis of cement components). Subsequent contraction indicates adsorption of water by fine cement particles, and their hydration. Gelatin plus water showed shrinkage compared to the combined vols., but 0.001 N HCl produced no vol. change, though other HCl concns. showed initial increases. The humps on the plaster of Paris and portland cement curves due to thermal effects being eliminated, they resemble the gelatin-water curve closely, indicating that adsorption of water to form hydrated material occurs in gel structure, rather than formation of definite hydrates. JEROME ALEXANDER

**Osmotic investigations with rubber solutions.** H. KROEPELIN AND W. BRUMSDAGEN. *Ber.* 61B, 2441-3(1928).—Collodion sacks supported by extn. thimbles being used, measurements were made on 7 different concns. between 5 and 20 g./l. of the first fraction of an ether-sol. rubber from acetone-extd. crepe in benzene, between 11° and 40°. The size  $b$  decreased with increasing concn. The micelle wt. was calcd. from the formula used by Meyer and Mark:  $M = 22.41(1 + \alpha t)/p(v - b)$ , where, as a first approximation,  $b$  and  $M$  are assumed const. Good agreement of  $M$  values was found, variation being between 185,000 and 227,000. Measurements at 40° are less exact, judging from less consistent values for  $b$ . Micelle wts. agree with those given by Meyer and Mark for benzene solns. in order of magnitude. G. L. CLARK

**Crystalline pepsin.** JOHN H. NORTHROP. *Science* 69, 580(1929).—Dialysis under pressure at  $p_H$  3.0 and 5° of a concd. soln. of com. pepsin (1:10,000 U.S.P.) until a heavy ppt. was formed, stirring at 37° for an hr., filtering and cooling the filtrate slowly gave 1-2% of crystals in several days. Recrystn. was effected by dissolving in dil.  $NaHCO_3$ .

at 37° and pptg. with dil.  $\text{H}_2\text{SO}_4$ . These crystals have the properties of pepsin (hydrolyze gelatin, casein, egg albumin and edestin in acid soln., and are rapidly inactivated by heat) with an activity of 1:20,000 U.S.P., which is somewhat less than some amorphous preps. The crystals are small hexagonal prisms (0.01 to 0.10 mm. long, sep. and in clusters) and remain const. in compn. during 7 successive crystns. Their soly. remains const. on repeated washing with dil. HCl. The crystals are insol. in 0.01M HCl ( $p_{\text{H}}$  3.0) but sol. in stronger acid and in alkali. The material is pptd. by half satn. with  $(\text{NH}_4)_2\text{SO}_4$ , by Cu salts, U acetate,  $\text{Pb}(\text{OAc})_2$ ,  $\text{CCl}_3\text{COOH}$  and safranine and coagulates on boiling. It contains 14.5% N and has a diffusion coeff. in  $\text{H}_2\text{O}$  at 8° of 0.085 sq. cm. per day (corresponding to a mol. wt. of about 10,000).

DAVID DAVIDSON

**Apparent dissociation constants of the amino acids and certain related substances; a summary of the data.** P. L. KIRK AND CARL L. A. SCHMIDT. *Univ. Calif. Pub. in Physiol.* 7, 57-69(1929); cf. *C. A.* 23, 1877.—A tabulation of the data on 44 amino acids and peptides with a bibliography of 57 references and a discussion. J. S. H.

**Combination of proteins, amino acids, etc., with acids and alkalis. II. Titration curves of amino acids in presence of formaldehyde.** LESLIE J. HARRIS. *Proc. Roy. Soc. (London)*, B104, 412-39(1929).—Curves were obtained showing the variation in  $p_{\text{H}}$  (dtd. colorimetrically) on titration of various amino acids: (glycine, alanine, phenylalanine, tyrosine, glutamic acid, aspartic acid), dissolved in aq. HCHO soln., by means of NaOH. With a const. HCHO concn., each amino acid behaved as a simple acid (the methylene deriv. of the amino acid) possessing a determinate  $p_{\text{H}}$  value. In the usual formol titration, the apparent  $p_{\text{H}}$  values are approx. 3 units less than for the corresponding free amino acids in aq. soln.; methylene derivs. are formed in equil. with the amino acid and have resultant NaOH titration curves; the  $p_{\text{H}}$  end points are displaced 3 units to the less alk. side of the  $p_{\text{H}}$  scale, compared with the amino acids themselves, the apparent  $p_{\text{H}}$  value is practically unaffected by the ratio of amino acid to HCHO or by the concn. of the amino acid, provided the concn. of HCHO is kept const. On the other hand, with increasing concn. of HCHO the apparent  $p_{\text{H}}$  value decreased. The apparent basic const. of the amino acid was dtd. by titration with HCl, and was practically unaltered by addn. of HCHO. These results support the zwitterion hypothesis that addn. of HCHO produces no change in the true acidic const. (measured by titration with HCl) but decreases the true basic const. (measured by titration with NaOH).

JOSEPH S. HEPBURN

**Solubility of silicon in hydrofluoric acid.** CH. BEDEL. *Compt. rend.* 188, 1255-7, 1294-6(1929).—The soly. of Si in HF varies with the concn. of the acid. Addn. of oxidizing agents to HF increases the soly. of Si. In the presence of Pt, Ag and Cu, Si is the electroneg. element, while with Pb, Fe, Zn, Mg and Al it is the electropos. element. The nature of the metal present influences the soly. accordingly. E. SCHOTTE

**Kinetics of the solution of cadmium in hydrochloric acid.** K. JABLONSKI AND H. WĄCHSSELFISZ. *Roczniki Chem.* 9, 340-7(347 French)(1929); cf. *C. A.* 23, 3396.—The velocity of evolution of  $\text{H}_2$  by the action of 5 N HCl on metallic Cd was studied. The freshly prepd. cylinders of Cd, cleaned with emery, were dissolved very slowly, the velocity of soln. decreased and became zero after a short time. After 20 hrs. the digestion of Cd in HCl became active and soon  $K$ , measured by the amt. of  $\text{H}_2$  evolved in a min., became const.; 24 hrs. afterward,  $K$  increased more and more, being measured always in the same acid. This is the first case of this kind, for till the present time, in dissolving the metals, the velocity of the reaction increased during the period of incubation. Agitation was without influence on the soly. of Cd. A temp. coeff. = 2.02 was obtained, corresponding to ordinary chem. reactions. The soly. of Cd in HCl is a purely chem. process, independent of diffusion. J. KUČERA

**Solid solutions, isomorphism and symmorphisms among oxides of bivalent metals. I. The systems:  $\text{CaO}-\text{CdO}$ ,  $\text{CaO}-\text{MnO}$ ,  $\text{CaO}-\text{CoO}$ ,  $\text{CaO}-\text{NiO}$  and  $\text{CaO}-\text{MgO}$ .** G. NATTA AND L. PASSERINI. *Gazz. chim. ital.* 59, 139-43(1929).—Bivalent metallic oxides which cryst. in the cubic system with lattices of the NaCl type comprise a very large group of compds., some of which differ notably both in chem. behavior and in the dimensions of their metal ions. It would therefore be expected that many of the oxides, though having identical cryst. lattice forms, would not be isomorphic in the strict definition of the term. Nevertheless it has not been known to what extent true isomorphism exists and where only simple symmorphisms exist. True isomorphism exists only when mixed crystals form. In the present work, an x-ray examn. (powder method) was made of 5 binary systems of CaO and other bivalent metals. The solid solns. were obtained by decompn. of solid solns. of other compds. of the metal obtained by crystn., by fusion or by pptn. The simplest way was to calcine rapidly, and at temps. not much above those required for complete dehydration or evolution of  $\text{CO}_2$ , solid solns. of the hydrox-

ides or carbonates prepd. by pptn. The x-ray photographs of the products were compared with those of the simple oxides and mech. mixts. of the oxides. In the system  $\text{CaO}-\text{CdO}$ , there is complete and perfect miscibility between the 2 oxides in the solid state, and, within exptl. errors, the deformations of the lattice are proportional to the % compn. Identical solid solns. were obtained from mech. mixts. of the pure oxides prepd. by diffusion at temps. above  $600^\circ$ . In the system  $\text{CaO}-\text{MnO}$  there is only partial miscibility between the 2 oxides, which does not vary appreciably with the temp. With the systems  $\text{CaO}-\text{NiO}$ ,  $\text{CaO}-\text{CdO}$  and  $\text{CaO}-\text{MgO}$ , neither solid solns. nor compds. are formed, with  $\text{CaO}-\text{MgO}$  not even at  $1500^\circ$ . In general, in binary systems of  $\text{CaO}$  and other oxides with similar lattices, the soly. in the solid state diminishes rapidly with increase in the difference between the diams. of the metal ions. II. The systems  $\text{CoO}-\text{NiO}$ ,  $\text{CoO}-\text{MgO}$ ,  $\text{CoO}-\text{MnO}$ ,  $\text{CoO}-\text{CdO}$ ,  $\text{NiO}-\text{MgO}$ ,  $\text{NiO}-\text{MnO}$  and  $\text{NiO}-\text{CdO}$ . L. PASSERINI. *Ibid* 144-54.—The expts. were continued with the object of detg. whether there is a quant. relation between the soly. and the at. dimensions. All possible binary systems among  $\text{ZnO}$ ,  $\text{MgO}$ ,  $\text{NiO}$ ,  $\text{CoO}$ ,  $\text{MnO}$ ,  $\text{CdO}$ ,  $\text{CaO}$ ,  $\text{SrO}$  and  $\text{BaO}$  were studied, but in the present paper only the systems  $\text{CoO}-\text{NiO}$ ,  $\text{CoO}-\text{MnO}$ ,  $\text{CoO}-\text{CdO}$ ,  $\text{NiO}-\text{MgO}$ ,  $\text{NiO}-\text{MnO}$  and  $\text{NiO}-\text{CdO}$  are described in detail. The samples were prepd. by calcination at approx.  $350^\circ$  of the solid solns. or of the mixts. of the corresponding hydroxides obtained by pptn. from soln. of the chlorides by  $\text{KOH}$ . The powder method of x-ray examn. was used as in the preceding expts. In the systems  $\text{CoO}-\text{NiO}$ ,  $\text{CoO}-\text{MgO}$ ,  $\text{CoO}-\text{MnO}$  and  $\text{NiO}-\text{MgO}$  miscibility between the oxides is complete, and the displacement of the lattice is proportional to the % compn. In the system  $\text{NiO}-\text{MnO}$  the soly. of the oxides was, under the conditions, only partial. In the systems  $\text{CoO}-\text{CdO}$  and  $\text{NiO}-\text{CdO}$  no solid solns. were formed, which is attributed to the great difference between the diams. of the metal ions. C. C. DAVIS

Addition of H acid as a function of acidity and in presence of strong electrolytes. G. R. LEVI AND G. DELPONTE. *Giorn. chim. ind. applicata* 11, 103-6(1929).—H acid combines with  $(\text{O}_2\text{NC}_6\text{H}_4\text{N})_2$  to the same extent (about 85%) regardless of the alkyl. of the soln. ( $\text{Na}_2\text{CO}_3$ ,  $\text{NaHCO}_3$  and  $\text{Na}_2\text{CO}_3 + \text{NaCl}$  were tried). However, when acids are present the reaction proceeds further.  $\text{AcOH}$ ,  $\text{H}_3\text{BO}_3$ ,  $\text{HF}$ , citric,  $\text{HCOOH}$  and  $\text{H}_3\text{PO}_4$  produced increasing yields, while  $\text{H}_2\text{SO}_4$ ,  $\text{HClO}_4$  and  $\text{HCl}$  increased the yield to 94-95%. Further addn. of a strong electrolyte, as  $\text{NaCl}$ ,  $\text{ClO}_4^-$  and  $\text{SO}_4^{--}$ , decreased the yield to about 90%, probably by decreasing dissocn. of the mineral acid.  $\text{H}_3\text{PO}_4$  had much less effect than its dissocn. const. as an acid would indicate, ranking with  $\text{AcOH}$  and such weak acids. A. W. CONTIERI

Strong electrolytes. H. R. RAIKES. *J. S. African Chem. Inst.* 11, 55-66(1928).—A review of Debye's theory of complete dissocn. in dil. solns. of strong electrolytes and explanations for the irregular mobility of  $\text{Co}$  and  $\text{Li}$  ions. J. W. SHIPLEY

Conceptions of electric potential differences between two phases and the individual activities of ions. E. A. GUGGENHEIM. *J. Phys. Chem.* 33, 842-9(1929).—G. sets forth the principle that the elec. potential difference between 2 points in different media can never be measured and has not yet been defined in terms of phys. realities; it is a conception which has no phys. significance. The electrostatic potential  $\psi$  detcs. the equil. of the hypothetical fluid electricity, whereas the chem. potential  $\mu_i$  detcs. that of an uncharged mol. of type  $i$ . But the equil. of an ion of type  $i$  and charge  $e_i$  is detd. by the function  $\bar{\mu}_i = \mu_i + e_i\psi$ , which it is suggested should be called the "electrochemical potential"; this has a real phys. significance. The principle is illustrated by showing that the phenomena of diffusion, partition between 2 media, membrane equil., cells without and with liquid junctions, and reaction rates are completely describable in terms of  $\bar{\mu}_i$ . E. G. VANDEN BOSCHE

Effect of air on the potential of the mercury-mercurous sulfate electrode. MERLE RANDALL AND HENRY A. STONE. *J. Am. Chem. Soc.* 51, 1752-4(1929).—Cells of  $\text{H}_2-\text{Hg}-\text{Hg}_2\text{SO}_4$ , both with and without air, came to the same equil. in from 24 to 48 hrs. at an e. m. f. of 0.73694 v. for 0.1 molal  $\text{H}_2\text{SO}_4$  and 0.71858 v. for 0.2101 molal  $\text{H}_2\text{SO}_4$ . E. G. VANDEN BOSCHE

Notes on the concentration and activity of hydrogen ions. G. A. BRAVO. *L'industria chimica* 4, 211-3(1929).—This is the first part of a monograph on H ions, including methods for their detn. as well as a study of the laws governing them. There is at present no book on this subject in the Italian language. A. W. CONTIERI

Theory, measurement and application of  $p_H$  values. W. D. JARVIS. *Elec. Times* 4, 80-1(1928); *Science Abstracts* 31B, 573.—For power-house practice, applying the nic theory of corrosion to boilers, the  $p_H$  value range is from 5.6 to 8.0, and the color indicators are: phenol red,  $p_H$  6.8-8.0; bromothymol blue,  $p_H$  5.9-7.7; bromocresol purple,  $p_H$  5.6-6.8. H. L. D.

The calibration of conductivity cells for use with dilute solutions. I. At 18 C. W. DAVIES. *Trans. Faraday Soc.* 25, 129-23(1929).—When interionic forces are taken into account the solvent correction usually applied to salt solns. requires modification. The effect of the correction is to reduce all of Kohlrausch's values by 0.06 unit or more. The correction has been applied to Kohlrausch and Maltby's data for KCl and the equation:  $\Lambda_0 = 129.85 - 79.8 \sqrt{C}$  is put forward as a basis for cell const. detns. at low concns. II. The conductivity of potassium chloride at 25°. J. GRINDLEY AND C. W. DAVIES. *Ibid* 133-7.—Sources of error in detg. the true cond. of KCl soln. are discussed in detail and the calcd. corrections given. The cond. of aq. KCl solns. up to 0.0015 *N* at 25° has been measured. The equation  $\Lambda_0 = 150.59 - 109.0 \sqrt{C}$  is proposed as a basis for cell detns. at this temp.

L. B. MILLER  
The determination of the alkali-combining quantity of the most important sugars. PAUL HIRSCH AND RUDOLF SCHLAGS. *Z. physik. Chem.*, Abt. A, 141, 387-412(1929).—By a method based on elec. cond. measurements, the authors are able to det. the alkali-binding properties of sugar solns. with much greater accuracy than has been done so far. The addn. of sugar to a NaOH soln. lowers the elec. cond. of the latter, because of combination with the sugar. This decrease in cond., which takes a well-defined course, can be accurately measured and used for analytical purposes. The equiv. cond. of the Na-sugar salts can be detd. by means of the H electrode and the amt.,  $\vartheta$ , of the combined NaOH per mol. sugar can be calcd., as well as its dependence upon the  $p_H$ . From the  $p_H$  and  $\vartheta$  curves the conclusion is drawn that all sugars examd. have more than one acid group per mol., confirming the assumption that sugars are dibasic acids. The dissoen. const. of the sugars examd. were also detd. by a special procedure. The following sugars were used: *D*-glucose (anhyd.), *D*-fructose, sucrose, lactose and maltose.

J. C. JURRIJENS  
Equilibrium between the carbonates and bicarbonates of sodium and potassium in aqueous solution at 25°. ARTHUR E. HILL AND STERLING B. SMITH. *J. Am. Chem. Soc.* 51, 1626-36(1929).—No "stable pair" exists in this quaternary system at this temp. A new tetragene salt is found, which does not occur in any of the 3-component systems. It has the formula  $K_2CO_3 \cdot NaHCO_3 \cdot 2H_2O$ . Its crystn. paths were studied exptlv.

R. I. RUSH  
Application of the law of mass action to the double decomposition of [solutions of] salts. LEMARCHANDS AND MME. LEMARCHANDS. *Compt. rend.* 188, 254-6(1929); cf. *Compt. rend.* 187, 601-3(1928).—The equil. const. for the reaction of  $BaSO_4$  with HCl and with  $CaCl_2$  solns. at 100° have been calcd. in reference to the activities of the reacting substances.

B. C. A.  
The equilibrium constant of double decompositions in aqueous solution. MADAME LEMARCHANDS AND M. LEMARCHANDS. *Compt. rend.* 188, 1289-91(1929); cf. preceding abstr.—The reaction const. of the reaction between  $BaCl_2$  and  $H_2SO_4$  is detd. at 18° and found to be 0.0000237. With the help of the reaction const. at 100° the heat of reaction is calcd. The value 10610 cal. is not very different from that found by thermochem. measurements.

E. SCHOTTE  
Equilibrium of esterification and activity of molecules. STEFAN POZNAŃSKI. *Roczniki Chem.* 9, 354-60(360 English)(1929).—In the previous reports (*C. A.* 23, 1559, 2093) the so-called "equil. const."  $K_e$  of the reaction of AcOH and EtOH in the liquid phase was calcd., and varying values were found for different mixts.  $K_e$ , the equil. const. of the same reaction in the gaseous phase, did not vary. A true const.  $K'$ , was calcd. for the liquid phase:  $K_e = 14 (\pm 10\%)$ . This value is, according to Świentosławski,  $K_e = K_e^{z_2 z_4 / z_1 z_3} < z_1(z_2, z_3, z_4)$  representing the change of the fugacity of acid (alc., ester, water) produced by the 3 other ingredients of the mixt. This  $z$ , change of fugacity, was proved to be equal to a ratio of an activity coeff. of the ingredient in the soln. (mixt.) to the activity coeff. as a pure substance. In the same way as for the ions, the ratio of the activity to concn. of mols. was considered as an "activity coeff." The ratio of the 2 activity coeffs. is a relative activity coeff.

J. KUČERA  
Concentration of sugar and velocity of hydrolysis in acid medium. H. COLIN AND A. CHAUDUN. *Compt. rend.* 188, 1291-2(1929); cf. *C. A.* 20, 1936; 22, 4037.—Different acids not only give different ratios of the velocity const. but for each acid this value diminishes with the decrease in concn. of the acid. No simple relation could be found between the velocity and  $p_H$ .

E. SCHOTTE  
Chemical equilibria which involve reactions between two condensed phases. MANFRED MANNHEIMER. *Am. J. Sci.* [5], 17, 534-42(1929); cf. *C. A.* 21, 1743.—The research on equilibria between fused salts and metals is reviewed and a general method is derived mathematically for detg. the reliability of the exptl. results. The method

rests on the fact that the points of the equil. are located on stoichiometrically computable curves independent of the special law of mass action and independent of the true mol. coeffs. Application is made to the systems:  $2\text{Ag} + \text{PbCl}_2 \rightleftharpoons \text{Pb} + 2\text{AgCl}$ ,  $\text{Cd} + \text{PbCl}_2 \rightleftharpoons \text{Pb} + \text{CdCl}_2$ . The general equations of transformation of the coordinate system for change of mol. coeffs. are derived.

H. W. WALKER

The equilibrium between water, the nitrates and the sulfates of sodium and potassium. E. CORNEC, H. KROMBACH AND A. SPACK. *Compt. rend.* 188, 1250-3 (1929).—The study of this system made by Hamid (*C. A.* 20, 1164) at 90° and at 25° is extended over the range between 90° and -2°. The isothermal diagrams show the compns. of the satd. solns. represented on squares, the vertices of which correspond to the simple salts,  $\text{NaNO}_3$ ,  $\text{KNO}_3$ ,  $\text{Na}_2\text{SO}_4$  and  $\text{K}_2\text{SO}_4$ . At 90° 5 salts,  $\text{NaNO}_3$ ,  $\text{KNO}_3$ ,  $\text{K}_2\text{SO}_4$ , anhyd.  $\text{Na}_2\text{SO}_4$  ( $S_0$ ) and glaserite ( $G$ ) can exist in equil. with solns. of different compns. Contrary to the results of Hamid,  $\text{NaNO}_3$  and  $G$  cannot coexist. When the temp. is lowered, the double salt, darapskite ( $D$ ),  $\text{Na}_2\text{SO}_4 \cdot \text{NaNO}_3 \cdot \text{H}_2\text{O}$ , begins to form at 74°. Its field of existence increases and reaches that of  $\text{KNO}_3$  at 60° at a point representing a soln. satd. with the 4 salts. The fields of  $D$  and  $G$  then approach each other and meet at 44°, another inversion point.  $D$  and  $G$  can then coexist. At 32.4° Glauber's salt ( $S_{10}$ ) makes its appearance and at 30.9° its field touches that of  $G$  on the side  $\text{Na}_2\text{SO}_4 \cdot \text{K}_2\text{SO}_4$ . At 24.3°  $S_{10}$  and  $D$  can exist together, while below this temp. the field of  $S_0$  decreases until, at 21.8°, it no longer exists. The increase of the field of  $S_{10}$  continues until, at 17.6°, it reaches the field of  $\text{KNO}_3$ , where another quadruple point exists. Below this the 2 double salts cannot coexist.  $D$  leaves the side  $\text{Na}_2\text{SO}_4 \cdot \text{NaNO}_3$  at 13°, assumes a triangular shape and disappears at 10°.  $S_{10}$  then increases and reaches the side at 1.8°.  $G$  assumes here a triangular form and finally disappears at -2°.

H. F. JOHNSTONE

Melting points of the mixture of cyclohexane and benzene. IWAQ SETO. *Bull. Centr. Research Inst. South Manchurian Railway Co.* 13, 123-5 (1928).—The relation between the d. and the compn. of the  $\text{C}_6\text{H}_{12}$ -cyclohexane mixt. was detd.; a max. vol. expansion was found at 55.56% cyclohexane, the expansion of 1 g. of the mixt. at 20° being 0.013 cc. The m.-p. curve also was detd. There is at -41.9° a eutectic contg. 74.44% cyclohexane.

K. SOMEYA

Iron oxide reduction equilibria—a critic from the standpoint of the phase rule and thermodynamics. OLIVER C. RALSTON. *Bur. Mines Bull.* 296, 326 pp. (1929).—A crit. survey is made of existing data concerning the properties of the common oxides of Fe, their combinations with each other and the reduction equilibria of the various solid and liquid Fe-O compds., in order more logically to study the rate of reduction of Fe ore in a blast furnace.

DOWNS SCHAAF

Free-energy charts for predicting equilibrium pressures and concentrations. RALPH F. NIELSEN. *Ind. Eng. Chem.* 21, 568-71 (1929).—It is suggested that a chart be made for each pure substance in question. The lines on the charts would present const. pressure or const. concn. The abscissa of the chart would be temps., and the ordinates would be some function of free energy or of heat content. Equil. pressures and concns. could be read directly from such charts by those who knew nothing about thermodynamics just as heat-entropy charts are used in engineering. Charts for  $\text{O}_2$  are presented.

F. E. BROWN

Charts for predicting equilibria. MERLE RANDALL. *Ind. Eng. Chem.* 21, 571-2 (1929); cf. preceding abstr.—The free-energy equation  $F = F^\circ + RT \ln (A_{\text{O}_2} A_{\text{R}}^r / A_{\text{L}} A_{\text{M}}^m)$  is changed to  $-F/4.5787 T = (F^\circ/4.5787 T) - \log (A_{\text{O}_2} A_{\text{R}}^r / A_{\text{L}} A_{\text{M}}^m)$ . At equil.,  $F/4.5787 T = 0$  and  $-F^\circ/4.5787 T = \log K$ , where  $K$  is the equil. const. When all activities are unity,  $K = 1$ , and  $\log K$  and also  $-F^\circ/4.5787 T$  are equal to 0. When  $-F/4.5787 T$  or  $\log K$  is plotted against  $1/T$ , nearly a straight line results. Figures to show the application of these graphs to the system  $\text{H}_2$ ,  $\text{O}_2$  and  $\text{H}_2\text{O}$  and to the system  $\text{CO}_2$ ,  $\text{CO}$  and  $\text{C}$  are explained.

F. E. BROWN

The heat capacities of ethyl and hexyl alcohols from 16° K. to 298° K. and the corresponding entropies and free energies. KENNETH K. KELLEY. *J. Am. Chem. Soc.* 51, 779-86 (1929); cf. *C. A.* 23, 1344, 2645.— $\text{EtOH}$  was studied in one glassy and one crystalline state. At 18-90° K. the heat capacities of the glass and crystals nearly parallel each other but diverge a little with rising temps. There is a sharp rise in heat capacity of the glass from 90° to 96° K. and the glass begins to crystallize at 110° K. Hexyl alcohol does not tend to form a glass. The higher alcs. seem to become thermodynamically less stable with successive addns. of  $\text{CH}_2$  groups. The entropies of glasses at 0° K. increase with the complexities of their constituent mols.

F. E. BROWN

The heats of solution of some salts in water and ethyl alcohol solutions. J. R. PARTINGTON AND W. E. SORGE. *Phil. Mag.* [7], 7, 209-47 (1929).—Definitions are

given for such terms as integral heat of soln., intermediate heat of soln., differential heat of soln., etc. A *calorimeter* that can be used either isothermally or adiabatically is described. The calorimeter heater, the method of making the energy measurements, and other details of the app. are fully described. Measurements were made of the heats of soln. and diln. of KCl, KCNS, NaCNS, anhyd.  $\text{CuCl}_2$  and anhyd.  $\text{Ca}(\text{NO}_3)_2$  in  $\text{H}_2\text{O}$ . Heats of soln. of NaCuS, anhyd.  $\text{CuCl}_2$  and anhyd.  $\text{Ca}(\text{NO}_3)_2$  in solns. of EtOH were also measured.

L. H. REYERSON

**The heat of dissociation of nitrogen.** RAYMOND T. BIRGE. *Nature* 122, 842 (1928).—In reply to Gaviola (*C. A.* 22, 4370) Birge agrees that a revision of the Birge and Sponer value is necessary. A new calcn. based on the recent work of Herzberg (*C. A.* 22, 3582) gives 9.5 v. in agreement with Gaviola. The dissocn. heats of other gases are discussed in the light of this revision. The most probable values are, in Birge's opinion:  $\text{NO}$  7 v.;  $\text{CO}$  11 v.;  $\text{O}_2$  7.0 v.

J. B. AUSTIN

**The heat of dissociation of nitrogen.** R. S. MULLIKEN. *Nature* 122, 842(1928).—Mulliken supplements the discussion of Birge (cf. preceding abstr.) and arrives at the same conclusions.

J. B. AUSTIN

**The heat of vaporization of water and the specific volume of saturated steam between 210° and 250°.** M. JAKOB AND W. FRITZ. *Z. Ver. deut. Ing.* 73, 629-36 (1929).—The following figures are, resp., temp. in °C, pressure in kg./sq. cm., heat of vaporization in kg. cal./kg. and sp. vol. of satd. steam in cu. m./kg.: 200, 15.85, 462.8, 0.1271; 210, 19.45, 453.3, 0.1041; 220, 23.65, 443.3, 0.08599; 230, 28.53, 432.8, 0.07146; 240, 34.13, 421.7, 0.05970; 250, 40.55, 409.9, 0.05011. App. and procedure are described in detail.

A. WHITE

**Heat of vaporization of carbon.** IMRE BRÓDY AND TIVADAR MILLNER. *Chem. Rundschau Mitteleuropa & Balkan* 4, 150-1(1927); *Chem. Zentr.* 1928, I, 237.—The heat of vaporization of C was calcd. to be 160,000 cal.

### 3—SUBATOMIC PHENOMENA AND RADIOCHEMISTRY

S. C. LIND

**The new quantum mechanics.** J. H. VAN VLECK. *Chem. Reviews* 5, 467-507 (1928).—An "explanation of some of the philosophy and logic underlying the new theory" and a survey of its phys. and chem. applications and possibilities. W. WEST

**Electron theory of valence.** WORTH H. RODEBUSH. *Chem. Reviews* 5, 509-31 (1928).—R. discusses valence from the modern viewpoint and criticizes some of the quantum mech. approaches. His views are applied to polarity in org. compds., as the Grignard compds., to reactivity in org. compds., etc. W. WEST

**Hydrogen-ion wave function.** V. GUILLEMIN, JR., and C. ZENER. *Proc. Natl. Acad. Sci.* 15, 314-8(1929).—An approx. wave function for the ion is developed. Its usefulness is demonstrated by evaluating the energy parameter  $E$  in the Schrödinger differential equation for the  $H_2^+$  ion in the normal state as a function of the internuclear distance. The results agree with those calcd. by Burrau (*C. A.* 21, 1753). H. F. J.

**Remarks on a research of Joh. Kleiber on the luminosity of the atom.** D. G. BOURGIN and E. E. LIBMAN. *Ann. Physik* [5], 1, 1096-8(1929).—A polemical discussion. R. H. FERGUSON

**Ratio of the mass of the proton to that of the electron.** V. ROJANSKY. *Nature* 123, 911-2(1929).—By following a similar procedure to that used by Eddington in evaluating the constant  $ch/2\pi e^2$  (*C. A.* 23, 1809), an "empirical" value of 1849.6 is found for the ratio  $M/m$ . I. J. PATTON

**The energy of the helium atom in the fundamental state.** EGIL A. HYLLERAAS. *Physik. Z.* 30, 249-50(1929).—The first plane model of the He atom proposed by Bohr has been shown to have an ionization potential of 28.15 v. while the space model of Bohr and Kramers gives 20.63 v. The work of Lyman on the He spectrum gives 24.46 v. as the correct value. H. gives a computation of the He atom in its unexcited state, based upon the new quantum mechanics, which gives  $\lambda = -1.45162$  while Lyman's work gives  $\lambda = -1.45175$ . W. W. STIFLER

**Relativistic theory of an atom with many electrons.** J. A. GAUNT. *Proc. Roy. Soc. (London)*, A124, 163-76(1929).—This is a highly mathematical paper in which the ordinary classification of multiplets and the selection and summation rules are derived from Dirac's relativistic equation. It is then shown that the total angular momentum has the same properties in the new theory as in the non-relativistic theory as developed by Born, Heisenberg and Jordan, using matrices, or by Dirac using  $q$ -numbers. Hence the work of these authors can be taken over with little amendment. A selection rule, which heretofore has received little theoretical attention, is then discussed. A wave mechanics theory of multiplets is discussed and the summation rule for intensities in a multiplet is proved to a first approximation. W. W. STIFLER

**The theory of the valence octet in the torulus atom. VIII. Determination of the structure of fluorescence resonators in some classes of organic compounds.** DAN RĂDULESCU and N. BĂRBULESCU. *Bul. soc. stiinte Cluj* 4, 333-56(1929); cf. *C. A.* 23, 1573. —It is shown that the fluorescence resonator for anthracene is identical with the general resonance of the form A, previously developed, the electrons of which are spread over the mol. The structure of the fluorescence resonator has been developed for some polynuclear hydrocarbons, e. g., acridines, etc. An outline of the exptl. procedure and tables of data are included. LOUIS WALDBAUER

**Molecular structure and properties of homopolar compounds. II. Structure of carbon atom and isomerism in homologous series.** A. DIBROVA. *Ukrainskii Khim. Zhur.* 3, Sci. Pt., 435-44(1928); cf. *C. A.* 22, 3347. —Comparing the b. ps. and sp. grs. of isomeric aliphatic hydrocarbons, halogen compds. and alcs., it was observed that normal primary compds. have the highest b. p. and sp. gr. Primary iso compds. and secondary normal compds. have lower b. ps. and sp. grs. Tertiary compds. have the lowest b. ps. and sp. grs. It was concluded that the 4 valence electrons of C atom in the level L are divided by 2 between the two  $2s$  and  $2p$  quantum orbits, thus explaining the relationships in b. ps. and sp. grs. of different structural isomers in homopolar series of aliphatic compds. JAROSLAV KUČERA

The possible occurrence of some important exceptions to the selection principle relative to the total quantum number. The N spectrum of thorium. JEAN THIBAUD. *Compt. rend.* 188, 1394-6(1929).—An examn. of the x-ray spectra, in the region of longer wave lengths by means of a grating, of the elements Ta, W, Pt and Au has revealed a set of doublets which can be fitted into a Moseley diagram, and which lie between 47 and 61 Å. U. From the values of the energies of the N levels as detd. by Bohr and Coster, the observed lines are found to agree with the energies of transition between the sub-levels  $N_{IV} - N_{VI}$  and  $N_V - N_{VI-VII}$ , resp., with an error ranging from 0.5 to 3%. That these lines are due to such a forbidden transition in which  $n$  does not change seems to be the only plausible explanation. The spectra of Ag, Pa, Bi and Th were examd. Only Th yielded any data, but the lines were of the usual type and not the abnormal N doublets. It is concluded that these forbidden transitions occur only when the selection rules for  $j$  and  $k$  are satisfied and in cases where the ratio of the energies of the sub-levels involved is large.

C. J. HUMPHREYS

The formation, predissociation, and dissociation of molecules, explained by the analysis of the vibration spectrum of sulfur monoxide. VICTOR HENRI AND FRANZ WOLFF. *J. phys. radium* [6], 10, 81-106(1929).—New quantum mechanics has shown that the formation of a mol. by 2 closely approaching atoms depends upon the mutual orientations of the magnetic moments of the valence electrons. The valence electrons of the ensemble should be distributed according to the Pauli principle. The analysis of the vibration spectrum makes possible the calcn. of the energy of "normal disscocn" of a mol. AB into 2 neutral atoms, as well as the energies of "excited disscocn." where one or both atoms are excited. The correspondence between the vibration levels of a neutral mol. and those of an excited mol. makes possible the prediction of the moment when the latter passes into the state of predissocn. The emission spectrum produced by an oscillating discharge in  $SO_2$  has been analyzed and shown to be due to SO. The energy of disscocn. has been found to be 148,000 cal., and the moment of inertia,  $j_0$  is equal to  $32 \times 10^{-40}$ . A triatomic mol. of the type  $AB_2$  may be disscocd. by an electronic bombardment into an excited mol. AB and an atom B.

C. J. HUMPHREYS

An isotope of oxygen of mass 17 in the earth's atmosphere. W. F. GIAUQUE AND H. L. JOHNSTON. *Nature* 123, 831(1929).—A no. of lines in the atm.  $O_2$  absorption spectrum obtained by Dieke and Babcock are found to be due to the alternate rotation levels of the 18-16  $O_2$  mol.; this mol. has every rotational state while the 16-16 mol. has only alternate levels, in confirmation of wave-mech. theory. Babcock's plates also show a no. of feeble lines which G. and J. attribute to a 17-16  $O_2$  mol. The normal state of this mol. has  $1/2$  unit of vibration and both odd and even rotational levels exist. Intensity estimates lead to an estimate of the abundance of the 18-16 mols. as 1 in 1250, and of the 17-16 mol. as about 1 in 10,000, as a max.

W. WEST

Some new features of the atmospheric oxygen bands, and the relative abundance of the isotopes  $O^{16}$ ,  $O^{18}$ . HAROLD D. BABCOCK. *Proc. Natl. Acad. Sci.* 15, 471-7(1929).—A new band named A' and attributed to the  $O_2$  mol. but unaccounted for has been described by Dieke and B. (*C. A.* 21, 3828). New data are given on this band and it is now attributed to the isotope of oxygen  $O^{18}$ . Measured positions of the lines are in accord with theoretical predictions and the expected odd-numbered doublets appear. A method is described for detg. the relative intensities of the A and A' bands. For the A band a laboratory source and variable air path are used and for the A' band the solar spectrum. Relative intensity estimates obtained in this way confirm Aston's conclusion that the proportion of  $O^{18}$  is of the order of 1:1000 of  $O^{16}$  and explain why the mass spectrograph has failed to reveal  $O^{18}$ . A series of weak doublets has been observed symmetrically placed between the intense doublets of the P and R branches of both the A and B bands. They appear to be missing isotopic doublets affected by some perturbation of the mol.

C. J. HUMPHREYS

The constitution of oxygen. F. W. ASTON. *Nature* 123, 488-9(1929); cf. Giauque and Johnston, *C. A.* 23, 3623.—No evidence has been obtained from mass spectroscopy which would lead to the supposition that O is other than a simple element. Measurements on packing fractions with O (16) as a standard and the at. wts. of H, F and I detd. in this way agreed with the accepted value to within 1 part in 10,000. Thus if O (18) exists, it cannot be present even to the extent of one part in 1000. In the O spectrum, if O (18) exists, a line O (18) O (16) should appear at 34; the line was found, although faint; A. believes it to be due to S (34). In the  $H_2O$  spectrum the faint line at 20 might be due to Ne (20) or  $A^{++}$  (40) or Si (28)  $C^{++}$  (12). If these two effects are due to O (18), then they correspond to 0.14 and 0.32%, resp.

G. G.

The internal constitution and radiation of stars. TCHESLAS BIALOBRZSKI. *J. phys. radium* [6], 9, 237-48(1928).—A general review of the principal results of modern

research in the field of theoretical astrophysics, with special regard to radiant energy.

**Recent experimental confirmation of the undulatory mechanics in the case of the movements of electrons.** MAURICE DE BROGLIE. *Rev. gén. sci.* 40, 69-71(1929).—A discussion of recent work by a number of investigators, tending to show that a stream of electrons is capable of exhibiting optical properties such as diffraction, refraction and interference.

**Atomic transformations and their relationship to chemistry and physics.** OTTO HAHN. *Sitzb. preuss. Akad. Wiss. Special No.*, 52-60(Jan. 24, 1929).—A review. Considerable discussion of radioactivity and cosmic radiation is given. W. E. V.

**The actinium problem.** G. ELSÉN. *Z. anorg. allgem. Chem.* 180, 304-20(1929).—A review of the existing exptl. work on the heavier members of the Act series and a crit. discussion of the various theories on the genesis of the Act family are given. E. believes that a U isotope of at. wt. greater than U I is the parent substance. J. B. A.

**Conditions of formation of clusters of radioactive atoms.** H. HERSZFINKIEL AND H. JEDRZEJOWSKI. *Compt. rend.* 188, 1167-9(1929).—The expts. were designed to find the conditions for reformation of clusters of radioactive atoms, after evapn. H. and J. detd. the atoms of the active deposit from the surface of such liquids as  $H_2O$ ,  $HCl$  and  $Hg$ . The formation of at. clusters is aided by the presence of impurities, and may be completely absent when proper precautions for cleanliness are taken. The adsorption of active deposit by filter paper is due, not to mol. clusters, but to adsorption of atoms by the filter paper. Radioactive clusters do not penetrate by recoil into the solid acting as support.

**Cosmic radiation and radioactive disintegration.** W. F. G. SWANN. *Nature* 122, 998(1928).—S. discusses the expt. of Maxwell (cf. C. A. 23, 3400) and notes that the modern view of cosmic radiation makes it extremely unlikely that this radiation has anything to do with radioactive disintegration. From the known absorption coeff. of this radiation S. deduces that 1 Po atom would absorb a cosmic ray quantum once in every seventy million years.

**Production of pure uranium.** ERLING BOTOLFSÉN. *Tids. Kemi Berguesen* 9, 66-7(1929).—Uranyl nitrate is heated in air and decompd. to oxide, and then by heating in  $O_2$  oxidized to  $U_3O_8$ .  $U_3O_8$  is then reduced with Ca in a vacuum. For 2 parts  $U_3O_8$  is used 1 to 1.5 parts Ca. The reaction mixt. is placed in a steel tube of 10 cm. length, 2 cm. diam., closed at one end, all placed in a quartz tube, 40 cm. long, 3 cm. diam. U is sepd. as a metallic powder, Ca in excess is evapd. and condensed.  $U_3O_8$  is totally transformed to metallic U. After cooling a mixt. of U in powder, CaO in pieces like drillings, and in distd. Ca in lumps remains. U can be sepd. nearly totally by passage through a sieve. The rest of Ca and CaO was removed by treating with 2% AcOH. The analysis indicated 99.95% U. By x-ray spectral analysis using Siegbahn's method no impurity could be recorded.

**Rate of decay of polonium in different points of the U. S. S. R.** L. N. BOGOVA-VLENSKII. *Nature* 123, 872(1929).—B. in Leningrad deposited Po electrolytically on brass disks, measured the activity of each disk and sent one to each of 18 places about the country. After 5 months the samples were returned to Leningrad, their activities again measured and the rate of decay calcd. for each sample. The half periods found were not identical but ranged from 125.6 days (Tiflis) to 181.6 days (Krasnodar). B. explains these observations on the basis of Perrin's theory of an external source of radiant energy.

**Mass spectrum of lead from bröggerite.** C. N. FENNER AND C. S. PIGGOT. *Nature* 123, 793-4(1929).—The age of the specimen of bröggerite, which was the source of the Pb used by Aston in his mass-spectrum analysis of Pb, is  $919.5 \times 10^6$  years, as calcd. from the chem. analysis for U, Th and Pb. The calcn. made using Aston's estimate of the percentage of  $Pb^{206}$  and  $Pb^{207}$  yields an age of  $908.4 \times 10^6$  yrs., but the estd. intensity of  $Pb^{208}$  gives an age of  $1313 \times 10^6$  yrs. The discrepancy may be due to error in the intensity est. in the mass spectrum, or to an error in the factor expressing the disintegration equiv. of Th in terms of U. A higher degree of precision in the intensity measurements seems required.

**Optical method for analyzing photographs of  $\alpha$ -ray tracks.** J. M. NUTTALL AND E. J. WILLIAMS. *Nature* 123, 799(1929); cf. C. A. 23, 3154.—Accuracy and convenience of stereoscopic photographic method for  $\alpha$ -ray tracks, pointed out by Curtiss, is confirmed by authors, who have been using a method for several years depending on the same essential principle.

**Successive  $\alpha$ -transformations.** G. GAMOW. *Nature* 123, 606(1929).—The paradox that, in successive  $\alpha$ -transformations, it is the slowest particles that come out first is

explained by assuming that all of the  $\alpha$ -particles in question are originally in the same quantum state. The energy with which the particles leave will depend on the nature of the forces acting between them, whether the first ones take more than their share or less. In a radioactive nucleus the attractions of the particles for each other outweigh their repulsions and therefore the first particle is the most difficult to remove.

H. F. JOHNSTONE

**Evaluation of  $\alpha$ -radiation of the active deposit of actinium by the measurement of its  $\beta$ -radiation.** NAHMIA. *Compt. rend.* **188**, 1165-7(1929).—In order to replace  $\alpha$ -ray by  $\beta$ -ray measurements in following a chem. reaction, expts. were carried out to find the ratio between the  $\beta$ -radiation under certain conditions and the total  $\alpha$  radiation of Act derivs. A plate was placed in An to cover it with active deposit. The ionization current  $I_\beta$ , produced in the  $\beta$ -ray chamber by Act C'', and the satn. current,  $I_\alpha$ , produced by the  $\alpha$ -rays of Act C in a chamber where they were completely absorbed, were measured.  $I_\alpha$  was measured after the  $\beta$ -radiation had diminished to  $1/20$  its initial value. The total  $\alpha$ -radiation for the Act family was measured.  $I_\alpha \text{ total} = I_\alpha \times 4.89 = 1320 I$ . Also in *J. chim. phys.* **26**, 319-26(1929).

LOUIS WALDBAUER

**The active volume of the Geiger point counter.** SHUNJI SHIRAI. *Proc. Phys. Math. Soc. Japan* [3], **11**, 12-6(1929).—A brass tube 2 cm. in diam. was used as the counting chamber. The needle point was a Pt wire 0.4 mm. diam. ground to a sharp point and then slightly rounded. A beam 1 mm. wide of  $\alpha$ -rays from a radon tube was applied to one of the holes bored on the sidewalls of the chamber and the no. of  $\alpha$ -particles per 10 min. was counted at various positions for some range, the source being moved away from the hole along the beam. By moving the source parallel to the axis of the chamber the same measurements were repeated at each hole. The actual form of the active vol. is nearly a cone, with the vertex at the point of the needle and the base at the front wall. A plan of the set-up and the methods of making measurements are described in detail.

C. H. BADGER

**Fine structure of the magnetic spectrum of  $\alpha$ -rays of thorium C.** S. ROSENBLUM. *Compt. rend.* **188**, 1401-3(1929).—App. is described for the study of  $\alpha$ -ray velocities, consisting essentially of a source of radiation and a photographic plate mounted in a vacuum chamber, which is placed between the poles of an electromagnet giving a field of about 3600 gauss. The  $\alpha$ -radiation of Th C is found to consist of 4 rays. If the velocity of the strongest is taken as 1, the other 3 have the following relative magnitudes; 1.003, 0.975, 0.961. The results are independent of the form of the radioactive source, the size of the bundle of rays, the position of the source in the magnetic field and the degree of evacuation, which varied between 0.1 and 0.001 mm.

C. J. HUMPHREYS

**The straggling of  $\alpha$ -particles from polonium in passing through gases.** HENRY EYRING. *Phys. Rev.* [2], **33**, 386-8(1929).—The straggling coeffs.  $\alpha$  for  $\alpha$ -particles from Po in several gases have been detd. from the ends of the Bragg ionization curves. The value for air of 0.61 mm. checks closely that obtained by other methods. The values for polyat. gases are greater than the theoretical.

BERNARD LEWIS

**The spatial distribution of the  $\gamma$ -radiation of radium in light-dispersive media.** MARC BRUZAU. *Ann. phys.* [10], **11**, 5-140(1929).—Diffusion renders all calcs impossible. According to recent ideas of Compton, radiation occurs with emission of electrons by shock, and increase in wave length, each primary ray giving a wide, diffuse band; and the  $\gamma$ -rays of diffusion of any medium being softer than the primary  $\gamma$ -rays. Its quality can only be defined by the secondary effective wave length. In order to effect comparisons between the 2 emissions it was necessary to define also the length of the primary wave. The exploration of the diffusing medium was made with the aid of a little chamber of 2-cc. volume, where the current was due almost wholly to wall effect; and was approx. proportional to the product of the intensities of the exciting radiations by the absorption coeff. of the wall. —The sensitivity of such a chamber is then a function of the at. no. of the wall, and of the wave length. The small chamber was calibrated against a large chamber where wall effect was avoided. This large chamber, with gas effect only, permitted the measurement of the energy emitted in the form of  $\gamma$ -rays per sec. by 1 g. of Ra. The results of the exploration of a mass of irradiated water are related to the nature of the walls of the chamber. It is possible to evaluate at each depth the effect produced by secondary  $\gamma$ -radiation. The ratio of the second to the first is greater the heavier the wall, as could be predicted theoretically, and shows the difference in the nature of the two radiations. By means of the absorption coeffs. and the laws of their variation with the wave length one can calc. the wave length of the secondary radiation, and pass from the knowledge of the ionization currents to that of the intensities of the exciting radiations. The method permits the testing of app.

used in Curietherapy, and could also be used to study the spatial distribution of x-rays. Finally, the results of this research suggest some reservations to the measurements by Millikan of cosmic rays in lakes at great altitudes.

L. A. SARVER

**The measurement of the active deposit from radium by penetrating  $\gamma$ -rays.** IRENE CURIE. *Compt. rend.* 188, 64-6(1929).—C. discusses the correction necessary in measuring the quantity of an active deposit of Ra C when some radiation from Ra B also enters the chamber, confirming the work of Slater (*C. A.* 16, 4129).

L. A. SARVER

**Internal absorption of  $\gamma$ -rays.** J. A. GRAY AND A. J. O'LEARY. *Nature* 123, 568(1929).—Corrections are made in the previous est. of the internal absorption of the  $\gamma$ -rays of Ra D and the fraction of the atoms emitting  $\gamma$ -rays (cf. *C. A.* 19, 1530, 1817). On the basis of the relative ionization and av. energies produced by  $\beta$ -rays of Ra E in equil. with Ra D and by the soft and hard  $\gamma$ -rays, and taking into account the fact that  $\beta$ -rays are ejected by the hard  $\gamma$ -rays from M and N levels, the following figures are arrived at: Out of 43 atoms disintegrating, 24 atoms emit  $\gamma$ -rays. Of these, 19 suffer internal absorption. It seems probable that, in the case of all substances, only a fraction of the atoms emit  $\gamma$ -rays after a  $\beta$ -ray disintegration.

H. F. JOHNSTONE

**The existence of radioactive recoil ions of high mobility.** LORA LANE LOEB AND LEONARD B. LOEB. *Proc. Natl. Acad. Sci.* 15, 305-10(1929).—This investigation was made to verify, if possible, the results of Erikson (*C. A.* 19, 602), who found a group of positive ions about recoil atoms of Rn, Tn and An, the mobility of which was 4.35 cm./-sec./v./cm., a value which is greatly in excess of the usual 1.56 and which has not been satisfactorily explained. The results were obtained with the positive ions of Th C formed from recoil atoms of Th C. The Rutherford a. c. method with a high field and a high frequency square-wave potential from a commutator was used. The results show no indications of the faster ions observed by E. The discrepancy may lie in a fundamental difference in the nature of the recoil atoms of Rn and of Th C, or in a contamination of the air blast used by E. by radioactive emanations.

H. F. JOHNSTONE

**Nuclear levels and artificial disintegration.** RONALD W. GURNEY. *Nature* 123, 565 (1929).—The author (*C. A.* 23, 329) and later Gamow (*C. A.* 23, 1807) have suggested the existence of quasi-discrete levels in the at. nucleus and have made applications to artificial disintegration. By treating the nucleus as a simple potential barrier Gamow showed that the probability of penetration of the incident  $\alpha$ -particle steadily decreases with decreasing velocity. If other solns. of the Schrödinger equation are considered, however, the possibility of resonance phenomena exists. This indicates that a variation of the velocity of the  $\alpha$ -particle may be accompanied by great fluctuations in the probability of penetration when the energy enters the range corresponding to one of the possible quasi-discrete levels.

H. F. JOHNSTONE

**Disintegration of aluminum.** C. PAWLOWSKI. *Compt. rend.* 188, 1334-6(1929); cf. *C. A.* 23, 3850.—On plotting the max. range of H-particles from Al against the range of the  $\alpha$ -particles used, the author concludes that the lower limit of the range of  $\alpha$ -particles that can be used to produce H-rays from Al is 1 cm. Using Bothe's formula for calcg. the max. range of the H-rays, he found no agreement with the actual curve. On plotting the relative no. of H-particles (of range greater than 18 cm.) per  $\alpha$ -particle, against the range of the  $\alpha$ -particles used, the curve shows an abrupt increase in the no. of H-rays with great range of  $\alpha$ -particles. There is some disagreement between the exptl. curve and the curve obtained by Gasmow (*C. A.* 23, 1047 and 1807) by the use of wave mechanics.

LOUIS WALDBAUER

**Radioactive isotopes of lead and the ultimate product of the radioactive series.** OTTO ERBACHER. *Metallwirtschaft* 7, 222-4(1928).—General discussion of the products of radioactive processes which lead to Pb isotopes and of the use of the latter in analytical chemistry as indicators of extreme sensitivity.

EMIL KLARMANN

**Refraction of light waves by electrons.** S. K. MITRA AND HRISHIKESH RAKSHIT. *Nature* 123, 796-7(1929).—A theoretical investigation of the electron density required to produce appreciable reflection of light waves ( $\lambda = 10^{-5}$  cm.) by electrons. A beam of light, entering at grazing incidence on the surface of a thoriated W strip at 2300° K., will, after passage over 10 cm., be shifted approx.  $7.8 \times 10^{-4}$  cm. from the surface. This effect should be detectable if suitable expts. can be arranged.

W. WEST

**The recombination of positive ions with free electrons.** R. SEELIGER. *Physik. Z.* 30, 329-57(1929).—A comprehensive survey, with bibliography.

L. W.

**The nature of the ions in air.** HENRY A. ERIKSON. *Phys. Rev.* [2], 33, 403-11 (1929); cf. *C. A.* 22, 4054.—Results are given showing the production and aging of the initial pos. ion in dried air and dried N<sub>2</sub>. Results are also given showing that when the final pos. air ion of mobility 1.36 is passed into moist air the final ions disappear and a swifter 1.87 ion appears. These in turn change back to 1.36 ions. E. assumes that a

neutral  $\text{H}_2\text{O}$  mol. gives up an electron to the final 1.36 two-mol. pos. ion, thus giving a one-mol. pos. ion which has a higher mobility. This  $\text{H}_2\text{O}^+$  ion ages by attaching itself to another mol., forming a slower 1.36 ion. Reasons are given for E.'s view that the initial and final pos. ions consist of 1 and 2 mols., resp.\* BERNARD LEWIS

Some problems relating to the mobility of gaseous ions. A. M. TYNDALL. WITH A NOTE BY C. F. POWELL. *Proc. Phys. Soc. (London)*, 41, 248-57(1929).—A lecture with suggestions as to future progress. P.'s note discusses the elimination of wax seals in the "four gauze" method (C. A. 23, 782) by enclosing the app. in a glass tube and sealing in the electrodes. LOUIS WALDBAUER

Dependence of mobility of ions in air on the relative humidity. EZER GRIFFITHS AND J. H. AWBERY. *Proc. Phys. Soc. (London)*, 41, 240-7(1929).—The relationship between relative humidities and the mobilities of negative ions in air at atm. pressure has been examnd. with a view to possible application in hygrometric measurements. The method employed was a modification of Zeleny's original method, the end of a wind channel being closed by a gauze disk fitted with a guard ring through which a steady stream of air of definite humidity was pumped. The motion of the neg. ions in the air stream was balanced by a counter potential gradient, and the mobility was deduced from the crit. potential required to produce a balance. Efforts were made to construct a direct indicating instrument by amplifying the current sufficiently to obtain deflection on a robust moving-coil indicator, but the variations in the amplification factor were found to be too serious. LOUIS WALDBAUER

Ionization of gases by positive ions. RICHARD M. SUTTON. *Phys. Rev.* [2], 33, 364-72(1929).—With a tube of simple design, pos. ions of K are driven by accelerating potentials up to 750 v. into Ne and A at various pressures. Pressure ranges between 0.05 and 1 mm. give definite variation of ionization with pressure. Ionization by this process does not offer a sharp initial point but a measurable amt. is present in Ne at 100 v. and in A between 100 and 150 v. The efficiency of the effect is less than for electron bombardment in these gases; it is several fold greater in A than in Ne. In neither gas has the efficiency reached a max. at 750 v. though there is evidence with A that the max. efficiency may be found at a slightly higher accelerating potential. The pressure range within which the ionization effect shows itself is higher than would be expected from kinetic theory, which seems to indicate the presence of long mean free paths for the pos. ions, in accord with results of other observers using a magnetic analysis app. BERNARD LEWIS

Theory of ionization in columns. II. GEORGE JAFFÉ. *Ann. Physik* [5], 1, 977-1008(1929).—A theory of ionization in columns, previously developed (cf. C. A. 8, 1541) is now extended to cover several parallel columns, and the possible reciprocal actions between them are considered. Various cases are treated with certain simplifying assumptions for different durations of exposure to the ionizing radiation. Formulas are developed for the production and recombination of ions in a single column, for homogeneous volume ionization, for the rise of ionization pressure, etc. Comparison with exptl. data, especially those of J. Schemel, shows good agreement between theory and expt. W. W. STIFLER

Experimental investigations of the change in the dielectric constants of a very dilute gas by the action of electrons. LUDWIG BERGMANN AND WALTER DÜRING. *Ann. Physik* [5], 1, 1041-68(1929).—The change in the dielec. const. of a gas in high vacuum due to the action of electrons was detd. by the so-called second Drude method, the gas occupying the space between the plates of a condenser set up in such a way in relation to the charging system that a resonance position could be established. This gives a measure of the capacity of the condenser and of the dielec. const. of the gas. A glowing cathode was the source of electrons. The results indicate that with increasing electron density the dielec. const. decreases. Within the exptl. error the detd. abs. values of the dielec. const. agree with the theoretical. The dispersion was also found to correspond to the theoretical. At const. electron density the measured deflection of the resonance position depends upon the wave length. R. H. FERGUSON

Latent carriers of electricity in the gaseous discharge. S. A. RATNER. *Proc. Natl. Acad. Sci.* 15, 318-23(1929).—In some expts. on the discharge of electricity through gases in which large hollow electrodes were used R. has observed considerable ionization currents inside the electrodes. These currents were investigated in a special app. in which precautions were taken to prevent the entrance of any electrons, high-speed positive ions or other carriers of electricity from penetrating into the ionization chamber. In spite of these precautions, however, large currents could be detected. From the nature of the currents the conclusion is reached that they cannot be ascribed to a photoelec. effect or to electrons or high-speed positive ions that may have passed be-

cause of a polarization of the elec. field surrounding the ionization chamber. Metastable atoms capable of being ionized by collision with each other or with gaseous mols. may account for the currents. These latent carriers must exist at a concn. greater than 1 to every  $10^4$  mols. The currents increase more rapidly than the discharge currents producing them since the no. of collisions between the metastable atoms increases as the sq. of the no. of atoms. It is difficult to interpret some other properties of the currents, for instance, the lack of satn. or the sudden increase in the current when the pressure is reduced below a certain value. The expts. may throw light, however, on the complicated phenomena observed behind a perforated cathode and usually ascribed to high-speed positive ions passing through the aperture in the cathode. H. F. J.

**High-frequency discharge in gases.** BHABESH CHANDRA MUKHERJEE AND ATUL KRISHNA CHATTERJI. *Nature* 123, 605(1929).—The general nature of striated discharges appears to be the same for all gases. With external electrodes the striations are generally of the nature of "double layers" and with the internal electrodes they always have a comb-like appearance, excepting at low pressures. The thickness of the striae increases as the pressure is lowered until finally the glow extends beyond the electrodes where striations can be observed. The same glow discharge can be obtained with only 1 external electrode. In this case the discharge is of the form of 2 convergent beams with their apexes away from the electrode. H. F. JOHNSTONE

**The diffraction of electrons by crystalline powders.** M. PONTE. *Compt. rend.* 188, 244-6(1929).—A method is briefly described which enables one to obtain the complete crystal lattice of a substance in a short time on a small plate, with a small sample of powder, small current consumption and no delicate technic with an accuracy of about 2%. It is suggested that the method will prove valuable in the investigation of surface phenomena. L. A. SARVER

**Action of metastable atoms of helium on a metal surface.** M. L. E. OLIPHANT. *Proc. Roy. Soc. (London)* A124, 228-42(1929).—A beam of metastable He atoms was produced by the impact of pos. ions at glancing incidence on the walls of a gas-free Pt canal. On collision with a metal surface, these metastable atoms set free electrons, the max. velocity of which corresponds to the difference between the energy of the metastable state and the work function of the surface. The fraction of the metastable atoms which can be reflected from a metal surface varies with the gas condition of the surface. The production of metastable atoms by glancing impact of pos. ions on a metal surface was proved by direct expt. While some sputtering is produced by the impact of the fast moving neutral atoms, the intensity of such disintegration is far less than that due to the pos. ions. This suggests that the charge of the ion is a factor in the process. W. W. STIFLER

**Emission of positive ions from metals.** H. B. WAHLIN. *Nature* 123, 912(1929).—A detn. of  $e/m$  for the positive ions from heated metals shows: Cu, Fe, Ni and Pt give alk ions only; W, Mo and Ta, when heated to a temp. where vaporization becomes appreciable, give ions of at. wt. agreeing with that of the emitter. I. J. PATTON

**The electronic theory of metals according to Sommerfeld, and the mean free path of the electrons.** L. BRILLOUIN. *Compt. rend.* 188, 242-4(1929).—A criticism of recent work by Houston, Frenkel and Mirobulow (*C. A.* 22, 4354). L. A. S.

**The theory of electron emission from metals.** LOTHAR NORDHEIM. *Physik. Z.* 30, 177-96(1929).—A mathematical derivation of the state of electrons in a metal is made on the basis of the Pauli principle. The distribution of the electrons meeting the surface and a theory of the reflection coeff. of the surface layer are also derived. On these fundamental considerations an explanation of the emission processes taking place from the incandescent state, by the action of an elec. field and by the action of light, is given. The results are considered as proofs for the Fermi-Dirac distribution principles and for the null-point energy of electron gas. H. F. JOHNSTONE

**Laws of scattering of canal rays in passage through solids. A note on the work of E. Homma.** CHR. GERTHSEN. *Ann. Physik* 87, 1000-2(1928).—Homma's estn. of the most probable angle of deflection is criticized; the correction alters essentially the interpretation of the observations. W. WEST

**Effect of various gases and vapors upon the sparking voltage of small tubular electrodes.** KANJI HONDA AND KIYOKI OTSUKA. *Bull. Inst. Phys. Chem. Research (Tokyo)*, 8, 319-34; *Abstract Ed.* 2, 43-5(1929).—When a stream of gas flows into the gap between tubular and disk electrodes, sparking voltage is lowered. Thus with 50-cycle a. c. and a 10-cm. gap, sparking voltage in kv.<sub>max</sub> is 72 for H<sub>2</sub>, for HCl 71, N<sub>2</sub> 70, air 68, N<sub>2</sub>O 67, CO 65, O<sub>2</sub> 63, Cl<sub>2</sub> 58, NO<sub>2</sub> 57, CO<sub>2</sub> 56, H<sub>2</sub>S 56, CH<sub>4</sub> 55, NH<sub>3</sub> 55, NO 54, SO<sub>2</sub> 53 and C<sub>2</sub>H<sub>4</sub> 50. When sparking discharge takes place in an atm. of the above gases, sparking voltage is in the same order as in the case of sphere gap discharge, where

it depends upon the magnitude of ionization potential. This difference is due mainly to the difference in the form of corona discharge at the tip of the tube, this being a pulsating discharge in the first case and a glow discharge in the 2nd. From Townsend's formula,  $v_+ = 1080\sqrt{x}$ , the frequency of the pulsating discharge can be calcd. Here  $v_+$  is pos. ion velocity,  $x$  is the field gradient in v./cm.,  $p$  the pressure of gas in mm. of Hg and the frequency is approx. expressed by  $v_+/g$ , in which  $g$  is the gap length in cm. Good agreement was obtained between calcd. and observed values. Thus with  $g = 2$ ,  $v_+/g$  is 5500 and the observed value 5680; with  $g = 3$ , these values, resp., are 3300 and 3000; with  $g = 4$ , 2000 and 1950. It was observed that vapors of such antiknock materials as  $\text{CCl}_4$  and  $(\text{C}_2\text{H}_5)_2\text{Se}$  always raise the sparking voltage. H. SROERTZ

**Mechanical ionization of gases under extreme pressures at any desired low temperature.** WILHELM ANDERSON. *Physik. Z.* 30, 360-4(1929); cf. C. A. 21, 1228.-From general principles, A. concludes that at extreme pressures the ionization potential of gases becomes zero, which leads to metallic conduction. This is used to explain the paradox stated by Eddington in his book on the Internal Constitution of Stars, that in very dense stars, "the stars will need energy to cool." LOUIS WALDBAUER

**Use of Ebert's ion counter in determination of number and mobility of the small ions in the atmosphere.** V. I. BARANOV AND E. S. SHCHEPOTIEVA. *Physik. Z.* 29, 741-50(1928).—While it has been known for some time that ion counts made by the Ebert aspiration app. are influenced by the presence of ions of av. and small mobility, it is now realized that all measurements made in the ordinary way with the instrument are uncertain on account of the unknown action of heavy ions. Methods of eliminating the effect of heavy ions are described in detail. W. WEST

**Indication of hydroxyl in a water-vapor discharge tube.** G. I. LAVIN AND FRANCIS B. STEWART. *Nature* 123, 607(1929).—The presence of OH in the gas from a water-vapor discharge tube has been demonstrated by photographing the exit tube with a quartz spectrograph. The well-known band at 3060 A. U. was obtained. The intensity of the band is increased by the addn. of a small amt. of  $\text{O}_2$  to the  $\text{H}_2\text{O}$  vapor. The active gas appears to possess both reducing and oxidizing properties. These are illustrated by the reduction of  $\text{CuSO}_4$  and oxidation of metallic Ag. H. F. JOHNSTONE

**Anomalous terms in the spectrum of doubly ionized lead.** STANLEY SMITH. *Nature* 123, 566(1929); cf. C. A. 23, 1054.—The following lines have been classified in the spectrum of Pb III:  $\lambda\lambda 995.75, 1165.05$  form the doublet  $6^3\text{P}_{1/2}-6^1\text{D}_2$ , and  $\lambda\lambda 4004.16, 3925.23$  the doublet  $6^1\text{D}_2-6^3\text{F}_{3/2}$ . The lines at  $\lambda 1439.42$  and  $\lambda 3832.83$  are  $6^1\text{P}_1-6^1\text{D}_2$  and  $6^1\text{D}_2-6^1\text{F}_3$ , resp. These are the only cases on record of the appearance of  $\text{F}\bar{\text{D}}$  combinations for 2 valence electron systems. Of the 3 terms  $6^3\text{P}_{012}$ , only  $6^3\text{P}_1$  has been found. This is in agreement with the known facts regarding Zn I, Ca I and Hg I. H. F. JOHNSTONE

**Astrophysical estimate of ionization potential of vanadium.** A. VIBERT DOUGLAS. *Nature* 123, 606-7(1929).—By the method outlined in a previous note (C. A. 22, 4055) based on the behavior of the spectra of Cepheid variables, the ionization potential of V was found to be 6.74 v. This agrees with that obtained by spectroscopic methods. H. F. JOHNSTONE

**The photoelectric effect of molten tin and two of its allotropic modifications.** ALEXANDER GOETZ. *Phys. Rev.* [2], 33, 373-85(1929).—See C. A. 23, 2358. B. L.

**The longitudinal distribution of photoelectrons.** ANTONIO CARRELLI. *Nature* 123, 836-7(1929).—C. extends Sommerfeld's first approximation for the photoelec. emission and for the impulse acquired by the emitted electrons when the exciting wave length is long compared with the at. radius, to the case where there is no limitation on  $\lambda$ . W. WEST

**The maximum velocity of photoelectric electrons in the selective sensitivity range of potassium.** HORST TEICHMANN. *Ann. Physik* [5], 1, 1069-95(1929).—By use of the Lenard anti-tension method, the velocity distribution of the photoelec. electrons of K was measured. The source of light was a quartz Hg lamp. It is shown that the max. velocity of the emitted electrons in the selective sensitivity range corresponds to the value given by the Einstein equation. Measurements were made for wave lengths of  $\lambda = 436, 405, 365.5, 313, 302$  and 280; the resp. max. velocities were 0.73, 0.79, 0.89, 0.97, 0.99 and  $1.05 \times 10^8$  cm. per sec. There is a relation between the max. velocity and the frequency of the light. The amt. of gas in the metal influences the results so that the contact potential increases as the vacuum is lowered. An app. is described for the prepn. of gas-free electrodes by distn. of the metal under high vacuum. R. H. FERGUSON

The average "forward" momentum of photoelectrons. E. J. WILLIAMS. *Nature* 123, 565-6(1929); cf. *C. A.* 23, 1346.—W.'s exptl. value of 1.40 for the ratio of the av. forward momentum of photoelectrons emitted from  $O_2$  and  $N_2$  by absorption of x-rays to the momentum of the incident radiation shows remarkable agreement with the value of 1.44 calcd. by Sommerfeld on the basis of probability considerations.

H. F. JOHNSTONE

The magnetic susceptibilities of several organic gases. FRANCIS BITTER. *Phys. Rev.* [2], 33, 389-97(1929).—A method for measuring the magnetic susceptibilities of gases similar in principal to that used by Wills and Hector (*C. A.* 18, 1232) but simpler in operation was developed. The following results, given in mol. susceptibility  $\times 10^4$ , were obtained: methane 12.2, ethane 27.3, propane 40.5, butane 57.4, isobutane 56.3, ethylene 12.0 and acetylene 12.5. The standards used were  $H_2$  3.94 and  $N$  11.8. The error given is less than 4% relative to each other. It is shown that the results cannot be reconciled with the assumption that the susceptibility of one of these mol. is equal to the sum of the susceptibilities of the atoms of which it is made up. The hypothesis is suggested that the susceptibilities of these substances are detd. by the binding electrons, and it is shown that this assumption leads to a satisfactory interpretation of the observations if the 2  $CH_2$  groups of ethylene are supposed held together by electrostatic forces and the  $CH$  groups by a bond similar to the ordinary C—C bond, such as in  $C_nH_{2n+2}$  mols. It is shown that among the previous measurements of the susceptibility of  $H_2$  and  $N_2$ , those of Wills and Hector are probably the most nearly correct.

BERNARD LEWIS

Dielectric polarization of liquids. V. Atomic polarization. C. P. SMYTH. *J. Am. Chem. Soc.* 51, 2051-9(1929); cf. *C. A.* 23, 3835.—Values for the at. polarization have been calcd. or taken from the literature for a no. of substances. FRANK URBAN

Observations on the lattice dimensions of the system:  $Fe_x-Sb_y$ . IVAR OFTEDAL. *Z. physik. Chem.*, Abt. B, 4, 67-70(1929).—Previous measurements (cf. *C. A.* 21, 3499) of the lattice dimensions of the system  $Fe_x-Sb_y$  were repeated and identical values found. The results of the system  $Fe_x-Sb_y$  with  $a = 4.123$  and  $c = 5.168$  A. U. are not in agreement with those of Hägg (*Nova Acta Reg. Soc. Sci. Upsal.* 7, No. 1 (1929), viz.:  $a = 4.106$  and  $c = 5.145$  A. U.; O. believes that his detns. were made on a system of a higher Fe content than that of H., because of a different mode of prepn. and rapid cooling.

R. D. BUMBACHER

X-ray study of the system: palladium-hydrogen. J. D. HANAWALT. *Phys. Rev.* [2], 33, 444-58(1929).—A unique grating parameter  $a_0 = 4.017$  A. U. results when Pd is charged with  $H_2$  either electrolytically or from the gas phase in disagreement with the results of Linde and Borelius (*C. A.* 22, 1066). Larger values of  $a_0$  are possible, but are not stable at  $20^\circ$ . A difference in stability between some of the electrolytically charged specimens as compared with those charged from the gas phase is assocd. with the mech. state of the micro-crystals in the 2 cases. The concn.  $Pd_2H$  is assocd. with the value  $a_0 = 4.017$ . The  $L_{III}$  absorption limit of Pd is changed by the presence of  $H_2$ , which causes a shift in the main edge of 0.87 X. U. toward shorter wave lengths, and the occurrence of a secondary absorption 10 X. U. toward shorter wave lengths. These are taken to indicate a chem. combination between Pd and H atoms forming  $PdH$ . Impurities in the Pd affect very markedly its occlusion of  $H_2$ . The unique value of  $a_0 = 4.017$  does not appear but rather all distentions in the range 3.885 to 4.030 are observed.

BERNARD LEWIS

X-ray diffraction in liquids of the terpene series. V. I. VAIDYANATHAN. *Indian J. Physics* 3, 371-89(1929).—A systematic study of the x-ray haloes given by 21 liquids belonging to the terpene series was made by using  $Cu K\alpha$  radiation. A gradual increase in the diam. of the mols. of the liquids and an approx. constancy for each class of liquids are observed. The nature of the haloes is explained by the idea that x-ray diffraction peaks in liquids occur at distances equal to the mean mol. distances, with the conception that the distribution of mols. around any mol. depends on their form and symmetry. The sharpness of the halo and structural symmetry of camphene justify the prediction of a sharp halo in liquids with sym. mols. Five long-chain olefinic terpenes, geraniol, linalool, rhodinol, citral and citronellal, showed peaks at nearly the same angle corresponding to a diam. of 4.95 A. U. Terpeneol had a diam. of 5.08 A. U., the inner halo being more prominent than with geraniol, linalool or rhodinol. The group menthone, carvone and thujone with a CO group in the ring of the compd. showed peaks corresponding to 5.35 A. U. In the transition to the cyclic terpenes of the formula  $C_{10}H_{16}$  there was a further increase in the diam. to 5.45 A. U. and 6 A. U. Of these, terpinene, *d*-limonene, *dl*-limonene, *d*- $\alpha$ -phellandrene and sylvestrene were monocyclic; camphene, *d*-pinene and *l*-pinene were dicyclic. The pinenes gave 2 haloes. The 4 sesquiterpenes,

cadinene, inene, caryophyllene and cedrene, showed a diffuse halo between  $15^\circ$  and  $25^\circ$  outside the principal one.

**X-ray diffraction in liquid alloys of sodium and potassium.** KEDARESWAR BANERJEE. *Indian J. Physics* 3, 399-408(1929).—A series of x-ray diffraction haloes produced by liquid alloys of Na and K of different proportions has been studied with the radiation from a Mo target in a Shearer tube. The alloy is regarded as a soln. of an excess of Na or K in the liquid compd.  $\text{Na}_2\text{K}$  and the results are discussed in accordance with the results of Krishnamurti for x-ray diffraction in aq. solns. The halo is nearly the same as that given by  $\text{Na}_2\text{K}$  when the amt. of dissolved metal is small compared to the amt. of the solute  $\text{Na}_2\text{K}$ , and the halo is practically the same as that given by the metal when either of the metals preponderates to a large extent. In the intermediate stages the effect is regarded as a superposition of the effects due to  $\text{Na}_2\text{K}$  and the metal in excess. From the size of the halo for  $\text{Na}_2\text{K}$  obtained graphically it appears that the 3 atoms of this compd. are placed at the corners of a triangle. A faint inner ring is observed in cases where the excess of either of the metals in  $\text{Na}_2\text{K}$  is small. H. W. WALKER.

**Diffraction of x-rays by two-dimensional crystal lattice.** V. LINNİK. *Nature* 123, 604-5(1929).—When a thin beam of x-rays is passed through a crystal cleft into very thin layers in such a manner that the orientation of the sep. layers is not destroyed the effect of the 2-dimensional lattices will be added. On the other hand, the space effect due to the penetration of the rays will be destroyed by the incoherence of waves produced by scattering from incorrectly spaced layers. Such a crystal may be produced in mica by heating it to redness and cooling. From measurement of the spectra produced the mols. are shown to be at the apexes of equilateral triangles, the sides of which are equal to 5.2 Å. U. Because of the ease of interpretation of these spectra, the method may be of service in the study of crystal structure. Also in *Z. Physik* 55, 502-6(1929). H. F. JOHNSTONE.

**The temperature dependence of electron emission under high fields.** WM. V. HOUSTON. *Phys. Rev.* 33, 361-3(1929).—An expression showing the temp. dependence of electron emission under high fields is secured by combining the results of Fowler and Nordheim (*C. A.* 22, 3829) with the Fermi distribution of velocities used in the Sommerfeld electron theory of metals. The result is similar to that obtained previously by considering the diminution of the work function by the field (*C. A.* 22, 1538). The temp. variation is small and decreases as the external field increases. It is of the right order of magnitude to agree with the most recent observations. B. L.

**The efficiency of quenching collisions and the radius of the excited mercury atom.** E. GAVIOLA. *Phys. Rev.* [2], 33, 309-18(1929).—The evidence for and against the assumption of Foote (*C. A.* 21, 3555) that every collision of a foreign gas mol. with an excited Hg atom is efficient in quenching the resonance radiation is discussed, and a new calcn. of the efficiency of collisions is given based on Stuart's (*C. A.* 19, 2909) measurements. This shows that the efficiency can be assumed to be equal to one for  $\text{CO}$ ,  $\text{H}_2$  and perhaps  $\text{O}_2$  but that it is undoubtedly smaller than one for  $\text{H}_2\text{O}$ ,  $\text{N}_2$ , A and He.  $\text{CO}$  has actually a greater quenching efficiency than  $\text{H}_2$ . The radius of the excited Hg atom is calcd. by using an improved value for the amt. of resonance radiation re-absorbed in the resonance vessel and found to be  $r_{\text{Hg}}' = 2.91 \times 10^{-8}$  cm. or 1.62 times normal values for  $\text{H}_2$ , and  $r_{\text{Hg}}' = 5.5 \times 10^{-8}$  cm. or 3 times normal for  $\text{CO}$ . The apparently higher quenching efficiency of  $\text{O}_2$  than  $\text{H}_2$  is explained by the partial oxidation of the Hg vapor and consequent decrease of the d. of the latter. It is shown that the life of metastable atoms increases with the admission of certain foreign gases into the fluorescence vessel. This is due to the fact that the life of the metastable atom decreases at low pressures because of collisions with the walls of the vessel. B. N.

**Electrode holder for arc-spectrum analysis.** LAURENCE L. QUILL AND PIERCE W. SELWOOD. *Ind. Eng. Chem., Anal. Ed.* 1, 180(1929). R. H.

**Decay of helium lines.** R. VON HIRSCH AND R. DÖPEL. *Ann. Physik* [5], 1, 963-76(1929).—The decay of the He lines was studied by the canal-ray method of Wien, a Steinheil prism spectrograph being used. The intensity of blackening of the plates was measured point by point at intervals of approx. 0.4 mm. Various times of exposure, ranging from 3 min. to 6 hrs., were used, depending upon the sensitiveness of the plates to the particular wave length which was being studied. The possible disturbances due to variations in pressure and the effects of different cathodes were studied in detail. Abs. values of the decay const., and of the time of decay,  $T$ , are given for 10 lines from  $2S$  to  $3P$ , for which  $\alpha > 25 \times 10^7 \text{ sec.}^{-1}$  and  $T < 4 \times 10^{-8} \text{ sec.}$  to  $2p - 5d$  for which  $\alpha = 5.3 \times 10^7 \text{ sec.}^{-1}$  and  $T = 1.7 \times 10^{-8} \text{ sec.}$  The smallest value given is for  $2P - 6D$  for which  $\alpha = 2.0 \times 10^7 \text{ sec.}^{-1}$  and  $T = 5.0 \times 10^{-8} \text{ sec.}$  W. W. STIFLER.

**A new titanium band system.** ANDREW CHRISTY. *Nature* 123, 873-4(1929).—

The work of Birge and Christy (cf. *C. A.* 22, 4369) in classifying the Ti oxide bands of the M-type stars is extended. Twenty bands, including 46 heads, between  $\lambda 7990$  and  $\lambda 6270$  have been assigned to a new system the lower level of which is shown to be the same as in the blue-green system. The heat of disson. for this level is calcd. to be 6.74 v. J. B. AUSTIN

**Spectral displacements in neodymium compounds.** FRITZ EPHRAIM AND PRIYADARANJAN RAY. *Ber.* 62B, 1520-5(1929).—The reflection spectra of the following compds. have been observed:  $\text{NdCl}_3$ ,  $\text{NdBr}_3$ ,  $\text{NdI}_3$ ,  $\text{NdF}_3$  (solid and in soln.),  $\text{Nd}_2\text{O}_3$ ,  $\text{Nd}(\text{OH})_3$ ,  $\text{Nd}_2(\text{SO}_4)_3$ ,  $\text{Nd}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$ ,  $\text{Nd}_2\text{O}_3 \cdot \text{SO}_3$ ,  $\text{Nd}_2(\text{C}_2\text{O}_4)_3 \cdot 10\text{H}_2\text{O}$ ,  $(\text{NH}_4)_2\text{Nd}(\text{NO}_3)_4$ ,  $(\text{NH}_4)_2\text{Nd}(\text{NO}_3)_4 \cdot 4\text{H}_2\text{O}$ ,  $\text{Nd}_2(\text{HPO}_4)_3 \cdot 4\text{H}_2\text{O}$ ,  $\text{Nd}_2(\text{HPO}_4)_3$ ,  $\text{Nd}_2(\text{HPO}_4)_3 \cdot 0.5 \text{H}_2\text{O}$ ,  $\text{NdBr}_3 \cdot n\text{NH}_3$ . The change in spectrum produced by changing the anion is briefly discussed. The method of prepn. is given for most of the salts. J. B. AUSTIN

**The "lanthanum contraction" and spectral displacements in compound formation—changes in the samarium spectrum.** FRITZ EPHRAIM AND PRIYADARANJAN RAY. *Ber.* 62B, 1639-50(1929).—The reflection spectra of the following compds. are reported:  $\text{Sm}_2\text{O}_3$ ,  $\text{SmF}_3$  (soln.),  $\text{SmOF}$ ,  $\text{SmCl}_3$ ,  $\text{SmCl}_3 \cdot 6\text{H}_2\text{O}$ ,  $\text{SmCl}_3$  (soln.),  $\text{SmCl}_3 \cdot 8\text{NH}_3$ ,  $\text{SmCl}_3 \cdot 5\text{NH}_3$ ,  $\text{SmBr}_3$ ,  $\text{SmBr}_3 \cdot 6\text{H}_2\text{O}$ ,  $\text{SmI}_3 \cdot 9\text{H}_2\text{O}$ ,  $\text{Sm}(\text{NO}_3)_3 \cdot 6\text{H}_2\text{O}$ ,  $\text{Sm}(\text{NO}_3)_3 \cdot 4\text{H}_2\text{O}$ ,  $\text{Mg}_3\text{Sm}_2(\text{NO}_3)_{12}$ ,  $\text{Mg}_3\text{Sm}_2(\text{NO}_3)_{12} \cdot 24\text{H}_2\text{O}$ ,  $\text{Sm}_2(\text{SO}_4)_3$ ,  $\text{Sm}_2(\text{SO}_4)_3 \cdot 8\text{H}_2\text{O}$  (room temp. and in liquid air),  $\text{Sm}_2\text{O}_3 \cdot \text{SO}_3$ ,  $\text{SmPO}_4$  (soln.),  $\text{Sm}_2(\text{C}_2\text{O}_4)_3$  (soln.),  $\text{Sm}(\text{CNS})_3 \cdot 6\text{H}_2\text{O}$ ,  $(\text{CH}_3\text{CO}_2)_2\text{Sm} \cdot 4\text{H}_2\text{O}$ , the ferrocyanide, the lactate, the formate, the acetylacetonate (alc. and  $\text{CS}_2$  solns.). It is claimed that these spectra give evidence of the "lanthanum contraction," i. e., that in rare earth ions of equal valence, the ones with highest at. no. have their electrons most tightly bound to the nucleus. Inner complex formation such as in the acetylacetonate and the lactate shifts the spectrum to the red. "Basic" salts cause a shift in the same direction. The solvent has a marked influence. The method of prepn. is given for most of the salts. J. B. AUSTIN

**Variation of the intensities in the helium spectrum with the velocity of the exciting electrons.** J. H. LEES AND H. W. B. SKINNER. *Nature* 123, 836(1929).—Results are shown for the variation of the intensity of the lines 3889 A. U. ( $2^3\text{S}-3^3\text{P}$ ) and 3965 A. U. ( $2^1\text{S}-4^1\text{P}$ ) with the velocity of the exciting electrons. A photographic method was used, and correction made for secondary excitation. Conclusions: At high electron velocity the triplets are feeble compared with the singlets; at low exciting velocity, the singlets are weak compared with the triplets. This seems to indicate a very close coupling of the spin of the exciting electron with those of the at. electrons. The light of the triplets is confined closely to the electron beam; the light of the singlets tends to spread away from it. The intensity results are not in accord with those of Peteri and Elenbaas (*C. A.* 23, 2883). W. WEST

**The shift in the 1.14 absorption band of some benzene derivatives.** JAMES BARNES AND W. H. FULWILER. *J. Am. Chem. Soc.* 51, 1750-2(1929); cf. *C. A.* 21, 3047.—A continuance of earlier work. An increase in the no. of Me substitutions on a benzene ring causes a shift toward the infra-red of the band at 1.14. Data are included on benzene, toluene, *p*-xylene, and mesitylene. WALLACE R. BRODE

**Arc spectrum of phosphorus.** D. G. DHAVALA. *Nature* 123, 799(1929).—The P arc lines  $4\text{P} - 4\text{S}_2$  and  $\times 4\text{P} - 4\text{P}$  have been found in the infra-red solar lines, as given by the revision of Rowland's preliminary table of solar spectrum wave lengths, at  $\nu = 10555$  to 11095. A 2nd group,  $2M_2(\text{N}_1 \leftarrow \text{O}_2)$  was identified in the region 4600-6000 and found in the solar spectrum. The ionizing frequency is  $\nu = 86521$ , corresponding to 10.68 v., i. e., slightly higher than that of S. W. WEST

**Structure of the OH bands.** ROBERT S. MULLIKEN. *Phys. Rev.* 31, 310(1928); cf. *C. A.* 23, 32.—Each OH band comprises (a) 6 main branches, (b) about 6 weak "satellite" series, (c) another weak branch extending toward high frequencies from each head. The main branches (for which  $\Delta j_k \neq \Delta j$ ) and 4 of the satellite series (for which  $\Delta j_k = \Delta j$ ) agree completely with the Hund's case b predicted structure for  $^2\text{S} \rightarrow$  (inverted)  $^2\text{P}$ , except that these satellite series although weak are much stronger than predicted. Branch (c) is now identified as an R branch ( $\Delta j = 1$ , — but  $\Delta j_k = 2$ ); a companion P branch, as yet unknown, may be expected. Occurrence of branch (c) and high intensity of satellite series show OH here as a transition case between CH  $\lambda 3900$  (good case b, 6 strong branches with  $\Delta j = 0, \pm 1$  and  $\Delta j_k = \Delta j$ ) and HgH (12 strong branches governed by  $\Delta j = 0, \pm 1$  without limitations on  $\Delta j_k - jk$  not being quantized for the  $^2\text{P}$  state here case a). The ZnH bands lie between OH and HgH in all these features. Two satellite series (Dieke and Watson's  $\sigma Q_1$  and  $\sigma Q_2$ ) have  $\Delta j_k = \Delta j$  like main branches, but differ by running counter to the usual "crossing-over" rules of  $\sigma$ -type doubling, constituting the first exception to these rules. C. J. HUMPHREYS

**Intensity of NO  $\gamma$ -bands.** B. POGANY AND R. SCHMID. *Z. Physik* **54**, 779-87 (1929); cf. *C. A.* **22**, 3355, 3584.

**A study of the helium band spectrum. II.** SUNAO IMANISHI. *Sci. Papers Inst. Phys. Chem. Research* (Tokyo) **10**, 237-52 (1929); cf. *C. A.* **23**, 3162.—The green and yellow regions of the He band spectrum have been photographed with hypersensitized plates by aid of a 15-ft. concave grating as described in the previous paper. Two new bands of par-helium  $2S(n=1) - 3P(n=1)$ , first member at  $\lambda$  517 $\mu$ , and  $2S(n=2) - 3P(n=2)$ ,  $\lambda$  521 $\mu$ , have been found and analyzed. The band  $2S(n=1) - 3P(n=0)$  mentioned by Weizel and Flichtbauer has been completed. The band,  $2S(n=0) - 3P(n=0)$ ,  $\lambda$  513 $\mu$ , given by Curtiss, has been extended. Ortho-helium  $2s(n=2) - 5p(n=2)$ ,  $\lambda$  338 $\mu$ , has been found and analyzed. Merton-Pilley-Fujioka bands in the green,  $\lambda$  495 and 535, have been reinvestigated with the more accurate methods of this investigation.

**Spectral displacements in praseodymium compounds. V.** FRITZ EPHRAIM AND PRIYADARANJAN RAY. *Ber.* **62B**, 1509-19 (1929); cf. *C. A.* **22**, 1728.—The reflection spectra of the following compds. are reported:  $\text{Pr}_2(\text{HPO}_3)_3$ ,  $\text{Pr}_2(\text{HPO}_3)_3 \cdot 0.5\text{H}_2\text{O}$ ,  $\text{Pr}_2(\text{HPO}_3)_3 \cdot 3\text{H}_2\text{O}$ ,  $\text{Pr}(\text{H}_2\text{PO}_3)_3$ ,  $\text{Pr}(\text{ClO}_4)_3 \cdot 8\text{H}_2\text{O}$ ,  $\text{Pr}(\text{IO}_3)_3$ ,  $\text{Pr}(\text{IO}_3)_3 \cdot 4\text{H}_2\text{O}$ ,  $(\text{NH}_4)_2\text{Pr}(\text{NO}_3)_6$ ,  $\text{Pr}_2\text{O}_3 \cdot \text{SO}_3$ ,  $\text{Pr}(\text{NO}_3)_3 \cdot n\text{NH}_3$ ,  $\text{PrBr}_3 \cdot n\text{NH}_3$ ,  $\text{Pr}(\text{OH})_3$ , the chloroplatinate, the ferrocyanide, the  $\beta$ -naphthalenesulfonate (anhyd. and with  $2\text{H}_2\text{O}$ ), the succinate ( $2\text{H}_2\text{O}$  and  $5\text{H}_2\text{O}$ ) and the acetylacetonate (anhyd.,  $2.5\text{H}_2\text{O}$ , molten, alc. soln.,  $\text{CS}_2$  soln.). The results are discussed in terms of "positive" and "negative" atoms and the tightness of the at. bonds. Water of crystn. shifts the spectrum to the violet. Changing through the halogens from F to I shifts to the red. O-contg. acid radicals shift to the violet, the shift being approx. proportional to the no. of O atoms. The solvent has a pronounced effect. With the acetylacetonate,  $\text{CS}_2$  shifted the lines to the red, alc. toward the violet. The method of prepn. is given for most of the salts.

**The spectrum of trebly ionized thallium.** K. R. RAO. *Proc. Phys. Soc. (London)* **41**, 361-5 (1929).—Examn. of the vacuum spark data of Carroll (*C. A.* **20**, 1560) has revealed the important combinations between the low  $^3D$  and  $^1D$  levels of the  $d^3s$  state and the triad of triplet and singlet  $F$ ,  $D$  and  $P$  terms of the  $d^3p$  configuration in Tl IV. In addn. to the recurrence of const. frequency differences the classification is justified by aid of the regular and irregular doublet laws and triplet interval ratios, applied to 28 electron-system spectra isoelectronic with Pt I.

**Wave length of the K lines of copper using ruled gratings.** J. A. BEARDEN. *Proc. Natl. Acad. Sci.* **15**, 528-33 (1929).—The method of using ruled gratings in the measurement of x-ray wave lengths is important because abs. values are thus obtained which are more accurate than those resulting from crystal measurements. The optical diffraction formula for computing wave lengths is given. The exptl. arrangement used in the measurement of the K lines of Cu is described in detail, attention being directed to the precautions taken to insure accuracy. The weighted mean of measurements of the 10 best of the 31 plates taken yielded:  $K_\alpha = 1.5422 \pm 0.0002$  A. U.,  $K_\beta = 1.3926 \pm 0.0002$  A. U. Every one of the 31 plates obtained from the 3 gratings used gave wave lengths greater than those calcd. from crystal diffraction data. These results are significant in that they lead to a modification of the values of fundamental const. as follows: the grating space of calcite so calcd. is 3.035 A. U., Avogadro's no.,  $N = 6.022 \times 10^{23}$  per g. atom, the electronic charge,  $e = 4.804 \times 10^{-10}$  e. s. u., Planck's const.,  $h = 6.604 \times 10^{-27}$  ergs, sec.<sup>-1</sup> and the fine structure const.,  $1/\alpha = 136.6$ . The value of the Rydberg const. obtained by using the value of  $e/m$  from diffraction expts. is about 0.4% too high.

**Molecular binding and low  $^4S$  terms of  $\text{N}^+$  and C.** LOUIS A. TURNER. *Proc. Natl. Acad. Sci.* **15**, 526-8 (1929).—The fact that it requires more energy to dissociate a  $\text{N}_2^+$  ion in the normal state by increasing its vibrational quantum no. than is required if it is first excited led Herzberg to conclude that the dissocn. of the normal mol. ion produces an atom and an ion, one of which is excited. Heitler and Herzberg have suggested that the  $\text{N}^+$  ion is in the excited  $2s(2p)^3\ ^4S$  state. Two lines given by Fowler and Freeman at  $\lambda$  4991.22 and  $\lambda$  5012.026 satisfy the expected intersystem combinations with the normal  $(2s)^2(2p)^3\ ^3P$  term, the wave lengths corresponding to 2.48 v. The corresponding combinations have not been found in the available data on C. The spectrum of Si is not well enough known to warrant such a comparison. The chief objection to the interpretation is that the energy of this state is so tremendously different from that of the other states arising from the same electronic configuration, according to Hund's theory. If the suggested interpretation is found to be correct, it will support the theory of Heitler and London of the quadrivalence of these atoms.

**Effect of volume changes on the infra-red vibrations of simple crystals.** E. O.

**SALANT.** *Proc. Natl. Acad. Sci.* 15, 533-7(1929).—By reasoning from the relationship of the law of force to the vibration frequencies of NaCl type crystals; given by Carpenter and Stoodley, formulas are derived by which the variations in the vibration frequencies of such crystals, due to changes of vol. occasioned either by change of pressure or temp. may be computed. Calcns. are given for NaCl, KCl, KBr and KI. The effect on frequencies of reflection bands is also considered. It should be possible to measure changes in vibration frequency experimentally, but it would be more difficult with reflection bands since the shifts are much smaller.

C. J. HUMPHREYS

**Radiation and distribution laws.** B. BRUŽS. *Acta Univ. Latviensis* 20, 433-41 (1929).—A thermodynamic derivation of the equations of Planck, Wien and Rayleigh-Jeans is given without the introduction of quantum assumptions. The phys. picture is of the sublimation of radiation,  $B_\lambda$ , of wave length  $\lambda$  from the black body  $A$ , in the reaction  $A = B_\lambda - Q_\lambda$ , where  $Q_\lambda$  is the heat of sublimation. It is assumed that

$\frac{d \ln p_\lambda}{dt} = \frac{Q_\lambda}{RT^2}$ ; that  $p \int_0^\infty p_\lambda d\lambda = \sigma T^4$ ; and that  $p_\lambda = \lambda^{-5} F(\lambda T)$ . On the

basis of these equations it is shown that Wien's equation results if  $Q_\lambda$  is independent of temp., and is a function only of the individual process; the Rayleigh-Jeans, if  $Q_\lambda$  is a function of the resulting  $p_\lambda$  only, and is zero at  $0^\circ$  abs.; and Planck's equation, without, of course, the quantum postulate, if there is a definite  $Q_\lambda$  at  $0^\circ$  abs. increasing in temp. parallel with the rise in pressure. A generalized equation of the Wien form is also given, which fits exptl. data, has a simple form, seems to have a common basis with Maxwell's distribution law, and seems to include several varieties of special distribution, including spectral lines.

**Some studies in the Stark effect for the diffuse lines of silver and lithium.** RUFUS H. SNYDER. *Phys. Rev.* [2], 33, 354-60(1929).

BERNARD LEWIS

**The Zeeman effect in the Angstrom CO bands.** II. F. H. CRAWFORD. *Phys. Rev.* [2], 33, 341-53(1929).—Certain exptl. improvements are noted over the first part of the work (Kemble, *et al.*, *C. A.* 22, 24). The present results include observations of the Zeeman effect which has been extended from the bands at  $\lambda\lambda$  5610, 5198 and 4835 to include  $\lambda\lambda$  4511 and 4394. Measurements on 30 patterns with  $M = 1$  (where  $M$  is the ordinal no. of the line in a branch) for fields from 18,000 to 36,000 gauss have shown the widths of the Zeeman patterns to be proportional to the field strengths to within 2%, the estd. accuracy of measurement. The weighted av. of the pattern widths for  $M = 1$  is 97.7%  $\Delta\nu_n$  and  $M = 2$  66.3%  $\Delta\nu_n$ , where  $\Delta\nu_n$  is the Lorentz triplet half width. The quantum mechanics predicts 100%  $\Delta\nu_n$  and 66.7%  $\Delta\nu_n$  for these widths, resp., as against 88.9% and 64% on the old quantum theory. Thirteen out of the possible 18 patterns predicted for the first 2 lines of the  $P$ ,  $Q$  and  $R$  branches have been resolved and measured and found to agree with predictions within the error of measurement. The intensity asymmetries reported previously have been found, whenever comparison in both high and low fields was possible, to behave qualitatively (though not quantitatively) as Kronig's (*C. A.* 22, 1101) calcns. predicts. Eight isolated lines ( $M = 23$  to  $M = 35$ ) in 4 bands have been found which show anomalously large Zeeman effects. Three (and possibly 4) new bands have been observed which from their behavior in the magnetic field must belong to the Angstrom group. B. L.

**The excitation of sodium by ionized mercury vapor.** HAROLD W. WEBB AND S. C. WANG. *Phys. Rev.* [2], 33, 329-40(1929).—The excitation of the Na spectrum by ionized Hg distg. from an arc was studied under controlled conditions in a tube. The spectrum produced by excited Hg atoms was compared with that due to Hg ions. The spectrum due to the excited atoms showed the marked "resonance" effect shown earlier by Bentler and Joseply (*C. A.* 21, 3021). The spectrum due to Hg ions also showed excitation corresponding to the excitation energy of the metastable Hg atom. This may be accounted for as due to metastable atoms formed as a result of recombination of Hg ions. An alternative explanation is that the excitation of a Na atom by Hg ion occurs by a 3-body impact involving a Hg ion, a Na atom and an electron. This was suggested by the fact that when Na is introduced into the ionized Hg there is a strong enhancement of the Hg lines originating in the two  $3S$  levels. It seems probable that both this and the above process are of the same nature. It was also noted that the spectrum excited by ionized Hg resembles the chemiluminescence spectrum resulting from mixing Na and  $\text{HgCl}_2$  vapors. The spark line of Hg  $\lambda$  3984, not previously found in the luminous Hg stream, was found when Na was present. B. L.

**Persistence of  $\lambda$  2537 in mercury at low pressures.** HAROLD W. WEBB AND HELEN A. MESSENGER. *Phys. Rev.* [2], 33, 319-28(1929).—The persistence of  $\lambda$  2537 excited by electron impact in Hg vapor was measured for vapor pressures correspond-

ing to the temp. range  $78^{\circ}$  to  $-19^{\circ}$ , the alternating potential method previously described (*C. A.* 18, 3532) being used. Between  $78^{\circ}$  and  $17^{\circ}$  this persistence varied inversely as the first power of the pressure and not inversely as the square of the pressure as predicted by theories of the diffusion of radiation by repeated absorption and reëmission. A modified theory of diffusion of radiation seems necessary to explain the persistence, which is much too small to be explained as dependent upon the life of the metastable atoms. As the pressure is lowered the persistence approaches a limiting value of the order of  $10^{-6}$  sec. The life of  $\lambda$  1849 was less than  $3 \times 10^{-6}$  sec. A radiation process probably assocd. with the 7.1-v. break in the crit. potential curves had a life of  $2.1 \times 10^{-6}$  sec. It is suggested that this is the life of the infra-red transition to the 6.7 v. level followed by the radiation of  $\lambda$  1849. Another process assocd. with an excitation potential lying between 5 and 6 v. had a life of about  $8.3 \times 10^{-6}$  sec. B. L.

The molecular spectrum of ammonia. I. Two types of infra-red vibration bands. G. A. STINCHCOMB AND E. F. BARKER. *Phys. Rev.* [2], 33, 305-8(1929); cf. *C. A.* 22, 4064.—The  $\text{NH}_3$  absorption bands at  $3.0\mu$  and at  $1.9\mu$  have been sufficiently resolved by means of gratings to reveal their fine structure, which proves to be of a different character in the 2 cases. The  $3\mu$  band is assocd. with a vibration of the element parallel to the symmetry axis of the mol., yielding one zero branch and a simple rotation series. At  $1.9\mu$  there is a series of almost equally spaced lines showing a uniformity in intensity so that the envelope is a single broad max. instead of the usual doublet. The band center cannot be selected by inspection. The vibration which gives rise to this band is normal to the symmetry axis. The moment of inertia of the mol. may be detd. about the line normal to the symmetry axis from the  $3\mu$  band, namely,  $I = 2.83 \times 10^{-40}$ . This does not yield the distances between at. nuclei. The  $1.9\mu$  corresponds to one of the 4 fundamental frequencies. Its character shows that it is not harmonic nor a combination of vibration along the axis. The  $10\mu$  and  $6\mu$  bands probably correspond to 2 other fundamentals. Further analyses must be made before the fourth fundamental can be selected and to det. the nature of vibrations involved. B. L.

Some relationships between singlets and triplets in the spectra of two electron systems. WM. V. HOUSTON. *Phys. Rev.* [2], 33, 297-304(1929).—The Darwin-Pauli treatment of the electron is applied to the Schrödinger equation for a 2-electron system. The results show that the division into singlets and triplets is justified only as a limiting case. Expressions are derived which give the position of the levels, the Zeeman effect pattern, and the intensities of the lines when the division into singlet and triplet cannot strictly be made. These expressions are shown to give the observed facts of several spectra. BERNARD LEWIS

Arc spectra in the region  $\lambda$  1600-2100. E. W. H. SELWYN. *Proc. Phys. Soc.* (London), 41, 392-403(1929).—A method is described for photographing spectra in the region  $\lambda$  1600 to  $\lambda$  2100. A vacuum spectrograph is provided with a fluorite window over the slit and a water-cooled arc chamber through which  $\text{N}_2$  is circulated so that a stream constantly passes between the arc and the slit. Pure  $\text{N}_2$  appears to be transparent down to the limit of transmission of fluorite. Sufficient accuracy in the measurements to establish provisional wave-length standards in the region is claimed. New measurements of the spectra of 13 elements are recorded, together with additions to the analysis of Mg I, Be I and B I made possible by the discovery of a no. of new lines. C. J. HUMPHREYS

The Kerr effect in viscous liquids due to radio-frequency oscillating field. S. C. SIRKAR. *Indian J. Physics* 3, 409-24(1929).—The Kerr effect in the viscous higher alcs. octyl, nonyl, decyl and undecyl, has been studied for radio-frequency oscillating field. A peculiar kind of restoration of light between crossed nicols is observed which is a phenomenon entirely different from the Kerr effect and is most conspicuous in the region of frequencies in which there is strong elec. absorption, the liquid becoming translucent in the elec. field at such frequencies. The Kerr effect in undecyl alc. becomes too small to be observed for an oscillating field of wave length 114 cm. showing the existence of a time of relaxation in the Kerr effect which lies between  $10^{-8}$  and  $10^{-4}$  sec. for this alc. H. W. WALKER

Electronic state in hydride molecules. ERIK HULTHÉN. *Arkiv. Mat. Astron. Fysik* 21B, No. 5, 5 pp.(1929).—H. investigated the band spectra of metal hydrides, especially those of the second group of the periodic table, and compared them with the spectra of their at. components. In addn. to the previous transitions, a set of faint  $^2\Sigma' \rightarrow ^2\Sigma$  transitions was found, emitted by very unstable  $^2\Sigma'$  states. These seem to fade out as one passes from  $\text{HgH}$  to  $\text{BeH}$ . Curves and mol. data are given. In the  $\text{HgH}$  spectrum the highly excited vibrational states in  $^2\Pi$  were extended. It was found that in  $^2\Pi_{1/2} \rightarrow ^2\Sigma$ , the higher members of this series appear as "tail"

bands, shaded off toward longer waves. The vibrational limits of  $^1\Sigma$  and  $^3\Pi_{1/2}$ ,  $^3\Pi_{3/2}$ ,  $^3\Sigma'$  fit well into the  $^1S$  and  $2^3P$  at levels of Hg, but no exact relation between the excited mol. states and the at. triplet  $2^3P_0$ ,  $2^3P_1$ ,  $2^3P_2$  could be found. Similar relations hold for the other hydrides studied. Bengtsson's data (C. A. 23, 564) on the AlH spectrum give the information that the  $^1\Sigma$ ,  $^3\Pi$ ,  $^3\Sigma'$  states originate in the normal  $2^3P$  and the excited  $3^3P$  states in the Al atom.

LOUIS WALDBAUER

**The determination of concentration gradients by means of bent light rays. A new method of observation.** OLÉ LAMM. *Z. physik. Chem.*, Abt. A, 138, 313-31 (1928).—This work has been undertaken as a preliminary step to an investigation of starch by means of Svedberg's ultra-centrifuge, since the usual method of detn. of concns. by means of ultra-violet absorption cannot be employed in the case of starch solns. The new method utilizes the deformation of a scale photographed through the layer of a soln. of varying concn. A preliminary expt. on diffusion of cane sugar indicates that the method may be used for accurate detns. of the variations of concn. at every moment.

EMIL KLARMANN

**Quantitative relationships for natural optical activity.** WERNER KUHN. *Z. physik. Chem.*, Abt. B, 4, 14-36 (1929).—Detns. were made to show distribution in various spectral regions of optical activity displayed. In many cases very weak absorption bands play a prominent part. In the theoretical part a quant. relationship is established between circular dichroism and optical rotatory power within and without the absorption bands. Optical activity is a refraction phenomenon:  $\phi = \pi/\lambda_{\text{vac}} (n_l - n_r)$  ( $\phi$  = rotation per unit length,  $n_l$  and  $n_r$  are refractive indices for left and right circularly polarized light). K. shows that even if  $\phi$  is large,  $n_l - n_r$  is in the 6th place of decimals only in visible light, but is much larger in the nearer ultra-violet. Considerations of the contributions made by the various absorption regions lead to the conclusion that rotation in the visible regions must often be subject to reversal of sign. Formulas are given for  $\phi$  within and without absorption bands.

A. P. SACHS

**Invisible oxide films on metals.** F. HURN CONSTABLE. *Nature* 123, 569 (1929).—In the early stages of oxidation the reflecting powers of Fe, Ni and Cu become somewhat smaller over the whole range of the spectrum, but slightly more so at the violet end than at the red, showing the existence of an absorption max. far in the ultra-violet. When reduced, Cu is attacked by  $H_2S$ , the color sequences are produced rapidly. If, however, the Cu surface has previously been exposed to air and then the  $H_2S$  admitted, the interference colors are developed very slowly. Heating the metal to  $300^\circ$  in a  $N_2$  vacuum of  $10^{-3}$  mm. does not remove the oxide film.

H. F. JOHNSTONE

**Comparative study of the Raman spectra of some hydrogen compounds.** M. DAURE. *Compt. rend.* 188, 1492-4 (1929).—An empirical classification of the types of Raman spectra is given, based upon the types of linkages in the mols. to which they are due. Compds. of the type M—H, such as HCl or  $NH_3$ , yield a set of frequencies designated by  $h$ , which lie between 278 and 340 waves per mm. Another group designated by  $l$ , occurring in compds. such as  $C_2H_6$ ,  $C_2H_4$ , etc., lying between 20 and 196 waves per mm. seems to be due to linkages M—M, especially in the C chain. Similar  $l$  lines are found due to compds. with a C=C bond including benzene, toluene and the xylenes.

C. J. HUMPHREYS

**The Raman effect.** C. SCHAEFER. *Z. Physik* 54, 153-4 (1929).—The infra-red frequency of NaCl, LiF and NaF is not found in the Raman effect. The reason is to be sought in the nature and type of vibration.

GEORGE GLOCKLER
